*POYNING's law*, an act of parliament made in Ireland under Henry VII. whereby all the statutes of force in England were made of force in Ireland; which before that time they were not. Nor are any now in force there, made in England since that time.

The law took its name from Sir Edward Poyning, lord lieutenant of that kingdom at the time of its making.

*POZZOLANA*, a reddish kind of earth, used in Italy for sand. See *SAND*.

The best is found about Pozzuoli, Baize, and Cumæ, in the kingdom of Naples, from the first of which places it takes its name.

*Pozzolana*, mixed with lime, makes the best mortar in the world. See *MORTAR*.—It hardens and petrifies in water: it penetrates black flints, and whitens them. It is of particular service in making moles, and other buildings, in maritine places. Agricola takes it to be of an aluminous and sulphurous nature. See Vitruvius, Pliny, de Lorme, &c. who set a great value on it.

PRACTICAL philosophy, } MUSIC.  
PHILOSOPHY.

*PRACTICE*, in arithmetic, *PRACTICA Italica*, or *Italian usages*; certain compendious ways of working the rule of proportion, or golden rule; especially where the first term is 1, or unity. See *GOLDEN rule*.

They were thus called from their expediting of *practice* and business; and because first introduced by the merchants and negotiants of Italy. See *RULE*.

The most useful of these *practices* are as follow:—1. Since the use of the rule of three is to find a fourth proportional to three given numbers, divide the first and second, or the first and third, by some common number, if that can be done exactly; and work with the quotients in their stead: as in the following example:

Price of 3 lb is 9 sh. What is the price of 7 lb?

3) 1 3

3

facit 21 shil.

Price of 14 lb is 26 shil. What is the price of 7 lb.

7) 2 2) —

1

facit 13 shil.

2. If the first term be 1, and the second an aliquot part of a pound, shilling, or penny; divide the third by the aliquot part: the quotient is the answer. Note, To find the aliquot part; those who cannot do it otherwise, may see the table of aliquot parts of a pound under the article *ALIQUOT*.

E. gr. If 1 ell cost 10 shil. What cost 557 ells?

facit l. 478: 10s.

3. If the first or third number be 1; the other not exceeding large; and the middle term a compound, i. e. consist of several denominations; it may be wrought without reduction thus:

Price of 1 lb is 3 s. 8 d. 3 q. What is the price of 5 lb?

5

facit 18 s. 7 d. 3 q.

For 4 farthings making a penny, 5 times 3 farthings make 3 d. 3 q. and 12 pence making 1 shilling, five times eight pence make 3 s. 4 d. which, with 3 d. from the place of farthing, make 3 s. 7 d. Lastly, five times 3 shillings make 15 shillings, and with the 3 shillings from the place of pence, 18 s. The price required therefore is 18 s. 7 d. 3 q.

4. If the middle term be not an aliquot, but an aliquant part, resolve the aliquant part into its aliquot parts; divide the middle term by the several aliquots, the sum of the quotients is the answer. To find the aliquot parts contained in an aliquant, see the table of aliquant parts of a pound under the article *ALIQUANT*.

For an instance of this rule:

If 1 ell cost 15 shil. What cost 124 ells?

$\frac{1}{2}$

$\frac{1}{2}$  62

$\frac{1}{4}$

31

facit 93 l.

5. If the first or second term be 1; and in the former case, the second or third, in the latter the first, be resolvable into factors; the whole operation may be performed in the mind without writing down any figures; as in the following example.

Price of 1 lb is 24 shil. What is the Price of 20 lb?

$\frac{4}{6}$

$\frac{4}{6}$

6

80

6

facit 48: 0s.—24 l.

6. Where one of the given numbers is 1, we have several compendious usages, to save multiplication and division. E. gr. If 9 lb cost 20 shil. What does 1 lb cost?

It is obvious the sum required is had by adding to the tenth part of 20 s. viz. 2 s. the ninth part of the tenth, viz. 3 d.  $\frac{1}{2}$ , and  $\frac{1}{5}$  of a penny; the answer therefore is 2 s. 3 d.  $\frac{1}{2}$  and  $\frac{1}{5}$ .

Again: If 5 lb cost 64 shil. What cost 1 lb?

Since 5 is half of 10, the double of the tenth part of the given price, viz. 10 s. 9 d.  $\frac{1}{2}$  q. is the sum required.

Again: If 1 lb cost 18 d. What will 19 lb cost?

Since 19=20-1; from the given price doubled, and increased by a cypher, viz. 360, subtract the simple 18; the remainder is 342 d.=28 s. 6 d. the sum required.

7. If two terms of the same denomination differ by an unit, we have a peculiar kind of compend, which will be clear from the following examples. E. gr. If 5 lb cost 30 s. What will 4 lb cost?

Since the price of 4 lb is one fifth part short of that of 5 lb, divide the given price 30 by 5; the quotient 6 being subtracted from the dividend, the remainder, viz. 24 s. is the sum required.

Again: If 8 lb cost 24 s. What cost 9 lb?

Since the price of 9 lb exceeds that of eight by one eighth part; divide the given price 24 by 8; and add the quotient 3 to the dividend; the sum 27 is the answer.

8. Sometimes one may use several of these compends or *practices* in the same question. E. gr. If 100 lb cost 30 s. 4 d. What cost 50 lb?

50) 2. 2

facit. 15 s. 2 d.

Again: 60 lb cost 4 s. What cost 2520?

**PRÆ**, a Latin preposition, literally signifying *before*; used in composition with several words in our language, to denote the relation of priority. See **PREPOSITION** and **COMPOSITION**.

Of late, our writers, in Latin words anglicised, for *præ*, usually write *pre*, restraining the Latin orthography to words that are still Latin, or used as such. Hence, for

**PRAGMATIC** \* *sanction*, in the civil law, is defined by Hottoman, a rescript, or answer of the sovereign, delivered by advice of his council, to some college, order, or body of people, upon their consulting him on some case of their community.

\* The word is formed from the Greek *πραγμα*, *negotium*, business.--- It is sometimes also called absolutely *pragmatic*, to *πραγματικον*.

The like answer given to any particular person, is called simply *rescript*, *rescriptum*. See **RESRIPT**.

The term *pragmatic sanction* is chiefly used among the modern writers, for that famous ordonnance of Charles VII. of France, published in 1268. containing a regulation of ecclesiastical discipline, conformable to the canons of the council of Basil; and since used by the Gallican church, as a barrier against the enterprizes and encroachments of the court of Rome.

The scope of the *pragmatic sanction* was, to regulate the form of elections made by the clergy; to declare the collations to belong to ordinaries, the prevention alone reserved to establish prebends; to assign a third of the benefices to graduates; to abolish reservations, annates, and other like grievances.

Pope Pius II. obtained an abrogation of this sanction from Louis XI. on which occasion the court of Rome, transported with joy, dragged the *pragmatic* through the streets, whipping it all the way, as Xerxes anciently did the Hellepont.

I

But the parliament opposed this abrogation with a great deal of vigour, and refused its consent to the last. So that maugre all the efforts of Rome, the *sanction* still held in force; till the concordat passed between pope Leo X. and Francis I. in 1515. when the *pragmatic sanction* was abolished. See **CONCORDAT**. The parliament of Paris again opposed the innovation, and refused to confirm the concordat; and was not brought to give its consent at last, till after repeated orders of the king; together with a secret resolution taken, always to judge conformably to the tenor of the *pragmatic sanction*.

**PRAGMATICAL**, **PRAGMATICUS**, a term sometimes used in the same sense as *practical*, *mechanical*, or *problematical*.

Stevinus, in his hydrostatical elements, calls certain mechanical or practical experiments, which he undertakes to instruct his reader how to make, by the name of *pragmatical* examples: and in the like sense is the word sometimes used by other naturalists.

**PRATIQUE** \*, or **PRATTIC**, in commerce, a negotiation or communication of commerce, which a merchant-vessel obtains in the ports it arrives in, and the countries it discovers.

\* The word is French, and signifies, literally, *practice*.

Hence to obtain *pratique*, is to obtain a liberty to frequent a port, to go ashore, buy and sell, &c. We could never have any *pratique* with the inhabitants of Nova Zembla.

**PRATIQUE** is particularly used for a licence to traffick, granted to the master of a ship in the ports of Italy, upon a bill of health; that is, a certificate that the place whence he came, is not annoyed with any infectious disease.

**PRAXEANS**, a sect of heretics, so called, from their author Praxeas.

This heresiarch was of Asia, and lived in the second century. He was at first a disciple of Montanus, but quitted him, and soon after set up a sect of his own; teaching, that there was no plurality of persons in the godhead; and that it was the Father himself that suffered on the cross. Which sentiment was afterwards adopted by the Monarchici, Sabellians, and Patripassians, See **SABELLIAN**, **PATRIPASSIAN**, &c.

**PRAYER**, in theology, a petition put up to God, either for the obtaining of some future favour, or the returning of thanks for a past one. See **WORSHIP**.

Divines distinguish three kinds of *prayer*:

*Vocal*, which is clothed in words and sounds to be uttered with the mouth. See **VOCAL**.

*Mental*, which is only formed or conceived in the mind, and not delivered in words. See **MENTAL**.

*Ejaculatory*, which is a short, sudden flight, without study, order, or method.

Mythic divines, again, distinguish *prayer* into *active* and *passive*. See **ACTIVE** and **PASSIVE**.

Among us, *prayer* is frequently considered under the divisions of *preconceived* and *extemporary*.

Under the first come all set forms, whether public or private, by which the mind is directed in the order, manner, expression, &c. of its petitions. See **LITURGY**.

The second is that where the mind is left to itself, its own conduct, both as to matter, manner, words, &c.

The Romanists also prefer *prayers* to saints, the virgin, the angel Gabriel, &c. See **SAINT**, **OFFICE**, **Ave Mary**, &c.

**PREACHING** \*, in theology, the declaration, or promulgation of the word of God, in public, by a person authorized, and in a place appointed for the purpose. See **SERMON**, **PRIEST**, **GOSPEL**, &c.

\* The word is derived from the Hebrew *paraſch*, *exposuit*, he expounded.

Anciently, none but bishops were allowed to *preach*: now, not only priests, but deacons, are qualified. See **BISHOP** and **DEACON**.

Bishop Wilkins has delivered the art of *preaching*, in a treatise called *Ecclesiastes*, or the preacher. See **ECCLESIASTES**.

The religious of the order of St. Dominic assume the quality of *preaching-brothers*, friars-predicant, or predicants. See **DOMINICAN**.

**PRÆADAMITE**, **PRÆADAMITA**, a denomination given to the inhabitants of the earth, conceived, by some people, to have lived before Adam.

Isaac de la Pereyra, in 1655. published a book to evince the reality of *Præadamites*, by which he gained a considerable number of proselytes to the opinion: but the answer of Demarets, professor of theology at Groningen, published the year following, put a stop to its progress; though Pereyra made a reply.

His system was this: The Jews he calls *Adamites*, and supposes them to have issued from Adam; and gives the title *Præadamites* to the Gentiles, whom he supposes to have been a long time before Adam.

But this being expressly contrary to the first words of Genesis, Pereyra had recourse to the fabulous antiquities of the Egyptians and Chaldeans, and to some idle rabbins, who imagined there had been another world before that described by Moses.

He was apprehended by the inquisitors in Flanders, and very roughly used, though in the service of the Dauphin. But he appealed from their sentence to Rome; whither he went in the time of Alexander VII. and where he printed a retractation of his book of *Præadamites*.

**PREAMBLE**, in law, the beginning of an act of parliament, &c. serving, as it were, for a key, to open the intent of the makers

makers of the act, and the mischiefs intended to be prevented or remedied thereby. See ACT.

**PREBEND, PRÆBENDA**, the portion a prebendary receives for his maintenance out of the estate of a cathedral or collegiate church. See **PREBENDARY**.

The term *prebend* is usually confounded with *canonicate*, or *canonica*; yet there is a real difference. A *prebend* is properly a right which an ecclesiastic has in a cathedral, or collegiate church where he officiates, to receive certain ecclesiastical revenues, and to enjoy certain dues, either in money or in kind; (so called à *præbendo*, q. d. *afforded* or *allowed* him; not à *præbendo auxilium* or *consilium episcopo*) whereas *canonica* is a mere title, or spiritual quality, which a person enjoys independent of any præstation, or any temporal revenue: so that the *prebend* may subsist without the *canonicate*; but the *canonicate* is inseparable from the *prebend*.

For it is not to the *prebend* that the right of suffrage, and other spiritual rights are annexed, but to the *canonicate*; and when the *prebend* is joined to the *canonicate*; it becomes spiritual by virtue of the *canonicate* to which it is attached. See **CANONICA**.

Anciently the pope created canons with a right of having place in the choir, a deliberative voice in the chapter, and an expectation of the first *prebend* that should become vacant; but this was prohibited by the council of Trent: yet the pope still confers the *canonicate* without any *prebend*, when he would confer a dignity in a church, for the obtaining whereof, it is required the candidate be a canon.

This they call a *canonicate ad effectum*, and sometimes *jus ventosum*, which is no more than an empty title, conferred purely to qualify a man for a dignity restrained to the capacity of canon.

In some churches there are *double prebends*, and in others *semi-prebends*.

Originally the *prebend* was only a livery, or portion of things necessary to life, given daily; at present the rents and profits of the church are divided into fixed portions, called *prebends*, which are enjoyed independently. The nomination to *prebends* is in the king. In France it is one of the honorary rights of the king, on his joyful accession to the crown, to nominate to the first *prebends* vacant by death in the cathedral and collegiate churches.

*Prebends* are either *simple*, or with *dignity*.--The latter are such as, beside their *prebends*, have some jurisdiction annexed to them.

**Theological, or divinity PREBEND** is a *prebend* appropriated to a doctor in divinity, in each cathedral and collegiate church throughout France, for preaching on Sundays, and making a public lecture thrice a week.

**Preceptorial PREBEND**, is that *prebend* whose revenues are destined for the support of a preceptor or master, who is obliged to instruct the youth of the place *gratis*.

The *canonicate* is not here necessary to the *prebend*.

Panorm. observes, that in the cathedral church of Chartres there are *prebends* appropriated to laymen, and for the subsistence of some persons of birth and distinction.

**PREBENDARY, PRÆBENDARIUS**, an ecclesiastic who enjoys a *prebend*. See **PREBEND**.

*Prebendaries* and canons of cathedral and collegiate churches have this in common, that they have each a portion of the revenues of the church for their subsistence; the one under the title of *præbenda*, *prebend*; the other under the title of *canonica*, or *canonicate*; and have each places, and voices in the chapter: but they differ in this, that the former receives his portion or *prebend* in consideration of his officiating and serving in the church; but the latter without any such consideration, merely by his being received into the cathedral or college, *per assignatum stallum in choro, & locum in capitulo*. See **CANON, &c**

**Golden PREBENDARY of Hereford**, called also *præbendarius episcopi*, is one of the twenty-eight minor *prebendaries*, who has, *ex officio*, the first canon's place that falls.

He was anciently confessor of the bishop and cathedral, and had the altars; on which account he was called the *golden prebendary*.

**PRECARIÆ, or PRECES**, in our ancient law-books, days works, which the tenants of certain manors are bound to give their lords, in harvest-time.

These, in some places, are corruptly called *bind-days*, for *biden-days*, from the Saxon, *biddan*, to pray.

**Magna PRECARIA** was a great or general reaping-day.

The lord of the manor of Harrow in Middlesex had, 21. Ric. 2. a custom, that by summons of his bailiff on a general reaping-day, then called *magna precaria*, the tenants should do one hundred ninety-nine days work for him; every tenant that had a chimney sending a man.

**PRECARIOUS**, in commerce, an appellation given to a kind of trade carried on between two nations at war, by the intervention of a third at peace with them both.

Thus the English hold a *precarious* commerce with the Spaniards by means of the Portuguese; when the two former nations being at war, the third lends its vessels, its colours, and name, to continue their trade.

**PRECARIOUS**, in jurisprudence, is applied to a fund or stock, of which a person has not the full propriety, whereof he cannot dispose absolutely, and which is most of it borrowed.

**PRECE partium**, in law, the continuance of a suit by consent of both parties. See **CONTINUANCE**.

**PRECEDENCE, PRECEDENCY, or PRÆCEDENCY**, a place of honour which a person is intitled to in companies; either sitting, or walking. See **RANK**.

*Precedency* is either of *courtesy*, or *de jure*, of right.

The former is that which is due to age, to estate, &c. which is regulated by custom and civility.

The latter is settled by authority, and where broken in upon, gives an action at law. See **NOBILITY**.

The point of *precedency* is thus ordered by the heralds:--After the king, the princes of the blood, viz. the sons, grandsons, brothers, and nephews of the king, take place; then the great officers of the church and crown, viz. the archbishop of Canterbury; then the lord chancellor, or lord keeper of the great seal; next, the archbishop of York; the lord high treasurer; the lord president of the privy-council; the lord privy-seal; next, dukes, then marquises, dukes eldest sons, earls, marquises eldest sons, dukes younger sons, viscounts, earls eldest sons, marquises younger sons, bishops, barons, viscounts eldest sons, earls younger sons, barons eldest sons, privy-councillors, judges, masters in chancery, viscounts younger sons, barons younger sons, knights bannerets, baronets, knights of the bath, knights bachelors, colonels, serjeants at law, doctors, esquires, lieutenant colonels, majors, captains, bachelors of divinity, law, &c. masters of arts, gentlemen, yeomen, tradesmen, mechanics.

Note, That great officers of court, of what degree soever they are, take place above all others of the same degree or order of nobility; viz. the master of the horse, lord great chamberlain of England, lord high constable of England, lord marshal of England, lord admiral of England, lord steward, and lord chamberlain of his majesty's household.--So the secretaries of state, if peers, take place of all of that degree, except the great officers aforesaid.--Dukes, marquises, earls, barons, &c. not having any of the said offices, nor being descended of the blood-royal, take place according to the seniority of their creation.--The ladies take place, or *precedency*, according to the degree of quality of their husbands.

**PRECEDENT**, in law, frequently denotes an original, authentic instrument, or writing; serving as a form to draw others by: See **ORIGINAL, &c**.

Hence *precedent-books*, &c. full of draughts of deeds, conveyances, &c. for attornies.

**PRECENTOR \*, PRÆCENTOR**, a dignitary in cathedral churches, popularly called the *chantor*, or *master of the choir*. See **CHANTOR**.

\* The *præcentor* is so called, from the Latin *præ*, and *cano*; because he is supposed to lead the choir, and sing before the rest.

**PRECEPT, PRÆCEPTUM**, in law, a command in writing; sent by a chief justice, justice of peace, or other like officer, for the bringing of a person, record or other matter, before him.

**PRECEPT** is also used for the command, or incitement, whereby one man stirs up another to commit felony, theft, &c.--Bracton speaks of three diversities of offending in murder; viz. *præceptio*, *fortia*, *consilium*.

*Præceptio*, is the instigation used before-hand; *fortia*, the assistance in the fact; *consilium*, the advice either before or after. See **MURDER, ABETTOR, &c**.

**PRECEPTORIAL prebend**. See the article **PREBEND**.

**PRECEPTORY, PRÆCEPTORIA; commandry**; a kind of benefice held by the more eminent among the ancient knights-templars, who were created by the grand master, with the title of *præceptores templi*, i. e. *masters of the temple*. See **TEMPLAR**.

Stephens, *de jurisd. lib. 4.* says, the *preceptories* were only a kind of cells, all subordinate to their principal mansion, the temple in London. See **TEMPLE**.

Of these *preceptories*, Dugdale says, he finds sixteen recorded, as anciently belonging to the templars in England, viz. Cressing Temple, Balthal, Shengay, Newland, Yevely, Witham, Temple-Bruere, Willington; Rotheley, Ovenington, Temple-Comb, Trebigh, Ribstane, Mount St. John, Temple-Newsum, and Temple-Hurst. But there were more. See **COMMANDRY**.

**PRECES**. See the article **PRECARIÆ**.

**PRECESSION, PRÆCESSIO**, in astronomy, a term applied to the equinoxes, which, by a very slow insensible motion, change their place, going backwards, or westward, i. e. in *antecedentia*, as astronomers call it, or contrary to the order of the signs. See **EQUINOX**.

It is shewn, in the new astronomy, that the pole, the solstices, the equinoxes, and all the other points of the ecliptic, have a retrograde motion; and are continually moving from east to west, or from aries towards pisces, &c. by means whereof the equinoctial points are carried further and further back, among the preceding signs of stars, at the rate of about 50 seconds each year; which retrograde motion is called the *precession, recession, or retrocession of the equinoxes*.

Hence, as the fixed stars remain immoveable, and the equinoxes go backward, the stars will seem to move more and more eastward with respect thereto; whence the longitudes of the stars, which are reckoned from the first point of aries, or the vernal equinox, are continually increasing. See **LONGITUDE** and **STAR**.

Hence it is that the constellations have all changed the places assigned them by the ancient astronomers: in the time of Hipparchus, and the oldest astronomers, the equinoctial points were fixed to the first stars of aries and libra; but the signs are now no longer in the same points; and the stars which were then in conjunction with the sun when he was in the equinox, are now a whole sign, or 30 degrees, to the east thereof: thus the first star of aries is now in the portion of the ecliptic called *taurus*; and the first star of *taurus* now resides in *gemini*; and *gemini* is advanced into *cancer*, &c. See SIGN and CONSTELLATION.

The equinoxes will have made their revolution westward, and will be returned to aries again; or the constellations will have made theirs eastward, and will again fall into their former places, with regard to the equinoxes, in 25816 years, according to Tycho; in 25920, according to Ricciolus, and in 24800, according to Cassini.

The ancients, and even some among the moderns, have taken the equinoxes to be immovable; and ascribed that change of distance of the stars herefrom, to a real motion of the orb of the fixed stars, which they supposed to have a slow revolution about the poles of the ecliptic; so as that all the stars perform their circuits in the ecliptic, or its parallels, in the space of 25920 years; after which they should all return again to their former places.

This period the ancients called the *Platonic*, or *great year*; and imagined, that at its completion every thing would begin as at first; and all things come round in the same order they have already done. See *Platonic YEAR*.

The physical cause of the *precession* of the equinoxes, Sir Isaac Newton demonstrates, does arise from the broad spheroidal figure of the earth; which again arises from the earth's rotation around its axis. See *EARTH*.

**PRECIOUS**, or *PRÆTIOUS stone*, called also *gem* and *jewel*, is a stone extraordinarily hard, durable, transparent, and of a beautiful colour or water. See *STONE* and *GEM*.

Of these we may distinguish three kinds:

1. Such as are intirely transparent; which again may be divided into such as are either colourless, as the *diamond*; or coloured, as the *emerald*:— which division of coloured gems may be subdivided into those of one colour, as the *ruby*; and those with several, as the *amethyst*.

2. Brilliant, or shining, as the *Bohemian granate*.

3. Semi-transparent, as *opal*. See *OPAL*.

Bishop Wilkins divides *precious stones* into *more* and *less transparent*.

The *less transparent* he distinguishes by their colours; into red, as the *sardian* and *cornelian*; pale, fleshy colour, like that of a man's nail, as the *onyx*; bluish, as the *turquois*; pale purple, as the *chalcidony*; and those of various colours, as *opal* and *cat's eye*.

The *more transparent* he distinguishes into such as are colourless, as the *diamond* and *white sapphire*; and coloured, which are either red, as the *ruby*, *carbuncle*, and *granate*; yellow, as the *chrysolite* and *topaz*; green, as the *emerald*, *smaragd*, and *beryl*; bluish, as the *sapphire*; and purple or violaceous, as the *amethyst* and *hyacinth*.

Dr. Woodward divides *precious stones* somewhat more precisely, into *opaque*, *semi-opaque*, and *transparent*.

The *opaque* are either of one colour, as the *turquois*; or of various colours, as *lazuli*, and *jasper*.

*Semi-opaque* either have their colours *permanent*, as the *agat*, *chalcidony*, *onyx*, *sardonyx*, *cornelian*, and *beryl*; or their colours *vary* according to the position of the light, as the *oculus cati*, and *opal*.

*Transparent stones* are either *with colours*; as the *topaz* and *hyacinth*, yellow, or partaking thereof; *granate*, *ruby* and *amethyst*, red; *sapphire*, *water-sapphire*, and *aquemarine*, blue; and *emerald*, or *chrysolite*, green, or partaking thereof:— or *without colours*, as the *crystal*, *pseudo-diamond*, *white sapphire*, and *diamond*.

The *natural history*, *characters*, *properties*, &c. of each stone, see under its proper article, *DIAMOND*, *CORNELIAN*, *RUBY*, *TURQUOIS*, *ONYX*, *EMERALD*, *CHRYSOLITE*, &c.— For the *medicinal virtues* of precious stones, or gems, in the general, see *GEM*.— The *origin and formation* of precious stones, see under *STONE*.— For the *art of engraving* on precious stones, see *ENGRAVING*.— The *art of cutting* them, see under *LAPIDARY*. *Mosaic work* of precious stones, see *MOSAIC*.

**PRECIPE**, or *PRÆCIPE quod reddat*, a writ of great diversity both as to form and use; extending as well to writs of right, as to other writs of entry and possession.

It is sometimes called a *writ of right close*, as when it issues out of the court of chancery close; sometimes a *writ of right patent*, as when it issues out of chancery patent, or open, to any lord's court, for any of his tenants deformed, against his deformer. See *WRIT*.

**PRECIPITANT**, *PRÆCIPITANS*, in chymistry, a term applied to any liquor, which, being poured on a dissolution, separates what is there dissolved, and makes it *precipitate*, i. e. fall to the bottom of the vessel. See *DISSOLUTION*.

Thus oil of tartar, and the volatile spirit of sal armoniac, are *precipitants* with regard to the dissolution of gold in aqua regalis; and common water is a *precipitant* with regard to the dissolution of jalap in spirit of wine. See *PRECIPITATION*.

**PRECIPITANT** is also used in medicine, for a remedy which separates and precipitates any heterogeneous matter contained in the mass of blood; and by this means abates any irregular fermentations, effervescences, or the like disorders, which that matter had excited.

Among the number of *precipitants*, are ranked harts-horn, crabs-eyes, ivory, bezoard, barks of oak, and guaiacum, iron, quinquina, chalk, &c.

**PRECIPITATE**, *PRÆCIPITATUS*, in chymistry, a substance which having been dissolved in a proper menstruum, is again separated from its dissolvent, and thrown down to the bottom of the vessel, by the pouring in of some other liquor. See *PRECIPITANT*.

The chymists make various *precipitates* of mercury, which are of various colours, as the *precipitants* vary; viz. *white*, *red*, *yellow*, *green*, &c. See *MERCURY*.

*White*, called also *sweet PRECIPITATE*, is prepared of mercury dissolved in spirit of nitre, and precipitated with salt-water, or spirit of salt, into a white powder.

If, in lieu of the former precipitants, hot urine be poured on the dissolution, we have a *pale rose-coloured precipitate*.

To make the *red* or *corrosive PRECIPITATE*, they take the dissolution of mercury made in spirit of nitre; evaporate all the humidity over a gentle fire, till nothing remains but a white mass; which, by increasing the fire, they rubify, or raise to a red colour.

*Green PRECIPITATE* is made with mercury, copper, and acid spirits;— *yellow precipitate* with mercury, and oil of vitriol.

But these three last are improperly called *precipitates*, because not procured by *PRECIPITATION*. See *PRECIPITATION*.

**PRECIPITATION**, *PRÆCIPITATIO*, an operation in chymistry; being a kind of separation, whereby a body dissolved and suspended in any menstruous liquor, is detached therefrom, and falls down to the bottom of the vessel. See *OPERATION*.

*Precipitation* is either *spontaneous*, or *artificial*.

*Spontaneous PRECIPITATION* is, when the particles of the dissolved body separate of themselves from their dissolvent.

*Artificial PRECIPITATION* is, when some other body, called a *precipitant*, is added to procure this separation. See *PRECIPITANT*.

There is also a *total precipitation*, wherein the dissolved parts are all separated, and sunk to the bottom; and a— *partial precipitation*, wherein some of the parts dissolved are still suspended in the fluid, and do not fall down.

To account for the operation of *PRECIPITATION*: It may be observed, that a fluid menstruum may be made to sustain a body specifically heavier than itself, either by making the resistance, arising from the cohesion of the parts of the fluid, equal to the excess of specific gravity of those bodies above that of the menstruum. See *MENSTRUUM*.

Or, by the heavy body's being joined to some lighter one; so that the two together only make one whole, equal in weight to the fluid.

In the first case, the resistance, we know, is still proportional to the surface of the corpuscles; so that the surface being diminished, the resistance is weakened: the proportion therefore of the tenacity of the menstruum, to the gravity of the corpuscles, being thus destroyed, a *precipitation* must ensue.

*Precipitation*, then, may be effected two ways, on this foundation; viz. either by the dropping in a liquor specifically lighter, or specifically heavier. In the former case, the gravity of the menstruum, which is always proportional to the compound gravities of both, will by this mixture become lighter: thus, the menstruum being diluted, the force of cohesion is also weakened, so as to become unable any longer to sustain the bodies; so hydrometers, which are easily sustained in water, upon pouring in a good deal of any burning spirits, sink to the bottom of the glass.

And this agrees not only with the laws of mechanics, but with experiments: thus spirit of sal armoniac does very plentifully precipitate the filings of metals, dissolved in acid menstrua; though it be abundantly lighter than any of them.

The same thing is done quicker by spirit of wine, whose gravity is known to be almost the least of any liquor.

By this spirit also, all salts, which are suspended in water, are precipitated, and so unite into crystals. So, if you drop distilled vinegar in the scoria of antimony diffused in water, it falls to the bottom, and affords the golden sulphur.

After the same manner, water, vinegar, &c. make a *precipitation* from acids, though more sparingly: nay, acids themselves, being poured upon others, which are heavier, will precipitate whatever is swimming in them. Thus spirit of salt precipitates either lead, copper, or tin, dissolved in oil of vitriol: so little need is there of alkalies in this business, though the chymists have unanimously contended for them as absolutely necessary.

In the second case, *precipitation* will succeed by the addition of a heavier liquor to the menstruum. For the particles of this liquor, what with their weight, and what with the impetus they acquire in their descent, carry down and sink all the solid corpuscles they meet with in their way; so that the corpuscles being thus forced down, and kept there by this adventitious liquor, cannot mount up into their former situation.

To try the truth of this reasoning by experiments; not only acid spirits, but even mere water, will be found to precipitate tinctures of vegetables extracted by spirit of wine: and the very same

tinctures, extracted with water or wine, are precipitated very copiously by acid spirits, which are heavier.

Metals, when dissolved in spirit of sal armoniac, are precipitated with oil of vitriol, or spirit of nitre. When suspended in aqua fortis, they are precipitated with oil of vitriol, or bezoaric spirit of nitre.

As to bodies suspended by means of their union with other lighter ones: this is properly the case of dissolved metals; and to this may the last case of precipitation be reduced. Here, the particles of a metal being separated by a dissolvent, and rendered imperceptible by their extreme littleness, only float, because united to very light particles of the acid spirit, which keeps them suspended; though the great surface they have, both on account of their smallness, and of their union with the acids, frequently contributes to the effect.

Now, as they are in a forced equilibrium with the fluid wherein they swim; and as the causes that sustain them, are only accidental; they must of course be precipitated to the bottom, when the acid or menstruum abandons them; from whatever cause it be: it is even sometimes sufficient, that the quantity of the fluid, wherein they are sustained, be diminished. For then several of the metallic particles, though still joined to their acid, coming to meet and unite, assume a smaller surface, with regard to their mass; thus, being no longer held up by the largeness of their surfaces, they subside to the bottom.

When the menstruum abandons a dissolved body; if that body be lighter than the menstruum, the contrary to precipitation will ensue, i. e. the body will rise: thus camphor being mixed in oil of olives, and the whole dissolved, the camphor rises first, &c.

If it happen, that the particles, when abandoned by the dissolvent, are equally heavy with the sustaining fluid, they will neither rise nor fall; only several of them now reuniting, form little masses, sufficient to spoil the limpidness and transparency of the fluid; as is the case in resin dissolved in spirit of wine, and water poured over them: where the water uniting closely with the spirit of wine, makes it let go the greatest part of the resinous particles.

Thus is effected what we call an imperfect precipitation; which, in reality, is no more than a disposition to precipitate.

If in this case the aqueous particles of the fluid be hid, and, as it were, absorbed among the gross molecules of the dissolved matter; it forms what they call a coagulum. See COAGULATION.

Sometimes, when the liquors are poured one on another, the salts with which they abound, being put into motion by their attractive force, they run mutually to embrace one another; and because they do not recoil far back after the congress, they are at length so united, as to become like a solid, there being very little phlegm remaining, as is very observable in tartarum vitriolatum.

In these experiments there happens such a conflict and effervescence, as evaporates almost all the moisture, with which the salts are diluted. And upon this depends the rationale of chymical coagulation, a thing of very great consequence in the business of precipitation. Nor can we account for oil of tartar's precipitating bodies dissolved in acids, any otherwise than from its making a kind of coagulum with these corpuscles, and thereby becoming too heavy for, and exceeding the tenacity of, the menstruum.

Such are the general principles of precipitation.

**PRECIPUT** \*, *q. d. precipuate*, in the French jurisprudence, an advantage belonging to any one, in a thing to be divided; or a portion taken off, and set by, in his favour, ere the division be made.

\* The word is formed from the Latin *precipuus*, chief, principal.

In noble partition, the eldest has always the principal fief, or manor, for his *preciput*.—In which view, the *preciput* coincides with the right of primogeniture. See PRIMOGENITURE.

**PRECISION**, *PRÆCISIO*, in the schools, the same with *abstraction*. See ABSTRACTION.

**PRECONISATION**, a proposition or declaration, which the cardinal patron makes in the consistory at Rome, of a person nominated by some prince to a prelature, by virtue of letters whereof he is the bearer; which the pope complying with, gives his collation. See COLLATION.

The date of the bulls is dispatched on the same day with the preconisation. See BULL.

**PRECONTRACT**, *PRÆCONTRACTUS*, a contract made before, or prior to another: chiefly used in relation to marriages. See CONTRACT.

**PRECORDIA**, or *PRÆCORDIA*, &c. the parts about the heart; *e. gr.* the pericardium, the diaphragm, the hypochondria, and even the heart itself, with the lungs, spleen, &c. See HEART.

The word is also ordinarily used for the fore-part of the region of the thorax. See THORAX.

Pliny, and some other authors, use it for all the viscera or entrails: *Præcordia vocamus uno nomine exta in homine*. See VISCERA.

One of the principal differences between men and brutes consists in this; that there is a greater correspondence and communication between the head and heart of the former than the latter: which correspondence is effected by means of a greater number of nerves, sent from the brain to the heart and *præcordia*; brutes only receiving nerves to the *præcordia* by the branches of the *paravagum*; and man, likewise, by the intercostal pair.

The reason, Dr. Willis well observes, is, that brutes being void of discretion, and but little subject to passions, need not, like man, a double passage for the spirits, the one for the service of the vital functions, the other for the reciprocal impression of the affections. See NERVE, SPIRIT, BRAIN, &c.

**PRECURSOR**, *PRÆCURSOR*, *fore-runner*, in theology, a person who goes before any one to notify his coming.

The term is peculiarly applied to St. John Baptist, who is styled the *precursor* of Jesus Christ, from what is said of him by St. Luke; *Thou, child, shalt go before the face of the Lord, to prepare his way*.

**PREDECESSOR**, a person who has preceded another in the same office or employ. See ANCESTOR.

**PREDESTINARIAN**, a person who adheres to the doctrine of absolute predestination. See PREDESTINATION.

St. Augustin is looked on as the founder of the sect of *predestinarians*; he being the first of the fathers that seems to have asserted the doctrine in such express terms; though the Jansenists and Jesuits are still greatly divided about the real doctrine of St. Augustin, in this article; each interpreting him consistently with their own scheme. See JANSENISM, &c.

Father Sirmond contends for an ancient sect of *predestinarians*, or *predestinians*, *prædestiniani*, cotemporary with St. Augustin himself, and who had their rise in Africa, in the monastery of Adrumetum; from a misunderstanding of St. Augustin's doctrine. It is added, that the opinion spread thence throughout the Gauls; where one of them, a priest, named Lucidus, was condemned by Faustus bishop of Rheggio; and his sentence confirmed by two councils.

The doctrine was again broached in the ninth century, by Godschalcus a Benedictine; who, as Hincmar in a letter to Pope Nicolas, says, maintained with the ancient *predestinarians*, who had been already anathematized, that God *predestinated* some to eternal life, and others to eternal death; that God did not will all people to be saved; that Jesus Christ did not die for all, but only the elect, or those that are saved, &c. See GRACE, &c.

This doctrine was again condemned in a synod held at Mentz: but the Jansenists, particularly the friends of Mess. de Port-Royal, and among the rest, the president Mauguin, have refused F. Sirmond; and shewn, that the heresy of the *predestinarians* is a mere chimæra; adding, that St. Fulgentius, St. Prosper, and the other disciples of St. Augustin, only looked on it as an imaginary heresy, invented by the enemies of St. Augustin's doctrine, to traduce it.

In effect, the chief evidences father Sirmond produces to the contrary, are the priests of Marseilles, who are suspected of semi-pelagianism. See SEMI-PELAGIAN.

**PREDESTINATION**, *PRÆDESTINATIO*, in theology, a judgment, or decree of God, whereby he has resolved, from all eternity, to save a certain number of persons, hence named elect. See ELECT.

Others define *predestination*, a decree to give faith in Jesus Christ, to a certain number of men; and to leave the rest to their own malice and hardness of heart. See FAITH.

The Remonstrants define *predestination* more laxly and generally, the decree of saving believers, and damning unbelievers. See ARMINIAN.

The greatest difficulties wherewith the modern theology is clogged, turn on the article of *predestination*: both the Romish and Reformed churches are divided about it: the Lutherans speak of it with horror; the Calvinists contend for it with the greatest zeal; the Molinists and Jesuits preach it down as a most dangerous doctrine; the Jansenists assert it as an article of faith: the Arminians, Remonstrants, and Pelagians, are all avowed enemies of *predestination*. See JANSENIST, MOLINIST, CALVINISM, PELAGIAN, &c.

Those strenuous patrons of Jansenism, the Port-Royalists, teach, that God *predestinates* those who he foresees will co-operate with his grace to the end. Du Pin adds, that men do not fall into sin, because not *predestinated*; but they are not *predestinated*, because God foresaw their sins. See ELECTION, REPROBATION, &c.

**PREDESTINATION** is also used for a concatenation of second causes appointed by providence, in virtue whereof, things are brought to pass by a fatal necessity; contrary to all appearances, and against all opposition. See FATE and DESTINY.

The Turks are great *predestinarians*; they esteem the lightest accident predetermined; and on this account, are much more daring in battle, and run greater risks of their lives, than they would otherwise do. See MAHOMETANISM.

**PREDETERMINATION**, *PRÆDETERMINATIO*, in philosophy and theology.—The schoolmen call that concurrence of God, which makes men act, and determines them in all their actions both good and evil, *physical predetermination*, or *premotion*. See PROMOTION and ACTION.

Divines hold, that God has no part in sin; inasmuch as he only affords his concurrence to the physical part of human actions, not to the moral part. See LIBERTY and NECESSITY.

*Physical predetermination*, or *premotion*, if there be any such thing, is that action of God, whereby he excites a second cause to act; or by which, antecedently to all operation of the creature, or before it could operate in consequence either of the order of nature or reason, he really and effectually moves and occasions it to produce all its actions: that is, whatever the creature does or acts, is really done and acted by the agency of

of God on the creature, who is all the time passive. So that without such *predetermination* of God, all creatures must remain in an eternal state of inactivity; and with such *predetermination*, it is impossible but they should do what they are thus put upon doing.

It is strongly controverted, whether or no such a *physical predetermination* be necessary to the action of natural causes? The Scotists maintain the negative; urging, that all natural causes are, of their own nature, determined to a certain action; whence it should seem needless to call in a new *predetermination* of God, *e. gr.* to fire, to make it warm the hand. For if an object be, by the course of divine providence, applied to fire; what need a second application of the fire, to make it warm the object applied thereto? since beings are not to be multiplied unnecessarily. See CAUSE.

And such *predetermination* some philosophers hold still less requisite to produce the acts of the will: at least, say they, the human mind must be allowed the common power and privilege of a second cause; and therefore be intitled to produce its own acts, as well as other strictly natural agents. See WILL.

The Thomists, on the other hand, stand up strenuously for the *physical predetermination*: one of their principal arguments is drawn from the subordination of second causes to the first. Where there are several subordinate agents, say they, the lower agents do not act, unless first moved and determined thereto by the first; this being the very essence of subordination.

Again, the like they argue from the dominion of God over all his creatures: it is of the essence of dominion, say they, to apply and direct things subject thereto, to its own operations; and this, if the dominion be only mortal, morally; but if it be also physical, physically. And that this is the case in respect of God and his creatures, is confessed. See GOD.

**PREDIAL tithes**, *decimæ PRÆDIALES*, are tithes paid of things which grow from the ground only; as corn, hay, fruit, &c. See TITHE.

**PREDIATORY debt**. See the article DEBT.

**PREDICABLE**, *PRÆDICABILE*, in logic, a general quality, or epithet; which may be predicated of, or applied to, several subjects.

Thus animal is *predicable* both of man and beast: man is *predicable* of Peter and James: triangle is *predicable* of an hundred different kinds of figures; as right angles, scalanes, isosceles's, &c. See PREDICATE.

The schoolmen reduce the *predicables* to five classes, *viz.* *genus*, *species*, *proprium*, *differentia*, and *accidens*; under one or other of which all that can be predicated of any subject, is included. See GENUS, SPECIES, PROPRIUM, &c.

A *predicable* is also called *universale logicum*, as having respect to other particular, and inferior, or subject things; thus animal is an universal, with regard to man and beast.

It is called a *logical universal*, to distinguish it from a metaphysical one; which is a common being, considered in itself, and therefore denominated universal in *essendo*; whereas the logical one is only universal as to our conception and application. See UNIVERSAL.

Among the schoolmen, *predicable* is usually defined, *unum, aptum prædicari de multis, univoce, & divisim*: or, somewhat more clearly, a *predicable* is a nature which may be predicated univocally of all things to which it is common; and which, as it is dividually multiplied in all its subordinates, may be aptly predicated of them all.

Thus, when the appellation of *virtue* is attributed to justice, prudence, temperance, fortitude, charity, &c. the same reason may be given why each is distinguished by such name; as being all, founded in a mediocrity, and being agreeable to right reason, which is the character of virtue.

Hence, if there be several things called by some common name; but the reason of such name is not the same in all, but different; these do not come under the number of *predicables*. As in the instance, *canis*, dog, which is both applied to a domestic animal, distinguished by its barking; to a constellation of the heavens; and to a sea-fish.

The way by which the mind comes to form such *predicables*, or universals, is this: among those things which fall under our observation, we find some characters and properties common to several, and others peculiar to each: what we find common, we consider apart; and thus form an universal equally applicable to all. See GENERAL.

**PREDICABLY**, *PRÆDICABILITER*, is used in the schools in opposition to *predicamentally*.—Thus, matter is said to be united to form *predicably*, or *per accidens*; to exclude the notion of a predicamental accident.

**PREDICAMENT**, *PRÆDICAMENTUM*, in logic, a class, or order of beings, or substances; ranged according to their natures; called also *category*, and sometimes *categoriema*. See CATEGORY, CATEGOREMA, POSTPREDICAMENT, &c.

The word *prædicamentum* was first introduced by Boethius, in lieu of the Greek *κατηγορημα*; and is used among the school-writers with a good deal of latitude and variety: for it either signifies the act of *predicating*, or a common *predicate* itself; or, the genus or basis of any category; or, the collection of several common predicates disposed in a certain order:—which last is its most usual acceptation.

Hence some define *predicament*, a series of predicates traced from the genus, or highest term, through all the inferior genera and species.—Thus, a series of *substance* drawn from *substance* through *body*, *living*, *animal*, *man*, to *Peter*, is called the *predicament* of substance.

The usual definition among logicians is, that *predicament* is a natural order, or scheme, of some more general or universal thing, and of all that is contained under the same; that is, all the subordinate genera, species, and individuals.

The properties of a *predicament*, *ex parte vocis*, i. e. of the term or word whereby the *predicament* or *predicamental* series is denoted, the logicians hold, are, that it be *one*, *simple*, *precise*, and *concinuous*.

*Vox una, & simplex, rebus concinna locandis.*

The conditions requisite *ex parte rei*, or of the thing to be ranged in a *predicament*, are contained in the following verse:

*Entia per sese, finita, realia, tota:*

i. e. it must be a *positive being*, in exclusion of non-entities, negations, privations, impossibilities, &c. and a being *per se*, to exclude accidental things, factitious things, &c. and *finite*, that is, of a limited nature and extent, to exclude God and other transcendentals: *real*, since its intention is for the better and more commodious disposing of things in their places, to be the more distinctly known and conceived; and *whole*, or complete, as not being in the relation of a component part, or as only accessory to some other.

**PREDICAMENTAL accident**. See the article ACCIDENT.

**PREDICATE**, *PRÆDICATUM*, in logic, that part of a proposition which affirms or denies something of the subject. See PROPOSITION.

Thus, in, *God made the world*; *made the world* is the predicate; *God*, the subject. See SUBJECT.

A *predicate*, say the schoolmen, is properly a name *predicated* or spoken of another, as its subject: as *man*, in the proposition, *Peter is a man*.

It is a celebrated rule or law of *predicates*, that nothing is esteemed to be absolutely spoken or affirmed of another, unless it be affirmed thereof in such manner, or by such an affirmation, as wants nothing either in the subject, *predicate*, or copula, to make it true.

This also is a noted property of a *predicate*, that it contains, in some measure, its own subject: thus, metal contains gold, copper, iron, &c. of which it is *predicated*.

The word *predicate* is sometimes used indifferently with *attribute*; but the more accurate writers make a distinction. Every *predicate* is indeed an attribute, since whatever is *predicated* of a thing, is attributed to it: so, if animated be *predicated* of man, it is also attributed to him: but every attribute is not a *predicate*: thus soul, learning, &c. are attributed to man, but not *predicated* of him. See ATTRIBUTE.

**PREDICATING**, in logic, is properly the act of affirming or denying somewhat of something.—As, *Man is not a stone*; *body is a substance*. The thing thus predicated, is called *predicate*. See PREDICATE.

In the doctrine of universals, or predicables, to *predicate* is to speak or declare a thing truly, directly, and affirmatively. Thus man is *predicated* of several, i. e. it is truly and directly affirmed that these several are men; as when I say, *Socrates is man*, *Plato is man*, *Aristotle is man*, &c. See PREDICABLE.

The things *predicated* of others are reducible to three classes: *genera*, as animal, of man, &c. *forms*, as whiteness, of a swan, &c. and *equals*, of things of equal extent, as species, difference, proprium, &c.

The schoolmen distinguish several ways of *predicating*; as, 1. *In quod tantum*, which is to *predicate* essentially, both as to the thing and the manner; as, *Justice is a virtue*. 2. *In quale tantum*, which is to *predicate* accidentally, both as to the thing and the manner; as *Peter is learned*. And, 3. *In quale quid*, or *in quale post quid*, which is to *predicate* both essentially and accidentally, as, *Man is rational*.

**PREDICTION**, *PRÆDICTIO*, divination, prophecy, or foretelling of what is to come; either by divine revelation, by art and human invention, or by conjecture. See DIVINATION, REVELATION, &c.

Divines labour hard to make the *predictions* in the old Testament tally with the events in the New. See PROPHECY.

The *predictions* of oracles were all dark and ambiguous. See ORACLE.

**PREDOMINANT**, *PRÆDOMINANS*, that which prevails, appears most, or has some superiority or ascendance over another thing.

Thus we say, bitterness is the *predominant* quality among tastes, or that which is most perceived. It is a rule, that sugar is never to *predominate* in confections, nor pepper in ragoufts.

**PRE-EMPTION**, *PRÆEMPTIO*, a privilege anciently allowed the king's purveyor, of having the choice and *first buying* of corn and other provisions for the king's house; but taken away by the *stat. 19 Car. 2*. See PURVEYOR.

**PREENING**, in natural history, the action of birds, cleaning, composing and dressing their feathers, to enable them to glide more easily through the air. See FEATHER.

For

# P R E

For their use herein, nature has given them an admirable piece of furniture; viz. two peculiar glands, which secrete an unctuous matter into an oil-bag, perforated; out of which the bird, on occasion, draws it with his bill. See OIL-BAG.

PRE-ESTABLISHED *harmony*. See the article HARMONY.

PRE-EXISTENCE, PRÆEXISTENTIA, the state of a thing actually in being before another. See EXISTENCE.

The ancient Pythagoreans and Platonists all asserted the *pre-existence* of human souls, i. e. that they were in being before they were joined to our bodies. See METEMPSYCHOSIS, and TRANSMIGRATION.

Origen also held the eternal *pre-existence* of souls. See SOUL.

The orthodox believe, that God created the world out of nothing; and not of a *pre-existent* matter. See WORLD, &c.

Some persons have held mankind *pre-existent* to Adam. See PRE-ADAMITE.

PREFACE \*, PRÆFATIO, an advertisement in the beginning of a book to inform the reader of the design, order, method, &c. observ'd therein; of what is necessary to receive its full effect, and facilitate the understanding thereof. See BOOK.

\* The word is formed from the Latin *præ* and *fero*, q. d. to speak before.

There is no part of writing that requires more art, or that fewer authors succeed in, than *prefaces*. *Prefacing* is, in effect, a particular species of writing, and has its peculiar character and taste to distinguish it from all others. It is neither argumentation, discourse, narration, nor apology.

PREFACE of the *mass*.—The Romanists call that part of their *mass* which precedes the consecration, and which is to be rehearsed in a peculiar tone, *preface*. See MASS.

The use of *prefaces* in the church, they contend, is very ancient; and conjecture, from some passages of St. Cyprian, &c. that it was in use in the times of the apostles.

The *preface* to the *mass* anciently had, and still has, very different names in different churches. In the Gothic, or Gallican rite, it is called *immolation*; in the Mozarabic rite, *illation*; anciently among the French, it was called *consecration*; in the Roman church alone, it is called *præfatio*, *preface*.

PREFECT, PRÆFECTUS, in ancient Rome, was one of their chief magistrates, who governed in the absence of the kings, consuls, and emperors. See PROPREFECT.

His power was somewhat different at different times; but was always greatest under the emperors. His principal care was the government and administration of the city of Rome.

He took cognizance of all crimes committed in the city, or within an hundred miles thereof. He judged capitally and finally, no appeal lying from him; and even by the 62d novel, he presided in the senate, taking place before all the patricii and consulares, &c.

He had the superintendence of the provisions, policy, buildings, and navigation.

There is still a *prefect* of modern Rome, who is a kind of governor; differing little from the ancient *præfectus*, except that his authority only extends to 40 miles round the city, whereas that of the *præfect* of ancient Rome reached 100 miles round.

PREFECT of the *pretorium*, PRÆFECTUS PRÆTORII, was the chief or leader of the pretorian bands, or cohorts, destined for the emperor's guard. See PRETORIAN.

The pretorian legion, according to Dion, consisted of ten thousand men. Suetonius refers the institution of *præfectus prætorii* to Augustus. It is added, that he was usually taken from among the Roman knights.

By the favour of the emperors, his authority grew very considerably; inasmuch that he became the arbiter and supreme judge of all affairs.

To reduce this extravagant authority, Constantine divided the *præfecture* of the pretorium into four *præfectures*; and each of these he again subdivided into civil and military departments; though the name was only reserved to him who was invested with the civil authority; and that of *comes belli* given him who had the command of the cohorts. See COUNT.

Thus the office of *præfect* of the pretorium, which, in its origin, and till the time of Constantine, was military, and succeeded to that of *magister equitum*, now commenced a purely civil magistrature; and at length became the prime dignity of the empire.

The succeeding emperors, following Constantine's division, divided the empire into four *præfectures prætorii*, as into four dioceses; viz. the Gauls, Illyria, Italy, and the East. See DIOCESE.

The provinces whereof these dioceses consisted, had their particular governors; as the head of whom was the *præfect*, who, though he had not the command of the army, yet had the power of the sword, decided ultimately of all causes, and had all the marks and honours of sovereignty.

Justinian created a fifth *præfect* of the pretorium for the government of Egypt, which had been torn off from the diocese of the East by the invasion of the Vandals during the empire of that prince.

Under Augustus, the officer sent to govern Egypt with a proconsular authority, was called *præfectus Augustalis*.

PREGNANCY, the state of a woman when she has conceived, or is with child. See CONCEPTION.

The same state, with a view to the bearing of the child in the womb, is called *gestation*. See GESTATION.

VOL. II. N<sup>o</sup> 122.

# P R E

Hence also the act of *impregnating*. See GENERATION; FLOWER, SEED, &c.

PREGNANT.—*Negative* PREGNANT, in law. See NEGATIVE.

PREJUDICE, PRÆJUDICIUM, a false notion or opinion of any thing, conceived without a due previous examination thereof. See FALSHOOD, OPINION, &c.

*Prejudice*, q. d. pre-judgment, does not import a judgment merely as prior to another in respect of time, but as being prior thereto in respect of knowledge or of sufficient attention to the thing; the preposition *præ* expressing an anticipation, not so much of time, as of knowledge and due attention. See ERROR.

Hence *prejudice* is also called among the schoolmen, *anticipatio*, & *præventa cognitio*, a preconceived opinion, &c. See JUDGMENT, TRUTH, FALLACY, SENSE, &c.

PREJUDICIAL *action*. See the article ACTION.

PRELATE \*, PRÆLATUS, an ecclesiastical superior, raised to some eminent and superior dignity of the church. See DIGNITARY.

\* The word comes from the Latin *prælatus*, of *præ*, before; and *fero*, I bear, carry.

Patriarchs, primates, archbishops, bishops, generals of religious orders, certain crosiered and mitred abbots, and even deans and archdeacons, are ranked among the number of *prelates*.

PRELATE of the *garter* is the first officer of that noble order; and ancient as the institution itself. See GARTER.

William de Edynton, then bishop of Winchester, was the first *prelate* at the erection of the order; and it has been continued in that fee ever since.

It is an office of great honour, but has neither salary nor fees; only a convenient lodging allowed in Windsor-castle; and as oft as the *prelate* comes thither, (by the sovereign's command) he is to have court-livery allowed for himself and servants.

PRELIMINARY \*, or PRÆLIMINARY, something to be examined, dispatched, or determined, ere an affair can be treated of thoroughly, and to purpose.

\* The word is formed from the Latin, *præ*, before, and *limen*, threshold.

*Preliminaries* of peace take up the greatest part of treaties. They consist in examining of powers, qualities of princes, ranks of ambassadors, &c.

PRELUDE, PRÆLUDIUM, in music, a symphony used by way of introduction or preparation to what follows.

A *prelude* is usually a flourish, or an irregular air, which the musician plays off-hand, to see if his instrument be in tune; and to lead him into the piece to be played.

PREMISES, PRÆMISSÆ, in logic, the two first propositions of a syllogism. See SYLLOGISM.

When a syllogism is in form, the two *premises* being granted, the conclusion cannot be denied. See CONCLUSION.

The *premises*, says Chauvin, are properly the parts of the antecedent of an argument, when complex; and are called *præmissæ*, because premised to the conclusion. See ANTECEDENT, &c.

Thus in the argument, *Every man is an animal, Peter is a man, therefore Peter is an animal*: the propositions, *Every man*, &c. and *Peter*, &c. are the *premises*. See PROPOSITION.

*Premises* are the principles of our reasonings; as being clear, evident, and demonstrative propositions, from the relations whereof to one another, we draw or infer new truths, propositions, &c. See REASONING, PRINCIPLE, AXIOM, &c.

The *premises* are either *equal*, where neither suffices alone for the drawing a conclusion, as in the instance above; or *unequal*, the one *major*, greater, from which alone the conclusion is drawn; the other *minor*, or less, which only serves in applying the antecedent to the consequent. See CONSEQUENT.

In the common practice of the schools, however, every syllogism, or formal argument, of what kind soever, is said to have a major and a minor, how equal soever the *premises* may be. See MAJOR, and MINOR.

PREMISES, in law, the lands, &c. mentioned in the preamble or beginning of a deed, lease, conveyance, or the like.

PREMIUM, or PRÆMIUM, literally denotes a reward, or recompence.

Among merchants it is taken for that sum of money, viz. 8 or 10 per cent. which is given to an insurer, for insuring the safe return of any ship or merchandize. See POLICY of insurance.

PREMIUM is also used in the money and paper-trade, for what is given for a thing above *par*.

Thus, lottery-tickets, &c. are said to bear so much, e. gr. 10 or 20 s. *premium*, when they are sold for so much beyond the prime cost, at which the government issued them.

PREMONSTRANTES, or PRÆMONSTRATENSES, a religious order of regular canons instituted in 1120. by S. Norbert; and thence also called *Norbertines*.

The first monastery of this order was built by Norbert in the Isle of France, three leagues to the west of Laon; and by him called *Præmonstre*, *Præmonstratum*, whence the order itself was denominated; though, as to the occasion of that name, the writers of that order are divided.

The order was approved by Honorius II. in 1126. and again by several succeeding popes. At first the abstinence from flesh was rigidly observed. In 1245. Innocent IV. complained of its being neglected, to a general chapter. In 1288. their general, William, procured leave of pope Nicolas IV. for those of the

order to eat flesh on journeys. In 1460. Pius II. granted them a general permission to eat meat, excepting from Septuagesima to Easter.

The religious of this order are clothed in white, with a scapulary before the cassock. Out of doors, they wear a white cloak and white hat; within, a little camail, and at church a surplice, &c.

In the first monasteries built by Norbert, there was one for men, and another for women, only separated by a wall. In 1137. by a decree of a general chapter, this practice was prohibited, and the women removed out of those already built, to a greater distance from those of the men.

**PROMOTION**, *PRÆMOTIO*, in the schools, the action of God co-operating with the creature, and determining him to act. See **PREDETERMINATION**, and **ACTION**.

*Physical promotion*, according to Alvarez, Lemos, &c. is a complement of the active power, whereby it passes from the first act to the second; i. e. from a complete and next power, to action. It is an influence or participation of the virtue of the first cause, which makes the second cause actually active. See **CAUSE**.

**PREMUNIENTES**, in law, writs dispatched to each bishop to call them to parliament, warning them to bring with them the deans and archdeacons, one proctor for each chapter, and two for the clergy of his diocese. See **CONVOCATION**.

**PREMUNIRE**\*, *PRÆMUNIRE*, a term used both for an offence, for a writ granted thereupon, and for the punishment thereof.

\* The word is a corruption of the Latin, *pramonere*, q. d. to forewarn, or bid the offender take care; of which a reason may be drawn from the words of the statute 27 Edw. III. and the form of the writ, *Pramunire facias prefatum prepositum, & J. R. procuratorem, &c. quod tunc sint coram nobis*.

These will all be understood from one: anciently, then, the church of Rome, on pretence of her supremacy, and the dignity of St. Peter's chair, took upon her the disposal of most of the bishopricks, abbeyes, and other ecclesiastical benefices of worth, by mandates, or bulls, called *expectative graces*, and *provisiones*, before they become void. See **PROVISION**, and **EXPECTATIVE**.

Edward III. not brooking so intolerable an encroachment, made several statutes against those who drew the king's people out of the realm, to answer to things properly belonging to the king's court; and another to restrain the privilege of the pope.

The pontiff, however, still persisted in his pretensions; and the conflux of people from England to Rome, to sue for them, was as great as ever.

This occasioned Richard II. to make several statutes of the like import with those of Edward III. particularly one, where he assigned their punishment to be this; *That they should be out of the king's protection, attached by their bodies, i. e. imprisoned during life; and lose their lands, goods and chattels; which is since called the penalty of a premunire*.

Henry IV. made new statutes against other abuses of this kind not fully obviated in those of his predecessors; adding certain new cases, and laying on them the same penalty.

By later statutes, the like penalty of *premunire* is laid on some other offenders; as, e. gr. by that 1 Eliz. on him who denies the king's supremacy a second time.—By 13 Eliz. on those who assert the pope's authority, or refuse the oath of supremacy; on seditious talkers of the inheritance of the crown; and such as affirm the king or queen to be a heretic.—And by statute 13 Car. 2. on those who affirm, that the parliament begun November 1640. is not yet dissolved; or that there is any obligation in an oath or covenant, &c. to endeavour a change of government either in church or state; or that the houses of parliament have a legislative authority without the king.

**PREMUNIRE** is now chiefly used for the punishment appointed by the statutes above-mentioned.—Thus, when it is said a man for an offence *shall incur a premunire*, it is meant, he shall incur the penalty appointed by the statute 16 Ric. 2. commonly called the *statute of premunire*.

**PRENDER**\*, in law, a power or right of taking a thing before it is offered. See **RENDER**.

\* The word is formed from the French, *prendre*, to take.

Such a thing *lies in render, but not in prender*. *Coke's Rep. part 1.* Sir John Peter's case.

**PRENDER de baron** is an exception to disable a woman from pursuing an appeal of murder against the killer of her former husband, taken from her having married a second. See **APPEAL**.

**PRENOMEN**, *PRÆNOMEN*, among the Romans, a proper name, or name prefixed to the general name of the family; as, Caius, Lucius, Marcus, &c. See **NAME**.

The *prenomen* answers to our Christian name, Peter, Paul, &c. It was not introduced among the Romans till long time after the *nomen*. See **NOMEN**.

The name of the family was given by the Romans to their children the day after their birth; but the *prenomen* was not given them till they took the virile habit. See **VIRILE**.

Varro reckons up thirty *prænomena* among the Romans. The usual ones may be reduced to eighteen.

The Greeks had no *prænomena*: they had but one name.

**PRENOTION**, *PRÆNOTIO*, or *PRÆCOGNITIO*, a no ice, or piece of knowledge preceding some other, in respect of time. See **NOTION**.

Such is the knowledge of the antecedent; which must precede that of the conclusion. See **KNOWLEDGE**, **PREJUDICE**, &c.

**PREPARANTIA**, or *PRÆPARANTIA vasa*, in anatomy, the spermatic vessels; being two arteries, and as many veins of the testicles: thus called by the ancients, from an opinion, that the seed began to be prepared herein. See **SPERMATIC vessels**, **SEED**, and **GENERATION**.

**PREPARATION**, *PRÆPARATIO*, *apparatus*, in mathematics, makes one of the parts or branches of a demonstration. See **DEMONSTRATION**.

If it be a proposition in geometry that is to be demonstrated, the *preparation* consists in certain lines to be drawn in the figure: if a proposition in arithmetic, in some computation to be made to come the more easily at the demonstration.

**PREPARATION**, in chymistry and pharmacy, is applied to the several manners of managing the materia medica, and of disposing it to serve the several purposes.

There are various *preparations* of mercury, antimony, and other drugs to purify them, sublime, calcine, edulcorate them, &c. See **MERCURY**, &c.

Crude antimony is used in sudorific decoctions; though, when it has undergone a certain *preparation*, it becomes a violent vomitive. See **ANTIMONY**.

**PREPARATORY torture**. See the article **TORTURE**.

**PREPARED antimony**. See the article **ANTIMONY**.

**PREPARED opium**. See the article **OPIUM**.

**PREPENSED**, *PRÆPENSUS*, in law, denotes *fore-thought*.

In which sense we say, *prepensd malice*, &c.

If, when a man is slain upon a sudden quarrel, there were malice *prepensd* formerly between them, it makes it murder; and, as it is called in some statutes, *prepensd murder*. See **MURDER**.

**PREPOSITION**, *PRÆPOSITIO*, in grammar, one of the parts of speech or discourse. See **SPEECH**.

The *proposition* is an indeclinable particle, which yet serves to govern the nouns that follow it. Such are *per*, *pro*, *propter*, *in*, *with*, *through*, *from*, *by*, &c. See **PARTICLE**.

They are called *prepositions*, because *præposita*, placed before the nouns they govern. See **NOUN**.

F. Buffier does not allow the *preposition* to be a part of speech, but merely a modificative of a part of speech, viz. of the noun; serving only to modify or circumstantiate it. See **MODIFICATIVE**.

**PREPOSITUS villa** is sometimes used for the chief officer of the king, in a town, manor, or village.

In ancient records, the *prepositus villa* was no more than the bailiff of the lord of the manor. See **BAILIFF**.

*Prepositus villa* is sometimes also used, in later writers, for the constable of a town, or petty constable. See **CONSTABLE**.

**PREPOSITUS ecclesiæ**. See the article **CHURCH reve**.

*Quatuor homines prepositi*, in Crompton, &c. denote four men of each town, which are to appear before the justices of the forest in their circuit.

**PREPUCE**, *PRÆPUTIUM*, in anatomy, the *fore-skin*; a prolongation of the cutis of the penis, covering the glans, or extremity of the yard.—See *tab. anat. (Jplanch.) fig. 10. lit. cc.* See also **PENIS**, and **GLANS**.

Dr. Drake observes, that nature does not seem more various in any part of her works than in the *prepuce*; for the figure and proportion whereof there does not seem any standard.

Hence, probably, arose the necessity of circumcision, so generally practised throughout the oriental parts; not out of a view to religion, but to cleanliness, and to prevent diseases, which a detention of the mucus of the *sub-preputial* glands might breed in those hot countries. For even here, the same author adds, he has known some, who, having large *prepuces*, called *filbert-prepuces*, have been frightened at the appearance of a mucus oozing out upon a mere plenitude from between the *prepuce* and glans: which, it is probable, the great legislator of the Jews might have a view to in the first institution of circumcision. See **CIRCUMCISION**.

The skin of the *prepuce* is double; at the connexion of the internal skin, to the other part, are several oval and roundish glandules placed irregularly about the joining of the glans to the corpora cavernosa, and on the glans itself.

Their use is to separate a liquor to render the agitation of the *prepuce* on the glans easy. When this liquor becomes rancid, as upon old age, or venereal contacts, it excoriates the glans and *prepuce*, and even sometimes contracts the latter, and renders it necessary to be divided, to afford a passage to the glans. See **PHIMOSIS**, and **PARAPHIMOSIS**.

**PREROGATIVE**, *PRÆROGATIVA*, a privilege, or pre-eminence, which one person has over another. See **PRIVILEGE**, &c.

The word is borrowed from the appellation of a century in ancient Rome, which gave the first vote, or suffrage, in the *comitia*, or assemblies for the election of magistrates; *quasi prærogati*; because first asked, or their suffrage first required. See **SUFFRAGE**, and **CENTURY**.

Their vote was called *omen prærogativum*, because the rest usually gave their votes the same way. See **OMEN**.

**PREROGATIVE of the king**, *PRÆROGATIVA regis*, is that power, pre-eminence, and privilege, which the king hath over, not on y other persons, but over the ordinary course of the common law, in right of his crown.

Such

## P R E

Such are these, that the king may pardon a person condemned to die: that the king's person is subject to no man's suit; his possessions cannot be taken from him by any violence, or wrongful distein: his goods and chattels are subject to no tribute, toll, or custom, nor distrainable, &c. See KING.

**PREROGATIVE court** is a court belonging to the archbishop of Canterbury, wherein all wills are proved, and all administrations granted, that belong to the archbishop by his *prerogative*; that is, where the party at his death had bona notabilia, five pounds or upwards, out of the diocese where he died, and within the archbishop's province. See PROBATE, BONA NOTABILIA, &c.

All citations and decrees of this court run in the name of the archbishop. See ARCHBISHOP.

This court, for the province of Canterbury, is kept in the common-hall in Doctors Commons, in the afternoon, next day after the arches. See ARCHES.

The judge is attended by the register, who sets down the decrees and acts of court; and keeps records, &c. all original wills and testaments of parties dying, having bona notabilia.

The place is usually called the *prerogative office*, now kept in Dean's court; where, for a moderate fee, one may have a copy of any such will. See WILL.

The archbishop of York hath also the like court, called his *exchequer*.

**PRESAGE, PRÆSAGIUM**, an augury, or sign of something to come. See AUGURY.

The Romans judged of future events by certain signs, which their superstition, or the artifice of their priests, had invented. Their most celebrated *presages* were founded on the flight of birds, or the entrails of victims: all night-birds passed for birds of ill *presage*. See VICTIM, &c.

It is a popular error, that comets *presage* misfortunes. See COMET.

Close weather, and a southern wind, *presage* rain. See WEATHER, &c.

**PRESBYTA, πρεσβυτης**, in optics, a term applied to persons in whom the configuration of the crystalline of the eye is too flat, so that they see distant things clearly, but those near at hand confusedly. See VISION.

The reason is, that in near objects, the visual rays passing the retina before they unite, there can be no distinctness, since the distinct base falls too far off beyond the retina. See CRYSTALLINE, and RETINA.

This defect is helped only with convex-glasses, or spectacles; which will make the rays converge sooner, and, if they are well fitted, fall exactly on the retina. See CONVEX, and SPECTACLE.

The word is formed from the Greek, *πρεσβυς, senex*; because old people are naturally subject to this defect; time, and the friction of the eye-lids, &c. gradually wearing the ball flat.

*Presbyta* are opposed to *myopes*, in whom the crystalline is too round. See MYOPES.

If the distance between the retina and the crystalline be too small, the person will likewise be a *presbyta*. See CRYSTALLINE, &c.

**PRESBYTER, a priest**, or person in priests orders. See PRIEST.

He is thus called, from the Greek, *πρεσβυτης, elder*, of *πρεσβυς, old*; because, anciently, none were ordained but such as were advanced in years. See ELDER, AGE, &c.

The great dispute between the retainers to the Geneva and the Roman discipline, is about the sameness or difference of *presbyters* and bishops, in the times of the apostles. See BISHOP, and EPISCOPACY.

The *presbyteral* character is held indelible. See CHARACTER.

**PRESBYTERIANS**, a name assumed by the Calvinists of Great Britain. See CALVINISM.

The *presbyterians*, as to doctrine, agree with the church of England: their chief difference lies in the point of discipline, *viz.* who shall appoint the governors of the Church, and what subordination there shall or shall not be between them. See HIERARCHY.

The *presbyterians* allow of no hierarchy, no subordination in the persons of their ministers; bishops and priests, they maintain, in the times of the apostles, were the same; and therefore, though they allow episcopacy as now settled in the church of England to be very ancient, yet they deny it to be *jure divino*. See BISHOP, and EPISCOPACY.

In lieu of a series of ministers one over another, in quality of priests, bishops, and archbishops, their polity consists in a series of assemblies, or synods: thus every minister is to be obedient to the classis under which he lives; and that classis to a synod, provincial, classical, or oecumenical. See CLASS, SYNOD, PRESBYTERY, &c.

The power of ordination, with them, resides in a classis; and none are admitted to administer the sacrament, but those ordained by the imposition of hands of other ministers.

They make use of deacons to take care of their poor; and in the government of the church, call in lay-elders; whence their name, from the Greek, *πρεσβυτης*, signifying *senior, elder*. See ELDER.

This is now the reigning discipline in the church of Scotland; as it was, during the inter-regnum, in England.

## P R E

**PRESBYTERY, PRESBYTERIUM, πρεσβυτεριον**, an assembly of the order of the presbyters, or priests, with lay-elders, for the exercise of church discipline. See PRESBYTERIAN.

The kirk, or church of Scotland, is divided into sixty-nine *presbyteries*, each consisting of a number of parishes, not exceeding 24, nor less than twelve.

The ministers of these parishes, with one ruling elder chosen half-yearly, constitute a *presbytery*; who, meeting in their chief town, whence the *presbytery* is denominated, chuse a moderator, or rather prolocutor, half-yearly.

They determine all appeals from kirk sessions, *i. e.* from the several parochial assemblies; but can try nothing at the first instance cognizable before a kirk session. See KIRK session.

They compose all differences between ministers and people; for which end they hold *presbyteral* visitations in each parish, where they examine the registers of the kirk sessions, &c.

They inquire into repairs of churches; see that the glebe, &c. suffer no dilapidations; appoint schools in the parishes; and see that the funds be not misapplied.

It is they alone can exclude from the communion, license probationers, suspend, depose, and, in effect, determine all ecclesiastical matters within their district. From the *presbytery* there lies an appeal in all cases to provincial synods. See SYNOD.

**PRESBYTERY, presbyterium**, is sometimes also used for the choir of a church, because anciently appropriated to the presbyters. See CHURCH, and CHOIR.

In opposition to the *nave*, or body of the church, which was for the people. See NAVE, &c.

**PRESCIENCE**, in theology, *prevision*, or *fore-knowledge*; that knowledge which God has of things to come.

The doctrine of predestination is founded on the *prescience* of God, and on the supposition of all futurity's being present to him. See PREDESTINATION.

Human reason can scarce reconcile the *prescience* of God with the free-agency of man. See LIBERTY, and NECESSITY.

How are we to admire the depth of the *prescience* and wisdom of God, who, in giving the first motion to matter, forelaw all the possible combinations this first impression might undergo during infinite ages! Malebr.

**PRESCRIPTION, PRÆSCRIPTIO**, in law, a right or title acquired by use and time.

*Prescription* is a sort of title introduced for assuring the property of effects in favour of persons who have possessed them a certain time; and to keep off any who would disquiet them, or recover the thing possessed, after the term fixed by the laws. See POSSESSION.

Tourell calls *prescription* a penalty imposed by the laws upon negligence; and adds, that possessors who have no other title to plead but *prescription*, are only legal usurpers.

In effect, however, the law of *prescription* does not punish the indolence of proprietors; but only interprets their silence for their consent; presuming, that a man who neglects to assert his right for a long series of years, gives it up.

There are some of the lawyers who doubt, whether time and unjust *prescription* be any legitimate means of acquiring: others, more favourable, call it the *patroness of mankind*; as being a general presumption under which the law will have men live in peace.

In the common law, *prescription* is usually understood of a possession from time immemorial, or beyond the memory of man; as, when my ancestors, or his from whom I have an estate, have enjoyed and used it all the time whereof any memory remains.

But in the civil law, and even in our common law, there are *prescriptions* of a much shorter date. *Prescription* of forty years excludes all actions whatever. *Reform. Leg. Eccles.*

The custom of Paris allows of a *prescription* of ten years, if the parties be present; and twenty, if absent, in favour of peaceable possessors of an inheritance, if they have any title, however controverted; and of thirty years in favour of those who possess without any title at all.

In Normandy, a *prescription* of forty years peaceable possession is equivalent to a title, to immoveables; and for moveables, and personal actions, a *prescription* of thirty years suffices.

In Romish countries, *prescription* does not avail against the church, if short of an hundred years. In France, *prescription* of twenty years is admitted against all crimes, except duelling, which was excluded by a declaration of the year 1679. In matters of adultery, five years suffice, *i. e.* provided there have been a discontinuance of prosecution all that time.

By our statutes, a judge or clerk convicted of false entering pleas, &c. may be fined within two years; but, those elapsed, he *prescribes* against the punishment of the statute.

The crime of maintenance or embracery, whereby perjury is committed by a jury, must be prosecuted within six days; otherwise the parties *prescribe*. See JURY.

There is no *prescribing* against a man's lord; no *prescription* avails to take off any servitude or tenure: a title is always required there.

The author of the history of the inquisition observes, that no time of *prescription* avails in matters of heresy; even death itself does not secure the suspected from the researches of that tremendous court. See INQUISITION.

PRES;

# P R E

**PRESCRIPTION**, in medicine, the act or art of assigning a proper and adequate remedy to a disease; from an examination of the symptoms thereof, and an acquaintance with the virtues and effects of the materia medica. See **REMEDY**, and **DISEASE**. The methodus præscribendi is the last, finishing piece of furniture of a physician, and is the result of all the rest; joined with a ready, present thought. See **MEDICINE**, and **PHYSICIAN**. To *prescribe* with judgment, elegance, &c. a moderate acquaintance with pharmacy, i. e. with the forms and preparations of medicines, is required. See **PHARMACY**. The merits of a bill or *prescription* consist in its being concise, pertinent, efficacious, and agreeable; in the best and suitable materials being pitched on; those assembled in the most judicious proportions, made up in the best and most convenient form, and applied in the justest dose; a due regard being still had to the non-naturals regimen, intervals of application, &c. Sydenham excelled in *prescription*. See **DOSE**, **DIET**, &c. *Prescription* is either *officinal*, or *extemporaneous*; the former consists in ordering the medicines which the apothecaries keep by them ready prepared according to their dispensatory. See **OFFICINAL**, and **DISPENSATORY**. *Extemporaneous* is that which the physician frames of himself, *pro re nata*, according to the circumstances of the patient, to be made up by the apothecary according to the physician's bill. See **EXTEMPOREANEOUS**. **PRESENCE**, **PRÆSENTIA**, a term of relation, used in opposition to *absence*; and signifying the existence of a person in a certain place, or the state of a person considered as co-existing with another. See **CO-EXISTENCE**. In this sense, an obligation is said to be passed in *presence* of a notary and witnesses. At the breaking open a seal of a minor, or an absent person, the *presence* of a substitute is necessary. The schoolmen hold, that *presence*, in speaking of bodies, denotes not only a co-existence, but a sort of contact. They distinguish two kinds of *presence*; the one *virtual*, in which sense a spirit, or mind, is said to be *present* to a body when it acts thereon; the other *corporeal*, which consists in a physical contact. The treasurers, &c. of France have what they call a *right of presence*, a certain sum due on their actual attendance in their offices; to oblige them to be more assiduous in their function. A person absent in the service of the king, or a community, is reputed as *present*. The Roman catholics believe the real *presence* of Jesus Christ in the eucharist, both in body and soul. See **TRANSUBSTANTIATION**. **PRESENT**, **PRÆSENS**, in grammar, the first tense, or inflexion of verbs; expressing the time *present*, or that which now is. See **TENSE**. It is a particular piece of address in eloquence, to make use of the *present* for a past tense, in order to express a past action with the more force and warmth.—Thus, the fleet is no sooner in full sea, than the heavens *begin* to lour, the winds *rise*, the waves *dash* against each other, thunder *rolls*, and lightning *glares* on all sides; the ships *lose* their masts and rudders, and *are* driven imperiously against the rocks. **PRESENTATION**, **PRÆSENTATIO**, in the canon law, the act of a patron, nominating and offering his clerk to the bishop or collator, to be instituted in a benefice of his gift, which is void. See **PATRON**, **COLLATION**, &c. The *presentation* must be tendered to the bishop within an hundred eighty-two days after the living is vacant, else it lapses to the bishop; and if the bishop do not collate in half a year more, it lapses to the archbishop; and from him in a like time to the king, who may stay as long as he pleases; for *nullum tempus occurrit regi*. By some customs, a lay-patron has only four months time to make his *presentation* in; and if he have presented a person incapable, he may vary it, and make a new *presentation* within the four months. See **BENEFICE**. The word is formed from the ancient phrase, *præsentare ad ecclesiam*, which originally signified the patron's sending, or placing a person in a church; and which itself is formed from *re-præsentare*, which, Selden observes, is used in the council of Lateran, and elsewhere, for *præsentare*. See **PARSON**. **PRESENTATION of the virgin** is a feast of the Romish church held on the twenty-first of November, in memory of the holy virgin's being presented by her parents in the temple, to be there educated. See **VIRGIN**. It is pretended, that there were young women brought up in the temple of Jerusalem; which some endeavour to prove from the second book of Maccabees, *Sed & virgines quæ conclusæ erant, procurrebant ad Oniam*; which is the sentiment of Eutochius on this passage. And Lyranus adds, that other more ancient authors observe, that young women were educated till marriage, either in the temple, or at least in buildings contiguous thereto. Emanuel Comnenus, who began to reign in 1143. makes mention of this feast in his constitution. Some even imagine it to have been established in the eleventh century among the Greeks; and think they see evident proofs of it in some homilies of George of Nicomedia, who lived in the time of Photius: so that it seems a mistake in some modern critics to refer its institution to Gregory XI. in 1372.

# P R E

Some take it to have been instituted in memory of the ceremony practised among the Jews for their new-born females; corresponding to the circumcision on the eighth day for males. See **CIRCUMCISION**. **PRESENTATION of our lady** also gives the title to three orders of nuns. See **RELIGIOUS**. The first, projected in 1618. by a maid named *Joan of Cambray*. The habit of the nuns, according to the vision she pretended to have, was to be a grey gown of natural wool, &c. but this project was never accomplished. The second was established in France about the year 1627. by Nic. Sanguin, bishop of Senlis. It was approved by Urban VIII. This order never made any great progress. The third was established in 1664. when Fred. Borromeo, being apostolical visitor in the Valteline, was intreated by some devout maids at Morbegnoubourg to allow them to live in community in a retired place; which he granted, and erected them into a congregation, under the title of *congregation of our lady*. They live under the rule of St. Augustin. **PRESENTTEE**, in the canon law, a clerk presented by a patron to a collator. See **PRESENTATION**. **PRESENTMENT**, in law, a denunciation or information of the jurors themselves, or of some other officer, as a justice, constable, searcher, surveyor, &c. of an offence, inquirable in the court whereto it is presented. See **JURY**, &c. *Affise of darrein PRESENTMENT*. See the article **ASSISE**. **PRESENTS**, **PRÆSENTIA**, *free-gifts* or *gratuities*; especially those given by the clergy, or the states of a realm, to a king. See **BENEVOLENCE**. They are so called, because given into the hands of a person present; by which they are distinguished from *munera*, gifts, which are sent to the party, or delivered by the intervention of a third person. Thus the XVIIIth law, *de verb. signif. Absentibus res donari dicantur, munera autem mitti, & præsentia offerri*. There is no accosting the eastern princes without making them *fine presents*. Kings usually make rich *presents* to ambassadors sent to their courts. **PRESEPE**, or **PRÆSEPE**, in astronomy, a name given to three nebulous stars in the breast of the sign Cancer, or the Crab; two of them of the seventh, the third of the sixth magnitude.—their longitudes, latitudes, &c. see among those of the other stars in **CANCER**. **PRESERVATIVE**, or **PRÆSERVATIVE**, in medicine, a remedy taken by way of precaution: or to secure a man from a disease that threatens him. See **REMEDY**. The principal *preservatives*, according to Boerhaave, are abstinence, quiet, drinking of warm water; and after this, a gentle and continued motion till the first appearance of sweat; then a profuse sleeping, the body well covered. By such means, cras humours are diluted, the vessels are relaxed, and noxious matter excreted. He adds, that the best defence against the force of external cold is to lessen the winter's cloathing late in the spring, and to increase the summer's cloathing soon in autumn. In time of plague, *preservatives* are very necessary against the contagion of the air, &c.—See **PLAGUE**, and **CONTAGION**. Generous wines, cardiacs, and sudorifics, are *preservatives*. Dr. Alprunus tells us, he made incisions with a lancet in inguine dextro & sinistro, and put in setons, to give passage to the venom; which proved an excellent *preservative* against the plague that raged at Prague in 1680. Dr. Wenceslaus Dobr. Zensky de Nigro Ponte gives us an universal *preservative* against infection in all diseases. Whoever, says he, in conversing with patients of any kind, would *preserve* himself from infection, must, while he is within the sphere of their effluvia, never swallow his spittle, but spit it out: for he conceives it to be the spittle that first imbibes the infection. See **SALIVA**. **PRESERVING of timber**. See the article **TIMBER**. **PRESIDENT**, **PRÆSES**, an officer created, or elected, to *preside* over a company, or assembly; so called in contradistinction to the other members, who are termed *residents*. **Lord PRESIDENT of the council** is the fourth great officer of the crown; as ancient as the time of king John, when he was styled *conciliarius capitalis*. See **COUNCIL**. His office is to attend on the king, to propose business at the council-table, and to report to the king the several transactions there. **PRESIDIAL**, a tribunal, or bench of judges, established in the several considerable cities of France, to judge ultimately, or in the last resort, of the several causes brought before them by way of appeal from the subaltern judges. The *presidials* make one company with the officers of the bailiages and seneschaupees, where they are established. The edict of 1551. establishes *presidials* under these two conditions; first, that they may judge definitely, and without appeal, to the sum of 250 livres, or 10 livres *per annum*. And, 2. to the sum of 1500 livres by provision. When they judge in the former case, they are obliged to pronounce it with these words, *par jugement dernier*; in the second, *par jugement présidial*. When they judge finally of appeals from inferior judges, they may not pronounce the sentence or appeal, *au nant*, void; that form only belonging to the sovereign courts: but are to pronounce

# P R E

pronounce simply, that *it has been well or ill-judged*.----To judge *presidially* and finally, they must be at least seven in number.

**PRESS, PRÆLUM**, in the mechanic arts, a machine made of iron or wood; serving to squeeze or compress any body very close. See **MACHINE**, and **COMPRESSION**.

The *ordinary presses* consist of six members or pieces; viz. two flat, smooth planks, between which the things to be pressed are laid; two screws, or worms, fastened to the lower plank, and passing through two holes in the upper; and two nuts in form of an S, serving to drive the upper plank, which is moveable, against the lower, which is stable, and without motion.

**Presses used for expressing of liquors** are of various kinds; some, in most respects the same with the common *presses*, excepting that the under plank is perforated with a great number of holes, to let the juice expressed run through into a tub, or receiver, underneath.

Others have only one screw, or arbor, passing through the middle of the moveable plank; which is made to descend into a kind of square box, full of holes on all sides, through which the juices flow in proportion as the arbor is turned, by means of a little lever applied thereto.

**Press used by joiners**, to keep close the pieces they have glued, especially panels, &c. of wainscot, is very simple; consisting of four members. viz. two screws and two pieces of wood, four or five inches square, and two or three feet long, whereof the holes at the two ends serve for nuts to the screws.

**Press used by inlayers** resembles the joiners press, except that the pieces of wood are thicker, and that only one of them is moveable; the other, which is in form of a tressel, being sustained by two legs, or pillars, jointed into it, at each end.

This *press* serves them for sawing and cleaving the pieces of wood required in marquetry, or inlaid work. See **MARQUETRY**.

**Founders Press** is a strong square frame, consisting of four pieces of wood firmly joined together with tenons, &c.

This *press* is of various sizes, according to the sizes of the moulds; two of them are required to each mould, at the two extremes whereof they are placed; so as that by driving wooden wedges between the mould and the sides of the *presses*, the two parts of the mould wherein the metal is to be run, may be pressed close together. See **FOUNDRY**.

**Printing Press** is a very complex machine, serving to *press* the sheet of paper upon the forms, which the workman has first smeared or *beat* over with ink; so as that the characters, or types, whereof the forms are composed, may leave their marks or impressions thereon. See **PRINTING**.

The parts of this *press* are the two *cheeks*; see **CHEEK**; the four planks, viz. the *cap*, *head*, *shelves*, and *winter*, the *back* of the *press*, where the ink is placed, the *spindle* with its *nut*, the *hose* with its *hooks*, the *platen-plate* with its *plugs*, the *carriage*, the *coffin*, *gallows*, *tympan* and its *joints*, &c. Lastly, the *handle*, to bring the *plank* on which the *coffin* is fixed backwards and forwards; and the *bar* to work the *spindle*, and *press* the *platen* on the forms.

See the *form and use of these several parts described under the article PRINTING press*.

**Messenger of the Press**. See the article **MESSENGER**.

**Rolling Press** is a machine used for the taking off prints from copper-plates.

It is much less complex than that of the letter-printers. See its description and use under the article *rolling press* **PRINTING**.

**Press**, in coining, is one of the machines used in the striking of money; differing from the balance, in that it has only one iron bar to give it motion, and *press* the moulds or coins; is not charged with lead at its extreme, nor drawn by cordage. See **COINING**.

**Binders Press**, or *cutting Press*, is a machine used equally by book-binders, stationers and pastboard-makers; consisting of two large pieces of wood, in form of cheeks, joined by two strong wooden screws; which being turned by an iron bar, draw together, or set asunder, the cheeks, as much as is necessary for the putting in of the books, or paper, to be cut.

The cheeks are placed flat on a wooden stand, in form of a chest, into which the cuttings fall. A-side of the cheeks are two pieces of wood, of the same length with the screws; serving to direct the cheeks, and prevent their approaching or opening unequally upon turning the screw.

Upon the cheeks is the shaft or fust, to which the cutting-knife is fastened by a screw, which has its key to dismount it on occasion, to be sharpened.

The shaft consists of several parts; among the rest, a wooden screw or worm, which catching within the nuts of the two feet that sustain it on the cheeks, bring the knife to the book or paper, which is fastened in the *press* between two boards. This screw, which is pretty long, has two directories, or pieces of wood, which, both as to their form and effect, resemble those of the screws of the cheeks. To make the shaft slide square and even on the cheeks, so that the knife pushed along by the workman may make an equal paring; that foot of the shaft where the knife is not fixed, has a kind of groove, directed by a thread fastened along one of the cheeks. Lastly, the knife is a

VOL. II. N° 122.

# P R E

piece of steel, six or seven inches long, flat, thin and sharp; terminating at one end in a point like that of a sword; and at the other in a square form, which serves to fasten it to the shaft. See **BOOK binding**.

**Press**, in the woollen manufactory, is a large wooden machine, serving to *press* cloths, serges, rateens, &c. thereby to render them smooth and even, and to give them a gloss. See **CLOTH**, &c.

This machine consists of several members; the principal whereof are the *cheeks*, the *nut*, and the *worm* or *screw*, accompanied with its bar, which serves to turn it round, and make it descend perpendicularly on the middle of a thick wooden plank, under which the stuffs to be pressed are placed. See **PRESSING**.

The calender is also a kind of *press*, serving to *press* or calender linens, silks, &c. See **CALENDER**.

**PRESSING**, in the manufactures, the action of violently squeezing a cloth, stuff, linen, &c. in a *press*, to render it even, smooth, polished, and glossy. See **CLOTH**, &c.

This, in the filken and linen manufactures, they properly call *calendering*. See **CALENDER**.

There are two manners of *pressing*; the one *hot*, the other *cold*.

**Method of PRESSING cold**.---After the stuff has had all its preparations, i. e. has been scoured, fulled, and shorn, (see **FULLING** and **SHEERING**) it is folded square, in equal plaits; and a skin of velum, or fine smooth pastboard, put between each plait. Over the whole is laid a square wooden plank; and in this condition it is put in the *press*; which is driven tight down by means of the screw turned full upon it, by the hands assisted with levers.

After it has lain a sufficient time under the *press*, they take it out, remove the pastboards or velums; and lay it up to keep. It may be observed, that some do not use a *press* with a screw in *pressing cold*; but content themselves with laying the stuff on a firm table, after plaiting and pastboarding it as before; covering the whole with a wooden plank, and loading this with a weight, greater or less, as is judged necessary.

**Method of PRESSING hot**.---The stuff having received all its preparations, as before, it is sprinkled a little with water, sometimes with gum-water spurted over it with the mouth; then plaited equally; and between each two plaits are put leaves of pastboard; and between every sixth and seventh plait, as well as over the whole, an iron or brass plate, well heated in a kind of furnace for the purpose.

This done, it is laid upon the *press*; and a screw brought forcibly down upon it, by means of a long iron bar.

Under this *press* are laid five or six pieces one over another, at the same time; all furnished with their pastboard and iron plates. When the plates are well cold, they take the stuffs from under the *press*, remove the pastboards and plaits, and stitch it a little together, to keep it in the plaits.

This manner of *pressing* woollen stuffs is very pernicious, and was only invented by the manufacturers to cover the defects of the stuffs, and excuse their not giving them all the shearings, dyes, and preparations, that are necessary to render them perfect. Accordingly it has been frequently prohibited.

**PRESSING to death**. See the article **PAINE fort & dure**.

**PRESSION**, or **PRESSURE**, in the Cartesian philosophy, an impulsive kind of motion, or rather endeavour to move, impressed on a fluid medium, and propagated through it. See **MOTION**, **FLUID**, and **CARTESIAN**.

In such a *pression* the Cartesians suppose the action of light to consist; see **LIGHT**. And in the various modifications of this *pression* by the surfaces of bodies, whereon that medium is thus pressed, they suppose the various colours to consist, &c. See **COLOUR**.

But Sir Isaac Newton has taught us better: for if light, e. gr. consisted only in a *pression*, propagated without actual motion, it could not agitate and warm such bodies as reflect and refract it, as we actually find it does; and if it consisted in an instantaneous motion, or one propagated to all distances in an instant, as such *pression* supposes, there would be required an infinite force to produce that motion every moment in every lucid particle.

And if light consisted either in *pression*, or in motion propagated in a fluid medium, whether instantaneously, or in time, it must follow, that it would infect itself *ad umbram*; for *pression* or motion in a fluid medium cannot be propagated in right lines beyond any obstacle which shall hinder any part of the motion; but will infect and diffuse itself every way into those parts of the quiescent medium, which lie beyond the said obstacle.

Thus the force of gravity tends downwards, but the *pression* which arises from that force of gravity, tends every way with an equable force; and with equal ease and force is propagated in crooked lines as in strait. Waves on the surface of water, while they slide by the sides of any large obstacle, do infect, dilate, and diffuse themselves by degrees into the quiescent water lying beyond the obstacle. The waves, pulses, or vibrations of our air, in which sounds consist, do manifestly infect themselves, though not so much as the waves of water; for the sound of a bell, or of a cannon, can be heard over a hill, which intercepts the sonorous object from our sight; and sounds will be propagated as easily through crooked tubes as through strait.

But light is never observed to go in curve lines, nor to inflect itself *ad umbram*. For the fixed stars do immediately disappear on the interposition of any of the planets, as well as some parts of the sun's body by the interposition of the moon, Venus, or Mercury.

**PRESSURE of the air.** See the article AIR.

Most of the effects anciently ascribed to the *fuga vacui*, are now accounted for from the weight and *pressure* of the air. See VACUUM.

The *pressure* of the air on the surface of our earth, is balanced by a column of water of the same base, and about thirty-five feet high; or one of mercury of about twenty-nine inches. See TORRICELLIAN experiment, and BAROMETER.

The *pressure* of the air on every square inch on the surface of the earth is computed to be about fifteen pounds avoirdupois. See BATHING.

**PRESSURE of fluids.** See the article FLUID.

**PREST** \*, a duty in money, paid by the sheriff upon his accounts in the exchequer, for money left or remaining in his hands.

\* The word is French, *prest*, where it signifies ready.

**PREST-MONEY** is a sum of money which binds those who receive it, to be ready at command, at all times appointed: chiefly understood in the listing of soldiers.

**PREST-SAIL**, in the sea language, is when a ship carries all the sail she can possibly croud.

This is sometimes done in giving chase, &c. but it is a dangerous experiment, lest the ship overfet, or bring her masts by the board; in which latter case she becomes an easy prey.

**Auditors of the PREST.** See the article AUDITOR.

**PRESTATION-MONEY**, a sum of money paid yearly by archdeacons, and other dignitaries, to their bishop, *pro exteriori jurisdictione*.

**PRESTATION, PRÆSTATIO**, was also anciently used for other payments: *Et quieti sint de præstatione muragii*, Chart. Hen. 7. — Sometimes also for *pourveyance*.

**PRESTER** †, a meteor, consisting of an exhalation thrown from the clouds downwards with such violence, as that by the collision it is set on fire. See METEOR.

† The word is Greek, *πρεστηρ*, the name of a kind of serpent, called also *dipjar*, to which this meteor is supposed to bear a resemblance.

The *prester* differs from the thunder-bolt in the manner of its inflammation; and in its burning and breaking every thing it touches with greater vehemence. See THUNDER-BOLT.

**PRESTER John**, or *Jean*, an appellation given the emperor of the Abyssinians; because anciently the princes of this country were really priests, and the word *jean* in their language signifies king.

It was the French who first made him known in Europe under this title. His empire was anciently of vast extent; at present it is confined to six kingdoms, each about the bigness of Portugal.

The name *Prester John* is altogether unknown in Ethiopia, and took its rise hence, that the people of a province where this prince usually resides, when they request any thing, say, *Jean-roi*, i. e. my king. His proper title is, *The Grand Negus*.

There is also a *Prester John* of Asia, mentioned by M. Polo the Venetian. His jurisdiction is in the country of Canguing, between China, Sifan, and Thibet; a kingdom mightily valued by the Chinese for its policy, and the number of its fortified cities; though they have usually the utmost contempt for foreign countries.

Some say this latter is so called from a Nestorian priest, mentioned by Albericus, towards the year 1145. to have mounted the throne. Others, that he takes the name from a cross which he bears in his hand as a symbol of his religion.

**PRESTIMONY, PRÆSTIMONIA**, in the canon law, a term about which authors are much divided. — It is derived à *præstatione quotidiana*, and is by some defined a kind of benefice served by a single priest: in which sense, *prestimony* is the same with a presbyterial chapel. See BENEFICE.

Others will have *prestimony* to be the incumbency of a chapel, without any title or collation; such as are most of those in castles, where prayers or masses are said; and which are mere oratories unendowed. — Whence also the term is applied in the Romish church to certain perpetual offices bestowed on canons, religious, or others, for the saying of masses, by way of augmentation of their livings.

Others, again, will have *prestimony* to be a lease or concession of any ecclesiastical fund, or revenue belonging to a monastery, to be enjoyed during life.

Du Moulin makes *prestimony* a profane benefice, which, however, has a perpetual title, and an ecclesiastical office with certain revenues attached to it; which the incumbent is allowed to sell, and which may be possessed without tonsure: such as the lay churchwardens of Notre-dame. He adds, that in propriety the canonries of chapels are benefices of this nature.

Upon the whole, the surest opinion seems to be this, that *prestimony* is a fund or revenue appropriated by the founder for the subsistence of a priest, without being erected into any title of benefice, chapel, prebend, or priory; and which is not subject either to the pope, or to the ordinary; but whereof the patron, and those who have a right from him, are the collators, and nominate and confer, *pleno jure*.

**PRESUMPTION, PRÆSUMPTIO**, in law, a suspicion, or conjecture founded on a verisimilitude.

*Presumption* is of three sorts. — 1. *Violent*, which many times is allowed a full proof; as if one be killed in a house, and a man is seen to come out of the house with a bloody sword, and no other person was at that time in the house; this, though but a *presumption*, is a proof. — 2. *Probable*, which has but a small effect. — 3. *Light*, or *temerarious*, which is of no prevalence at all.

In cases of a charter, or feoffment, if all the witnesses to the deed be dead; the violent *presumption* that stands for a proof, gives continual and quiet possession: *Stabit præsumptio, donec probetur in contrarium*. Coke on Lit.

**PRESUMPTION** was also anciently used for *intrusion*. See INTRUSION.

**PRESUMPTIVE heir**, the next relation, or heir at law, to a person; who is to inherit from him *ab intestato*; and who, it is presumed, will be heir: nothing but a contrary disposition of the testator being able to prevent him. See HEIR.

**PRETENCE**, in heraldry. See the articles INESCUTCHEON, and ESCUTCHEON of *pretence*.

**PRETENSED**, or **PRETENDED right**, in law, is where one is in possession of lands and tenements, which another, who is out, claims and sues for. — Here the *pretensed right* is in him who so claims or sues.

**PRETER naturam**, in medicine, &c. See the article NATURE.

**PRETER**, or **PRETERIT, PRÆTERITUS, pass**, in grammar, an inflexion of verbs, expressing the tense or time passed. See VERB.

*Preter*, or *preterit*, is a general name that comprehends all the inflections corresponding to the several tenses, or several circumstances and relations of the time past; all which the Latins, &c. distinguish by particular inflections or terminations of the verb; which make the proper notion of tenses. See TENSE.

The modern languages, particularly the English, in lieu of different terminations of the verbs themselves, have usually recourse to those of their auxiliaries and participles. See VERB, and PARTICIPLE.

The *preter*, or past time, is subdivided by grammarians into *preter-imperfect*; as, e. gr. *I had, I thought*; in the Latin, *Habebam, cogitabam*; in the French, *J'avois, je pensois*; — the *preter-perfect*, as, *I have had, I have thought, habui, cogitavi, j'ai eu, j'ai pensé*; — and *preter-pluperfect*, as, *I had thought, I had had, habueram, cogitaveram, j'eus eu, j'eus pensé*.

The English have properly but two cases or kinds of the *preter* tense: viz. the *preter* time of the imperfect action, as, *I was at supper then*, but had not yet done it: and the *preter* time of the perfect action, as, *I had then supped*, and it was then done. — The *preter* tense is oftenest formed of the present tense, by adding *ed*; as, *I burned*.

The French have a particular case of the *preter-perfect*, which F. Buffier calls the *preterit simple*, in opposition to the former, called the *preterit composite*; others call it the *preterit indefinite*, because expressing a thing done indeterminately; as, *j'écrivis hier*. This answers to the aoristus of the Greeks; and in the distinction of this from the compound *preterit* does one of the greatest niceties in the practice of the French language consist. See AORISTUS.

In the passive voice, the Latins, French, &c. have recourse to participles and auxiliaries, like the English, to form their *preter* tenses; as, *I was loved, amatus eram, j'étois aimé*, &c.

**PRETERIT, PRÆTERITUS**, in the Roman jurisprudence. — *Infans PRÆTERITUS* in that of whom the father has forgot to make mention in his testament; which renders it intirely null. See TESTAMENT.

Exheredation of his son is allowed in a father, but never *preterition*.

**PRETERITION**, or **PRETERMISSION**, in rhetoric, a figure whereby, in pretending to pass over a thing untouched, we make a summary mention thereof. See PARALEPSIS.

*I will not say he is valiant, he is learned, he is just*, &c.

The most artful praises are those given by way of *preterition*. See RETICENCY.

**PRETERNATURAL rains.** See the article RAIN.

**PRETEXT**, or **PRETENCE**, a colour, motive, or cause, either real, or apparent. See COLOUR.

**PRETEXTA**, or **PRÆTEXTA**, among the Romans, was a long white gown, or toga, having a band or border of purple at bottom. See TOGA.

It was worn by children of quality till the age of puberty, i. e. by boys till seventeen, at which time they laid it aside, and assumed the virile gown. Girls wore it till marriage. See VIRILE.

It took its name *pretexta*, according to Godwyn, *quod ei purpura prætexta erat*, because guarded about with purple silk.

The *pretexta*, at first, was a robe of state, or ceremony, worn only by the chief magistrates, and the priests; nor was it lawful for such who wore this gown to be arraigned, or sentence to pass against them, till it was pulled off.

In continuance of time it was permitted to noblemens children; and, at length, even to all Roman children in general.

**PRETIOUS.** See the article PRECIOUS.

# P R E

**PRETIUM** *sepulchri*, in old law-books, &c. those goods accruing to the church wherein a corps is buried.

In the Irish canons, *lib. 19. cap. 6.* it is ordered, that along with every body that is buried, there go his cow, horse, apparel, and the furniture of his bed; none of which may be disposed of otherwise than for the payment of debts, &c. as being familiars and domestics of the deceased. See **HERIOT**, **MORTUARY**, &c.

**PRETOR**, **PRÆTOR**, an eminent magistrate, or minister of justice, in ancient Rome. See **JUDGE** and **JUSTICE**.

In the first ages of the commonwealth, all the great magistrates were styled *pretors*; afterwards the title was bestowed on all the principal officers of the army: at last, *pretor* became restrained to a particular magistrate.

About the year of Rome 388. the people soliciting to have one of the consuls always chosen from among themselves, the senators granted it, on condition that a new magistracy should be erected, to be filled wholly from among the patricians: such was the origin of the *preture*, *pratura*; which, Livy observes, was first discharged by Spurius Furius; and whose office was to look to the administration of justice and equity between man and man; much in quality of a lord chief justice, or lord chancellor, or rather both in one.

But business increasing in proportion as the empire was enlarged, a second *prator* was created, to take cognizance of the affairs of foreigners residing at Rome: upon which the former was distinguished by the title of *prator urbanus*, or *major*; and the latter by that of *prator peregrinus*, or *minor*.

The number, in after-times, was much increased: under the reign of Augustus there were twelve *pretors*, and afterwards eighteen; two whereof were called *pratores cereales*, as being charged with the providing of corn and grain; and two others *pratores fidei commissarii*.—In the code, *l. 1. t. 39.* we find a law of the emperors Valentinian and Marcian, which reduces the *pretors* to three.

The office of the *pretor*, or *prator urbanus*, was to render justice in the city: he had a power to interpret the laws, to supply and reform them; and even to make new ones, when the public good required it. See **CIVIL LAW**.

In the institutes, the edicts of the *pretors* are called *jus honorarium*; whence it should seem, they had only the force of laws out of respect to that eminent magistrature; the business of the *pretor* being rather to look to the observation of the old laws, than to make new ones. See **EDICT**.

Some are of opinion, he had not the *jus gladii*, the power of the sword; the cognizance of criminal matters being the special province of the prefect of Rome. See **PREFECT**.

But others are of another sentiment. In the general, it is very difficult to fix precisely how far his power extended. When he walked, he was preceded by six lictors; and was clothed with the robe called *trabea*.

His authority, like that of the other magistrates, was very much weakened and reduced under the emperors. In the Digest and Code is a title *de officio pratoris*.

**PRETOR** was also a title among the Romans, given the governor of a province, who had served the office of *pretor*. See **PRO-PRETOR**.

Whence provinces governed by *pretors*, or restrained to those who had discharged that office, were called *pretorian provinces*. See **PROVINCE**.

**PRETORIAN guards**, **PRÆTORIÆ cohortes**, were the soldiers of the emperor's guard; so called, as some imagine, from their place or station in the palace or court called *pratorium*. See **PRETORIUM**.

Their institution is owing to Scipio Africanus, who first established a company of the bravest men in his army, picked out for the purpose, to be his guard, and never to stir from his side in battle. See **GUARD**.

Their number was at length increased, as Dion tells us, to ten thousand. They were commanded by an officer created by Augustus, called *præfectus prætorii*. See **PREFECT**.

**PRETORIUM**, **PRÆTORIUM**, among the Romans, the place, hall, or court, wherein the *pretor* of a province lived, and wherein that magistrate sat to administer justice to the people. See **PRETOR**.

There were of these *pretoriums* in all the cities of the Roman empire.—The scripture mentions that of Jerusalem under the name of *judgment-hall*; and there are still some remains of one at Nîmes in Languedoc.

**PRETORIUM** was also the tent or pavilion of the general of the Roman army; wherein councils of war, &c. were held. See **TENT**, and **PAVILION**.

From the time of Augustus, the emperor's tent in the camp was distinguished by the title of *pratorium Augustale*.

**PRETORIUM** was also a place in Rome where the pretorian guards were lodged. See **PRETORIAN**.

Some will have the *pretorium* to be properly the tribunal of the *præfectus prætorii*; or an auditory destined for the rendering of justice in the emperor's palace. See **PREFECT**.

This they argue from St. Paul's epistle to the Philippians; and from this place called *pratorium*, they will have the guards to have been denominated *prætoriani*, because assembled here for the emperor's safety.

# P R I

Others will not allow the *pretorium* to be any tribunal, or seat of justice, but merely the imperial guard-house.

Perizonius has an express dissertation to prove, that the *pretorium* was no court of justice in St. Paul's time; but the camp or place where the *pretorian* guards were quartered. He adds, that the name *pretorium* was not given to places where justice was administered till long time after; when the office of the *præfectus prætorii* was converted into a civil function.

**PREVARICATION**, **PRÆVARICATIO**, in the civil law, is where the informer colludes with the defendant, and so makes only a feigned prosecution.

Sylvius, in his comments on Cicero, *pro Cluentio*, gives us the difference between the three terms, *calumniari*, *prævaricari*, and *tergiversari*. He who in his accusation forges faults never committed, is said *calumniari*: he who undertakes one's suit, and either will not add reasons in behalf of his client, or not answer the objections of his adversary, when he is able, is said *prævaricari*: and he who desists in his accusation, and lets the suit drop, *tergiversari*.

**PREVARICATION**, in our law, is when a man falsely and deceitfully seems to undertake a thing, with intention that he may destroy it: *e. gr.* where a lawyer pleads booty, or acts by collusion, &c.

**PREVARICATION** is also used for a secret abuse committed in the exercise of a public office, or of a commission given by a private person.

**PREVARICATOR**, **PRÆVARICATOR**, in the university of Cambridge, is a master of arts, chosen at a commencement, to make an ingenious, satirical speech, reflecting on the misdemeanors of the principal members. See **TERRÆ filius**.

**PREVENTION**, **PRÆVENTIO**, in the canon, &c. law, the right which a superior person or officer has to lay hold of, claim, or transact an affair, prior to an inferior one, to whom otherwise it more immediately belongs.

The word is chiefly used in speaking of the pope's *preventing* the ordinary collators; and of the royal judges *preventing* subaltern ones. See **COLLATION**, **JUDGE**, **JURISDICTION**, &c.

The Roman canonists maintain, that the pope, who is the source of all jurisdiction, has not transmitted it privately to the ordinary collators; but that he may still not only collate concurrently with them, but also *prevent* them by using his original power as head of the church. See **EXPECTATIVE**, and **PROVISION**.

These *preventions* are grown odious in several countries, where they do not now obtain without a world of modifications and restrictions; and the civil power in France always judges in favour of the ordinary collators. See **PREMUNIRE**.

The pope has no *prevention* to the prejudice of lay-patrons; but by the concordat he has reserved to himself the right of conferring elective benefices by *prevention*, and even cathedral and collegiate dignities. See **CONCORDAT**.

If the provisions of the pope, and collations of the ordinary, bear date on the same day, the Ultramontane canonists give the preference to the pope; the French to the ordinary.

The cardinals have a particular indulgence not to be *prevented* by the pope within six months.

**PRIAPÆIA**, in poetry, a name given to certain obscene epigrams, and other pieces, composed on the god Priapus; whereof we have many instances in the Greek Catalecta. See **PRIAPUS**.

**PRIAPISM**, *πριαπισμὸς*, in medicine, a continual and painful erection or tension of the yard. See **ERECTION**, and **PENIS**.

The term is derived from *Priapus*, a heathen god, whom the poets and painters represent with a yard always stiff and erect. See **PRIAPUS**.

As satyrs are usually painted after the same manner, the disease is also called *satyriasis*, or *satyriasmus*.

Some, however, distinguish between the *satyriasis* and *priapismus*; in that the latter is without any effusion, or desire of coition; but the former attended with both.

The immediate cause of a *priapism* is the heat, pungency, or acrimony of the semen, accompanied with a convulsion of the muscles of the part, which compressing the veins and cavernous bodies, prevent the return of the blood.

The more remote causes are too hot, sharp, stimulating foods; cantharides are also found to perform the same effect, but with much more violence. There are instances of people, especially old men, who, making use of cantharides to enable them to satisfy their passions the better, have been seized with a *priapism*, which has been followed with universal convulsions, and even death. See **CANTHARIDES**.

**PRIAPUS**, *πριαπὺς*, a term sometimes applied to the genital parts of men, *viz.* the penis, and testes. See **GENITAL**.

The name took its rise from *Priapus*, a fabulous deity, particularly adored at Lampſacus, the place of his birth; who, for the extraordinary size of his parts, was exceedingly revered by the women; insomuch that the scripture seems to tell us, king Asa dethroned his mother Maachab, because she had consecrated a grove to Priapus, and presided at his sacrifices.

**PRICE**, **PRETIUM**, the value of a thing. See **VALUE**.

**PRICE current**, in commerce, a weekly account of the current value of most commodities. See **CURRENT**.

**PRICK post**, in building. See **POST**.

**PRICKED wine**. See the article **WINE**.

**PRICKING**,

# PRI

**PRICKING**, in the sea-language.—To **PRICK** the *plat*, or chart, is to make a point therein, near about where the ship is now, or is to be at such a time; in order to find the course they are to steer. See **COURSE**, **CHART**, &c.

**PRIER** *age*. See the article **AGE**.

**PRIER** *aid*. See the article **AID**.

**PRIEST**, *sacerdos*, a person set apart for the performance of sacrifice, and other offices and ceremonies of religion. See **SACRIFICE**, **RELIGION**, &c.

Thus the false gods and goddesses of the heathens had their *priests*; *priests* of Mars, of Bacchus, of Hercules, of Isis; and some of them their priestesses. See **PONTIFF**, &c.

The Jews had two orders, *viz.* *priests* and *levites*, who served in the temple. See **LEVITE**, &c.

The Mahometans have their *priests* called *scheik* and *muphti*; and the Indians and Chinese their *bramins* and *bonzas*. See **MUPHTI**, **BRACHMAN**, &c.

**PRIEST**, **PRESBYTER**, in the Christian church, is a person invested with holy orders; in virtue whereof, he has a power to preach, pray, administer the sacraments, &c. and, in the Romish church, also, to bless, absolve, &c. See **ORDERS**.

By the canons, a man must be twenty-four years of age ere he be admitted to the priesthood; anciently thirty years were required. See **ORDINATION**.

The holy scripture usually confounds the title of *priest*, *presbyter*, with that of *bishop*, *episcopus*; and does not seem to give any superiority to the one over the other: and yet the absolute equality among all the *priests* in the government of the church has few instances, but what are contested. See **PRESBYTER**.

Blondel and Salmasius maintain with a world of reason, that in the primitive church, the *priests* governed with perfect equality, and without any other pre-eminence beside that of age; and yet to consult the fathers and tradition, the *presbyterian* form of government would scarce seem to have been known among the ancients. See **PRESBYTERIAN**.

In effect the primitive writers speak of nothing but episcopacy; and of that too, frequently in such terms, as if they esteemed it of apostolical institution. See **EPISCOPACY**, and **BISHOP**.

As, in the ancient church, the deacons had the management and administration of the revenues of the church, their authority grew apace, and in a little time they were got above the *priests*. St. Jerom used his utmost endeavours to prove, that deacons were originally inferior to *priests*; and the council of Nice decided the question in favour of the latter. See **DEACON**.

Indeed, an order of deacons having been instituted without any other function than to assist the *priest* at the altar; these have made no difficulty of owning the superiority of the *priests*. Add to this, that the order of a deacon being now become necessary to arrive at that of a *priest*, there is no room to dispute the precedence: but the deacons who had retained their function, had the disposal of the revenues, and paid the *priests* their pensions, still maintained the superiority. Upon which, the sixth council in Trullo pronounced once more on the dispute, and gave the pre-eminence to the *priests*.

**Arch PRIEST**, see the article **ARCH priest**.

**Cardinal PRIEST**, see the article **CARDINAL**.

**High PRIEST**, see the article **PONTIFEX**.

**Regular PRIEST**, see the article **REGULAR**.

**PRIESTS of the oratory**, see the article **ORATORY**.

**PRIEST's cap**, in fortification, see **BONNET à pretre**.

**PRIMA naturalia**, in physics, atoms or the first particles whereof natural bodies are primarily composed; called also *minima naturalia*, which see: see also **PARTICLE**, **ATOM**, &c.

**Tria PRIMA**, in chymistry, see the article **TRIA**.

**PRIMÆ viæ**, in medicine, the first passages of the chyle; including the œsophagus, stomach, intestines, and their appendices. See **CHYLE**, &c. see also **VIÆ**.

**PRIMAGE**, a duty at the water-side appointed by a statute of Henry VIII. to be paid to the master and mariners of the ship, by the merchants whose goods are loaded or unloaded. It is paid to the master for the use of his cables and ropes, in moving the goods; and to the mariners for their service and assistance.

This is different, in different places; in some 12 d. per tun, in others, a penny per pound; in others, six-pence per bale or pack. See **DUTY**, and **CUSTOM**.

**PRIMARY planet**, a planet which revolves round the sun as a centre. See **PLANET**.

Such are Saturn, Jupiter, Mars, the Earth, Venus, and Mercury; thus called in opposition to secondary planets, or satellites. See **SATURN**, **VENUS**, &c.

Some authors restrain the *primary planets* to the superior ones, *viz.* Saturn, Jupiter and Mars; but very impertinently.

**PRIMARY affections**,  
**PRIMARY collateral points**,  
**PRIMARY dials**,  
**PRIMARY motion**,  
**PRIMARY place**,  
**PRIMARY qualities**,  
**PRIMATE**, **PRIMAS**, an archbishop, invested with a jurisdiction over several archbishops or bishops. See **ARCH-BISHOP**.

DIAL,  
MOTION,  
PLACE,  
QUALITY.

# PRI

Father Sirmond derives the origin of *primates* hence; that the large provinces having been divided and subdivided by the emperors, the first divisions were called firsts, others seconds, others thirds, &c. and the title *primate* given to the metropolitan, *i. e.* to the bishop of the city which was the capital of the province, ere the division was made. See **METROPOLIS**, and **METROPOLITAN**.

This metropolitan *primate* had some jurisdiction over the bishops of the inferior provinces; and was also called *patriarch*. See **PATRIARCH**.

The term *primate* is Latin, and signifies the first, or president of a society; the Greek word corresponding to it is ἐξάρχης, *exarch*. See **EXARCH**.

Those who hold for a strict ecclesiastical hierarchy, maintain a *primate* to be he who has several metropolitans under him; as a patriarch has several *primates*. Yet it is pretty evident from history, that *primates* were at first confounded with patriarchs: thus Socrates, enumerating ten patriarchs, does not make any distinction thereof from *primates*.

In Africa, after the distinction was made, the *primates* were not at all subject to the patriarch: thus the bishop of Carthage, who was *primate*, paid no obedience to the bishop of Alexandria, who was patriarch.

Nor, to be a *primate*, was it necessary to have metropolitans for suffragans: each province of Africa, except those which composed the diocese of Alexandria, had its *primate*; this quality being given to age.

In France, the subdivision of provinces gave occasion to the erection of *primates*: thus Aquitaine, *e. gr.* being divided into two provinces, the archbishop of Bourges became *primate* of the Aquitaines, because Bourges was the capital of the first.

Thus also the division of England into two provinces, Canterbury and York, in 1152. gave occasion to the introduction of *primacies* among us; Canterbury, which was the metropolis before, thence giving the title of *primate of all England* to its prelate, though the archbishop of York still claims that of *primate of England*. And accordingly, the first has some jurisdiction over all England, relating to administrations, &c. which the latter has only within his own province. See **PROVINCE**.

**PRIME**, **PRIMUS**, the first in order, degree, or dignity, among several things of the same or like kind.

Thus we say, *prime minister*, *prime mover*, *prime cost*, &c. See **MINISTER**, **MOBILE**, &c.

**PRIME**, or **PRIME minute**, in geometry, denotes the sixtieth part of a degree. See **DEGREE**.

**PRIME** is sometimes also used for the tenth part of an unit. See **DECIMAL**.

In weights, it is used for the twenty-fourth part of a grain. See **GRAIN**.

**PRIME number**, in arithmetic, a number which can only be measured by unity; or whereof: is the only aliquot part: such are 5, 7, 11, 13, &c. See **NUMBER**.

*Prime numbers inter se*, among themselves, are those which have no common measures besides unity; thus 12 and 19 are *prime numbers inter se*.

**PRIME figure**, in geometry, is that which cannot be divided into any other figures more simple than itself. See **FIGURE**.

Such is a triangle among planes; and the pyramid in solids.—For all planes are made of the first, and all bodies or solids compounded of the second.

**PRIME vertical** is the vertical circle which passes through the poles of the meridian. See **VERTICAL**.

**PRIME verticals**, in dialing, or **PRIME vertical dials**, are those projected on the plane of the *prime vertical circle*, or on planes parallel thereto. See **DIAL**.

These are what we likewise call direct, erect, north or south dials.—But since every plane hath that pole raised or depressed thereon, which lies open to it; therefore this plane (if a direct south) hath the south pole elevated, and consequently the style (whose height must be the complement of the latitude of the place) will point downwards. Wherefore to find the hour's distance from the meridian upon this plane, the proportion is, As the radius is to the sine of the style's height, or co-latitude; so is the tangent of the hour, or angle at the pole, to the tangent of the several hours distance from the meridian. By this canon, the hours requisite for the plane, as also the half-hours, quarters, &c. being calculated and set in a table; the dial is described after the same manner, as the horizontal dial. North direct erect dials are but the backside of the south, because lying in the same azimuth with it; therefore it is no more but turning the south dial up-side-down, and leaving out the superfluous hours between 5 and 7, and 4 and 8, and the north dial is made. Only note that the style must point upwards to the north pole. Harris.

**PRIME of the moon** is the new moon at her first appearance, for about three days after her change. See **NEW moon**.

**PRIME** is also used in the Romish church, for the first of the canonical hours, succeeding to lauds. See **HOURS**, **LAUD**, &c.

**PRIME**, in fencing, is the first and chief of the guards; which is that the body is in, immediately after drawing the sword; being fittest to menace and terrify the enemy, by reason the point of the sword is held higher up to the eye, than in any of the other guards. See **GUARD**.

**PRIME**, or **PRIMING of a gun**. See **PRIMING**.

PRI-

**PRIMICERIUS**, in antiquity, the first or chief person in any office or dignity. See **CHIEF**, **PRINCIPAL**, &c.

In this sense the word occurs frequently in the code, and even in our old English laws: though it is there also occasionally used for a nobleman; as, *Primicerius totius Angliæ*.

The Romans had great variety of *primicerii*, both in church, and the emperor's court; a *primicerius of the empress*, *primicerius augustalis*, *primicerius of the bardariotæ*, *primicerii of the legions*, of the court, of the chamber, of the palace, &c.

The ecclesiastical *primicerius*, Du Cange observes, was the same with the *chantor* among us. See **CHANTOR**.

In the church of Metz, the *primicerius* is the first dignitary of the diocese, and presides at assemblies of the clergy, in prejudice of the bishop.

At Venice, the dean of the church of St. Mark is called *primicirio*, or *primicerius*: he is independent of the patriarch of Venice, and enjoys episcopal privileges.

**PRIMIER seisin**, in law, *PRIMA seifina*, or the *first seisin*; a branch of the king's prerogative, whereby he had the first possession of all lands and tenements held of him in chief, whereof his tenant died seized in fee; and consequently the rents and profits thereof: till the heir, if he were of age, did homage; and if under age, till he became of age.—But all charges arising by *primier seisin*, are annulled by a stat. 12 Car. II. See **SEISIN**.

**PRIMING**, or **PRIME of a Gun**, is the gunpowder put in the pan or touch-hole of a piece, to give it fire by.

The *priming* is the last thing done in charging. See **CHARGE**.

For pieces of ordnance, they have a pointed iron rod, to pierce the cartridge thro' the touch-hole; called *primer*, or *priming-iron*.

**PRIMING**, among painters, signifies the laying on of the first colour. See **COLOUR**, and **PAINTING**.

**PRIMIPILARI**, or **PRIMOPILARI**, or **PRIMIPILARES**, in antiquity, were properly such as had formerly borne the office of *primipilus*, or first centurion of a legion, to whom was entrusted the care of the banner. See **COHORT**.

Some will also have *primipilarii* to have been a denomination given to the soldiers of the first cohort of a legion.

The *primipilarii* had considerable advantages; one of the chief was, that most of the soldiers who died in the campaign, left them their heirs.

**PRIMIPILUS**, or **PRIMOPILUS**, or **PRIMIPILI centurio**, in antiquity, the centurion of the first cohort of a legion, who had charge of the Roman eagle. See **CENTURION**, and **COHORT**.

**PRIMITIÆ**, the *first fruits* gathered of the earth; whereof the ancients made presents to the gods. See **FRUITS**.

In Leviticus, the *primitiæ* of all fruits are enjoined to be offered to God. See **TITHE**.

In our law, the *primitiæ* are one year's profits, after avoidance, of every spiritual living, as rated in the king's books. See **FIRST fruits**.

**PRIMITIVE**, in grammar, a *root*; or a word in a language, which is neither derived from any other language, nor compounded from any other words of the same. See **ROOT**, **WORD**, &c. Thus, *God* is a *primitive*; *Godly*, a derivative; *God-like*, a compound. See **DERIVATIVE**.

**PRIMITIVE**, in arithmetic. See **PRIME**, and **NUMBER**.

**PRIMO beneficio ecclesiastico habendo**, in law, a writ directed from the king to the lord chancellor, appointing him to bestow the benefice that shall first fall in the king's gift, above or under such a value, upon this or that clerk. See **BENEFICE**.

*Propositio de PRIMO adiacente*. See **PROPOSITION**.

**PRIMOGENITURE**, **PRIMOGENITURA**, the right of first-born, or eldest son or child.

The *right of primogeniture* seems to be an unjust prerogative, and contrary to natural right: for since it is birth alone gives children a title to the paternal succession, the chance of *primogeniture* should not throw an inequality among them.

Accordingly, the right of *primogeniture*, which calls the elder-born to the crown, preferably to the other, was not introduced into France till very late: it was unknown to the first race of kings; and even to the second.

The four sons of Clovis shared the kingdom equally among themselves; and Louis le Debonnaire did the same: it was not till the race of Hugh Capet, that the prerogative of succession to the crown was appropriated to the first-born.

By the ancient custom of *gavel-kind*, still preserved in some parts of our island, *primogeniture* is of no account; the paternal estate being equally shared by all the sons. See **GAVEL-KIND**.

**PRIMOPILUS**. See the article **PRIMIPILUS**.

**PRIMUM ens**. See the article **ENS**.

**PRIMUM mobile**, in the Ptolemaic astronomy, the ninth or highest sphere of the heavens, whose centre is that of the world, and in comparison of which the earth is but a point. See **MOBILE**.

This they will have to contain all the other spheres within it, and to give motion to them, turning itself, and all them, quite round in twenty-four hours. See **MOBILE**.

**PRIMUS peronæus**. See the article **PERONÆUS**.

**PRIMUS scælenus**. See the article **SCÆLENUS**.

**PRINCE**, **PRINCES**, in politics, a person invested with the supreme command of a state or country; independent of any superior. See **SOVEREIGN**, **MONARCH**, **KING**, &c.

VOL. II. N° 122.

**PRINCE** is also used for a person who is sovereign in his own territory; yet holds of some other, as his superior or lord, and pays homage or tribute to him.

Thus all the *princes* of Germany are feudataries of the emperor: they are as absolute in their respective principalities, as the emperor himself; yet are all bound in certain services to him. See **EMPEROR**. See also **ELECTORS**, **ELECTORAL**, and **COLLEGE**.

**PRINCE**, in ancient records, frequently signifies no more than *lord*.—Du Cange gives a great number of instances of this usage. See **LORD**.

In effect, the word *princeps* in Latin, whence *prince* in English, originally signifies only the *chief*, or *first*: it is compounded of the Latin *primus*, and *caput*; and is properly a word of dignity and office, not of property and sovereignty.

Thus, in the charter of king Offa, after the bishops had subscribed their names, we read, *Brordanus patritius*, *Binuanus princeps*; and afterwards the dukes subscribed their names.

And in a charter of king Edgar, in *Mon. Angl. tom. 3. p. 301*. *Ego Edgarus rex rogatus ab episcopo meo Deorwolfe, & principe meo Aldredo, &c.* And in *Mat. Paris, p. 155*. *Ego Halaen princeps regis pro viribus assensum præbeo, & ego Turketillus dux concedo*.

**PRINCE of the youth**.—Among the ancient Romans, it was the custom for the emperor in his life-time to nominate him whom he would have to succeed in the empire, under the title of *princeps juventutis*, & *Cæsar*. See **CÆSAR**.

In the *ludus Trojanus*, the youth who was chosen captain, was also called *princeps juventutis*. See **TROJANUS**.

**PRINCE** is also a title given to the issue of *princes*, or those of the royal family. See **SON**, and **DAUGHTER**.

In which sense they are called, particularly in France, *princes of the blood*; as partaking of the blood to which the sovereignty is appropriated: and not by any hereditary right, but as a patrimony substituted to all the royal race. See **BLOOD**.

In England, the king's children are called *sons and daughters of England*: the eldest son is created *prince of Wales*. See **PRINCE of Wales**. The cadets, or younger, are created dukes or earls, with what title the king pleases. They have no apapages, as in France; but only what the good pleasure of the king bestows on them. See **APANAGE**.

The sons are all by birth counsellors of state: the daughters are styled *princesses*; to violate the eldest of which, unmarried, is at this day high treason.

To all the king's children belongs the title of *royal highness*: all subjects are to kneel, when admitted to kiss their hand; and at table, out of the king's presence, they are served on the knee. The first *prince* of the blood in France is called absolutely *monseigneur le prince*.—The quality of *prince of the blood* gives a rank and precedence, but does not include any jurisdiction; they are *princes* by order, not by office.

Wicquefort observes, that it is not fifty years since the *princes* of the blood of France gave place to all ambassadors, even those of republics; and it was at the king's request, that they were since allowed the precedence.

The moment a pope is elected, all his relations become *princes*. See **POPE**, **NEPOTISM**, &c.

**PRINCE of Wales**, the eldest son of England. See **SON**.

He is born duke of Cornwall; and immediately intitled to all the rights, revenues, &c. belonging thereto; as being deemed, in law, at full age on his birth-day.

He is afterwards created *prince of Wales*; the investiture whereof is performed by imposition of a cap of state, and a coronet, a verge of gold, and a ring. He holds the principality by patent, granted him and his heirs, kings of England.

The title and principality were first given by king Edward the first to his eldest son: till that time the eldest son of England was called *lord prince*. While Normandy remained to the king of England, the eldest son was always styled duke of Normandy: since the union, his title is *Magna Britannia princeps*.

He is reputed, in law, the same person with the king: to imagine his death, or to violate his wife, is high-treason. His revenues, as duke of Cornwall, are computed at 14000*l. per annum*. The revenues of the principality were estimated, 300 years ago, at 4680*l. per ann.*

**PRINCE's metal**. See the article **METAL**.

**PRINCIPAL**, **PRINCIPALIS**, the chief, most considerable, or necessary part of a thing.

Thus we say, the mayor is the *principal* magistrate of a city or town: a council of war consists of the *principal* officers. In a peroration, the *principal* points insisted on are to be briefly summationed up. The *principal* of a college, or hall, is the master thereof. See **UNIVERSITY**.

**PRINCIPAL**, in commerce, is the capital of a sum due or lent; in which sense the word is used in opposition to *interest*. See **INTEREST**.

**PRINCIPAL** is also used for the first fund or sum put by partners into common stock; by which it is distinguished from the calls or accessions sometimes required, when the former proves insufficient.

**PRINCIPAL point**, in perspective, is a point in the perspective plane; upon which a line drawn from the eye, perpendicular to the plane, falls. See **POINT**.

This point is in the intersection of the horizontal and vertical plane, and is also called *the point of sight*, and *point of the eye*. See **SIGHT**, &c.

**PRINCIPAL ray**, in perspective, is that which passes perpendicularly from the spectator's eye to the perspective plane, or picture. See **RAY**.

Whence the point, where this ray falls on the plane, is by some also called the *principal point*, which other writers call the *centre of the picture*, and the *point of concurrence*. See **POINT**.

**PRINCIPAL, PRINCIPALUM**, in old law-writers, is sometimes used for a *heir-loom*. See **HEIR-LOOM**.

In *Urchenfield com. Hereford*, certain *principals*, as the best beast, best bed, best table, &c. pass to the eldest child, and are not subject to partition.

**PRINCIPAL** is sometimes also used for a *mortuary*, or *corse present*.—*Item lego equum meum vocatum le bay gelding, ut offeratur ante corpus meum in die sepulture mee, nomini principalii. Test. Joh. de Macclesfield, 9 Hen. 5.*

**PRINCIPAL cause**,  
**PRINCIPAL challenge**,  
**PRINCIPAL officers of the navy**,  
**PRINCIPII petitio**,  
 See the articles } **CAUSE**,  
 } **CHALLENGE**,  
 } **NAVY**,  
 } **PETITIO**.

**PRINCIPLE, PRINCIPIUM**, a term frequently used for the cause, source, or origin of any thing. See **CAUSE**, &c.

In which sense we say, the *principle of thinking, of willing, &c.*

In physics, we must ever have recourse to a first *principle*, which is God. See **CAUSE**.

The Manichees admit of two *principles*, the one of good, the other of evil; which they establish in quality of two contrary deities, constantly opposing each other. See **MANICHEE**. See also **GOOD** and **EVIL**.

According to the doctrine of Pelagius, our own wills are the *principles* of our good actions, and we ourselves the *principles* of our good wills. See **PELAGIANS**.

**PRINCIPLE** is defined, among the school philosophers, to be that from which any thing is, is done, or known: *unde aliquid est, fit, aut cognoscitur*; which is a very extensive signification, and agrees to all kinds of *principles*.

Thus, the premises are *principles*, in respect of the conclusion; and thus fire, and every other agent, are the *principles* of things which they produce. See **ACTION**, and **AGENT**.

The Thomists define *principle* to the like effect: *id à quo aliquod procedit aliquo modo*.

Philosophers usually distinguish *principles*, into those of *being*, *principia essendi*; and those of *knowing*, *principia cognoscendi*: or, *principia rei*, and *cognitionis*.

Of the first they make two kinds; *viz. principles of origination*, which are those from which something proceeds really the same with the *principle*; as in the procession of the Son and Spirit from the Father in the Trinity.—And *principles of dependency*; in which sense, any cause is a *principle*, in respect of the thing caused; or a subject, in respect of the accidents inherent in it.

The *second* is that from which we borrow or derive our knowledge of some other thing; or it is that which makes the thing be known.—Such are *axioms, definitions, hypotheses*; such also are *examples, explanations, &c.* See **KNOWLEDGE**.

**Innate PRINCIPLES**. See the article **INNATE**.

**PRINCIPLE**, in physics, or **PRINCIPLE of a natural body**, is something that contributes to the essence of a body; or whereof a natural body is primarily constituted. See **BODY**.

Aristotle defines *principles* to be those things which are not made or constituted of themselves, nor of other things, but all things of them: *Quæ non fiunt ex se invicem, nec ex aliis, sed ex iis omnia*.

To give an idea of natural *principles*, consider a body in several states; a coal, *e. gr.* that was just now a piece of wood: it is evident there is something in the coal, which before existed in the wood; this, whatever it is, is a *principle*, and is what we call *matter*. See **MATTER**.

Again, there must be something joined with this matter, to make it wood rather than fire, or fire rather than wood: this is another *principle*, and is what we denominate *form*. See **FORM**.

Matter and form, then, are universal *principles* of natural bodies. The *Peripatetics* add a third *principle*, *viz. privation*; for though, say they, a thing is not made from nothing; yet it must be made from its not being that thing before.—This Aristotle calls *privation*, and admits it as a third *principle*.—But the moderns reject it: for if *privation* be a *principle*, it is at least so in a very different sense from matter and form. See **PRIVATION**.

Some late philosophers admit no *principles* but *acid* and *alkali*. See **ACID**, and **ALKALI**.

Aristotle distinguishes two sorts of natural *principles*, as they concur in the generation, or in the composition of bodies.

**PRINCIPLES of generation**, or of a body *in fieri*, are those without which a natural generation can neither be, nor be conceived.—Such are the three *principles* above-mentioned, *matter, form, and privation*.

**PRINCIPLES of composition**, or of a body *in facto esse*, already made, are those whereof natural bodies really consist.—Such, according to him, are *matter* and *form*; to which some add a third, *viz. union*, to connect the two others together.—But this is only necessary upon supposition of substantial forms. See **SUBSTANTIAL FORM**.

*Principles* are usually confounded with *elements*; yet is there a real difference: elements are properly the first and simplest beings, arising from the first determination or assemblage of *principles*. They are the simplest things in which matter and form are

combined.—Elements and *principles*, therefore, differ in this, that a *principle*, as matter, is only a begun, not a complete nature; but an element is perfect and complete. See **ELEMENT**.

To this head may likewise be referred what we call *mechanical principles of bodies*, which serve to account for the mechanism or artificial structure of things, and all the varieties and differences of bodies from motion, figure, and other common affections. See **MECHANICAL**.

These *principles* are differently maintained by three or four different sects of philosophers; *viz.* the ancient Epicureans, or Corpuscularians, to whom may be added the modern Gassendists; the Cartesians; and the Newtonians. See **EPICUREAN**, **CORPUSCULARIAN**, **CARTESIAN**, and **NEWTONIAN**.

**PRINCIPLES**, in chymistry, are the first and simplest parts whereof natural bodies are compounded; and into which they are again resolvable by fire. See **PART**.

These are more properly, as well as more commonly, called *elements*. See **ELEMENT**.

The chymists make five *principles*; three whereof are called *active principles*; which are supposed to act of themselves, and do not need to be put in motion by others: such as salt; sulphur, or oil; and mercury, or spirit. See **ACTIVE**.—The salt they suppose the foundation of all flavours; see **SALT**: the sulphur, of odours; see **SULPHUR**: and the spirit, or mercury, of colours; see **SPIRIT**.

The two *passive principles*, which have no force inherent in themselves, and only act by being join'd with some of the others, are phlegm, and caput mortuum, which they also call *elementary principles*. See **PASSIVE**, and **PHLEGM**, &c.

**PRINCIPLES**, among Hermetic philosophers.—According to these gentlemen, the two *universal principles* of sensible nature are subtle and solid, which being joined in a greater or less degree, generate all that beautiful variety of beings in the universe.

The three *natural principles* are salt, sulphur, and mercury. These *principles* generate the four elements; and are, as it were, secondary elements, inasmuch as they are contained in all mixed bodies. Sulphur is the first, and stands in the place of male; mercury the second, standing in the place of female; and salt the third, which copulates the others together. *Diff. Hermet.*

**PRINCIPLE** is also applied to the foundations of arts and sciences. See **ART**, and **SCIENCE**.

In this sense we say, *principles* are not to be proved; they must be common notions. See **NOTION**, and **AXIOM**.

There is no disputing against a man that denies *principles*: the worst reasoning is that which includes a *petitio principii*, *i. e.* which supposes a *principle* that ought to be proved.

**PRINCIPLE** is also applied by extension to the first rules or *maxims* of an art. See **RUDIMENT**.

In this sense we say, a man is ignorant of the *principles* of geometry; meaning, he has not learnt Euclid's elements.—The *principles* of most arts and sciences are found in this dictionary, under their respective heads.

**PRINTER, typographus**, a person who composes, and takes impressions from moveable characters, ranged in order, or from plates engraven, by means of ink, and a press. See **PRINTING**. Fust, Guttemberg, Scheffer, Mentel, and Koster, were the *first printers*. The first that practised it in England was Fred. Corfeilles, brought over from Haerlem, under king Henry VI. In France, Gering; at Rome, Conrad Sweynheim, and Arnold Pannarts, both Germans; at Naples, Sixtus Rufinger.

The *great printers* were Aldus, and Paulus Manutius; the two Badii; William and Frederick Morel; Oporin; Frobenius; Rob. Hen. and Char. Stephens; Gryphius, Turnebus, Torres, Commelin, Plantin, Raphelengius, Vascolan, Bleau, Crispin, and the two Elzevirs.—The *learned printers* were, the Manutii, the Stephens's, the Badii, Turnebus, Wechel, Morel, Junta, &c.

Plantin had the title of *arch-printer*, *archi-typographus*, given him by the king of Spain, in consideration of his printing the polyglot of Antwerp.

The names, characters, and eloges of all the famous *printers* are found in part II. of the first tome of the *jugemens des savans*.

The *printers*, since the establishment of that art, are esteemed a part of the company of stationers and booksellers: before that establishment, the company consisted only of booksellers, binders, writers, illuminers, and parchment-makers.—The *parchment-makers* prepared the skins, and made the parchment or velum; which were then almost the only matters books were written on. The *writers*, or *copyists*, wrote and transcribed books after copies given them by the booksellers. The *binders* were charged with the binding of those days, which was very coarse; only consisting of two slight boards covered with some paltry leather. The *illuminers* painted in miniature, and gilt initial letters, head-pieces, tail-pieces, and other compartments. Lastly, the *stationers* or *booksellers* set the *writers* to work, and sold their copies in shops, and other places, on the days allowed them by the statutes to expose the same. See **BOOK**, **BOOKSELLER**, **BOOKBINDING**, **LIBRARIUS**, &c.

**PRINTING, typographia**, the art of taking impressions with ink, from characters and figures moveable or immoveable, upon paper, velum, or the like matter. See **CHARACTER**, **LETTER**, **INK**, **PAPER**, &c.

There are two kinds of *printing*; the one for books, the other from copper-plates, for pictures.—The first called *common-press-printing*, the second *rolling-press-printing*.

# P R I

The prime difference between the two consists in this, that the characters of the former are cast in relief, and those of the latter engraven in creux. See RELIEVO, ENGRAVING, &c. The art of *printing* is a modern invention: it is, indeed, of a very ancient standing among the Chinese; but then their *printing* is very different from ours. It must be owned, the European *printing*, in its original, was much the same with the Chinese; yet, as there was at that time no commerce or correspondence between Europe and China, the passage into the east by the cape of Good Hope being as yet undiscovered by the Portuguese; there is no room to charge the Europeans with borrowing their art from the Chinese: but each must be owned to have fallen on the same thing, though at very different times. Father Couplet assures us, that *printing* has been in use in China from the year 930. Father le Comte speaks more largely; saying, that it has been there from almost all ages: he adds, that there is this difference between theirs and ours, that, whereas we have but a very small number of letters in our alphabets, and by the various arrangement of these are able to form infinite volumes; we have the advantage, by making our characters moveable, to print the largest works with an inconsiderable quantity of letter; those that served for the first sheets, serving over again for the succeeding ones: the Chinese, on the contrary, by reason of the prodigious number of their letters, are precluded this resource; and find it more easy, and less expensive, to cut all their letters on wooden blocks; and thus to make as many blocks as there are pages in a book, and these of no further use but for that single work. Their method of *printing* see hereafter.

**Origin of PRINTING.**—Who the first inventors of the European *printing* were, in what city, and what year, it was first set on foot, is a famous problem long disputed among the learned. In effect, as the Grecian cities contended for the birth of Homer, so do the German cities for that of *printing*. Mentz, Haerlem, and Strasbourg, are the warmest on this point of honour: Italy also would have entered the lists; but the suffrages being at first divided between the first three pretenders, they are left in possession of the question, which, in reality, is not yet justly decided; though it must be owned, Mentz has always had the majority of voices.

We shall not enter into a nice disquisition of the merits of the cause, but only propose the pretensions of each.—John Mantel of Strasbourg, John Guttemberg and John Fust of Mentz, and L. John Koster of Haerlem, are the persons to whom this honour is severally ascribed, by their respective countrymen; and have all their advocates among the learned.

Mantel, a physician of Paris, enters the lists in behalf of his name-sake of Strasbourg; and contends that it was he first invented *printing* in the year 1442. and that, in consideration hereof, the emperor Frederic III. gave him a coat of arms corresponding thereto: he adds, that Guttemberg, whom he had taken in as a partner or associate, carried it to Mentz, where he took in Fust a partner.

The Haerlemers, with Boxhornius, Schrevelius, &c. refer the first invention to Laurenz Janz Koster of Haerlem, in the year 1430. adding that his associate Guttemberg stole away his tools while he was at church, and carried them to Mentz, where he set up for the first inventor; though others attribute this theft, &c. to his partner Fust.

Munster, Polydore Virgil, Pasquier, &c. will have Guttemberg, or Guttemburgh, to have really been the inventor of *printing*; and add that he took in Fust and Schoeffer for associates.

Naude, in his *Mascurat*, espouses the cause of Fust, or Fauft, or Faustus; and will have him to be the first *printer* in Europe, and that he took in Guttemberg for a partner. His reason for putting Fust in possession of this privilege, is, that the first books that were printed, appear to have been all of his impression. It is more than probable, had Guttemberg or Koster had a greater or an equal share in the invention, they would not have allowed him to attribute the whole to himself and his son-in-law Schoeffer, as he has done, without ever offering to do the like, or in the least contradicting him, and asserting their own right.

These editions are, 1. The *Catholicon Januensis*, dated in 1460. and now in the king's library. Fust's name, indeed, is not to this; but it is perfectly like the following ones, where it is. 2. The Latin bible of 1462. now in the French king's library. 3. Tully's Offices, in 4to, (the rest being all folio's) in the year 1465. and 1466. for there are copies in the Bodleian, and the library of C.C. college, Oxon, of both those dates. 4. Other Bibles of 1471. 5. St. Augustine *de civitate Dei*, 1473. 6. Mercurius Trimegistus *de potestate & sapientia Dei*, in 1503. 7. Titus Livius, in 1518.

Add to this, that at the beginning of Livy, is a privilege granted by the emperor Maximilian to Schoeffer, for the sole power of *printing* that author for ten years; and for six years, to all the other books he should print thereafter, in consideration of his father-in-law, Fust's, having invented the art of *printing*. This privilege is dated 1518. and signed Jac. Spiegel.

Erasmus, however, in the epistle after that privilege, does not positively aver the fact; he only observes, that the first or the chief inventor of that art is held to be J. Fust. In the advertisement to the said book, Nic. Carbachius speaks to the same effect as the privilege, and Erasmus.

As to Guttemberg, Mantel, and Koster, Naude observes, the

# P R I

person is not yet born that can say he has ever seen books printed by any of them, before, or as early as those of Fust. All that is urged on their behalf, is only founded on reports, conjectures, probabilities, forged authorities, and the jealousies of cities against one another.

Yet Salmuth, in his additions to Pancirollus, cites a public act, whereby it appears, that Fust, after having invented *printing*, and sustained it a long time on his own footing; at length took in Guttemberg as a partner, to contribute to the expence; which was very great, by reason the first books were most of them printed on velum, or at least parchment, and after the Chinese way.

But the cause is not thus decided: the advocates for Koster urge divers things, to put him in the place here assigned to Fust. Mr. Ellis, in the philosophical transactions, fathers books on him prior to any of those above referred to Fust; and even some as early as 1430. and 1432. It is certain, the Haerlemers shew printed books of that date, which agreeing so well with the account given by Theod. Schrevelius, and others, leaves Mr. Ellis little room to doubt, whether the honour of the invention be his or the other's due. All that belongs to Fust, according to this writer, is the honour of establishing the art in greater lustre and perfection at another place many years after.

But the difficulty lies, either in shewing why the practice should be at a stand from 1432. to the reviving of it at Mentz by Fust and Schoeffer, in 1465. or else in giving some account of the condition and progress of this invention during that interval.

Now, Boxhornius, Schrevelius, and other authors, expressly affirm, that so large a work as the *De Spiegel*, *Speculum Salutis*, of Koster, shewn at Haerlem for the first printed book, could never be his first essay: he must have had the art in its rougher rudiments before, and have made many trials on lesser works: no doubt his first attempts were on loose sheets, which we may suppose were easily lost. In effect, it must be allowed no inconsiderable argument in Koster's behalf, that the rudest and most artless performances seem to be his: Mr. Ellis mentions some things of this kind without date, which he had seen in the king's library at St. James's, in that of Bennet college and the Bodleian at Oxford, with all the marks of the utmost simplicity, and which might fairly bid for first essays. There is something so awkward and coarse in them, that any body almost might have done them; mere nature being sufficient, without any art or experience at all. The ink was only common writing ink, unartfully spread upon wooden blocks, very clumsily cut, &c.

By this time we have traced up the art to such a state, that it may, perhaps, scarce seem worth the contesting who it was invented it; and no doubt, *printing*, as it now stands, owes more to the genius and address of some of the later improvers, than it did to its first author.

The same consideration may make us more easy under our present ignorance of the inventors of most other arts; many of which had such simple unmeaning originals, that you or I should, perhaps, think it no mighty credit to be esteemed the authors of inventions nothing less artful and ingenious.

**Progress of PRINTING.**—The first printers, then, whoever they were, whether Koster, Fust, Schoeffer, or Guttemberg, made their first essays on wooden blocks, or forms, after the Chinese manner.

It is not improbable, says Mr. Bagford, they might take the hint from ancient medals and seals; but others rather imagine it to have come from the method of making playing cards, which, it is certain, bears a near resemblance to the primitive process of *printing*; as appears from the first specimens of that art above-mentioned. See CARDS.

The book at Haerlem, the vocabulary called *Catholicon*, and the pieces in the Bodleian and Benner's college, are all performed in this way; and the impression appears to have been only given on one side the leaves; after which the two blank sides were pasted together.

But they soon found the inconveniencies of this method; and therefore bethought themselves of an improvement; which was by making single moveable letters, distinct from one another.

These being first done in wood, gave room for a second improvement; which was the making of them, at length, of metal: and, in order to that, cutting moulds, matrices, &c. for casting them.

From this ingenious contrivance, we ought to date the origin of the present art of *printing*, as practised throughout Europe; contradicting from the methods of the Chinese abroad, and the card-makers at home, which were the same art, only practised in a different place, or with a different view.

And of this, Schoeffer, or Scheffer, first servant, and afterwards partner, and son-in-law, of Fust, at Mentz, above-mentioned, is pretty generally allowed the inventor: so that he was properly the first printer; and, in strictness, the bible, which was printed with moveable letters in 1450. was the first printed book; the next was Augustine *de civitate Dei*, then Tully's Offices, &c. about the year 1461.

But the art being yet in its infancy, there were some imperfections in the books they printed; among the rest was the want of capital letters: hence they left the places of the initial letters blank, and gave them to the illuminers to paint in gold, or azure: though, others say, this was done designedly, to enable them to pais off their books for manuscripts.

Some

Some authors tell us, that Fust carrying a parcel of his bibles to Paris, and offering them to sale as MSS. the French, upon considering the number of books, and their exact conformity with one another, even to a point, and that the best book-writers could not be near so exact, concluded there was witchcraft in the case; and by either actually indicting him as a conjurer, or threatening to do so, extorted the secret. And hence the origin of the popular story of Dr. Faustus.

From Mentz, the art of *printing* soon spread itself throughout a good part of Europe; Haerlem and Strasburgh had it very early; which, as the current of authors represent it, occasioned their pretending to the honour of the invention.

From Haerlem it passed to Rome in 1467. and into England in 1468. by means of Tho. Bouchier, archbishop of Canterbury, who sent W. Turner, master of the robes, and W. Caxton, merchant, to Haerlem, to learn the art. These privately prevailing with Corseilles, an under-workman, to come over, a press was set up at Oxford; and an edition of Ruffinus on the creed printed the same year in a broad octavo on paper.

From Oxford, Caxton brought it to London about the year 1470. In the same year it was carried to Venice, and to Paris, where Gering, Grantz, and Friburger, all Germans, invited thither by two doctors of the Sorbonne, set up a press in that learned house.

Hitherto there had been nothing printed but in Latin, and the vulgar tongues; first in Roman characters, then in Gothic, and at last in Italic. But in 1480. and, as some say, in 1476. the Italians cast a set of Greek types; and it was at Venice, or, as some say, at Milan or Florence, that the first editions in that language appeared.

The Italians too have the honour of the first Hebrew editions, which were printed about the same time with the Greek, at Soucino, a little city in the duchy of Milan; under the direction of two Jewish rabbins, Joshua and Moses, whose works are dated in the year of the world 5240, answering to the year 1480. of the christian æra.

Towards the end of the 16th century, there appeared various editions of books in Syriac, Arabic, Persian, Armenian, Coptic, or Egyptian characters; some to gratify the curiosity of the learned, and others for the liturgic uses of the Christians of the Levant, printed chiefly at Paris; whither puncheons and matrices were sent from Constantinople by M. Savary, then ambassador at the Porte.

Out of Europe, the art of *printing* has been carried into the three other quarters of the world: for Asia, we see impressions of books at Goa, and in the Philippines; at Lima, Boston, Mexico, &c. for America; and at Morocco for Africa.

The Turks, indeed, rigorously prohibit *printing* throughout their empire, as imagining that the too free communication with books might occasion some change in religion or government; yet the Jews have several editions of their books printed at Constantinople, Thessalonica, &c.

**Method of PRINTING.**—The *printing* letters, characters or *types*, as they are sometimes called, we have already spoken of, under the articles LETTER and CHARACTER.

Of the method of forming or casting them, under the article **letter FOUNDRY.**

and of the art of engraving the puncheons, matrices, &c. in order thereto, under the articles ENGRAVING, PUNCHEON, MATRICE, &c.

The workmen employed in the art of *printing* are of two kinds; *compositors*, who range and dispose the letters into words, lines, pages, &c. according to the copy delivered them by the author: And *pressmen*, who apply ink upon the same, and take off the impression. See COMPOSITION, &c.

**Office of the compositor.**—The types being cast, &c. are distributed, each kind by itself, among the divisions of two long wooden frames, an upper and under one, called *cases*; each of which is divided into little cells, or boxes, of different sizes.

The boxes of the upper case are in number 98; and in these are disposed the capitals, small capitals, accented letters, &c.

In the cells of the lower case, which are fifty-four, are disposed the common running letters, with the points, comma's, spaces, quadrats, &c.

Each case is placed a little slope, like a reading-desk; that the operator may reach the upper boxes the better, and be in less danger of mixing the letters by stretching his arm over them. See CASE.

The compositor's post is against the middle of the case, and he works standing, holding an instrument usually made of iron, called the *composing-stick*, in one hand; with the other he takes the letters, points, comma's, &c. as he needs them, out of the boxes; ranges them on a slip of brass, called a *rule*, in his composing-stick; and, putting a space, to make a blank between each two words, forms one line after another; till the stick being full, he empties it out upon another instrument, called the *galley*; several of which ranged in a frame, called a *chase*, are ready for the press.

This short view of composing may need to be further illustrated and enlarged upon.—The *composing-stick*, then, (represented *tab. MISCELLANY, fig. 9.*) consists of a plate, or slip of iron, brass, wood, &c. more or less broad, and contrived so as to be made more or less long according to the width of the page, and the number of lines to be composed in it.

From the right side of this plate arises a ledge *aa*, about half an inch high, running the whole length of the plate, and serving to sustain the letters, the sides of which are to rest against it; from the same plate likewise arise three other lesser pieces, *b*, and *cc*, two of which, *cc*, are contrived to slide along it, that so the two pieces may be either approached or withdrawn at pleasure, to adjust the length of the line to the measure intended.

Add, that where marginal notes, references, &c. are required in a work, the two sliding pieces *cc* are opened in the composing-stick, to a proper distance from each other.

Ere the workman proceeds to compose, a rule, or thin slip of brass plate, cut to the length of the line, and of the same height as the letter, is placed in the composing-stick against the ledge thereof, for the letter to bear immediately against.

Things thus prepared, the compositor having the copy lying before him, and the stick in his left hand, with the right he picks up the letters, spaces, &c. and places them against the rule; while with the thumb of the left he presses them close to the upper screw, or check; and thus keeps them tight and steady; while the other hand is constantly employed in setting in more letters: the whole being performed with a degree of expedition and address, not easy to be imagined.

A line being thus composed, if it end with a word or syllable, and fill the measure, there needs no further care; otherwise more spaces are to be put between the several words to justify the lines, *i. e.* to make the measure quite full, so that every line may end even; and thus he proceeds to another line.

The spaces here used are a sort of blanks, of the like dimensions as the letters, but less high; and whose faces, therefore, when set, do not appear, nor give any impression. They are of several kinds according to the dimensions of the whites or intervals to be made by them, *viz.* quadrats, to fill up a break at the end of a paragraph, or the like; m quadrats, which are square, and of the thickness of an m, serving to make the distance after a period, or between sentence and sentence; n quadrats, of the thickness of an n, to be placed after colons, semi-colons, and comma's; and thick or thin spaces, to be used between the words in justifying, as above.

For marginal notes, in the spaces reserved for them, between the two sliding-pieces of the composing-stick, are put little quadrated pieces of metal, called *quotations*; which are justified by other smaller pieces; a slip of scaleboard being placed from the top of the page to the bottom, to keep the note and text at a due distance.

The first line thus completely justified, the compositor advances to the next; in order to which, he moves the brass rule from behind the former, and places it before it, and thus composes another line against it, after the same manner as the former: and thus he goes on till his stick be full, which he empties into the galley, after the manner following.

Taking the rule from behind the last line, he places it before it; and with his two middle fingers squeezes the lines in the stick close; his two fore-fingers at the same time being applied on the outside of the rule: thus he lifts them out of the stick, and clapping his two thumbs behind the first line, lifts them into the galley, taking care to disengage his two thumbs without breaking the lines.

The compositor having thus set the proper number of lines in his stick, *viz.* four, five, six, or more, and emptied them out into the galley; he again fills, and empties, as before, till a complete page be formed; remembering at the bottom of every page to set a line of quadrats, and at the end thereof the first word of the page ensuing, for a catch-word; and if it be the first page of the sheet, one of the letters for a signature.

The galley is a flat wooden instrument, in form of a long square; of a length and breadth proportionable to that of the page; it consists of two parts, the upper, called the *slice*, whereby the pages of large volumes, when composed, are slid on upon the stone; the other, which is the body of the galley, is ledged on three sides, to contain the slice; the inner ledge not to exceed half an inch in height, that the composed page rising above it be one half the height of the letter, may be tied up, or bound down, and removed without danger.

This galley is placed at the top of the case, and detained by two wooden pins from sliding down the boxes. See GALLEY.

The page, then, composed and ranged in the galley, he ties it up therein with a cord or packthread, and sets it by; and proceeds to the next, till the number of pages of the sheet be completed: which done, he carries them to the imposing or correcting-stone, there to range them in order, in a chase; which they call *imposing*.

The chase is a rectangular iron frame of different dimensions, according to the size of the paper to be printed on; having two cross pieces of the same metal, called a *long* and *short cross*, mortised at each end, into the frame, so as to be taken out occasionally.

By the different situations of these crosses, the chase is fitted for different volumes; for quarto's and octavo's, one traverses the middle lengthwise, the other broadwise, so as to intersect in the centre; which is the most customary situation: for twelves and twenty-fours, the short cross is shifted nearer to one end of the chase: For folio's the long cross is left intirely out, and the short one placed in the middle; and for broadsides, or sheets printed on one side only, both crosses are set aside.

To dress the chase, or range and fix the pages therein, they make use of a set of furniture, consisting of galleys, or slips of wood of different dimensions, and about half an inch high, that they may be lower than the letters: some of these are placed at the top of the pages, called *head-sticks*; others between them, to form the inner margin, called *gutter-sticks*; others at the sides, called *side-sticks*; and others at the bottom, called *foot-sticks*.

The pages, then, placed in order on the stone, the chase is put over them, and the galleys applied between the letter and the chase, in the position above-mentioned; the whole is locked up by means of small pieces of wood, cut in the wedge-form, called *quoins*, which are driven with a mallet and shooting-stick, to a sufficient tightness.

Before the form be quite locked up, they dress down the same by passing a smooth piece of wood, called the *plainer*, over the letters, to make their surfaces stand flat and even; and, when locked up, they shake it, to see that nothing stir.

In this condition the work is called a *form*, containing more or fewer pages, according to the volume. See FORM.

As there are two forms required for every sheet, when both sides are to be printed, it is necessary they be exactly of the same length and breadth; *i. e.* the corresponding galleys, head-sticks, &c. are to be equal in both forms, that the pages may fall exactly on the back one of another, which is called *register*.

Here, then, properly ends the compositor's office; the form, thus finished, being to be committed to the pressman.

Indeed, as it is impossible but there must be mistakes in the work, either through the oversight of the compositor, or by the casual transposition of the letters in the cases; after drawing off a proof, it is delivered to the corrector, who reading it over, and rectifying it by the copy, it is remanded to the former operator, to be corrected accordingly.—*For the characters used in correcting a sheet for the compositor, see CORRECTION.*

The compositor, then, unlocking the form upon the correcting-stone, by knocking out or loosening the quoins; and spreading his corrected proof so, as that the lines thereof range with the respective ones of the metal; by running his eye along both, he easily spies where corrections are to be made: according to which, he proceeds to pick out the faulty letters, points, &c. with a sharp-pointed steel bodkin, and puts others in their places.

Where the alterations are considerable, and particularly where insertions or omissions are to be made, there usually arises a necessity of over-running; in order to which they must decompose, or return the lines back from the chase into the galley, and from the galley again into the composing-stick, to be new-modelled and rectified accordingly.

If, *e. gr.* one or more words to be inserted in a line, cannot be got in by changing the spaces of the line for lesser ones; part of the line must be put back into the close of the preceding one, or forward into the beginning of the subsequent one, or both, till room is got. If the insertion be large, several lines will need to be over-run, either backward or forward, till a break is arrived at; when, if it be not got in, a line is to be driven out; and to get in that line, the next pages, either backward or forward, must sometimes be over-run, ere it can come in.

When an omission is to be made, the contrary course must be taken. If it be but little, the compositor takes it out, and drives out the remaining matter, by either enlarging his spaces, or bestowing the beginning of the following, or the close of the preceding line therein. If it be considerable, he may be obliged to over-run several pages, ere it can be driven out.

*Pressman's office, or PRINTING properly so called.*—To work off the form thus prepared and corrected by the compositor, there are three things required, paper, ink, and a press.

To fit the paper for use, it is to be first wet or moistened, by dipping several sheets together in water: these are afterwards laid in a heap over one another; and to make them take the water equally, are all pressed close down with a weight a-top. As to the degree of wetting, it must be according to the quality of the paper, and the size of the letter; small letters, and stiff paper, requiring most wetting.

A PRINTING-HOUSE is a place destined for printing, and fitted up for that purpose with presses, cases, and other furniture. The most considerable printing-houses in the world are those of the Louvre and Vatican.—The first, begun under Francis I. was carried to its utmost perfection under Louis XIII. by the care of cardinal Richelieu; and removed into the galleries of the Louvre by Louis XIV.

The Vatican printing-house, called also the *apostolical printing-house*, because the pope's bulls, decrees, &c. are printed therein, was begun by Pius IV. and finished with great magnificence by Sixtus V. See VATICAN.

Out of both these printing-houses have come forth very beautiful and splendid editions of the ancient authors. The Vatican was the first that printed books in the Arabic language.

The Clarendon printing-house at Oxford (so called, because built, in great measure, with the profits arising from the copy of lord Clarendon's history, which had been given to the university) promises well: it has already furnished us with a very fine English bible.

The PRINTING ink is of two kinds, black and red: the last occasionally used in the title-pages, calendars, &c. the first for the body of books. The composition of each, though now rec-

koned no part of the printers business, but usually furnished them by other hands, is as follows:

*For black ink:* An hundred pounds of nut or linseed oil, being reduced, by boiling, to the consistence of a syrup, is cleaned and purified by throwing into it two pounds of coarse bread, and about a dozen onions. They then boil thirty or thirty-five pounds of turpentine apart, till such time as they find, upon its cooling on paper, that it breaks clean, like glass, without pulverizing; for if it pulverize easily, it is a sign it is burnt. The oil and turpentine thus prepared, the first is gently poured, half cold, into the latter; and the two stirred together with a stick, till they be well mixed; after which, the composition, which is called the varnish, is set by, to be used occasionally.

Now, to proceed to make ink, they take a quantity of this mixture, and add to it a certain quantity of lamp-black; working it up with a kind of wooden muller, or brayer, till the whole be incorporated, and reduced into a kind of pulp; which is the ink for use.

Where more, that its thickness or strength is always to be proportioned to that of the paper, and the warmth of the weather; strong paper, and hot weather, requiring strong ink; and that the strength or weakness of the ink depends on the greater or less degree of coction of the varnish.

*For red ink:* They use the same materials as for black, excepting that instead of lamp-black they add a proper quantity of vermilion. Some hold, that by mixing and incorporating the bigness of a nut of fish-glue, or brandy, or the white of an egg with the ink, the vermilion acquires a greater lustre.

The ink is applied upon the forms by balls, which are a kind of wooden funnels, the cavities whereof are filled with wool covered with leather nailed to the wood. One of these the pressman takes in each hand, and applying them on the ink-block, to charge them with ink, he rubs them one against the other to distribute the ink equally; and, at last, smears over the form by beating or dabbing them several times over the whole face thereof: this leaves the form in a condition to be passed under the press, with the moistened paper laid thereon.

The PRINTING press (represented *tab. miscel. fig. 8.*) is a very complex machine: its two principal parts, each whereof consists of several others, are the *body* of the press, which serves to give the pinch or stroke for the impression; and the *carriage*, on which the form is laid to undergo the same. See PRESS.

The body consists of two strong cheeks *bb*, placed perpendicularly, and joined together by four cross pieces or planks. See CHEEK.

The first plank *cc*, called the *cap* of the press, is fixed, and serves to keep the two cheeks together at the due distance, at-top: the second *dd*, called the *head*, is moveable; being sustained by two iron pins, or *long bolts*, that pass the cap: in this plank is fixed a female screw or *worm*, with a *brass nut*, sustained by two *short bolts*, which keep it up: the third plank *ee*, called the *shelves*, serves to keep steady a part called the *hose*, in which the *spindle* (to be spoken of hereafter) is inclosed: the fourth plank *ff*, called the *winter*, is moveable; it bears the carriage, and sustains the effort of the press beneath, as the head does above; each giving way a little, the one upwards, the other downwards, to make the pull the easier.

The *spindle gg* is an upright piece of iron pointed with steel, of different dimensions; having a male screw, which goes into the female of the head above four inches. Through the eye *b* of this spindle, is rivetted the *bar*, by which the pressman works the press.

The lower part of the spindle passes through the shelves, being inclosed in a square wooden frame *i*, called the *hose*; and its point works into the plug, fixed in a brass pan supplied with oil; which pan is fixed to an iron plate let into the top of the platten. The pressman, then, by pulling or turning the bar fixed in the eye by an iron key, presses upon a square smooth piece of wood called the *platten*, and enables it to compress the form covered with the paper, tympan, and its blankets, which, in order hereto, are brought under the platten.

At each corner of the hose, is an iron hook fastened to those at each corner of the platten, with cords or packthread, very exactly.

The *carriage llll*, which makes the second principal member of the press, is placed a foot below the platten, having its fore-part supported by a wooden prop *m*, called the *fore-stay*, while the other rests on the winter. On this carriage, which sustains the plank, are nailed two long iron bars, or *rails*, *oo*; and on the plank are nailed short pieces of iron or steel *pp*, called *cramp-irons*, equally tempered with the rails, and which slide upon them when the press is turned in or out.

Under the carriage is fixed a small piece of iron called the *spit*, with a double wheel in the middle, round which leather *girts* are fastened, nailed to each end of the plank. To the outside of the spit is fixed a handle, or round, by which the pressman turns the plank in or out at pleasure.

Upon the plank is a square wooden frame or *coffin qq*, wherein is inclosed a marble or polished stone for the form to be laid on: To this coffin are fastened leather stay-girts, one to each side; which, being again fastened to the cheeks or the press, prevent the plank from running too far out, when drawn from

under the platten. On the fore-part of the plank is a gallows *ss*, which serves to sustain the tympan, when taken from off the form.

On the front of the coffin are three frames much alike, though serving for different purposes, *viz.* the two tympan and frisket: the tympan *ss* are square, made of three slips of very thin wood, and at top of a slip of iron, still thinner, called a *bead-band*: that called the *outward tympan* is fastened with iron joints to the coffin. They are both covered with parchment; and between the two are placed blankets, which serve to make the impression of the platten upon the surface of the letters more equable; as also to prevent the letters from being broken by the force of the press. The frisket *tt* is all of iron, very thin, fastened at top to the great or outward tympan, and sustained by a slip of wood hanging from the ceiling, when opened to take out the printed sheets, and put in others. It is also covered with parchment or paper, cut in the necessary places, that the sheet, which is between the great tympan and frisket, may receive the ink, and that nothing may hurt the margins. On the parchment of the great or outward tympan it is that the blank sheet is laid to be printed.

To regulate the margins, and make the lines and pages answer each other when printed on the other side; in the middle of the wood, in the sides of this tympan, are two iron points, which make two holes in the sheet, to be placed on the same pins, when the sheet is returned for an impression on the other side, called the *reiteration*.

Every thing now about the tympan being prepared for printing, and the pressman having inked or beat his form now placed on the stone, he brings the tympan and frisket down from the gallows upon the form; and advancing the plank under the platten by means of the spit-handle, or rounce, gives two strokes or pulls with the bar; and with the same handle turned the contrary way, brings back the plank, to take out the printed sheet, and put in the fresh one; and this he repeats till he have taken off the full number of sheets the edition is to consist of.

One side of the sheet being thus printed, it is remanded to the press for the other; and so disposed, as that the iron points pass through the holes already made in the sheet.

Sometimes it is required to cut the frisket afresh, where the second side is to be more or less full of *printing* than the first; as is frequently the case at the beginning and ending of books, &c.

The number of sheets of the edition being complete, and the form to be separated, to restore the letters into the cases, they first wash it in a boiling lye to take out the remains of the ink, scouring it with a brush, and then with fair water. This done, it is carried to a wooden frame to be unlocked, and the furniture, *i. e.* the sticks, &c. taken off to disengage it from the chafe. Then the compositor taking out several lines at once upon a little wooden ruler, he replaces each letter in its proper box, to be again used in the remainder of the impression; which last operation they call *distribution*.

Beside the several kinds of letters and characters above-mentioned, used in *printing*, they have likewise rules for blank lines, borders, and head and tail-pieces, accommodated to the several kinds of letters.

The *rules* for blank lines are of brass, and made exactly the height of the letter; otherwise they will either hinder the neighbouring letters from *printing*, or will themselves be hindered by them. These the compositor occasionally cuts into proper lengths, as his work requires.

The *borders* are a kind of ornaments in form of long bars, serving for the divisions of books, chapters, &c. Their depth is proportioned to the letter, and their length adjusted to the page; for being composed of several moveable pieces, it is easy lengthening or shortening them.

The *head and tail-pieces*, cut either in wood or pewter, are compartments used at the beginnings and endings of books.

The initial letters are sometimes cut in wood, and figured; sometimes cast like the other characters.

For the convenience of the binding, the *printers* had early recourse to signatures, *i. e.* letters of the alphabet placed at the bottom of the sheet, which shew the order they are to be bound in; as well as whether the quires be complete.

The *catch-words* serve nearly the same purpose: these are the first words of each page, which are inserted at the bottom of the preceding pages. The number of the pages are equally serviceable to the reader and the binder, to guide to references, and to warrant the book duly bound and collated: some *printers* formerly put them at the bottoms of the pages; but custom has carried it for the tops.

In the infancy of *printing*, they had likewise a *registrum chartarum* for the convenience of the binders: to draw this, at the end of each volume, they collected the signatures, and the first words of the four first sheets of each alphabet. To abridge it, they afterwards contented themselves to express the signatures, and how oft each letter was repeated: but the *registrum* has been long disused.

As to the faults which escape the corrector and compositor, they are usually noted in what we call *errata*. The ancient editions had no *errata*; but in lieu thereof they corrected the faults in each printed copy with a pen; which was easy enough in those days, though impracticable now. In effect, we have

anciently had *printers* who did not need an *errata* of above five articles in a volume of five hundred sheets: how different from some of the present set, who might make an *errata* of five hundred articles in a book of five sheets!

*Chinese PRINTING.*—There are three opinions as to the antiquity of the *Chinese printing*, one fixing it 300 years before Christ; another 900 years after him; and a third carrying it still farther back, and making it coeval with that mighty empire; though it must be allowed the last is much the least probable of the three.

Their manner of *printing* we have already hinted to be very different from that which now obtains among the Europeans; it is true, it has some advantage over ours in correctness, and the beauty of the character; but in other respects it comes far short, the single advantage of moveable characters making more than amends for all that is urged against us by some zealous advocates for this oriental *printing*.

Books are printed in China from wooden planks, or blocks, cut like those used in *printing* of callico, paper, cards, &c. among us. See CARDS, &c.

These blocks are made of a smooth, firm, close wood, and of the size of the leaf required. On the face-side they glue a paper, upon which some able penman draws out the several letters and characters, with a *Chinese pen*, which is a kind of pencil. This is the principal part of the work, and that whereon the success of the rest depends.

When finished, the block is put into the hands of a sculptor, or cutter in wood; who, following the several strokes of the writer with his gravers, and other sharp little instruments, makes them all appear in *relievo* on the wood. See CUTTING in wood.

When the carving or cutting is finished, they moisten what remains of the paper, and rub it gently off.

The ink they use in *printing* is the same with the common *Chinese ink*, wherewith they also write; and is made of lamp: black, mixed up with oil.

Their press resembles our rolling-press, much more than the letter-press. See ROLLING press.

As to their paper, it is inferior to ours: it is made of the inner bark or rind of a kind of rushes, beat up with water into a pulp or paste, and formed in moulds, much like ours. See PAPER.

The advantages of the *Chinese printing* consist in this, that they are not obliged to take off the whole edition at once, but print their books as they need them; that the blocks are easily retouched, and made to serve afresh; and that there needs no corrector of the press.

Its disadvantages are, that a large room will scarce hold all the blocks of a moderate volume; that the colour of the ink easily fades; and that the paper is apt to tear, and is subject to worms: whence it is that we see so few ancient books in China.

*Rolling-press PRINTING* is employed in taken off prints or impressions from copper plates engraven or etched. See ENGRAVING, and ETCHING.

It differs, as we have before observed, from *letter-printing*; in that the marks and characters, whose impressions are to be taken, in the former case, are indented, or cut inwards; and in the latter, are in *relievo*, or stand out.

This art is said to be as ancient as the year 1460. and to owe its origin to Finiguerra, a Florentine goldsmith, who, casting a piece of engraven plate in melted brimstone, found the exact print of the engraving left in the cold brimstone, marked with black licked out of the strokes by the liquid sulphur.

Upon this he attempted to do the same on silver plates with wet paper, by rolling it smoothly with a roller; and this succeeded.

This novelty tempted Baccio Baldini, a goldsmith of the same city, to attempt the same, which he did with success; engraving several plates of Sandro Boticello's design, and *printing* them off this new way: in which he was followed by Andrew Mantegna, then at Rome.

This knowledge getting into Flanders, Martin of Antwerp, a famous painter, graved abundance of plates of his own invention, and sent several prints into Italy, marked thus, *M. C.* After him Albert Durer appeared, and gave the world a vast number of prints both in wood and copper. About this time one Hugo de Carpi, an Italian painter, found out a way, by means of several plates of wood, to make prints resemble designs of *chiaro scuro*; and some years after, the invention of etching was discovered, which was soon made use of by Parmeggiano.

The art was not used in England till the reign of king James I. when it was brought from Antwerp by Speed.

The fabric of the rolling-press, and the composition of the ink used therein, with the manner of applying both in taking off prints, are as follow.

*Structure of the rolling-press.*—This machine, like the common press, may be divided into two parts; the *body* and *carriage*, analogous to those in the other.

The body consists of two cheeks of different dimensions; ordinarily about four  $\frac{1}{2}$  feet high, a foot thick, and two  $\frac{1}{2}$  apart; joined at-top and bottom by cross pieces. The cheeks are placed perpendicularly on a wooden stand, or foot, horizontally placed, and sustaining the whole press.

From

From the foot likewise rise four other perpendicular pieces, joined by other cross or horizontal ones; which may be considered as the carriage of the press; as serving to sustain a smooth, even plank, which is about four  $\frac{1}{2}$  feet long, two  $\frac{1}{2}$  feet broad, and an inch  $\frac{1}{2}$  thick; upon which the engraven plate is to be placed.

Into the cheeks go two wooden cylinders, or rollers, about six inches in diameter, borne up at each end by the cheeks; whose ends, which are lessened to about two inches diameter, and called *trunnions*, turn in the cheeks between two pieces of wood, in form of half-moons, lined with polished iron, to facilitate the motion.

The space in the half-moons, left vacant by the trunnion, is filled with paper, pasteboard, &c. that they may be raised and lowered at discretion; so as only to leave the space between them necessary for the passage of the plank, charged with the plate, paper, and blankets.

Lastly to one of the trunnions of the upper roller is fastened a cross consisting of two leavers, or pieces of wood, traversing each other. The arms of this cross serve in lieu of the handle of the common press; giving a motion to the upper roller, and that to the under: by which means the plank is protruded, or passed between them.

**Preparation of the ink.**—The ink used in rolling-press printing is a composition of black and oil mixed and boiled together in a due proportion.

The black is a factitious matter, made of the stones of peaches and apricots, bones of sheep's-feet, and ivory; all well burnt, beaten, sifted, and mixed together with spirit of wine, and sometimes only with water.

This black is usually brought hither ready prepared from Francfort on the Maine; whence our printers call it *Francfort-black*. See BLACK.

The oil wherewith they dilute this black, is nut-oil; which is boiled up differently, according to the different works it is to be used in.

They usually make three kinds, *thin*, *thick*, and *strong*; only differing in the degree of coction: the strong is that used in the finest works, &c.

To make the ink, they pulverize the black stone very carefully, and pass it through a fine sieve; then mix it up on a marble with the proper oil, by means of a muller, after the same manner as the painters do their colours.

**Method of PRINTING from copper plates.**—The ink being prepared, they take a little quantity of it on a rubber, made of linen rags, strongly bound about one another; and therewith smear the whole face of the plate; as it lies on a grate, over a charcoal fire.

The plate sufficiently inked, they first wipe it coarsely over with a foul rag, then with the palm of the left hand, then of the right; and, to dry the hand, and forward the wiping, rub it from time to time on whiting.

In wiping the plate perfectly clean, yet without taking the ink out of the engraving, consists a good part of the address of the workman. The French printers use no whiting, as being detrimental to the colour of the ink; nor do they lay the plate on the grate to warm, till after inking and wiping it.

The plate, thus prepared, is laid on a thick paper, fitted upon the plank of the press: over the plate is laid the paper, first moistened to receive the impression; and over the paper, two or three folds of blanketing, or other stuff.

Thus disposed, the arms of the cross are pulled; and by that means, the plate with its furniture passed through between the rollers; which pinching very strongly, yet equably, presses the moistened paper into the strokes of the engraving, whence it licks out the ink.

Some works require being passed twice through the press, others only once, according as the graving is more or less deep, or the greater or less degree of blackness the print is desired to have.

It must be observed, that the stronger and thicker the ink is, the stronger must the rollers pinch the plate: this tempts many of the workmen to use a thinner oil, in order to save labour; which proves prejudicial to the impression.

The wetting of the paper ought to be done two or three days before printing it, to render it the more supple and mellow: as the prints are drawn off, they are hung up to dry on lines, &c.

Lastly, after the number of prints desired have been wrought off from the plate, they rub it over with oil of olives, to prevent its rusting, and set it by against a new impression. If the strokes of the graving be perceived full of ink hardened therein, in the course of the printing, they boil it well in a lye, ere the oil be applied.

**PRIOR**, *before*, something that is nearer the beginning, than another to which it is compared. See PRIORITY.

**PRIOR** is particularly used for a superior of a convent of monks, or the second person after the abbot. See SUPERIOR, and MONASTERY.

*Priors* are either *claustral*, or *conventual*.

**Conventual PRIORS** are the same as abbots; all the difference between them being in name; both having the same rights, and both alike governors of monasteries. See ABBOT, and CONVENTUAL.

**Claustral PRIOR** is he who governs the religious of an abbey, or priory, in *commendam*; so called, because he has superiority in the cloister or monastery. See COMMENDAM.

His jurisdiction is wholly from the abbot; and ends with the abbot's death, unless he have been elected by the whole convent.

**Conventual priors** are of two kinds, *viz.* *regular conventual priors*, who govern religious living in community; and *secular or commendatary-conventual priors*.

Conventual priors are obliged to take up the priesthood within a year, or at most two, from the dates of their provision; in default whereof, their benefices are declared vacant.

**Priors** must be twenty-five years old, ere they can govern the convent; and twenty, if the convent be governed by another.

**Grand PRIOR** is the superior of a large abbey, where several superiors are required; as in the abbeys of Cluny and Fecamp.

In the monastery of St. Denys, there were anciently five priors; the first whereof was called the *grand-prior*.—In most monasteries there is also a *sub-prior*.—There are also *grand priors* in the military orders; as in that of Malta, or St. John of Jerusalem, &c.

**PRIORS alieni**, certain religious, born in France and Normandy, superiors of religious houses, erected for their country-folks here in England. See ALIEN.

These, Henry V. deeming no good members for this land, suppressed; and their livings were afterwards given by Henry VI. to other monasteries, and houses of learning; but chiefly, as Stow observes, to the erecting of those two famous colleges, called the *king's colleges of Cambridge and Eaton*.

**Arch PRIOR**, see the article ARCH prior.

**PRIORITY**, **PRIORITAS**, the relation of something, considered as it is *before*, or *prior* to another, *i. e.* nearer to the beginning, or the first. See POSTERITY.

The principal modes of *priority* are five, *viz.* in respect of *time*; as when we say, that the Grecian empire was *prior* to the Roman; *nature*, as when we say one is *prior* to two; *order*, *dignity*, and *causality*: which are all summed up in the technical distich;

*Tempore, natura, prius ordine, dic & honore;  
Effecto causam dicimus esse prius.*

**PRIORITY**, in law, denotes an antiquity of tenure, in comparison of another less ancient. See TENURE.

*To hold by priority*, is to hold of one lord more anciently than of another; in respect whereof the tenant is said to *hold in posteriority*. See POSTERITY. The lord of the *priority* shall have the custody of the body. *Crompt. Jurisd.*

**PRISAGE**, **PRISAGIUM**, that share which belongs to the king, or admiral, out of such merchandizes as are taken at sea, as lawful prize: which is usually a tenth part. See PRIZE.

**PRISAGE of wines**, a custom in certain ports, whereby the king challenges out of every vessel laden with wine, containing twenty tuns, or upwards, two tuns of wine, the one before, the other behind the mast, at his own price; which is twenty shillings *per tun*. See DUTY.

This custom varies a little in various places: at Boston, *e. gr.* every bark laden with ten tuns of wine pays *prisage*.

The term is now grown into disuse; and, in lieu of *prisage*, the custom, says Cowel, is popularly called *butlerage*; because it is the king's chief butler that receives it. See BUTLERAGE.

**PRISCILLIANISTS**, **PRISCILLIANISTÆ**, ancient heretics; who arose in Spain, or rather were derived thither from Egypt, towards the end of the fourth century.

The origin of this heresy is not well known; but it appears to have been brought into Spain by one Marcus of Memphis, who had for his disciple the rhetor Helpidius, under whom *Priscillian* was educated.

What their particular tenets were, is not easy to discover; but they are charged by their adversaries with indulging all kinds of secret filthiness, and nocturnal mixtures, under a religious notion.—Among their dogmata, this is said to have been one: *Fura, perjury, secretum prodere noli*. See FLORINIANS.

They held, that souls are of the same nature and substance with God: they admitted all the books of scripture, but allegorized them into their own sense. *Forbes*.

**Priscillian**, their leader, was a man of great birth, fortune, parts, and learning: he was condemned with some bishops his adherents, in a council at Saragossa, and in another at Bourdeaux; but he appealed to the emperor Maximus, and had a hearing at Treves; where, being convicted of broaching novelties, he was condemned to death, with several of his followers. See LIBERTINES.

**PRIZE**, or **PRIZE**, in navigation, a vessel taken at sea from the enemies of the state, or from pirates, by a man of war, or a merchant-man, having commission from the admiral.

Vessels are look'd on as lawful *prize*, if they fight under any other standard than that of the state from whom they have their commission; if they have no charter-party, invoice or bill of lading aboard them; if they be loaded with effects belonging to the king's enemies, or with contraband goods.

Those of the king's subjects recovered from the enemy, after having remained twenty-four hours in their hands, are deemed lawful *prize*.

Vessels that refuse to strike their sails, after having been summoned thereto by the king's ships, may be constrained to do it; and if they make resistance, and fight, are lawful *prize*.

**PRIZE**, in our statutes, is used for things taken of the subjects by the king's purveyors. See PURVEYOR.

Spelman

# PRI

Spelman describes *prifes* to be corn and other provisions taken from the country people, at lower rates than ordinary, for the maintenance of the king's household, garisons, &c. Roger de Monte alto, who married the sister of Hugo de Albeney, claimed the following privileges, viz. his castle of Refinge *cum* *prifis* 40 *dierum*, with *prifes* of 40 days: which phrase the same author understands of the liberty of taking provisions for the support of the garison of his castle, upon paying for them within 40 days. See *stat. 12. Car. II. cap. 34.*

**PRISM\***, **PRISMA**, in geometry, an oblong solid or body, contained under more than four planes, and whose bases are equal, parallel, and alike situated. See **SOLID**, &c.

\* It is thus called from the Greek *πρισμα*, something *saw*, or *cut off*.

The *prism* is generated by the motion of a rectilinear figure, as *ACB* (*tab. geom. fig. 16.*) descending always parallel to itself along the right line *AE*.

If the descendent be a triangle, the body is said to be a *triangular prism*; if square, a *quadrangular* one, &c.

From the genesis of the *prism*, it is evident it has two equal and opposite bases; that it is terminated by as many parallelograms as the base consists of sides; and that all the sections of a *prism* parallel to its base are equal.

Every triangular *prism* may be divided into three equal pyramids. See **PYRAMID**.

To measure the surface and solidity of a **PRISM**.—Find the area of the base, e. gr. *ABC*, (see **TRIANGLE**) and multiply it by 2; find the areas of the planes or parallelograms, that include or circumscribe it, and add their sum to the former product.

The sum is the whole surface of the *prism*.

Multiply then the base *BAC*, by the altitude *CD*; the product is the solidity of the cube *ABCDEF*. See **CENTROBARIC**.

All *prisms* are in a ratio compounded of their bases and altitudes: if then their bases be equal, they are to each other as their heights; and *vice versa*. Similar *prisms*, &c. are in a triplicate ratio of their homologous sides, as also of their altitudes.

**PRISM**, in dioptrics, is a glass in form of a triangular *prism*, much used in experiments about the nature of light and colour. See **LIGHT**, &c.

The phenomena and use of the *prism* arise from its separating the rays of light in their passage through it. See **RAY**.

The more general of these phenomena are as follow: for, to enumerate all would be endless; and even these are sufficient to demonstrate, that colours do not either consist in the contortion of the globules of light, as Des Cartes imagined; nor in the obliquity of the pulses of the ethereal matter, as Hook fancied; nor in the constipation of light, and its greater or less concitation, as Dr. Barrow conjectured; but that they are original and unchangeable properties of light itself.

**Phænomena of the PRISM**.—1. The sun's rays, transmitted through a *prism* to an opposite wall, project an image like the rainbow, of various vivid colours; the chief whereof are red, yellow, green, blue, and violet. See **RAINBOW**.

The reason is, that the various coloured rays, which were before mixed and blended together, are now, in virtue of their different refrangibilities, separated by refraction, in passing through the *prism*, and thrown, each colour, by itself. See **REFRANGIBILITY**.

For the blue rays, e. gr. represented by the dotted lines, (*tab. opt. fig. 50.*) beginning to be separated from the rest in the side *ca*, of the *prism abc*, by the first refraction in *dd*, are again separated further in the other face of the *prism bc*, by a second refraction the same way in *ee*: whereas in a plain glass, or even in a *prism* in a different position, the blue rays separated by the first refraction in the first surface, are again mixed by the second refraction at the other surface, which is made a contrary way. See **REFRACTION**.

2. The image, thus projected, is not round; but when the angle of the *prism* is 60 or 65 deg. about five times as long as broad.

Because some of the rays are refracted more than others, and therefore exhibit several images of the sun stretched out in length, as if it were but one.

3. Those rays which exhibit the yellow colour, swerve more from the rectilinear course, than those which exhibit the red; and the green more than the yellow; and the violet most of all.

4. If the *prism*, through which the rays are transmitted, be turned about its axis; so as the red, yellow, green, &c. rays be received in order on another *prism* about twelve feet distant from the former, through a little hole, and thence projected further, the yellow, red, &c. rays, though they fall in the same manner on the second *prism*, yet will not be projected on the same place as the red, but will be deflected further that way towards which the refraction is.

And if, in lieu of the second *prism*, they be received on a lens a little convex; the yellow, green, &c. rays, will be collected, each in its order, into a nearer focus than the red ones.—The reason of which two last phenomena is, that the yellow rays are refracted more than the red ones, the green ones more than the yellow ones, and the violet ones most of all,

# PRI

5. The colours of coloured rays, well separated, can neither be destroyed, nor in any manner altered by repeated refractions through a number of *prisms*, nor by passing through an illumined space, nor by their mutual decussations, nor by the neighbourhood of the shade, nor by being reflected from any natural bodies.

Because their colours are not modifications arising from refraction, but original and immutable properties thereof. See **COLOUR**.

6. All coloured rays collected together in any manner, either by several *prisms*, or a convex lens, or concave speculum, form whiteness; but being again separated after decussation, each exhibits its proper colour. See **WHITENESS**.

Because, as the ray was white, ere its parts were separated by refraction; so those parts being remixed, it recovers its whiteness; and the coloured rays, when they meet, do not destroy one another, but only intermix.

Hence dusts, or powders, red, yellow, green, blue, violet, &c. mixed in a certain proportion, become grey, or of the colour arising from a mixture of black and white; and would be perfectly white, but that some of the rays are absorbed.

Thus, if a circle of paper be smeared with all these colours apart, in a certain proportion, and turned swiftly about its centre, so that the species of the several colours may be confounded in the eye by the velocity of the motion, the several colours will disappear, and the whole be seen of one uniform colour between black and white.

7. If the sun's rays strike very obliquely on the inner superficies of a *prism*, the rays reflected will be violet; those transmitted, red.

8. If there be two *prisms*, the one full of a red liquor; the other of a blue one; the two joined together will be opaque; though, if both be filled either with a blue or a red liquor, they will, together, be transparent: for the one transmitting none but blue, the other none but red rays, the two together will transmit none at all. See **BLUE**.

9. All natural bodies, especially white ones, viewed through a *prism* held to the eye, seem fringed or hemmed on one side with red and yellow, on the other with blue and violet.

10. If two *prisms* be so placed, that the red of the one, and the purple of the other, meet on a paper encompassed with darkness, the image will be pale; but viewed through a third *prism* held to the eye at a due distance, will appear double, red, and purple.

And if two kinds of powder, the one perfectly red, the other blue, be mixed, a little body, being covered thick with the mixture, will exhibit a double image, the one red, the other blue, through a *prism* applied to the eye.

11. If the rays transmitted through a convex lens be received on a paper before they meet in the focus, the confine of light and shadow will seem tinged with a red colour; if beyond the focus, with a blue.

12. If the rays about to be transmitted through one part of the pupil, be intercepted by the interposition of some opaque body near the eye, the extremes of bodies lying beyond it will seem tinged with colours, as if seen through a *prism*, though less vivid.

Because the rays transmitted through the rest of the pupil are separated by refraction into divers colours; and the intercepted rays, which would be refracted a contrary way, are prevented from mixing and diluting them: whence also it is, that a body, viewed with both eyes thro' two little holes made in a paper, does not only appear double, but tinged with colours too.

**PRISMOID**, **PRISMOIDES**, in geometry, a solid figure, bounded by several planes, whose bases are right-angled parallelograms, parallel, and alike situated. See **PRISM**.

**PRISON**. See the article **GAOL**.

**PRISONER**, in law, one that is restrained of his liberty upon any action civil or criminal; or upon commandment.

A man, again, may be *prisoner* either upon matter of fact, or of record.

**PRISONER upon matter of record**, is he who, being present in court, is by the court committed to prison.

**PRISONER upon matter of fact**, is he who is committed upon an arrest, be it by the sheriff, constable, or other. See **ARREST**.

**PRIST**.—Unques **PRIST**. See the article **UNQUES**.

**PRIVATE average**, } See the articles } **AVERAGE**,  
**PRIVATE charters**, } **CHARTER**,  
**PRIVATE spirit**, } **SPIRIT**.

**PRIVATION**, **PRIVATIO**, the absence, want, or defect of something needed, or necessary.

In the canon law, *privation* is used for an interdiction, or suspension. See **DEPRIVATION**.

Mythic divines use the phrase, *privation of God*, for those drinefles which the soul experiences, to whom God does not make himself felt.

The church of Rome teaches, that children dying without baptism go into a limbus, where they undergo a *privation* of the sight of God.

**PRIVATION**, in physics, is a negative principle, which, with matter and form, the Peripatetics suppose, conspires to constitute natural bodies. See **MATTER**, and **FORM**.

*Privation*

*Privation* signifies no more than the absence of the future form: thus every thing, according to Aristotle, is formed of this, that it was not that thing before; *e. gr.* a chick arises hence, that it was not a chick before it was generated; which is what the philosopher calls *privation*. See **PRINCIPLE**.

Aristotle is very angry with the ancients, for not admitting *privation* as a principle, and imputes it to their ignorance thereof. But it is an injustice to reproach them with ignorance of what it is impossible to be ignorant of; and it is an illusion to produce this poor principle of *privation* as such a mighty mystery; there being no body but supposes it a thing known, that a thing is not before it is made. See **ARISTOTELIAN**, &c.

**PRIVATIVE**, in grammar, a particle, which, prefixed to a word, changes it into a contrary sense. See **PARTICLE**.

Thus, among the Greeks, the  $\alpha$  is used as a *privative*; as in  $\alpha\theta\eta\sigma$ , *atheist*,  $\alpha\psi\chi\alpha\lambda\alpha\sigma$ , &c.—The Latins have their *privative* in; as, *incorrigibilis*, *indeclinabilis*, &c.—The English, French &c. on occasion, borrow both the Latin and Greek *privatives*.

**PRIVATIVE modes**. See the article **MODE**.

**PRIVATIVE quantity**, in algebra, denotes a quantity less, than nothing; called also a *negative quantity*; in opposition to affirmative or positive quantities. See **QUANTITY**, **NEGATIVE**, &c.

*Privative quantities* are denoted by the character of subtraction—prefixed to them. See **CHARACTER**.

**PRIVILEGE\***, **PRIVILEGIUM**, in the general, any kind of right, prerogative, or advantage, attached to a certain person, condition, or employment, exclusive of others.

\* The word is formed from the Latin *privata lex*

**PRIVILEGE**, in law, is a particular right granted to a single person, place, community, or the like, whereby they are exempted from the rigour of the common laws.

*Privilege* is either *personal* or *real*.

**Personal PRIVILEGE** is that which is granted to any person either against or beyond the course of the common law.

Such, *e. gr.* is that of a member of parliament, who may not be arrested, nor any of his servants, during the sitting of parliament, nor for a certain time before and after. See **PARLIAMENT**.

**Real PRIVILEGE** is a franchise granted to a place. See **FRANCHISE**.

Such is that granted to our universities, by which none who are members thereof may be called to Westminster-hall upon any contract made within their own precincts.

So also, a person belonging to the court of chancery cannot be sued in any other court, certain cases excepted; and if he be, he may remove it by *writ of privilege*.

It is an ancient *privilege* for men to be exempted from arrests within the verge of the court, *i. e.* in or near the palace where the king is resident: because, in such cases, quarrels frequently happen; and the peace ought to be strictly kept there. See **PAX**.

In the laws of Hen. I. it is expressed, that peace ought to be maintained religiously and reverently within four miles of the king's doors towards the four quarters; and forty-nine acres, nine feet, nine palms, and nine barley-corns around. See **PEACE**.

**Attachment of PRIVILEGE**. See the article **ATTACHMENT**.

**PRIVILEGE**, in commerce, is a permission from a prince or magistrate, to make and sell a certain merchandize, or to engage in a certain commerce, either exclusively of others, or concurrently with them.

The first is called an *exclusive privilege*; the latter, simply, *privilege*.

*Exclusive privileges* are to be granted rarely, by reason of the hindrance they are of to trade: yet they are sometimes very just and reasonable, by way of reward for the invention of useful machines, manufactures, &c.

*Exclusive privileges for foreign commerce* are usually granted on the following conditions:—That the commodities be brought from remote parts, where there is no going without running great risks: that the *privilege* be only for a limited time: that the persons *privileged* be not allowed to monopolize, *i. e.* to raise and lower their commodities at pleasure; but that the sale and price be always proportionable to the expence, interests, &c. and that the *privileges* assist the state, on occasion, with part of their gains.

**PRIVILEGE for the impression of books**, is properly exclusive; being a permission which an author, or bookseller, obtains under a prince's seal, to have alone the impression of a book, with a prohibition of all others to print, sell, or distribute the same, within a certain term of years, usually 14, under the clauses and penalties expressed therein.

These *privileges* were unknown till the beginning of the 16th century, when they were introduced in France: the oldest is said to bear date in the year 1507. and to have been occasioned by some printers counterfeiting the works of others as soon as they appeared.

But people were yet at liberty to take or let them alone at pleasure, till the interests of religion, and the state, occasioned the restraining of this liberty.

In 1563. Charles IX. published a celebrated ordonnance, forbidding any person, on pain of confiscation of body and goods, to print any letter, speech, &c. without permission.

The like has been since done in England; though, at present, *privileges* are not only not required, but by the late act for securing the properties of books, seem needless.

**PRIVILEGES of the clergy**. See the article **CLERGY**.

**PRIVILEGE of the tabouret**. See the article **TABOURET**.

**PRIVILEGED debt**. See the article **DEBT**.

**PRIVITIES**, the natural parts of either sex; or those immediately ministering to the business of generation. See **GENITALS**.

**PRIVITY**, an intimate freedom, or private familiarity between two persons. See **PRIVY**.

The lawyers say, if there be lord and tenant, and the tenant hold of the lord by certain services; there is a *privity* between them in respect of the tenure.

**PRIUS**—*Nisi PRIUS*, in law. See **NISI**.

**PRIVY**, in law, a person who is partaker, or has an interest in an action or thing.

In this sense they say, *privies in blood*: every heir in tail is *privy* to recover the land intailed.

In old law-books, *merchants privy* are opposed to merchants strangers.

Coke mentions four kinds of *privies*.—*Privies in blood*, as the heir to his father; *privies in representation*, as executors and administrators to the deceased; *privies in estate*, as he in reversion, and he in remainder; donor and donee; lessor and lessee; lastly, *privy in tenure*, as the lord by escheat, *i. e.* when land escheats to the lord for want of heirs.

**PRIVY council**, a council of state, held by the king with his counsellors, to concert matters for the public service, the honour and safety of the realm, &c. See **COUNCIL**.

The *privy council* is, or ought to be, the primum mobile of the state, and that which gives the motion and direction to all the inferior parts. It is likewise a court of justice of great antiquity; the primitive and ordinary way of government in England being by the king and *privy council*.

It has been frequently used by all our kings for determining controversies of great importance: the ordinary judges have sometimes declined giving judgment till they had consulted the king and *privy council*; and the parliament have frequently referred matters of high moment to the same; as being by long experience better able to judge of, and by their secrecy and expedition, to transact, some state-affairs, than the lords and commons.

At present, the *privy council* takes cognizance of few or no matters except such as may not be well determined by the known laws, and ordinary courts, such as matters of complaint, and sudden emergencies.

The oath of a *privy counsellor* is, to the utmost of his power and discretion, truly and justly to counsel the king, and to keep secret the king's counsels.

Anciently, to strike in the house of a *privy councillor*, or elsewhere in his presence, was grievously punished: to conspire his death, is felony; and to effect it, treason.

With the advice of this council, the king issues proclamations that bind the subject, provided they be not contrary to law. See **PROCLAMATION**.

In debates, the lowest delivers his opinion first, the king last; and thereby determines the matter.

A council is never held without the presence of a secretary of state. See **SECRETARY**.

The members of the *privy council* in the year 1710. were in number 57; their officers, four clerks of the council, three clerks extraordinary, three clerks in the council-office, a keeper of the records, and two keepers of the council-chamber.

**Lord President of the PRIVY council**. See **PRESIDENT**.

**PRIVY seal**, a seal which the king uses, previously, to such grants, &c. as are afterwards to pass the great seal.

Yet the *privy seal* is sometimes used in matters of less consequence, which do not require the great seal. See **SEAL**.

**Lord PRIVY seal** is the fifth great officer of the crown, through whose hands pass charters and grants of the king, and all pardons signed by him, before they come to the great seal: also matters of less moment, which do not pass the great seal, *v. gr.* for payments of money, &c.

He is a lord by office, and a member of the *privy council*: he was anciently chief judge of the court of requests. See **PRIVY seal**, and **LORD**.

**Clerks of the PRIVY seal**. See the article **CLERK**.

**PRIVY chamber**. See the article **CHAMBER**.

**PRIZE**. See the article **PRIZE**.

**PRO confesso**. See the article **PRO-CONFESSO**.

**PRO indiviso**. See the article **PRO-INDIVISO**.

**PROBABILISTS**, a sect, or division, among the Romanists who adhere to the doctrine of *probable opinions*; holding, that a man is not always obliged to take the more probable side, but may take the less probable, if it be but barely probable. See **PROBABLE**.

The Jesuits and Molinists are strenuous *probabilists*. See **JESUIT**, &c.

Those who oppose this doctrine, and assert, that we are obliged on pain of sinning, always to take the more probable side, are called *probabiliorists*.

The Janfenists, and particularly the Port-royalists, are *probabiliorists*. See **JANSENISM**, &c.

**PROBABILITY**, in reasoning, *verisimilitude*; or an appearance of truth. See **TRUTH**.

To define it philosophically, *probability* is the appearance of the agreement or disagreement of two things by the intervention of proofs, whose connexion is not fixed or immutable, or is not perceived to be so; but is, or appears, for the most part, to be so; so as to suffice to induce the mind to judge the proposition to be true or false, rather than the contrary. See EVIDENCE.

That proposition, then, is *probable*, for which there are arguments and proofs to make it pass, or be received for true. See PROBABLE.

The entertainment the mind gives to this sort of propositions, is called *belief*, *assent*, or *opinion*. See FAITH.

*Probability*, then, being to supply the defect of our knowledge, is always conversant about propositions whereof we have no certainty, but only some inducements to receive them for true. See OPINION.

According to Aristotle, a proposition is *probable*, if it seem true to all or most people, and those the wiser and more reputable sort: But by *seem*, he means, what, after a close inquiry, shall seem to be true.

Of *probability* there are various degrees, from the confines of certainty and demonstration, down through improbability and unlikeliness to the confines of impossibility; and also degrees of assent from certain knowledge, and, what is next to it, full assurance and confidence, quite down to conjecture, doubt, distrust, and disbelief.

The grounds of *probability* are, in short, these two following; viz. the conformity of any thing with our own knowledge, experience, or observation, called *internal probability*; and the testimony of others vouching their observation, or experience, called *external probability*. See CREDIBILITY.

PROBABILITY, in poetry, denotes the appearance of truth in the fable or action of a poem. See ACTION and FABLE.

There are four kinds of actions; for a thing may be either only true, or only probable; or true and probable at the same time; or neither the one nor the other. See ACTION.

These four kinds of actions are shared between four arts: history takes the first, still keeping to truth, without regard to *probability*. See HISTORY.

Epic and dramatic poetry have the second, and still prefer *probability*, though false, to an *improbability*, though true: thus the death of Dido, who killed herself on her being deserted by Æneas, though false in itself, is a fitter subject for a poem, than the action of Samson, or the maid of Orleans.

Moral philosophy takes the third; and the fabulists, as Æsop, &c. the fourth. See FABLE.

Bossu adds, that the epopœia, in its nature and essence, uses truth and *probability* like morality; yet in its certainty and expression takes a liberty like that of Æsop: instances of each we have in the Æneid.

Poetical *probability* may be so either in respect of the rules of theology, of morality, nature, reason, experience, or opinion.

As to theology, there is scarce any thing but is probable, in respect hereof; because nothing is impossible to God. This is an expedient the poets have frequent recourse to, in order to bring things feigned contrary to the order of nature, within the bounds of *probability*. See this considered under the article MACHINE.

As to morality, we have observed, it requires both truth and verisimilitude: an ancient poet was condemned on the theatre for a slip herein, viz. for making a person, whom he represented as an honest man, say, that *though his tongue swore, his mind did not*.

Seneca accuses Virgil of an offence against *natural probability*, in saying, that the winds were pent up in caves; for, says that philosopher, wind being only air in motion, to suppose it at rest, is to destroy its nature. To which Vossius answers, that the poet only speaks of the natural origin of winds; which are produced in mountains by vapours, &c. pent there: just as we should say, the winds are inclosed in an *æolipyle*.

Virgil, likewise, committed an offence against *natural probability*, by making Æneas find deer in Africa; because that country produces none.

Indeed these faults are excusable, because, as Aristotle finely observes, they are not faults in the poet's art, but arise from his ignorance of something taught in the other arts.

However, care must be taken they be not too gross; there being some *probabilities* of this kind, which Æsop himself could not dispense withal: he would never be forgiven, were he to represent a lion fearful, a hare daring, a fox stupid, &c.

*Probability*, in respect of *reason*, is frequently broken in upon by those who affect nothing but the *merveilleux*. Here Statius is a notorious criminal: Tydeus, being surprised in an ambuscade by fifty braves, who had vowed his death, kills forty-nine of them, and pardons the last.

Again, two young kings, whereof this same Tydeus was one, the other Polynices, upon a quarrel, go together by the ears, and box it out; their swords all the while by their sides.

— *Scrutatur & intima vultus*

*Unca manus, penitusque oculis cedentibus instat.*

Scaliger accuses Homer of an offence against *experience*, in saying, that *Jupiter thundered and snowed at the same time*. This, says the critic, was never known; and yet have there been instances hereof even in our time.

But the principal and most important kind of *probability*, is that in respect of *common opinion*. A thing is probable when it

looks like truth: but sometimes it shall appear true to the people, and false to the learned; and *vice versa*. When, then, the learned and the people are divided, to which side must the poet adhere? Suppose, for instance, the adventure of Penelope, the history of Medea, Helena, or the like: what Virgil and Homer have written of them, shall appear probable to the populace; yet the learned read the contrary in history; some authors having written, that Dido was chaste, and Medea innocent; that Penelope was divorced and banished by Ulysses for abusing his absence; and that Helena never saw Troy.

This point is soon decided: Homer and Virgil make no scruple of leaving history, to improve their fables: Horace does not send the poets to the truths of history; but either to fables already invented, or to common fame.

All which is confirmed by Aristotle: where he says, that a poet does not tell, like an historian, what kind of person Alcibiades was, nor what he really did or said on this or that occasion; but what he probably might have done or said. Add to this, that Aristotle approves of the fable of Oedipus and Iphigenia, though it can never be imagined the truth of those stories was believed by the learned in those days.

In effect, every one finds his account in this conduct: the people think they see truth; and the learned do really see truths, and more solid ones too, than those the people look for; and more certain than those of the history, which the poet neglects. The more understanding they are, the less will they desire these historical truths in a poem, which is intended for other and deeper ends. The truths they require, are moral and allegorical truths. The Æneid was not written to teach us the history of Dido, but to shew, under that name, the genius and conduct of the republic founded by her, and the source and series of its differences with Rome. This we see with pleasure; and these truths are more agreeable, more certain and notorious, than any the poet could take from a history, so little known in his time.

To these kinds of *probability* may be added another, which we call *accidental probability*: it consists not in the using of several incidents, each probable apart; but in disposing them so as to hang probably together.

A man, *e. gr.* may probably die of an apoplexy; but that this should happen just in the nick, when the poet wanted it for unravelling, is highly *improbable*.

It is an offence against this kind of *probability* to produce an incident all at once, and without any preparation, which yet needed one. Virgil is wonderfully exact in this point: Juno prepares the tempest raised in the first book; Venus in the same book prepares the amours of the fourth. The death of Dido, in the end of the fourth, is prepared on the first day of marriage; Helenus in the third disposes the whole matter of the sixth; and in the sixth, the Sibyl predicts all the wars that follow.

PROBABLE *opinion*, a term long time controverted among the Romish casuists; usually defined an opinion founded on a grave motive, or an apparently good foundation, and which has authority enough on its side to persuade a wise disinterested person to assent to it. See PROBABILITY.

Others define a *probable opinion* to be that which being compared to the contrary opinion, becomes problematical, by a perfect equality of the reasons on each side; so that there is nothing in reason or nature to determine a man to this side rather than that.

But the Jesuits go still farther, and maintain, that to render an *opinion probable*, it suffices, that it be either built on a reason of some consequence, or on the authority of some one grave doctor. With these qualifications it is allowable to follow it, even though it be less *probable*, and less certain, than the contrary opinion: here it is the venom of *probability* lies. — This doctrine is attacked with infinite address by M. Pascal in the *provincial letters*.

One of the twenty-four patriarchs of the Jesuits, Castro Palao, asserts, that a judge, in a question of right, may give sentence according to a *probable opinion*, against a more *probable* one; and this, contrary to the judgment and persuasion of his own mind; *imo contra propriam opinionem*. Escobar. *tr.* 6. *ex.* 6. *n.* 45.

So Vasquez maintains, that it is lawful to follow the less *probable* and less secure *opinion*, discarding the more *probable*, and more secure one.

Lessius and Escobar, treating of the question, Whether a man may kill another for giving him a box on the ear? decide it to be a *probable opinion*, and speculatively true; though there may be some inconveniencies in the practice, for which it would be as well to let it alone. *In praxi tutam & probabilem judicant—sed non facile admittendam*. Let provinciales, p. 307, 308.

PROBANDA *proprietas*. See the article PROPRIETATE.

PROBATE, of a will, or testament, in law, is the exhibiting and proving a will and testament, before the ecclesiastical judges delegated by the bishop, who is ordinary of the place where the party dies. See WILL and TESTAMENT.

The ordinary is known by the quantity of goods the deceased hath out of the diocese wherein he departed; for if all his goods be in the same diocese, then the bishop of the diocese, or the archdeacon, according as their composition leads, has the *probate* of the testament. — If the goods be dispersed in several dioceses, so that there be any sum of note, *bona notabilia*, as five pounds

pounds, out of the diocese where the party lived; then is the archbishop of Canterbury the ordinary by *prerogative*. See *BONA notabilia*, and *PREROGATIVE*.

This *probate* may be made two Ways; either in *common Form* or *per testes*.—The proof in *common form* is only by the oath of the executor, or party exhibiting the will, who swears upon his belief, that the will exhibited by him, is the last will and testament of the deceased. See *EXECUTOR*.

The proof *per testes*, by *witnesses*, is, when over and besides his own oath, he also produces witnesses, or makes other proof to confirm, that it is the last will of the deceased; and this in the presence of such as may pretend some interest in the goods of the deceased; or at least in their absence, after they have been lawfully summoned to see such a will proved, if they think fit.

The latter course is commonly taken when there is fear of strife, or dispute about the deceased's goods: for some hold, that a will proved in common form only, may be called in question any time within thirty years after.

Where a will disposes of lands and tenements of freehold, it is now frequently proved by witnesses in chancery.

*PROBATICA piscina*. See the article *PISCINA*.

*PROBATION*, in a monastic Sense, a time of trial; or the year of noviciate, which a religious must pass in a convent to prove his virtue and vocation, and whether he can bear the severities of the rule. See *NOVICIATE*.

The year of *probation* commences from the day of novices taking the habit.

*PROBATION*, in the universities, denotes the examination and trial of a student who is about to take his degrees. See *DEGREE*.

*PROBATIONER*, in the presbyterian discipline, a person licensed by a presbytery to preach; which is usually done a year before he be ordained. See *PRESBYTERY*.

A student in divinity is not admitted *probationer* till after several trials: the first, private, before a presbytery; the second, public, before a congregation, the presbytery being present.

The private trials are a homily and exegesis; *i. e.* a theological subject is given in to the presbytery in theses, and the candidate answers any objections started against it.

The public trials are a popular sermon, and an exercise and addition; *i. e.* a text is handled, half an hour, logically and critically; and half an hour more, practically.

If he acquit himself to the satisfaction of the presbytery, he signs the confession of faith, owns the presbyterian government, &c. Upon which he receives a licence to preach.

*PROBATOR*, in law, an accuser, or approver; one who undertakes to prove a crime charged upon another: properly, an accomplice in the crime, who impeaches others. See *APPROVER* and *PROVER*.

*PROBATUM est*, *q. d. it is proved*; a term frequently subjoined to a receipt, for the cure of some disease. See *RECIPE*.

*PROBE*, a surgeon's instrument, wherewith to sound and examine the circumstances of wounds, ulcers, and other cavities. See *SPECULUM*.

*PROBLEM\**, *PROBLEMA*, in logic, a doubtful question; or a proposition that neither appears absolutely true, nor false; but which is probable on both sides, and may be asserted either in the negative or affirmative, with equal Evidence.

\* The word is originally Greek, *προβλημα*, signifying the same thing.

Thus, that the moon and the planets are inhabited by animals in some respect like us, is a *problem*: that the fixed stars are all suns, and each the centre of a several system of planets and comets, is a *problem*. See *PLANET*, *STAR*, &c.

*PROBLEM* is also a proposition expressing some natural effect, proposed in order to a discovery of its apparent cause.—Such are the *problems* of Aristotle.

A logical or dialectical *problem*, say the schoolmen, consists of two parts; a subject, or subject matter, about which the doubt is raised; and a predicate or attribute, which is the thing doubted whether it be true of the subject or not. See *SUBJECT* and *PREDICATE*.

There are four topical predicates, *viz. genus, definitio, proprium*, and *accidens*; whence arise four different kinds of dialectical *problems*.

The first, when the thing attributed to the subject is in the relation of a genus: as, whether fire be an element or not? See *GENUS*.

The second, when the thing attributed has the effect of a definition: as when it is asked, whether or no rhetoric be the art of speaking? See *DEFINITION*.

The third, when the attribute imports a propriety: as, whether it belong to justice to give every one their due? See *PROPER*.

The last is when the thing attributed is adventitious: as, whether justice is to be desired? See *ACCIDENT*.

*Problems*, again, may be divided into those relating to things to be done, or avoided, called *ethical*; those relating to the knowledge of nature, called *physical*; those relating to spirits, called *metaphysical problems*, &c.

*PROBLEM*, in geometry, denotes a proposition wherein some operation, or construction, is required; as, to divide a line, to make an angle, to draw a circle through three points not in a right line, &c. See *PROPOSITION*.

Messieurs of the Port-Royal define a *geometrical Problem*, a proposition given to be demonstrated, wherein something is required to be done; and what is done, to be proved to be the thing required.

A *problem*, according to Wolfius, consists of three parts. The proposition, which expresses what is to be done. See *PROPOSITION*.

The resolution, or solution, wherein the several steps, whereby the thing required is to be effected, are orderly rehearsed. See *RESOLUTION*.

The demonstration, wherein is shewn, that by doing the several things prescribed in the resolution, the thing required is obtained.

Accordingly, the general tenor of all *problems* is this: The things prescribed in the resolution being done, the thing required is done. See *DEMONSTRATION*.

*PROBLEM*, in algebra, is a question or proposition which requires some unknown truth to be investigated or discovered; and the truth of the discovery demonstrated.

In this sense it is a *problem*, to find a theorem. See *THEOREM* and *INVESTIGATION*.—Algebra is defined to be the art of resolving all *problems* that are resolvable. See *ALGEBRA*.

Kepler's *PROBLEM*, in astronomy, is the determining of a planet's place from the time; thus called from the astronomer Kepler, who first proposed it. See *PLANET* and *PLACE*.

The *problem*, stated in form, stands thus: To find the position of a right line, which passing through one of the foci of an ellipsis, shall cut off an area described by its motion, which shall be in any given proportion to the whole area of the ellipsis.

The proposer knew no way of solving the *problem* directly and geometrically; and therefore had recourse to an indirect method; for which he was taxed with an *αἰνιγματισμός*, or want of geometry; and his astronomy charged with not being geometrical. But the *problem* has since been solved directly and geometrically several ways, by several authors; particularly Sir Isaac Newton, Dr. Keill, &c. See *PLANET*, *PLACE*, &c.

<i>Determinate Problem,</i>	} See	<i>DETERMINATE.</i>
<i>Limited Problem,</i>		<i>LIMITED.</i>
<i>Linear Problem,</i>		<i>LINEAR.</i>
<i>Local Problem,</i>		<i>LOCAL.</i>
<i>Plain Problem,</i>		<i>PLAIN.</i>
<i>Solid Problem,</i>		<i>SOLID.</i>
<i>Sur-solid Problem,</i>		<i>SURSOLID.</i>
<i>Unlimited Problem,</i>		<i>UNLIMITED.</i>

*Deliacal Problem*, in geometry, is the doubling of a cube. See *CUBE*.

This *problem* was so called from the people of Delos, who, upon consulting the oracle for a remedy against a plague they were then infected with, were answered, that the plague should cease, when Apollo's altar, which was in form of a cube, should be doubled. See *DUPLICATION*.

This *problem* coincides with that for finding two mean proportionals between two given lines; whence that is also called the *Deliac problem*. See *PROPORTIONAL*.

*PROBLEMATICAL resolution*, in algebra, a method of solving difficult questions by certain rules, called *canons*. See *SOLUTION* and *CANON*.

*PROBOSCIS\**, in natural history, the trunk or snout of an elephant, and some other animals. See *TRUNK*.

\* The word is Greek, *προβοςκίς*, where it has the same signification.

The *proboscis* is a member issuing out of the middle of the forehead, serving instead of a hand; and having a little appendix fastened to the end thereof, in form of a finger.—By the *proboscis* the she-elephant sucks herself; and by the same conveys the milk to her young.

The *proboscis*, Mr. Derham observes, is a member so admirably contrived, so curiously wrought, and with so great agility applied by that unweildy animal, that it may pass as an instance of the Creator's skill, &c.

All quadrupeds have the length of their neck equal to that of their feet; the elephant alone excepted; in whom the shortness of the neck is compensated by the length of the *proboscis*.

The camelion has also a kind of trunk or *proboscis*, which is its tongue; and which it darts nimbly out of its throat, as if it spat it; and draws it in again instantaneously. It serves, like the elephant's trunk, to lay hold on, and take its food. See *CAMELEON*.

The microscope shews us a little trunk in flies and gnats, by means whereof they suck the blood of animals, or liquors, for their food.

*PROCATARCTIC\* cause*, the original, primitive, or pre-existent cause, or occasion, of an effect.

\* The word is Greek, *προκαταρκτικός*; formed from the verb *προκαταρχω*, I pre-exist, I go before.

Such, *e. g.* is a disease which co-operates with some other disease, subsequent thereto.—Thus, anger, or heat of a climate, bring on such a disposition of the juices, as occasions a fever; where the ill disposition is the immediate cause, and the heat or anger, the *procatarctic* cause.

*PROCEDENDO*, in law, a writ whereby a plea or cause, formerly called from an inferior court to the chancery, king's bench, or common pleas, by writ of privilege, habeas corpus, or certiorari, is released, and returned to the other court to be

*proceeded*

*proceeded* in; upon its appearing that the defendant has no cause of privilege, or that the matter comprized in the party's allegation is not well proved.

*Non PROCEDENDO ad assisam rege inconsulto.* See NON. PROCEDURE, PROCEEDINGS in law, the course of the several acts, expeditions, and instructions of a process, or lawsuit. See PROCESS.

*Procedure* is either civil or criminal.—*Civil procedure* is that where the estate alone is concerned: *criminal*, or *extraordinary procedure*, is that where the person is prosecuted.

PROCEED, among merchants, that which arises from a thing.—In which sense they say, the *net proceed*. See NET.

PROCELEUSMATICUS, *προκελευσματικός*, in the ancient poetry, a foot consisting of four short syllables: as, *ari-etat*. See FOOT.

PROCESS, PROCESSUS, in law, is used for all the proceedings in any cause or action, real or personal, civil or criminal, from the original writ, to the end. See ACTION.

In France they carry on a formal *process* against the memory of people killed in duels; or that have murdered themselves.—Pirates, when taken in the fact, are hanged without any *process*; as are sometimes also robbers.

PROCESS is also used in a more restrained sense, for that by which a man is first called into any temporal court; this being the beginning, or principal part, and that by which the rest of the business is directed.

The difference between *process* and *precept* or *warrant* of the justice, is this; that the precept or warrant is only to attach or convene the party, before any indictment or conviction, and may be made either in the name of the king, or the justice: but *process* is always in the king's name, and usually after an indictment. See PRECEPT.

PROCESS by attainder. See the article ATTAINDER.

PROCESS, in chemistry, the whole course of an operation, or experiment. See OPERATION and EXPERIMENT.

PROCESS, PROCESSUS, in anatomy, is a term of equal import with *apophysis*, *prominence*, *protuberance*, or *production*. See APOPHYSIS, &c.

*Process* is particularly applied to certain eminences of the bones, and other parts; distinguished by peculiar names, expressing their place, form, or the like. See BONE.

Such are the *processus peritonæi*, *processus vermiciformes*, *processus papillares*, *ciliares*, &c. See VERMICIFORMES, PAPIL-LARES, CILIARE, PERITONEUM, &c.

PROCESSUS *aliformis*,  
PROCESSUS *cornicularis*,  
PROCESSUS *pyrenoides*. } See { ALIFORMIS.  
CORNICULARIS.  
PYRENOIDES.

PROCESSION, PROCESSIO, in theology, a term used for the manner wherein the Holy Spirit is conceived to issue from the Father and the Son, in the mystery of the Trinity. See SPIRIT, TRINITY, PERSON, &c.

The Greeks and Latins are not agreed about the *procession* of the Holy Spirit. See GREEK.

PROCESSION also denotes a ceremony in the Romish church, consisting of a formal march of the clergy in their robes, and the people after them, putting up prayers, singing hymns, &c. and in this manner making a visit to some church, or other holy place.

There are general *processions* of all the people in jubilees, and in public calamities. See JUBILEE.—The *processions* of the holy sacrament are very solemn.—They have also *processions*, frequently, around the church, at the salutations, &c. in the mass. Anciently, among us, there were, in each parish, customary *processions* of the parish-priest, and the patron of the church, with the chief flag, or holy banner, attended by the other parishioners, each ascension-week; to take a circuit round the limits of the parish, and pray for a blessing on the fruits of the earth.—Of which custom there still remains a shadow in that annual perambulation, still called *processioning*; though the order and devotion of the ancient *processions* be almost lost.

PROCESSUM *continuando*, a writ for the continuance of the *process*, after the death of the chief justice, or other justices in the commission of oyer and terminer. *Reg. orig.* 128.

*Recordo & PROCESSU mittendis.* See RECORDO.

PROCHEIN *amy*, *PROXIMUS amicus*, in law, the *nearest friend*, or person next a-kin, to a child in nonage; and who, in that respect, is allowed in law to deal and negotiate for him, to manage his affairs, to see him redressed of any wrong, and to be his guardian, if he hold land in socage. See GUARDIAN. By *prochein amy* is commonly understood the guardian in socage: though, in propriety, it is he who appears in court for an infant who sues any action, and aids the infant in pursuit thereof.—For, to sue, an infant is not allowed to make an attorney; but the court will admit his *prochein amy*, next friend, as plaintiff; or his guardian, as defendant.

PROCIDENTIA, or PROLAPSUS *ani*, in medicine, is when, upon a discharge by stool, the intestinum rectum is protruded so far, as that it cannot be drawn back again into the body; or when drawn back, falls again. See RECTUM.

This is sometimes a chronical disease, especially when it arises from a palsy: its causes are a relaxation of the fibres of the rectum, or of the sphincter muscle; either from the adstriction of the alvus, a diarrhoea, dysentery, or tenesmus.

It is very difficultly cured, when attended with hemorrhoids: The principal cure is by astringents.—External assistance is also

required to reduce the fallen gut; which, if it be not soon had is apt to tumefy and mortify, by the contact of the air.

It is subject to relapse after reduction in children, especially upon violent crying; and it is difficult to keep up, in case of a diarrhoea.

PROCIDENTIA *uteri*, the descent, or falling down of the womb, caused by a relaxation of the ligaments which should hold it in its place. See UTERUS.

If the uterus fall into the vagina, so that its orifice may be either perceived with the finger within, or by the eye just without, the labia vulvæ; it is called a *bearing down* of the womb.—If it fall quite down, so as to hang pendulous without the labia, but so as that no more of the inside than the orifice is seen, it is called a *prolapsus*, or *procidentia*.—If falling thus low, it be turned inside out, and hang like a fleshy bag, with a rugged unequal surface, it is called a *perversio uteri*.

These disorders may proceed from violent motions, vehement coughing, sneezing, fluor albus. They appear most frequent in women with child, from the weight pressing and bearing hard upon the uterus; but especially if the foetus be dead, lie in a wrong posture, or be violently extracted.

After replacing the part, restringents both inwardly and by injection are here used; such as obtain in diarrhoea's, hæmorrhoids, the gonorrhoea simplex, &c.

PROCIDENTIA, or PROLAPSUS, *uvulae*, the descent or relaxation of the uvula, or almonds of the ears. See UVULA.

PROCLAMATION\*, PROCLAMATIO, an instrument dispatched by the king, with the advice of his privy-council, whereby the people are advertised of something which his majesty thinks fit for them to know; and whereby they are sometimes required to do, or not to do, certain things. See KING and PRIVY council.

\* The word is of Latin origin, formed from *proclamare*, *palam & valde clamare*.

*Proclamations* have the force of laws; but then they are supposed to be consistent with the laws already in being; otherwise they are superseded. See LAW.

PROCLAMATION is also used for a solemn denunciation, or declaration of war and peace. See WAR, &c.

PROCLAMATION also denotes the act of notifying to the people the accession of a prince to the crown. See ACCESSION.

The *proclamation* does not invest the prince with the regal authority; it supposes him already invested therewith, and only gives notice thereof to the people.

PROCLAMATION of a *fine* is a notice openly and solemnly given thereof in the court of common pleas where it passed, and at all the assizes in the county held within one year after the ingrossing it. See FINE.

These *proclamations*, at the assizes, are made on transcripts of the fine, sent by justices of the common pleas to the justices of the assize, and of the peace.

PROCLAMATION, in a monastic sense, is the accusation of a friar or brother, by another brother, in open chapter, and in presence of the superior and community, for some external crime he has seen him commit.

PROCONDYLUS, *προκονδυλος*, an appellation given to the first point of each finger. See CONDYLUS and FINGER.

PRO-CONFESSO, in law.—When, upon a bill exhibited in chancery, the defendant appears, and is in contempt for not answering, and in custody: upon an habeas corpus (which is granted by order) to bring him to the bar, the court assigns him a day to answer; which being expired, and no answer put in, a second habeas corpus is granted, and a farther day assigned; by which day, if he answer not, the bill, upon the plaintiff's motion, shall be taken *pro confesso*, or as allowed, unless cause be shewn by a day, which the court usually gives.

For want of such cause shewed, upon motion, the substance of the plaintiff's bill shall be decreed, *as if it had been confessed* by the defendant's answer: or, after a fourth insufficient answer made to the bill, the matter of fact not sufficiently answered unto, shall be taken *pro confesso*.

PROCONSUL, a Roman magistrate, sent to govern a province with a consular authority. See CONSUL and PROVINCE.

The *proconsuls* were appointed out of the body of the senate; and ordinarily, as the year of any one's consulate expired, he was sent *proconsul* into some province.

The *proconsuls* had the same honours, &c. with the consuls themselves; except that they had only six lictors and fasces before them. See FASCES.

The *proconsuls* did not ordinarily hear and determine processes in person, but had that office performed by their assessors, or other judges, constituted or delegated by them.

As the *proconsuls* had the direction both of justice, of war, and of the revenues; they had their several lieutenants in each capacity; these were called *legati*, and were ordinarily nominated by the senate. See LEGATUS.

The *proconsular* function only held a year. The charges of their journey backwards and forwards, were borne by the public, and were called *viaticum*. See VIATICUM.

After the partition of the provinces between Augustus and the people, those who presided over the provinces of the people were called especially *proconsuls*.

PROCONSUL, in our ancient law-books, is sometimes used for a *justice in eyre*, or *justice errant*. See JUSTICE.

PRO-

**PROCREATION**, **PROCREATIO**, the action of begetting, and bringing forth children. See **GENERATION**.

**PROCTOR**, **PROCURATOR**, a person commissioned to act as proxy, or delegate, in behalf of another. See **PROCURATOR**.

**PROCTOR**, *procurator*, in the civil law, is an officer appointed to appear in court, and manage the causes of parties who will make use of his procuration. See **CIVIL LAW**.

Anciently every body was obliged to appear in person; and when the affair happened to be drawn out to a great length, was allowed to create a *proctor*, or proxy, in his cause.

But this was a favour only granted for a certain time; till towards the middle of the 16th century, when it was decreed, that all procuration should hold till revoked.

**PROCTORS of the commons**, are persons skilled in the civil and ecclesiastical laws, who exhibit their proxies, and make themselves parties for their clients, to draw up acts and pleadings, produce witnesses, prepare causes for sentences, and attend the advocates with the proceedings. See **COLLEGE**.

They are thirty-four in number; are admitted by the archbishop's fiat; and wear black robes, and hoods lined with white furs.

**PROCTORS of the clergy**, are deputies, or representatives chosen by the clergy of each diocese, two for each; and by the cathedral and collegiate churches, one for each: to sit in the lower house of convocation. See **CONVOCATION**.

**PROCTORS in the university**, are two officers, chosen from among the students, to see good orders, and exercises daily performed there. See **UNIVERSITY**.

**PROCUMBENT leaves**, in botany, such leaves of plants as lie flat, or trailing on the ground. See **LEAF**.

**PROCURATION**, or **PROCURACY**, an act, or instrument, whereby a person is empowered to treat, transact, receive, &c. in another's name, as if he himself were actually present. See **PROCURATOR**.

When a man treats in behalf of another, the first thing is to examine his *procuracion*, or *procuracy*.

*Procuracion* is now little used in this sense, except in the case of a person who collects the fruits of a benefice for another.

**PROCURATION**, in the canon law, is used for the repast or entertainment anciently given to church-officers or ordinaries, who came to visit in churches or monasteries, whether they were bishops, archdeacons, or visitors. See **VISITATION**.

*Procuracion* was due to the pope's legates, and even to popes themselves, when they came into France; and the charge was comprized in the bulls then granted.

Complaints were frequently made to the pope, of the excessive charges of the *procuracions* of bishops and archdeacons, upon which they were prohibited by several councils and bulls.

That of Clement IV. mentioned in the *Monasticon*, is very express; wherein that pope tells us, complaint had been made, that the archdeacon of Richmond, visiting the diocese, travelled with one hundred and three horses, twenty-one dogs, and three hawks; and did so grievously oppress a religious house with that vast equipage, that he caused the monks to spend in an hour as much as would have maintained them a long time.

**PROCURATION** is now used for a sum of money paid yearly by parish-priests to the bishop, or archdeacon, in lieu of this entertainment, towards defraying the charge of their visitation. See **VISITATION**.

**PROCURATOR**, **PROCTOR**, or **PROXY**, a person who has a charge or office committed to him, to act in behalf of another. See **PROCURATION**, and **PROCTOR**.

Thus the *proxies* of the lords in parliament, in our law-books, are called *procurators*. See **PROXY**.

The word is also used for a vicar, or lieutenant.—Thus in Petrus Blesensis, we read of a *procurator regni*.

Those who manage causes in *Docket Commons*, are also called *procurators*, or *proctors*. See **PROCTOR**.

The bishops are sometimes called *procuratores ecclesiarum*, and the representatives sent by the clergy to convocation, *procuratores cleri*. See **CONVOCATION**.

In our statutes, a person who gathers the fruits of a benefice for another, is particularly called *procurator*; and the instrument empowering him to receive the same, *procuracy*.

**PROCURATOR** is also a kind of magistrate in several cities of Italy, who takes care of the public interests.—There are *procurators* of St. Mark, *procurators* at Venice, at Genoa, &c. Originally there was but one *procurator* of St. Mark at Venice: In 1442. the number was augmented to nine, when the senate made a decree, appointing, that for the future none should be admitted to the dignity but after the death of some of the nine. But in the necessities of the republic, the number was afterwards enlarged to forty; though of these there are only nine that bear the title of *procurators*, and whose place is regularly filled. They are administrators of the church of St. Mark, and of the revenues attached thereto, the patrons of orphans, and the executors of testaments.

This office receives more lustre from the merit of those who discharge it, than from its authority.—They are clothed in black, or violet, with ducal sleeves.

**PROCURATOR monasterii**, anciently, was the advocate of a religious house, who was to solicit the interest, and plead the causes of the society. See **ADVOCATE** and **ADVOUEE**.

**PROCURATORES ecclesie parochialis**, are the church-wardens, whose office is to act as *proxies* and representatives of the church. See **CHURCH WARDEN**.

**PROCYON**, in astronomy, a fixed star of the second magnitude in canis minor. See **CANIS MINOR**, and **CANICULAR**.

**PRODES homines**, *q. d.* wife or discreet men, in our ancient customs, a title given to the barons, and other military tenants, who are called to the king's council, and were to give advice according to the best of their prudence, and knowledge. See **THANE**, **BARON**, &c.

**PRODICTATOR**, among the Romans, a magistrate who had the power, and did the office of a dictator. See **DICTATOR**. The Romans sometimes created a *prodicator*, in cases where they could not have a dictator. Fabius Maximus was *prodicator*.

**PRODROMUS**, *προδρομος*, literally denotes a forerunner, a harbinger.—Hence,

**PRODROMUS morbus**, among physicians, is used for a disease which precedes or foreruns a greater.

Thus a straitness of the breast is a *prodromus* of a consumption, &c. a vertigo is sometimes a *prodromus* of an apoplexy. See **PHTHISIS**, **APOPLEXY**, **VERTIGO**, &c.

**PRODUCE**,—*Net PRODUCE*. See the article **NET produce**.

**PRODUCING**, in geometry, denotes the continuing a right line, or drawing it out farther, till it have any assigned length, See **LINE**.

**PRODUCT**, in arithmetic and geometry, the factum of two numbers; or the quantity arising from, or produced by, the multiplication of two or more numbers, lines, &c. into one another. See **FACTUM**.

Thus, if 6 be multiplied by 8, the *product* is 48. See **MULTIPLICATION**.

In lines it is always (and sometimes in numbers) called the *rectangle* between the two lines, multiplied by one another. See **RECTANGLE**.

**PRODUCTION**, in anatomy, a continuation, or process. See **PROCESS**.

**PROEDRUS**, *προεδρος*, in antiquity. See **EPISTATES**.

**PROEM**, **PROOEMIUM**, a term anciently used for *preface*. See **PREFACE**.

**PROEMPTOSIS**, in astronomy, that which makes the new moons appear a day later, by means of the lunar equation, than they would do without that equation. See **MOON** and **EQUATION**.

**PROFANATION**, in religion, the doing of something disrespectful to holy or sacred things. See **PROFANE**.

**PROFANE**, a term used in opposition to *holy*, *sacred*. See **SACRED**, &c.

Except churches, and church-yards, all places are esteemed *profane*.—By the canon law, a sacred chalice, or cup, becomes *profane*, by giving it a blow with an hammer.

**PROFANE** is also applied in general to all persons who have not the sacred character, and all things which do not belong to the service of religion.

In this sense, Xenophon, Seneca, &c. are *profane* authors.—

The Heathen priests, pontiffs, &c. also pass with us for *profane*.

**PROFECITIOUS**. See **ADVENTITIOUS**.

**PROFER\***, in law, the time appointed for the accounts of sheriffs, and other officers, to be given into the exchequer; which, by stat. 51. Hen. 3. is to be twice in the year. See **SHERIFF** and **EXCHEQUER**.

\* The word is formed of the French *proferer*, to produce.

**PROFER**, is also used for an offer, or endeavour to proceed in an action by a person concerned so to do.

Trinity-term shall begin the monday next after Trinity-sunday, whenever it shall happen to fall, for the keeping of the effoins, *profers*, returns, and other ceremonies heretofore in use. Stat. an. 32. Hen. 8.

**PROFER the half-mark**. See the article **HALF mark**.

**PROFESSED monk**, or *nun*, one who having made the vow, is admitted of a religious order. See **VOW**, **MONK**, and **RELIGIOUS**.

In this sense the word is used in opposition to *novice*. See **NOVICE** and **PROBATION**.

**PROFESSIO viduitatis**. See the article **VIDUITATIS**.

**PROFESSION**, **PROFESSIO**, in a monastic sense, the entering into a religious order; or an action whereby a person offers himself to God, by a vow of observing three things, *viz.* obedience, chastity, and poverty, which he promises inviolably to maintain. See **VOW**, **ORDER**, &c.

This is called *sanctæ religionis professio*, and the person a *religious professed*. See **RELIGIOUS**.

Persons are not admitted to make *profession* till after a year of probation. See **PROBATION**, **NOVICIATE**, &c.

**PROFESSOR**, in the universities, a person who teaches, or lectures publicly, some art or science, in a chair established for that purpose. See **CHAIR**.

The *professors* in foreign universities teach the arts, and have their classes of pupils; those in our universities only read public lectures in term-time. See **TERM**.

Of *professors* we have a great number, some denominated from the arts they profess, as *casuistical professor*, *Hebrew professor*, *physic professor*, *divinity professor*, &c.

Others from those who founded the *professorship*, or assigned a revenue for the support of the *professor*; as the *Savilian professors* of astronomy and geometry, the *Lucasian professor* of mathematics, *Margaret professor* of divinity, &c.

**Regius PROFESSORS**. See the article **REGIUS**.

PROFICISCENDUM. — *Capias conductos ad proficiscendum.*

See CAPIAS.

PROFILE, in architecture, the figure, or draught of a building, fortification, or the like, wherein are expressed the several heights, widths, and thickneses, such as they would appear, were the building cut down perpendicularly from the roof to the foundation.

Whence the *profile* is also called the *section*, sometimes *orthographical section*; and by Vitruvius also, *sciagraphy*. See SECTION and ORTHOGRAPHY.

*Profile*, in this sense, amounts to the same with *elevation*; and stands opposed to a *plan*, or *ichnography*. See PLAN and ICHNOGRAPHY.

PROFILE is also used for the contour, or out-line of a figure, building, member of architecture, or the like; as a base, a cornich, &c.

Hence *profiling* is sometimes used for designing, or describing the member with rule, compass, &c.

PROFILE, in sculpture and painting.—A head, a portrait, &c. are said to be in *profile*, when they are represented side-ways, or in a side-view.

As, when in a portrait there is but one side of the face, one eye, one cheek, &c. shewn, and nothing of the other.—On almost all medals, the faces are represented in *profile*. See MEDAL.

PROFITS, *pernor of*. See the Article PERNOR.

PROFLUVIUM, in medicine, any kind of flux, or liquid evacuation. See FLUX. Whence,

PROFLUVIUM *ventris*, flux of the belly, denotes a diarrhoea. See DIARRHOEA.

PROFUNDUS. See MUSCLE.

PROGNOSTIC\*, PROGNOSIS, in medicine, a judgment of the event either of a state of health, or of a disease: as, whether it shall end in life, or death; be long, or short; mild, or malignant, &c. taken from certain symptoms thereof. See SIGNUM and SYMPTOM.

\* The word comes from the Greek *προγνωσις*, *fore-knowledge*: whence also *προγνωστικον*, a *prognostic sign*.

In all continued fevers, Morton tells us, a strong equable pulse is a *good prognostic*, and always presages well, whatever other threatening symptoms attend it; on the contrary, a quick, feeble, intermitting pulse is a *prognostic* of death, how much soever the other symptoms may flatter. See PULSE.

Hippocrates observes, that all predictions and *prognostics* of acute diseases are very fallacious; Diemerbroeck, however, adds, that in the plague of Nimeguen, sixth day crises were constantly found fatal *prognostics*; also to be infected about the new, or full moon; faintings in the beginning of the disease, and palpitations of the heart, were found deadly *prognostics*; on the contrary, a pleurisy, and suppression of stool, were good *prognostics*.

The *prognosis* is a part of semeiology. See SEMEIOLOGY.

PROGNOSTICS of the weather. See the article WEATHER.

PROGRAMMA, anciently denoted a letter sealed with the king's seal. See SEAL.

PROGRAMMA is also a college term, signifying a billet, or advertisement posted up, or given into the hand, by way of invitation to an oration, or other college ceremony, containing the argument, or so much as is necessary for the understanding thereof. — *Programma's* are sent to invite people to assist at declamations, dramatic performances, &c.

PROGRESSION, PROGRESSIO, an orderly advancing, or going forward, in the same manner, course, tenor, &c.

PROGRESSION, in mathematics, is either *arithmetical*, or *geometrical*.

*Arithmetical PROGRESSION* is a series of quantities equidistant from each other; *i. e.* either increasing or decreasing by the same common interval or difference. See SERIES.

Thus 3, 6, 9, 12, 15, 18, &c. make an *arithmetical progression*; because increasing, or differing equally, by 3: Thus also 25, 20, 15, 10, and 5, are in *arithmetical progression* decreasing by a common difference, 5.

In every *arithmetical progression*, whether increasing or decreasing, the sum of the first and last term is equal to the sum of any two intermediate terms equidistant from the extremes; as also, if the number of terms be uneven, to the double of the middle term.—For instance:

$$\begin{array}{ccccccc} 3, & 6, & 9, & 12, & 15, & 18, & 21 \\ & & & 12, & 9, & 6, & 3 \\ \hline & & & 24, & 24, & 24, & 24 \end{array}$$

Hence 1°. we find the sum of any *arithmetical progression* by multiplying the sum of the first and last term by half the number of terms.

2°. Having therefore the first term, the difference, and the number of terms given; the sum of the *progression* is had by multiplying the first term by the number of terms, and to the product adding the product arising from the difference multiplied into the semi-difference of the number of terms from the square of that same number.

Thus, suppose the first term 3, the number of terms 7, and the difference 3; the product of 3 and 7 = 21 being added to the product 63, of the difference 3 multiplied into the semi-difference of the number of terms 7, from the square thereof 49, = 21, gives 84, the sum of the *progression*.

3°. The number of terms lessened by one, being multiplied by the common difference, and the first term added to the product, the sum is the last term. Thus in a *progression* of 52 places, where the difference is 3, and the first term 5; 51 being multiplied by 3, produces 153, to which adding 5, the sum 158 is the last term required.

4°. If the *progression* begin with 0, the sum of all the terms is equal to half the product of the last term multiplied by the number of terms.

Whence it follows, that the sum of a *progression* beginning from 0, is subduple the sum of so many terms, all equal to the greatest.

5°. In an *arithmetical progression*, as the difference of the sum of the first and last term from double the sum of the *progression*, is to the difference of the first term from the last; so is the sum of the first and last terms to the *progressional* difference.

*Geometrical PROGRESSION*, is a series of quantities increasing or decreasing in the same ratio or proportion; or a series of quantities that are continually proportional. See PROPORTION and GEOMETRICAL.

Thus 1, 2, 4, 8, 16, 32, 64, &c. make a *geometrical progression*; or 729, 243, 81, 27, 9, 3, 1.

1°. In every *geometrical progression*, the product of the extreme terms is equal to the product of two intermediate terms equidistant from the extremes; as also, if the number of terms be uneven, to the square of the middle term.—For example:

$$\begin{array}{ccccccc} 3, & 6, & 12, & 24, & 48, & 96 \\ & & & 12, & 6, & 3 \\ \hline & & & 288, & 288, & 288 \end{array}$$

2°. If the difference of the first and last term of a *geometrical progression* be divided by a number less than the denominator of the ratio, *i. e.* than the quotient of a greater term divided by a less; the quotient will be the sum of all the terms except the greatest: Hence, by adding the greatest sum, we have the sum of the whole *progression*.

Thus, in a *progression* of 5 terms, beginning with 3, and the denominator being likewise 3, the greatest term will be 243. If then the difference of the first and last term 240, be divided by 2, a number less by 1 than the denominator; the quotient 120, added to 243, gives 363, the sum of the *progression*.

Hence, 3°. the first or last term of a *progression*, is to the sum of the *progression*, as the denominator lessened by 1, to its power likewise lessened by 1; the exponent of which power is equal to the number of terms.

Thus supposing the first term 1, the denominator 2, and the number of terms 8; the sum will be 255.

4°. Hence also the difference between the last term and the sum is to the difference between the first term and the sum, as unity to the denominator: Wherefore, if the difference between the first term and the sum, be divided by the difference between the sum and the last term, the quotient is the denominator.

*Arch of PROGRESSION*. See the article ARCH.

PROHIBITED goods, in commerce, such commodities as are not allowed to be either imported or exported. See CONTRABAND.

PROHIBITIO *de vasto directa parti*, is a writ judicial, directed to the tenant, prohibiting him from making waste upon the land in controversy, during the suit.—It is sometimes also directed to the sheriff.

PROHIBITION, PROHIBITIO, the act of forbidding, or inhibiting any thing.

It is the *prohibition* of the law that makes the sin: A testator frequently bequeaths things with a *prohibition* to alienate.

PROHIBITION, in common law, denotes a writ issued out of the chancery, king's-bench, or common-pleas, to forbid some other court, either spiritual or secular, to proceed in a cause there depending; upon suggestion, that the cognizance thereof belongeth not to that court.

It is now usually taken for that writ which lieth for one, who is impleaded in the court Christian, for a cause belonging to the temporal jurisdiction, or the cognizance of the king's courts; whereby, as well as the party and his council, as the judge himself, and the register, are forbid to proceed any farther in that cause. See COURT, CIVIL LAW, &c.

PROJECTILE, or PROJECT, in mechanics, a heavy body, which being put into a violent motion by an external force impressed thereon, is dismissed from the agent, and left to pursue its course. See MOTION.

Such, *e. gr.* is a stone thrown out of the hand, or a sling, an arrow from a bow, a bullet from a gun, &c. See PROJECTION.

The cause of the continuation of the motion of PROJECTILES, or what it is determines them to persist in motion, after the first cause ceases to act, has puzzled the philosophers. See MOTION and COMMUNICATION.

The Peripatetics account for it from the air, which being violently agitated by the motion of the *projecting* cause, *e. gr.* the hand and sling, and forced to follow the *projectile*, while accelerated therein, does, upon the dismissal of the *projectile*, press

press after it, and protrude it forward, to prevent a vacuum. See VACUUM.

The moderns account for the motion of *projectiles* on a much more rational and easy principle; it being, in effect, a natural consequence from one of the great laws of nature; viz. That all bodies being indifferent as to motion or rest, will necessarily continue the state they are put into, except so far as they are hindered, and forced to change it by some new cause. See NATURE.

Thus a *project* put in motion must continue to move eternally on in the same right line, and with the same velocity; were it to meet with no resistance from the medium, nor had any force of gravity to encounter.

The doctrine of the motion of *projectiles* is the foundation of all gunnery. See GUNNERY.

**Laws of the motion of PROJECTILES—1.** If a heavy body be *projected* perpendicularly, it will continue to ascend or descend perpendicularly: because both the *projecting* and the gravitating force are found in the same line of direction.

2. If a heavy body be *projected* horizontally, it will, in its motion, describe a parabola; the medium being supposed void of resistance.

For the body is equally impelled by the impressed force, according to the right line A R, (*tab. MECHANICS, fig. 46.*) and by the force of gravity according to the right line A C, perpendicular thereto. While then the body by the action of the impressed force is arrived in Q; by the force of gravity it will be arrived in Q M; and, therefore will be found in M. But the motion in the direction A R will still be uniform (see MOTION); and, therefore, the spaces Q A and q A are as the times; and the spaces Q M and q m, are likewise as the squares of the times. Therefore,  $AQ^2 : Aq^2 :: QM : qm$ . That is,  $PM : pm :: AP : a p$ .

The course or path therefore, A M m, of a heavy body *projected* horizontally, is a parabola. See PARABOLA.

Two hundred years ago, the philosophers took the line described by a body *projected* horizontally, *e. gr.* a bullet out of a cannon, while the force of the powder exceeded the weight of the bullet considerably, to be a right line; after which it became a curve.

N. Tartaglia was the first who perceived the mistake, and maintained the path of the bullet to be a crooked line, throughout its whole extent; but it was Galileo who first determined the precise curve the bullet described; and shewed the path of the bullet, *projected* horizontally from an eminence, to be a parabola; the vertex whereof is the point where the bullet quits the cannon.

3. If a heavy body be *projected* obliquely, either upwards or downwards, in a medium void of resistance; it will likewise describe a parabola.

Hence, 1°. the parameter of the diameter of the parabola A S (*fig. 47.*) is a third proportional to the space through which the body descends in any given time, and the celerity, which is defined by the space passed over in the same time; *i. e.* to A P and A Q. —2°. Since the space described by a body falling perpendicularly in one minute, is 15 Paris feet in a second; the parameter of the diameter of the parabola to be described is found, if the square of the space passed over by the *projectile* with the impressed force in a second, be divided by 15. —3°. If then the velocity of the *projectiles* by the same, the spaces described in the same time by the force impressed, are equal; consequently the parameter of the parabola's passed over by the compound motion, is the same. —4°. If from the parameter of the diameter be subtracted quadruple the altitude of A P, the remainder is the parameter of the axis; the fourth part whereof is the distance of the vertex of the axis from the focus of the parabola. Hence the celerity of the *projectile* being given, the parabola described by the *projectile* may be laid down on paper. —5°. The line of direction of the *projectile* A R is a tangent to the parabola in A.

Sir Isaac Newton shews, in his *principia*, that the line a *projectile* describes, approaches nearer to an hyperbola than a parabola.

4. A *projectile* in equal times describes portions of its parabolic path, as A M, A m, which are subtended by equal spaces of the horizon A T, T t; *i. e.* in equal times it passes over equal horizontal spaces.

5. The quantity or amplitude of the path A B, *i. e.* the range of the *projectile*, is to the parameter of the diameter AS, as the sine of the angle of elevation R A B to its secant.

Hence, 1. The semiparameter is to the amplitude of the path A B, as the whole sine to the sine of double the angle of elevation. —2. If then the celerity of two *projectiles* be the same, the parameter is the same. Wherefore, since the semiparameter of the path, in the one case, is to the amplitude, as the whole sine to the sine of double the angle of elevation; and the semiparameter of the path in the other case is to the amplitude, as the whole sine to the sine of double the angle of elevation: We may say farther, as the amplitude is to the sine of the angle of double the elevation in the one case, so is the amplitude to the sine of the angle of double the elevation in the other case. The amplitudes therefore, or magnitudes of the paths, are as the sines of double the angles of elevation; the velocity of the *projectile* remaining the same.

6. The celerity of the *projectile* being the same, the amplitude

A B is greatest; *i. e.* the range of the *projectile* is greatest, at an angle of elevation of 45°; and the amplitudes or ranges, at angles of elevation equally distant from 45°, are equal.

This is found by experiment; and is likewise demonstrable thus: since the ratio of the sine of double the angle of elevation to the amplitude is always the same, while the celerity of the *projectile* remains the same; as the sine of double the angle of elevation increases, the amplitude will increase. Wherefore, since the sine of double the angle of elevation of 45° is radius, or the largest sine; the amplitude, or range in that elevation, must be the greatest. Again, since the sines of angles equidistant from right angles; *e. gr.* 80° and 100° are the same; and the double angles must be equidistant from a right angle, if the simple ones be so; the amplitudes or ranges at elevations equidistant from 45°, must be equal.

Hence, since as the whole sine is to the sine of double the angle of elevation; so is the semiparameter to the amplitude; and the whole sine is equal to double the sine of the angle of elevation, if that be 45°: Under the angle of elevation 45°, the amplitude is equal to the semiparameter.

7. The greatest range or amplitude being given; to determine the amplitude or range under any other given angle of elevation; the celerity remaining the same. Say thus; As the whole sine is to the sine of double the angle of any other elevation; so is the greatest amplitude or range, to the amplitude required.

Thus, suppose the greatest range of a mortar at 45°, to be 6000 paces, and the length of the range at 30°, required; it will be found 5196 paces.

8. The velocity of a *projectile* being given, to find its greatest range or amplitude. Since the celerity of the *projectile* is given in the space it will pass over by the impressed force; *e. gr.* in one second; there is nothing required but to find the parameter of the path (by *corol. 2.* of the 3d law); for half of this is the amplitude or range required.

Suppose, *e. gr.* the celerity of the *projectile* such as that in one second it will run over 1000 feet, or 12000 inches: If then 144000000 be divided by 181, the quotient will give the parameter of the path 795580 inches, or 66298 feet. The range or amplitude required, therefore, is 33149. Any object, therefore, found within this extent, may be struck by the *projectile*.

9. The greatest range or amplitude being given; to find the velocity of the *projectile*, or the horizontal space, it will pass over in a second. Since double the greatest amplitude is the parameter of the path; between double the greatest amplitude, and the space passed over in a second by a body falling perpendicularly, *viz.* 181 Paris inches, find a mean proportional; for this will be the space described by the *projectile* in the given second.

Thus, if the greatest amplitude be 1000 feet, or 12000 inches, the space required will be  $\sqrt{(12000.181)} = 120$  feet and 4 inches.

10. To determine the greatest altitude to which a body obliquely *projected* will rise. The rule is; bisect the amplitude A B in t, and from the point t erect a perpendicular t m; this t m will be the greatest altitude to which the body *projected*, according to the direction A R, will arise.

11. The range or amplitude A B, and the angle of elevation B A R, being given; to determine the greatest altitude of the *projectile*. If A R be taken for the whole sine, B R will be the sine, and A B the co-sine of the angle of elevation B A R: Wherefore say, As the co-sine of the angle of elevation is to the sine of the same; so is the amplitude A B to a fourth number, which will be B R; the fourth part whereof is the greatest altitude required.

Hence, since from the given velocity of a *projectile*, its greatest range or amplitude, and thence its range under any other angle, is found; the velocity being given, the greatest altitude of the *projectile* is likewise found.

12. The altitude of the range t m is to the eighth part of the parameter, as the versed sine of double the angle of elevation to the whole sine.

Hence, 1. Since, as the whole sine is to the versed sine of double the angle of elevation in one case; so is the eighth part of the parameter to the altitude of the range: And as the whole sine is to the versed sine of double the angle of elevation in any other case; so is the eighth part of the parameter to the altitude: but the velocity remaining the same, the parameter, in different angles of elevation, will likewise be the same: The altitudes of the ranges under different angles of elevations are as the versed sines of double their angles. —2. Hence also, the velocities remaining the same, the altitudes of the ranges are in a duplicate ratio of the sines of double the angles of elevation.

13. The horizontal distance of any mark or object, together with its height above, or depth beneath the horizon, being given; to find the angle of elevation required to hit the said object.

Wolffius gives us the following theorem, the result of a regular investigation: Suppose the parameter of the diameter AS, = a; In = b, Al = c, the whole sine = t. Then, as c is to  $\sqrt{a^2 - b^2 - c^2}$  so is the whole sine t, to the tangent of the angle of elevation required R A B.

Dr. Halley gives the following easy and compendious geometrical construction of the problem; which he likewise deduces from an analytical investigation.

Having the right angle LDA, (*fig. 48.*) make D A, D F, the greatest

greatest range,  $DG$  the horizontal distance, and  $DB, DC$ , the perpendicular height of the object; and draw  $GB$ , and make  $DE$  equal thereto. Then with the radius  $AC$ , and centre  $E$ , sweep an arch, which, if the thing be possible, will intersect the line  $AD$  in  $H$ ; and the line  $DH$  being laid both ways from  $F$ , will give the points  $K$  and  $L$ ; to which draw the lines  $GL, GK$ .

Here the angles  $LGD, KGD$ , are the elevations required for hitting the object  $B$ .—But note, that if  $B$  be below the horizon, its descent  $DC=DB$ , must be laid from  $A$ , so as to have  $AC=AD+DC$ . Note likewise, that if in descents,  $DH$  be greater than  $FD$ , and so  $K$  fall below  $D$ ; the angle  $KGD$  shall be the depression below the horizon.

It may be here observed, that the elevation sought constantly bisects the angle between the perpendicular and the object. This the author was not aware of, when he gave the first solution of the problem; but upon discovering it, observes, that nothing can be more compendious, or bid fairer for the perfection of the art of gunnery; since it is here as easy to shoot with a mortar at any object in any situation, as if it were on the level; nothing more being required but to lay the piece, so as to pass in the middle line between the zenith and the object, and giving it the due charge. See MORTAR.

14. The times of the *projections* or casts under different angles of elevation, the velocity remaining the same, are as the sines of the angles of elevation.

15. The velocity of a projectile, together with the angle of elevation  $RAB$ , being given (fig. 47.) to find the range, or amplitude  $AB$ , and the altitude of the range  $tm$ , and describe the path  $Amb$ . To the horizontal line  $AB$  erect a perpendicular  $AD$ , which is to be the altitude whence the projectile falling, might acquire the given velocity: on  $AD$  describe a semicircle  $AQD$ , cutting the line of direction  $AR$  in  $Q$ ; through  $Q$  draw  $Cm$  parallel to  $AB$ , and make  $CQ=Qm$ . From the point  $m$  let fall a perpendicular  $mt$  to  $AB$ : lastly, through the vertex  $M$  describe the parabola  $Amb$ .

Here  $Amb$  is the path sought,  $4CQ$  its amplitude or range,  $tm$  the altitude of the range, and  $4CD$  the parameter.

Hence, 1°. The velocity of a projectile being given, the amplitudes and altitudes of all the possible ranges are given at the same time. For, drawing  $EA$ , we have under the angle of elevation  $EAB$ , the altitude  $AI$ , and the amplitude  $4IE$ : Under the angle of elevation  $FAB$ , the altitude  $AH$ , the amplitude  $4HF$ . 2°. Since  $AB$  is perpendicular to  $AD$ , it is a tangent to the circle in  $A$ : hence the angle  $ADQ$  is equal to the angle of elevation  $RAB$ ; consequently  $AIM$  is double the angle of elevation; and therefore  $CQ$ , the fourth part of the amplitude, is the right sine;  $AC$  the altitude of the range, the versed sine of double the angle of elevation.

16. The altitude  $tm$  of a cast, or its amplitude  $AB$ , together with the angle of elevation  $RAB$ , being given; to find the velocity wherewith the projectile first moved, that is, the altitude  $AD$ , in falling from whence it would acquire the like velocity. Since  $AC=tm$  is the versed sine,  $CQ=\frac{1}{4}AB$ , the right sine of double the angle of elevation  $AIQ$ ; to the versed sine of double the angle of elevation, find the whole sine, and the height of the cast. Or to the right sine of double the angle of elevation, the whole sine, and the fourth part of the amplitude, find a fourth proportional. This will be the radius  $IQ$  or  $IA$ , the double whereof  $AD$  is the altitude required.

PROJECTING table. See the article TABLE.

PROJECTION, in mechanics, the action of giving a projectile its motion. See PROJECTILE.

If the direction of the force whereby the projectile is put in motion, be perpendicular to the horizon, the *projection* is said to be *perpendicular*; if parallel to the apparent horizon, it is said to be a *horizontal projection*; if it make an oblique angle with the horizon, the *projection* is oblique. See OBLIQUE.

The angle  $ARB$ , (tab. mechan. fig. 47.) which the line of direction  $AR$  makes with the horizontal line  $AB$ , is called the *angle of elevation of the projectile*.

PROJECTION, in perspective, denotes the appearance or representation of an object on the perspective plane. See PLANE.

The *projection*, e. gr. of a point, as  $A$ , (tab. perspect. fig. 1.) is a point  $a$ , through which the optic ray  $OA$  passes from the objective point through the plane to the eye; or it is the point  $a$ , wherein the plane cuts the optic ray.

And hence is easily conceived what is meant by the *projection* of a line, a plane, or a solid. See PERSPECTIVE.

PROJECTION of the sphere, in plano, is a representation of the several points or places of the surface of the sphere, and of the circles described thereon, or of any assigned parts thereof, such as they appear to the eye situate at a given distance, upon a transparent plane placed between the eye and the sphere. See SPHERE and PLANE.

For the laws of this *projection*, see PERSPECTIVE; the *projection of the sphere* being only a particular case of perspective.

The principal use of the *projection of the sphere* is in the construction of planispheres, and particularly maps and charts, which are said to be of this or that *projection*, according to the several situations of the eye, and the perspective plane with regard to the meridians, parallels, and other points and places to be represented. See PLANISPHERE, &c.

The most usual *projection* of maps of the world is that on the plane of the meridian, which exhibits a right sphere; the first

meridian being the horizon: The next is that on the plane of the equator, wherein the pole is in the centre, and the meridians the radii of a circle, &c. This represents a parallel sphere.

See the application of the doctrine of the projection of the sphere, in the construction of the various kinds of maps, under the article MAP.

The *projection of the sphere* is usually divided into *orthographic*, and *stereographic*, to which may be added *gnomonic*.

Orthographic PROJECTION, is that wherein the superficies of the sphere is drawn on a plane, cutting it in the middle; the eye being placed at an infinite distance vertically to one of the hemispheres. See ORTHOGRAPHIC.

Laws of the orthographic PROJECTION.—1. The rays by which the eye at an infinite distance perceives any object, are parallel.

2. A right line perpendicular to the plane of the *projection* is projected into a point, where that right line cuts the plane of the *projection*.

3. A right line, as  $AB$ , or  $CD$ , (tab. perspect. fig. 17.) not perpendicular, but either parallel or oblique to the plane of the *projection*, is projected into a right line, as  $EF$ , or  $GH$ , and is always comprehended between the extreme perpendiculars  $AF$ , and  $BE$ .

4. The *projection* of the right line  $AB$  is the greatest, when  $AB$  is parallel to the plane of the *projection*.

5. Hence it is evident, that a line parallel to the plane of the *projection*, is projected into a right line equal to itself; but if it be oblique to the plane of the *projection*, it is projected into one which is less.

6. A plane surface, as  $ABCD$ , (fig. 18.) at right angles to the plane of the *projection*, is projected into that right line; e. gr.  $AB$ , in which it cuts the plane of the *projection*.

Hence it is evident, that the circle  $BCAD$ , standing at right angles to the plane of the *projection*, which passes through its centre, is projected into that diameter  $AB$ , in which it cuts the plane of the *projection*.

It is likewise evident, that any arch, as  $cc$ , is projected into  $oo$  equal to  $Ca, Cb$ , which is the right sine of that arch; and the complementary arch  $cA$  is projected into  $oA$ , the versed sine of the same arch  $cc$ .

7. A circle parallel to the plane of the *projection*, is projected into a circle equal to itself; and a circle oblique to the plane of the *projection*, is projected into an ellipsis.

Stereographic PROJECTION, is that wherein the surface and circles of the sphere are drawn upon the plane of a great circle, the eye being in the pole of that circle. See STEREOGRAPHIC.

Properties of the stereographic PROJECTION.—1. In this *projection*, a right circle is projected into a line of half tangents.

2. The representation of a right circle, perpendicularly opposed to the eye, will be a circle in the plane of the *projection*.

3. The representation of a circle placed oblique to the eye, will be a circle in the plane of the *projection*.

4. If a great circle be to be projected upon the plane of another great circle, its centre will lie in the line of measures, distant from the centre of the primitive by the tangent of its elevation above the plane of the primitive.

5. If a lesser circle, whose poles lie in the plane of the *projection*, were to be projected; the centre of its representation would be in the line of measures, distant from the centre of the primitive, by the secant of the lesser circles distance from its pole, and its semidiameter or radius, be equal to the tangent of that distance.

6. If a lesser circle were to be projected, whose poles lie not in the plane of the *projection*, its diameter in the *projection*, if it falls on each side of the pole of the primitive, will be equal to the sum of the half tangents of its greatest and nearest distance from the pole of the primitive, set each way from the centre of the primitive in the line of measures.

7. If the lesser circle to be projected, fall intirely on one side of the pole of the *projection*, and do not encompass it; then will its diameter be equal to the difference of the half tangents of its greatest and nearest distance from the pole of the primitive, set off from the centre of the primitive one; and the same way in the line of measures.

8. In the *stereographic projection*, the angles made by the circles of the surface of the sphere, are equal to the angles made by their representatives in the plane of their *projection*.

Gnomonic PROJECTION of the sphere. See GNOMONIC projection.

Mercator's PROJECTION. See the article MERCATOR.

PROJECTION of globes &c. See the article GLOBE, &c.

Polar PROJECTION. See the article POLAR.

PROJECTION of shadows. See the article SHADOW.

PROJECTION, in alchymy, the casting of a certain imaginary powder, called *powder of projection*, into a crucible, or other vessel, full of prepared metal; or other matter, which is to be hereby presently transmuted into gold. See powder of PROJECTION.

Powder of PROJECTION, or of the philosopher's stone, is a powder supposed to have the virtue of changing any quantity of an imperfect metal, as copper or lead, into a more perfect one, as silver or gold, by the admixture of a little quantity thereof. See TRANSMUTATION.

The mark to which the alchymists direct all their endeavours, is to find the *powder of projection*; which every one of them has been within an ace of, an hundred times. See ALCHEMY.

For the characters, properties, virtues, &c. of this powder, see PHILOSOPHER'S stone.

PROJECTION in building. See PROJECTURE.

PROJECTIVE dialing, a manner of drawing, by a method of projection, the true hour-lines, furniture of dials, &c. on any kind of surface whatsoever, without any regard had to the situation of those surfaces, either as to declination, reclination, or inclination. See DIALING.

PROJECTURE, in architecture, the out-jetting, or promineny, which the mouldings and members have, beyond the plane or naked of the wall, column, &c. See NAKED, COLUMN, &c.

These the Greeks call *ecphoræ*, the Italians *sperti*, the French *saillies*, our workmen frequently *saillings over*, and the Latins *projecta*, from *projicio*, I cast forward; whence the English, *projecture*.

Vitruvius gives it as a general rule, that all the *projecting* members in buildings have their *projectures* equal to their heights: but this is not to be understood of the particular members, or mouldings, as dentils, corona's, the fasciæ of architraves, the abacus of the Tuscan and Doric capital, &c. but only of the *projectures* of intire cornices, &c. See CORNICE, &c.

The great point of building, according to some modern architects, consists in knowing how to vary the proportions of *projectures*, &c. agreeably to the circumstances of the building. Thus, say they, the nearness and remoteness, making a difference in the view, require different *projectures*; but it is evident the ancients had no such intention. See PROPORTION.

The *projecture* of the base and cornice of pedestals, M. Perrault observes, is greater in the antique than the modern buildings by one third; which seems to follow, in good measure, from the ancients proportioning this *projecture* to the height of the pedestals; whereas the moderns make the *projecture* the same in all the orders, though the height of the pedestal be very different.

The reason of this charge, which the moderns have made of the antique, the same author refers to a view to the appearance of solidity. See PEDESTAL.

PRO-INDIVISO, in law, a possession or occupation of lands or tenements, belonging to two or more persons, whereof none can say which is his several portion, each having the whole, &c. as co-parceners before partition. See FOUR party, COPARCENER and PARTITION.

PROKING, see FISHING.

PROLABIA, *fore-lips*; a term in anatomy for that part of the labia or lips which jets out. See LABIA.

PROLATE, in geometry, an epithet applied to a spheroid produced by the revolution of a semi-ellipsis about its longer diameter. See SPHEROID.

If the solid be formed by the revolution of a semi-ellipsis about its shorter diameter, it is called an *oblate spheroid*; of which figure is the earth we inhabit, and, perhaps, all the planets too; having their equatorial diameter longer than their polar. See OBLATE.

PROLATION, in music, the act of shaking, or making several inflections of the voice, on the same syllable.

PROLEGOMENA\*, in philology, preparatory observations, or discourses prefixed to a book, &c. containing something necessary for the reader to be apprized of, to enable him the better to understand the book, to enter deeper into a science, &c.

\* The word is Greek, *προλεγόμενα*, formed of *προλεγω*, I preface, or speak before.

The generality of arts and sciences require some previous instructions, some *prolegomena*. See PRELIMINARY.

PROLEPSIS, *προληψις*, a figure in rhetoric, by which we anticipate, or prevent what might be objected by the adversary. See FIGURE.

Thus: *It may perhaps be objected, &c.—You will ask, &c.*

But some man will say, how are the dead raised, or with what body do they come? Thou Fool, that which thou sowest, &c. Where the objection is turned into an argument against the adversary, as in the last instance, it is called *antitrophe*, or *inversio*—Where it is rejected as unsufferably absurd, it is called *Apodixis*. See ANTISTROPHE.

PROLEPTIC, *προληπτικός*, denotes a periodical disease, which anticipates, or whose paroxysm returns sooner and sooner every time; as is frequently the case in agues, &c.

PROLIFIC, in medicine, something that has the qualities necessary for generating. See FERTILITY.

Some physicians pretend to distinguish whether or no the seed be *prolific*. See SEED.

PROLIXITY, in discourse, the fault of entering into too minute a detail; of being too long, precise, and circumstantial, to a degree of tediousness. See STYLE.

*Prolixity* is the vice opposite to conciseness and laconism. See LACONISM.—*Prolixity* is a fault commonly charged on Guicciardini, Gassendus, &c.—Formal harangues at the head of an army, and deliberations, of nauseous *prolixity*, formerly so frequent, are now diffused in all the better histories.

PROLOCUTOR of the convocation, the speaker, or chairman of that assembly. See CONVOCATION.

The archbishop of Canterbury is, by his office, president, or chairman of the upper house of convocation.—The *prolocutor* of the lower is an officer chosen by the members the first day of their meeting, and to be approved of by the higher.

VOL. II.

It is by the *prolocutor* their affairs, debates, &c. are to be directed; and their resolutions, messages, &c. delivered to the higher house: by him all things propounded to the house are read, suffrages collected, &c.

PROLOGUE\*, PROLOGUS, in dramatic poetry, a discourse addressed to the audience before the drama or play begin. See DRAMA.

The word is formed from the Greek *προλογος*, *prologium*, fore-speech, formed of *προ*, and *λογος*, *sermo*.

The original intention of the *prologus* was to advertise the audience of the subject of the piece, and to prepare them to enter more easily into the action; and sometimes to make an apology for the poet.

This last article seems to have almost excluded the two former in the English drama; and to be in sole possession of the *prologus*.

The *prologue* is of a much more ancient standing than the epilogue. See EPILOGUE.—The French have left off the use of *prologues*; those few they now-and-then make have nothing in them of the genuine *prologue*, as bearing no relation to the subject, but being mere flourishes or harangues in praise of the king, &c.

In the ancient theatre, the *prologus* was properly the actor who rehearsed the *prologue*: the *prologus* was esteemed one of the dramatis personæ, and never appeared in the piece in any other character; so that the learned are surprized to find Mercury in Plautus's *Amphitryo*, speaking the *prologue*, and yet acting a considerable part in the play afterwards.

The *prologus*, therefore, among them, was a part of the piece; indeed, not an essential, but an accessory part;—with us, the *prologue* is no part at all; but something intirely distinct and separate: with them the drama was opened with the appearance of the *prologue*; with us it is not opened till after the *prologus* is retired: with us therefore the curtain is kept close till after the *prologue*; with them it must have been withdrawn before. Hence proceeds a still more considerable difference in the practice of the *prologue*: for with us the *prologus* speaks in his real or personal character; it is Mr. Booth or Mrs. Oldfield speaks, not Cato or Andromache: with them the *prologue* spoke in his dramatic character, not as Turpius or Attilius, but as *prologus*.

With us, he directs his speech to the audience, considered as in a play-house; to pit, box, and gallery: with them, he ought, in propriety, to have spoken as to a chorus of by-standers, or persons to be present at the real action: but this being in good measure inconsistent with the design of the *prologue*; their persons spoke in their dramatic capacity to the audience in its personal capacity; which was an irregularity that either the good fortune, or the good sense of the moderns, have freed them from.

They had three kinds of *prologues*; the first *προβήλικος*, wherein the poet delivered the argument of the piece; the second *οὐσαντικος*, wherein the poet recommended himself or his piece to the people; the third *αναφορικος*, wherein objections were obviated, &c.

PROLONGED face. See the article FACE.

PROLUSION, PROLUSIO, in literature, a term applied to certain pieces, or compositions, made previously to others, by way of prelude or exercise.

Diomedes calls the culex of Virgil, and his other opuscula, *prolusions*; because written before the great ones.—The *prolusions* of Strada are very ingenious pieces. The famous M. Huet, bishop of Avranches, had all Strada's *prolusions* by heart.

PROMETHEUS, in the ancient astronomy, was the name of a constellation of the northern hemisphere, now called *Hercules*, or *Engonasis*. See HERCULES.

PROMISE, in law, is when, upon a valuable consideration, a man binds himself, by his word, to do or perform such an act as is agreed on with another. See CONTRACT, PACT, COVENANT, &c.

PROMONTORY, in geography, a high point of land, or rock, projecting out into the sea;—the extremity of which to the sea-ward is usually called a *cape*, or *headland*. See CAPE.

PROMOTERS, PROMOTORES, in law, those persons, who, in popular and penal actions, do prosecute offenders in their name and the king's; and are intitled to part of the fines and penalties for their pains.

These, among the Romans, were called *quadruplatores*, or *delatores*; in English also *informers*.

Sir Tho. Smith observes, that *promoters* belong chiefly to the exchequer, and king's-bench. My lord Coke calls them, *turbidum hominum genus*, 3 Inst.

PROMPT payment, ready money. See PAYMENT.

In many cases there is a discount for *prompt payment*. See DISCOUNT, REBATE, &c.

PROMPTER, in the drama, an officer posted behind the scenes, whose business is to watch attentively the actors speaking on the stage, in order to suggest and put them forward when at a stand, to correct them when amiss, &c. in their parts.

PROMULGATED, PROMULGED, PROMULGATUS, something published, or proclaimed.

In this sense we say, the Jewish law was *promulgated* by Moses; the *promulgation* of the new law was chiefly effected by the apostles and disciples.

PRONAOΣ, *προναός*, in the ancient architecture, a porch to a church, palace, or other spacious building. See PORCH.

**PRONATION**, among anatomists. The radius of the arm has two kinds of motions, the one called *pronation*, the other *supination*. See **RADIUS**.

*Pronation* \* is, that whereby the palm of the hand is turned downwards; the opposite motion hereto is called *supination*, whereby the back of the hand is downwards.

\* The word is formed from the Latin *pronus*, prone, that which lies on the fore-side, or with the face downwards.

M. Winslow has lately advanced, that the *pronation* and *supination* of the hand are not effected solely by the motion of the radius; but that the cubitus in most cases contributes equally thereto; and that both bones usually move at the same time. *Vid. mem. acad. R. scienc. an. 1729. p. 36.*

There are peculiar muscles whereby the *pronation* is effected, called *pronators*.—The radius has two other muscles, called *supinators*, which have an opposite effect. See **SUPINATOR**.

**PRONATORS**, **PRONATOIRES**, in anatomy, two muscles of the radius, which serve to turn the palm of the hand downwards. See **PRONATION**.

They are distinguished by the names of *rotundus* and *quadratus*.

**PRONATOR radii quadratus**, or *brevis*, rises broad and fleshy, from the lower and inner part of the ulna; and passing transversely over the ligament that joins the radius to the ulna, is inserted into the superior and external part of the radius: which it helps to pull inwardly; together with the

**PRONATOR radii rotundus**, or *teretis*, a muscle which rises fleshy, from the internal extuberance of the os humeri, where those bending the carpus and fingers do arise; and firmly adhering to the flexor carpi radialis, descends obliquely downwards to its fleshy insertion a little above the radius, in the middle externally: its use is to move the radius and palm inwards. See *tab. anat. (myol.) fig. 1. n. 27. fig. 2. n. 15.*

**PRONOUN**, **PRONOMEN**, in grammar, a part of speech used in lieu of a noun or name. See **NOUN**.

Whence the denomination, from *pro*, and *nomen*, q. d. *for-noun*, or *name*.

As it would have been disagreeable to have been always repeating the same name, there are words invented in all languages, called *pronouns*, to save the necessity thereof, and to stand in the place of names; as, *I, thou, he, &c.*

As nouns are the marks or signs of things, *pronouns* are the signs of nouns.—Father Buffier, however, shews, that *pronouns* are real nouns or names; and that all the difference between what the grammarians call nouns, and *pronouns*, is, that the former are more particular, and the latter more general.

They are called *pronouns*, because used in the place of particular nouns. Indeed sometimes they do not fill the place of nouns intirely, but need other words to assist them, to express the object spoken of: such *e. gr.* are *who, whoever, &c.* which do not express any determinate object whereof a thing may be affirmed, unless accompanied with another word, especially a verb: As, *Whoever labours, deserves a reward.*

These father Buffier calls *incomplete pronouns*, to distinguish them from those which express an object completely; as, *I, thou, he, &c.*

The grammarians ordinarily distinguish *pronouns* into four classes, with regard to their different signification, formation, &c. *viz.* *pronouns personal, relative, possessive, and demonstrative*; to which may be added, *indeterminate pronouns*.

**Personal PRONOUNS** are those used in lieu of names of particular persons: such are, *I, thou, he, we, ye, they*. See **PERSON** and **PERSONAL**.

**PRONOUNS relative**, which Buffier calls *modificative*, or *determinative*, are those placed after nouns, with which they have such affinity, that without them they signify nothing: such are, *qui, who, that, &c.* See **RELATIVE**.

**PRONOUNS possessive** are those which express what each possesses, or what belongs to him; as, *mine, thine, his, &c.* See **RELATIVE**.

These are pure adjectives, and only differ from the rest by the relation they bear to *pronouns*, whence they are derived, and by some particular inflections, which they have in some languages. See **ADJECTIVE**.

**PRONOUNS demonstrative**, those which serve to indicate or point out the subject spoken of; as, *this, those, &c.* See **DEMONSTRATIVE**.

**PRONOUNS indefinite**, are those which express their subject indeterminately; as *whoever, any, &c.*—These coincide with what F. Buffier calls *incomplete pronouns*.

*Pronouns* are likewise divided into *substantive* and *adjective*.—To the first belong, *I, thou, he*: to the second, *my, mine, who, what, &c.*

*Pronouns* may also be considered in two states; the first, or foregoing state, as *I, we*; the second, or following one, as *me, us*.

**PRONOUNCING**, **PRONUNCIATION**, in painting, the marking and expressing the parts of all kinds of bodies with that degree of force necessary to make them more or less distinct and conspicuous.

Thus the painters, in speaking of a piece, say, these or these parts are well *pronounced*; which is a metaphorical way of speaking, as when we say, that a man who talks well has a fine *pronunciation*. See **EXPRESSION**.

**PRONUNCIATION**, **PRONUNTIATIO**, in grammar, the manner of articulating, or sounding the words of a language, represented to the eye by writing and orthography. See **WORD**, **LANGUAGE**, **SOUND**, &c.

From the definition it would seem, that the *pronunciation* were only the image of the orthography: but as we pronounce before we write, and only write to express what we pronounce, it is more just to lay down the *pronunciation* as the rule and model of orthography. See **ORTHOGRAPHY** and **WRITING**.

*Pronunciation* makes much the most difficult article of a written grammar: in effect, a book only expressing itself to the eyes in a matter that concerns the ears; the case seems next akin to that of teaching the blind to distinguish colours. See **GRAMMAR**.

Hence it is, that there is no part so defective in the grammars as the *pronunciation*; for the writer has frequently no term whereby to give the reader an idea of the sound he would express; for want of a proper term, therefore, he frequently substitutes a vicious or precarious one.

Thus the French grammarians frequently tell us, that the vowels, *a, e, i, &c.* are pronounced in French the same as in Latin; never considering, that there is not any known and determinate *pronunciation* of the Latin; but each nation, now, pronounces the Roman characters in the Latin, the same as it pronounces those same characters in its own language: thus the Latin *cæcus* is pronounced by the English, *sekus*; and by the Italians, *tchekous, &c.*

Hence it appears, that the relation between sounds and characters, as well as between things and words, is purely arbitrary and national.

Indeed, Plato seems of a contrary sentiment, and will have a natural relation between words and the things they express, as there is a natural relation between the signs made by mutes, and the things they would intimate: so that, according to Plato, to every several word there must be a several motion of the mouth relative to the action expressed by the word.

Whether or no there might be such a thing in the primitive language, we dare not undertake to say; but it is certain such a relation would require a facility of contortions in the mouth, to which we are strangers.

To give a just and precise idea of the *pronunciation* of a language, it seems necessary to fix, as nearly as possible, all the several sounds employed in the *pronunciation* of that language: this Mr. Lodwick has done in his attempt towards an universal alphabet, where he enumerates forty-three several simple sounds (some of them, indeed, strangers to the English language); and F. Buffier, who gives thirty-three several sounds in the French tongue, twenty-nine in the Italian, thirty in the German, twenty-two in the Spanish, and twenty-four in the English. See **ALPHABET**.

The French language is clogged with a difficulty in *pronunciation*, from which most others are free; and it consists in this, that most of their words have two different *pronunciations*; the one in common prose, the other in verse.

In prose, *e. g.* they omit the *pronunciation* of the final *s* in the plural of nouns, and of the *t* in the third person of the plural of verbs, and of several other final consonants; but in verse they *pronounce* all.

Thus, in *à quoi bon reveiller mes muses endormies?* the final *s* of *muses* is pronounced: and in *mille & mille douceurs* *semblent attachés*, the *t* of *semblent* is to be pronounced.

Add to this, that in prose they soften the sound of a great many words, pronouncing *craire* for *croire*; but in poetry the genuine *pronunciation* is retained. See **ENGLISH**, **FRENCH**, &c.

**PRONUNCIATION** is also used for the fifth and last part of rhetoric, which consists in regulating and varying the voice and gesture agreeably to the matter and words, so as more effectually to persuade and touch the hearers. See **RHETORIC**.

The *pronunciation* is of such importance, that Demosthenes called it the first, the second, and the third part of eloquence. See **ACTION**.

Quintilian defines the *pronunciation*, *vocis, & vultus, & corporis moderatio cum venustate*; a decent, agreeable manner of managing the voice, gesture, and action of the whole body. Cicero somewhere calls it *quædam corporis eloquentia*, a certain eloquence of the body; and in another place, *sermo corporis*, the language or speech of the body.

*Pronunciation* is the same with what we otherwise call *action*. See **ACTION**.—Some writers, particularly Mr. Henley, confound it with *elocution*, which is a very different thing. That author, when he styles himself *restorer of the ancient elocution*, means of the ancient *pronunciation*. See **ELOCUTION**.

There are three things which come under the *pronunciation*; the memory, voice, and gesture. See each under its proper article.

Augustus, to avoid being balked by his memory, and at the same time save the trouble of getting off by heart, used to harangue from a writing; as we are told by Dio and Suetonius.

**PRONUNCIATION**, in painting. See the article **PRONOUNCING**.

**PROOF**, **PROBATIO**, in arithmetic, an operation whereby the truth and justness of a calculation is examined and ascertained.

See **CALCULATION**.

The proper proof is always by the contrary rule: thus subtraction is the *proof* of addition, and multiplication of division; and *vice versa*. See **ADDITION**, **SUBTRACTION**, &c.

—The

— The *proof* of multiplication by 9 or by 7 is precarious. See MULTIPLICATION.

There would need no *proofs* in arithmetic, were it not that a man is liable to make mistakes; for all the rules and operations being built on demonstration, it is thence we are assured of their truth and certitude. See DEMONSTRATION.

The *proof*, then, does not confirm the rule, but only shews us whether or no we have applied it right. See RULE.

PROOF, in law, logic, &c. denotes the mediums, or arguments used to evince the truth of any thing. See TRUTH and SEMI *proof*. By the French law, a *literal proof*, or *proof in writing*, called also *dead proof*, *probatio mortua*, is preferable to a testimonial, or *proof viva voce*, by witnesses.—The ordonnance de Moulins excludes all *proof* by witnesses for loans of above 1000 livres. See EVIDENCE, WITNESS, TESTIMONY, &c.

The *proof* of crimes was anciently effected among our ancestors divers ways; viz. by duel or combat, fire, water, &c. See PURGATION, DUEL, FIRE, WATER, &c.

The *proof* by red-hot iron was very frequent: the accused, to purge himself, was here obliged to make an oath, as he touched the iron. The formula, ceremonies, prayers, &c. made on this occasion, are still extant in the notes at the end of the capitularies of Charlemagne. See ORDEAL.

This custom was abrogated by the emperor Frederic; but still obtains in Mingrelia; as we are told by Lamberti, in his relation inserted in Thevenot's voyages.

If they cannot have *proof* of a crime, a cross is laid at the bottom of a caldron full of boiling water, out of which the accused is obliged to fetch it with his naked hand and arm: this done, the arm is put up in a bag, tied, and sealed, and three days after opened; when, if there be no marks of the burn or scald, the accused is declared innocent.

In the kingdom of Siam, to have *proof* of a crime, the party is obliged to wash his hands in boiling oil, or to walk on burning coals; from either of which he must come out untouched to be reputed innocent.

Sometimes they oblige the two contending parties to plunge under water; and he who stays there longest gains the cause; and sometimes to swallow a grain of rice, prepared and charmed by their doctors: he who is able to swallow it is declared innocent, and carried home in triumph; and the accuser punished.—This looks like an imitation of what was done among the Jews to have *proof* of adultery.

The *proof* by combat is likewise said to subsist among the Mingrelians. See COMBAT and DUEL.

PROPAGATION, PROPAGATIO, the act of multiplying the kind, or of producing the like in the way of natural generation. See GENERATION.

Some plants are only propagated by sowing, as wheat, poppies, &c. The reason is, that the stem in these plants withers and dies away, and consequently is incapable of being planted: and as to the root, the whole force and virtue thereof passes into the ear, or spica, which being the useful part of the plant, exhausts the whole. See PLANT, SEED, and SEMINATION.

Sometimes plants are *propagated* by the roots, as the anemones, &c. In which case there is a considerable stock of seminal or spermatie virtue still reserved in the root, so as to be in a condition for shooting new fibres upon any favourable occasion. See ROOT.

Sometimes a branch lopped off, and set in the ground, shall shoot into a new plant; as we see in the willow, vine, poplar, &c. and sometimes a truncheon shall do the same. In this case, the plants being of a very porous texture, readily imbibe nourishment, and take root.—This method of *propagation* is particularly remarkable in the vine, any part of which, put any how in the ground, will become a plant. The little chips of elm are said to do the same. See BRANCH and PLANTING.

When a branch, or arm of a vine, shoots too great a length or withers towards the extreme, or grows too small to feed its grapes, it is usual to cut pieces of it off, and put them in the ground, which readily grow into thriving plants.

Nay, sometimes to bring up young plants, and make them grow and advance the faster, especially lemon, orange, and citron trees, they pass a branch or shoot of an old tree, without cutting it off, through an aperture of a vessel filled with good earth; upon which, the pores opening by the moisture and warmth, roots presently burst forth, which, being furnished with food both from the earth and the parent plant, grow at a great rate, and are soon in a condition to be separated from the parent, and shift for themselves. See STOCK, DWARF, &c.—Lastly, plants are sometimes also propagated by bulbs. See BULB.

PROPER, PROPRIUM, something naturally and essentially belonging to any being.

The school-philosophers, after Porphyry, distinguish four kinds of *propers*, or modes of *propriety*, which are expressed in the following verse.—*Est medicus, bipes, canescens, risibilisque.*

The first, called PROPRIUM *primo modo*, is what agrees to a single species, but not to all the individuals: this they call *soli, sed non omni*.—As, to be a geometrician, a physician, a divine, &c. which are things *proper* to man; but not to all men.

The second, PROPRIUM *secundo modo*, is what agrees to the

whole species, but agrees likewise to another, which they call *omni, sed non soli*.—Thus, to have two feet is *proper* to a man, but is likewise *proper* to a bird.

The third, PROPRIUM *tertio modo*, is that which agrees to a single species, but not at all times; *omni & soli, sed non semper*.

—As, to grow grey, according to Porphyry, is *proper* to a man, but it is to an old man.

The last, and highest, PROPRIUM *quarto modo*, is that which alone agrees to one kind, to all the individuals thereof, and at all times; *omni soli, & semper*.—Thus, the faculty of laughing is *proper* to man, of neighing to horses, &c. And it is this that Porphyry calls the *true proper*. See ESSENCE, &c.

The first three species are only accidents of the fifth vulgar predicable, to which they directly belong. See PREDICABLE.

The fourth is an universal agreeing to every individual, or subject of predication of any species, in such manner as to be always found absolutely in the species alone, but not at every determinate time: thus man alone is naturally risible; not that he is always laughing, but has the faculty of laughing at all times. See DEFINITION.

PROPER, in respect of words, denotes their immediate and peculiar signification, or that directly and peculiarly attached to them. See WORD and SIGNIFICATION.

In which sense the word stands opposed to *figurative* and *metaphorical*. See FIGURATIVE, &c.

PROPER is also used in a moral sense, to denote something that is usually found in things: as, their particular or specific virtues, &c.

In which sense we say, magnanimity is the *proper* virtue of heroes. See HERO.

PROPER is also used for the natural qualities necessary to succeed in a thing.

In which sense we say, people of a hot vigorous temperament are *proper* for the army; the cold and phlegmatic are *proper* for study. The Romans became less *proper* for war, in proportion as they grew more learned and polite.

PROPER, in grammar, is also applied to nouns or names, which are distinguished into *proper* and appellative. See NOUN.

Man is the appellative, Peter the *proper* name. See APPELLATIVE.

The *proper* name among Christians is that imposed at baptism. See NAME and BAPTISM.

PROPER *fraction* is such a one whose numerator is less than its denominator. See IMPROPER.

Such is  $\frac{3}{4}$ , or  $\frac{2}{3}$ , which is really less than unity; and therefore, properly speaking, a fraction. See FRACTION.

PROPER, in the civil jurisprudence, is used in opposition to *acquired*, for an inheritance derived by direct or collateral succession. See ACQUEST.

By the French laws, a testator can only dispose of one fifth of his *proper* effects; the paternal relations inherit the paternal *propria*, and the maternal the maternal ones: so that *propria* always return to the line whence they proceed.

The origin of the law which fixes this difference between *proper* goods and acquests, is not known; neither the Greeks nor Romans having ever made any such distinction.

Indeed it seems founded on this principle of natural equity, that men are usually desirous to preserve and attach to their family the goods they have received from their forefathers, and to transmit them to those descending from the same stock.

PROPER sometimes also stands as a reduplicative, serving to mark or design a thing more expressly and formally.

In this sense we say, Jesus Christ came to redeem the world in his *proper* person. The king did such and such a thing of his own *proper* motion.

PROPER *motion*. See the article MOTION.

PROPER *objects*. See the article OBJECT.

PROPERTY, or PROPRIETY, PROPRIETAS, that which constitutes or denominates a thing *proper*; or, it is a particular virtue or quality, which nature has bestowed on something, exclusive of all others. See PROPER and ESSENTIAL.

Thus colour is a *property* of light; extension, figure, divisibility, and impenetrability, are *properties* of body. See COLOUR, BODY, &c. Every day discovers new *properties* in the loadstone. See MAGNET.

PROPERTY, or PROPRIETY, in law, denotes *dominion*, or the highest right a man can have to a thing; and such as no-ways depends on any other man's courtesy. See RIGHT.

In this sense, none in our kingdom have the *property* of any lands or tenements, except the king, in right of his crown; all other lands being of the nature of fee, and held of the king either mediately or immediately. See FEE, KING, &c.

*Property* or *propriety*, however, is used for that right in lands or tenements, which common persons have; importing as much as *utile dominium*, though not *directum*. See DOMINIUM.

There are three manners of right or *property*; viz. *property* absolute, *property* qualified, and *property* possessory. See PROPRIETOR and FEE.

Incumbents have not the *propriety* of benefices, they have only the enjoyment thereof. See BENEFICE.—The monks have a long time disputed whether they had the *propriety* or the bread they eat, or only the use?

One may give the *propriety* of an estate, yet reserve the usufruct; in which case, by the death of the usufructuary, the usufruct is consolidated to the *propriety*. See CONSOLIDATION.

PROPHECY

**PROPHET**, *προφήτης*, a prediction, made by divine inspiration. See **PROPHET** and **INSPIRATION**.

A late author observes, that the Christians have this in common with the Pagans, that they equally build their religions upon *prophecy* and *divination*. See **DIVINATION** and **AUGURY**.

He adds, That divination was an art learnt by the Romans in schools, or under discipline; as the Jews did *prophesying* in the schools and colleges of the prophets.

In these schools, as the learned Dodwell observes, the candidates for *prophecy* were taught the rules of divination practised by the Heathens; who were in possession of the art long before them. It is added, that the gift of *prophecy* was not an occasional thing, but a constant and standing matter of fact; and some think they have discovered an establishment of an order of prophets in the old testament, in analogy to the Heathen diviners.

This is certain, from many passages of scripture, that there were great numbers of prophets among them, who not only exercised their talents in matters of government and religion, but even in the discovery of lost goods, and in telling of fortunes.

One of the greatest difficulties in christianity turns upon the completion of the scripture *prophecies*. In the prophets of the old testament are frequent predictions of the Messiah; which the writers of the new frequently urge to the Jews and Heathens as fulfilled in Jesus Christ; and on this principle evince the truth of his mission: but these texts thus urged from the old, in the new testament, are sometimes not to be now found in the old; and at other times, not urged in the new in the literal and obvious sense which they seem to bear in the old; whence most of the Christian commentators, divines, and critics, ancient and modern, judge them to be applied in a secondary, typical, allegorical, or mystical sense. See **ALLEGORICAL**, **ACCOMPLISHMENT**, &c.

Thus, *ex. gr.* St. Matthew, after an account of the conception of the Virgin, and the birth of Jesus, says, "All this was done, that it might be fulfilled which was spoken by the prophet, saying, Behold a virgin shall be with child, and shall bring forth a son, and they shall call his name Emanuel." But the words, as they stand in Isaiah, whence they are supposed to be taken, do, in their obvious and literal sense, relate to a young woman who was to bring forth a child in the days of Ahaz; as appears from the context, and as is owned by Grotius, Huetius, Castalio, Curcellæus, Episcopius, Hammond, Simon, le Clerc, Lamy, &c.

This *prophecy* then not being fulfilled in Jesus, in the primary, literal, or obvious sense of the words, is supposed, like the other *prophecies* cited by the apostles, to be fulfilled in a secondary, typical, or allegorical sense; *i. e.* this *prophecy*, which was first literally fulfilled by the birth of the prophet's son in the time of Ahaz, was again fulfilled by the birth of Jesus, as being an event of the same kind, and intended to be signified either by the prophet, or by God, who directed the prophet's speech. Grotius observes this to be the case in most, if not all the *prophecies* and citations quoted from the old in the new testament; and Dodwell, with Sir John Marsham, refer even the famous *prophecy* in Daniel, about the seventy weeks, to the time of Antiochus Epiphanes; shewing, that the expressions taken thence by Christ, and urged by him as predicting the destruction of Jerusalem by the Romans, have only in a secondary sense a respect to that destruction.

And even that famous *prophecy* in the Pentateuch, "A prophet will the Lord God raise up unto thee, like unto me; to him shall ye hearken;" which St. Luke refers to as spoken of Jesus Christ, is, by Simon, Grotius, Stillingfleet, &c. understood to signify, in its immediate sense, a promise of a succession of prophets.

It is allowed then, the apostles applied the *prophecies* they quote from the old testament, in a typical sense; but unhappily the rules whereby they quoted are lost. Dr. Stanhope laments the loss of the Jewish traditions or rules for interpreting scripture received among the rabbins, and followed by the apostles. But this loss Surenhusius, Hebrew professor at Amsterdam, thinks he has retrieved from the Jewish talmud, and the ancient Jewish commentaries; and has accordingly published to the world the rules whereby the apostle quoted the old testament.

But the truth is, these rules are too precarious, strained, and unnatural, to gain much credit. See **QUOTATION**.

Mr. Whiston condemns all allegorical explanation of the *prophecies* of the old testament cited in the new, as weak, enthusiastic, &c. and adds, that if a double sense of the *prophecies* be allowed, and there be no other method of shewing their completion, than by applying them secondarily and typically to our Lord, after having been in their first and primary intention long ago fulfilled in the times of the old testament, we lose all the real advantages of the ancient *prophecies*, as to the proofs of Christianity.

He therefore sets up a new scheme in opposition thereto: he owns, that taking the present text of the old testament for genuine, it is impossible to expound the apostles citations of the *prophecies* of the old testament, on any other than the allegorical foundation; and therefore, to solve the difficulty, is forced to have recourse to a supposition contrary to the sense of all Christian writers before him, *viz.* that the text of the old testament has been greatly corrupted since the apostolical age by the Jews. See **TEXT**.

His hypothesis is, that the apostles made their quotations out of the old testament rightly and truly from the Septuagint version, which in their time was in vulgar use, and exactly agreed with the Hebrew original; and that, as they made exact quotations, so they argued justly and logically from the obvious and literal sense of the said quotations, as they then stood in the old testament: but that since their times, both the Hebrew and Septuagint copies of the old testament have been so greatly corrupted, and so many apparent disorders and dislocations introduced therein, as to occasion many remarkable differences and inconsistencies between the old and new testament in respect to the words and sense of those quotations. See **SEPTUAGINT**, &c. As to the manner wherein these corruptions were introduced, he says, the Jews in the second century greatly corrupted and altered both the Hebrew and Septuagint, especially in the *prophecies* cited by the apostles, to make their reasoning appear inconclusive: that in the third century, they put into Origen's hand one of these corrupted copies of the Septuagint; which Origen mistaking for genuine, inserted in his Hexapla, and thus brought into the church a corrupted copy of the Septuagint; and that in the end of the fourth century, the Jews put into the hands of the Christians, who till then had been almost universally ignorant of the Hebrew, a corrupted copy of the Hebrew old testament.

The disagreement then between the old and new testament, in respect to the said quotations, he contends, has no place between the genuine text of the old testament, (now no-where existing) but only between the present corrupted text of the old and new testament: and therefore, to justify the reasonings of the apostles, he proposes to restore the text of the old testament, as it stood before the days of Origen, and as it stood in the days of the apostles: from which text thus restored, he doubts not it will appear, that the apostles cited exactly, and argued justly and logically from the old testament.

But this scheme of accomplishing *prophecies* labours under difficulties at least as great as the allegorical scheme. Its foundation is incredible, and its superstructure, from first to last, precarious. In effect, it is inconceivable the old testament should be so corrupted; and it may even be made appear, that the Hebrew and Septuagint disagreed in the times of the apostles: add to this, that the means whereby he proposes to restore the true text, will never answer that end; nor has he himself, from all the means he is yet possessed of, been able to restore one prophetic citation, so as to make that seem literally, which before only seemed allegorically applied. See **PENTATEUCH**, &c.

**PROPHET**\*, **PROPHETA**, *προφήτης*, a person inspired by God with the knowledge of future events; and commissioned to declare his laws, his will, &c. to the world. See **PROPHET**, and **DIVINATION**.

\* The word is derived from the Greek *προ*, and *φατος*, said; of *φημι*, I say; whence also the Latins derive their *fatus*, spoken.

Among the canonical books are those of sixteen *prophets*; four of which are denominated the *greater prophets*, *viz.* Isaiah, Jeremiah, Ezekiel, and Daniel; so called from the length or extent of their writings, which exceed those of the others, *viz.* Hosea, Joel, Amos, Obadiah, Jonas, Micah, Nahum, Habakkuk, Haggai, Zechariah, and Malachi; who are called the *lesser prophets*, from the shortness of their writings.

The Jews only reckon three *greater prophets*; Daniel they exclude, as no more to be ranked among the *prophets* than David: not but that both the one and the other foretold many important things; but because their manner of life differed from that of the other *prophets*, David being a king, and Daniel a peer.

In the Greek church, the *lesser prophets* are placed in order before the great ones; apparently because many of the *lesser prophets* are more ancient than the greater.

Among the Greeks too, Daniel is ranked among the *lesser prophets*.—In the 48th chapter of Ecclesiasticus, Isaiah is particularly called the *great prophet*; both on account of the great things he foretold, and the magnificent manner wherein he did it.

Spinosa says, the several *prophets* prophesied according to their respective humours; Jeremiah, *e. gr.* melancholy and dejected with the miseries of life, prophesied nothing but misfortunes.

Dacier observes, that among the ancients the name *poet* is sometimes given to *prophets*; as that of *prophet* is at other times given to *poets*. See **POET**.

**PROPHETICAL** types. See the article **TYPE**.

**PROPHYLACTICE**, *προφυλακτική*, that part of the art of medicine which directs the preventing or preserving from diseases. See **MEDICINE**, **PRESERVATIVE**, &c.

**PROPITIATION**, in religion, a sacrifice offered to God to assuage his wrath, and render him propitious. See **SACRIFICE**, **EXPIATION**, and **LUSTRATION**.

Among the Jews there were both ordinary and public sacrifices, as holocausts, &c. offered by way of thanksgiving; and extraordinary ones offered by particular persons guilty of any crime, by way of *propitiation*.

If it were a crime of ignorance, they offered a lamb or a kid; if done wittingly, they offered a sheep: for the poor, a pair of turtles was enjoined as a *propitiation*.

The Romish church believe the mass to be a sacrifice of *propitiation*.

*propitiation* for the living and the dead. The reformed churches allow of no *propitiation*, but that one offered by Jesus Christ on the cross.

**PROPITIATION** also gives the name to a solemn feast among the Jews, celebrated on the tenth of the month Tisri, which is their seventh month, and answers to our September.

It was instituted to preserve the memory of the pardon proclaimed to their forefathers by Moses on the part of God; who thereby remitted the punishment due for their worship of the golden calf.

**PROPITIATORY**, among the Jews, was the cover or lid of the ark of the covenant; which was lined both within and without-side with plates of gold; inasmuch that there was no wood to be seen. See **ARK**.

Some even take it to have been one piece of massive gold. The cherubims spread their wings over the *propitiatory*.

This *propitiatory* was a type or figure of Christ, whom St. Paul calls the *propitiatory* ordained from all ages.

**PROPLASM**, **PROPLASMA**, *προπλασμα*, is sometimes used for a mould, wherein any metal or soft matter, which will afterwards grow hard, is cast. See **MOULD** and **PLASM**.

**PROPLASTICE**, *προπλαστικη*, the art of making moulds, for casting things in. See **PLASTICE**, **MOULD**, **FOUNDRY**, &c.

**PROPOLIS**, *προπολις*, a thick yellow odorous substance, smelling like storax, nearly akin to wax; wherewith the bees stop up the holes and crannies of their hives, to keep out the cold air, &c. See **WAX**.

The *propolis* is a friable matter, by some esteemed sovereign in diseases of the nerves. It is also used to make holes in abscesses; and being heated on the fire, its vapour is received for inveterate coughs.

**PROPORTION**, **PROPORTIO**, in arithmetic, the identity or similitude of two ratio's. See **RATIO**.

Hence quantities that have the same ratio between them, are said to be *proportional*; *e. gr.* if A be to B, as C to D; or 8 be to 4, as 30 to 15; A, B, C, D, and 8, 4, 30, and 15, are said to be in *proportion*, or are simply called *proportionals*. See **PROPORTIONAL**.

*Proportion* is frequently confounded with *ratio*; yet have the two, in reality, very different ideas, which ought by all means to be distinguished.

*Ratio* is, properly, that relation or habitude of two things, which determines the quantity of one from the quantity of another, without the intervention of any third: thus we say, the ratio of 5 and 10 is 2; the ratio of 12 and 24 is 2. See **RATIO**.

*Proportion* is the sameness or likeness of two such relations: thus, the relations between 5 and 10, and 12 and 24, being the same, or equal; the four terms are said to be in *proportion*. Hence ratio exists between two numbers; but *proportion* requires at least three.

*Proportion*, in fine, is the habitude or relation of two ratio's, when compared together; as ratio is of two quantities. See **QUANTITY**.

*Proportion* again is frequently confounded with *progression*. In effect, the two often coincide; the difference between them only consisting in this, that progression is a particular species of *proportion*, wherein the second of the three terms is a mean *proportional* between the other two, or has the same ratio to the third, which the first has to the second.

Add to this, that *proportion* is confined to three terms, but progression goes on to infinity (so that progression is a series or continuation of *proportions*); and that in four terms, 3, 6, 12, 24, *proportion* is only between the two couples 3 and 6, and 12 and 24; but progression is between all the four terms. See **PROGRESSION**.

*Proportion* is said to be *continual*, when the consequent of the first ratio is the same with the antecedent of the second; as, if 3 be to 6, as 6 to 12. See **CONTINUED**.

The *proportion* is said to be *discrete*, or interrupted, when the consequent of the first ratio differs from the antecedent of the second; as if 3 be to 6, as 4 to 8. See **DISCRETE**.

*Proportion*, again, is either said to be *arithmetical*, or *geometrical*; as the ratio's are.

**ARITHMETICAL PROPORTION** is the equality of two or more arithmetical ratios, or the equality of difference between three or more several quantities.

Thus, 1, 2, 3, and 2, 5, 8, 11, 14, are in *arithmetical proportion*; because there is the same difference betwixt the numbers compared, which are 1 to 2, and 2 to 3; or 2 to 5, and 5 to 8.

If every term have the same ratio to the next, as the first has to the second; the terms are said to be in *continual arithmetical proportion*; as 5, 7, 9, 12, 15.

If the ratio between any two terms differ from that of any others; the terms are said to be in *arithmetical proportion discrete*, or interrupted; as where 2 : 5 :: 6 : 9, the ratio's of 5 and 6 being different from that of 2 and 5.

A series of more than four terms in *arithmetical proportion*, form an arithmetical progression. See **PROGRESSION**.

1. If three numbers be in *arithmetical proportion*, the sum of the extremes is equal to double the middle term: thus, in 3, 7, 11; the sum of 3 and 11 is equal to twice 7; *viz.* 14.

Hence we have a rule for finding a mean *arithmetical proportional* between two given numbers; half the sum of the two being the mean required: thus, half the sum of 11 and 3, *viz.* 14, is 7.

VOL. II.

2. If four numbers be in *arithmetical proportion*, the sum of the extremes is equal to the sum of the middle terms: thus, in 2 : 3 : 4 : 5; the sum of 5 and 2 is equal to the sum of 3 and 4, *viz.* 7.

Hence, four terms in *arithmetical proportion* are still proportional, if taken inversely, 5 : 4 : 3 : 2; or, alternately, thus, 2 : 4 : 3 : 5; or inversely and alternately, thus, 5 : 1 : 4 : 2.

3. If two numbers in *arithmetical proportion* be added to other two, the less to the less, &c. their difference is in a duplicate ratio, *i. e.* double that of the respective parts added: thus, if to 3 : 5 be added 7 : 9, the sums are 10 : 14; whose difference 4, is double the difference of 5 : 5, or 7 : 9. And if to this sum you add other two, the difference of the last sum will be triple the sum of the first two, and so on.

If two *arithmetical proportionals* be subtracted from two others in the same ratio, the less from the less, &c. the arithmetical ratio of the remainder is 0. Thus, from 9 : 7 taking 5 : 3, the remainders are 4, 4.

Hence, if *arithmetical proportionals* be multiplied by the same number, the difference of their products will contain the first difference as oft as the multiplier contains unity: thus, 3 : 5, multiplied by 4, produce 12, 20, whose difference 8 is equal to 4 times 2, the difference of 3 and 5.

4. If two numbers in *arithmetical proportion* be added to, or multiplied by, other two in another ratio of the same kind, less by less, &c. the sums are in a ratio which is the sum of the ratio's added or multiplied: thus 2 : 4 and 3 : 5 being added, the sums are 5 : 13, whose difference is 8, the sum of 2 and 6, the differences of the numbers given.

**GEOMETRICAL PROPORTION** is the quality of two geometrical ratio's, or comparisons of two couples of quantities. See **GEOMETRICAL**.

Thus 4 : 8 :: 12 : 24, are in *geometrical proportion*; the ratio of 4 and 8 being equal to that of 12 and 24; *i. e.* 4 is contained as often in 8, as 12 is in 24. Again, 9, 3, 1, are in *geometrical proportion*, 9 being triple of 3, as 3 is of 1.

If, in a series of terms, there be the same ratio between every two terms, that there is between the first and second; they are said to be *continual geometrical proportionals*: as 1 : 2 : 4 : 8.

If any two terms have a different ratio from that of the first and second, they are said to be in *disjunct*, or *interrupted geometrical proportion*; as are 2 : 4 : 3 : 6; where 2 is to 4, as 3 to 6; but not so as 4 to 3.

A series or progression of more than four *geometrical proportionals* is called a *geometrical progression*. See **PROGRESSION**.

1. If three quantities be in *continual geometrical proportion*, the product of the two extremes is equal to the square of the middle term: thus, in 6 : 12 :: 12 : 24, the product of 6 and 24 is equal to the square of 12, *viz.* 144. Hence we have a rule,

2. To find a mean *geometrical proportional* between two numbers, *e. gr.* 8 and 72.

Multiply one of the numbers by the other, and from the product 576, extract the square root 24; this will be the mean required.

3. To find a fourth proportional to the three given numbers, *e. gr.* 3, 12, 5; or a third proportional to two given numbers. Multiply the second 12 into the third 5, in the first case; and in the latter, multiply the second into itself: divide the product by the first 3, the quotient 20 is the fourth *proportional* sought in the one, or the third in the other.

The solution of this problem is what we popularly call the *rule of proportion*, or the *golden rule*, or *rule of three*. See **RULE**.

4. If four numbers be in *geometrical proportion*, the product of the extremes is equal to the product of the two middle terms: thus, in 2 : 5 :: 4 : 10, the product of 10 and 2 is equal to that of 5 and 4, *viz.* 20. Hence,

5. If four numbers represented  $a : b :: c : d$  be either in *arithmetical*, or *geometrical proportion*; they will also be in the same, if taken inversely, *viz.*  $d : c :: b : a$ ; or alternately, as  $a : c :: b : d$ ; or alternately and inversely, as  $d : b :: c : a$ .

6. If the two terms of a geometrical ratio be added to, or subtracted from, other two in the same ratio, the less to or from the less, &c. the sums or differences are in the same ratio: thus in 6 : 3 : 10 : 5, where the common ratio is 2; 6 added to 10, makes 16, as 3 to 5 makes 8; and 16 : 8 is in the same ratio as 6 : 3, or 10 : 5. Again, 16 being to 8, as 6 to 3, their differences 10 and 5 are in the same ratio.

The reverse of which proposition is likewise true; *viz.* if to or from any two numbers be added or subtracted other two, if their sums or differences be in the same geometrical ratio as the first two, the numbers added or subtracted are in the same ratio. Hence,

7. If the antecedents, or the consequents, of two equal geometrical ratio's, 3 : 6, and 12 : 24, be divided by the same 3; in the former case, the quotients 1 and 4 will have the same ratio's to the consequents, *viz.* 1 : 6 :: 24; and in the latter, the antecedents the same ratio to the quotients, *viz.* 3 : 1 :: 12 : 4.

8. If the antecedents or consequents of similar ratio's, 2 : 6, and 3 : 9, be multiplied by the same quantity 6; in the former case the facta 12 and 18 have the same ratio to the consequents, *viz.* 12 : 6 :: 18 : 9; and in the latter, the antecedents have the same ratio to the products, *viz.* 2 : 6 :: 3 : 9.

9. If in a *geometrical proportion*  $3:6::12:24$ , the antecedents be multiplied or divided by the same number 2; or divided by the same number 3; in the former case, the facts; in the latter, the quotients will be in the same *proportion*, viz.  $6:18::24:72$ , and  $1:3::4:12$ .

10. If in a *proportion*  $4:2::10:5$ , the antecedent of the first ratio be to its consequent, as the antecedent of the second to its consequent; then, by composition, as the sum of the antecedent and consequent of the first ratio is to the antecedent or consequent of the first, so is the sum of the antecedent and consequent of the second to the antecedent or consequent of the second, viz.  $6:2::15:5$ , or  $6:4::15:10$ .

11. If in a *proportion*  $6:4::15:10$ , as the antecedent of the first ratio is to its consequent, so is the antecedent of the other to its consequent; then, by division, as the difference of the terms of the first ratio is to its antecedent or consequent, so is the difference of the terms of the second ratio to its antecedent or consequent, viz.  $2:4::5:10$ , or  $2:6::5:15$ .

12. If in a *proportion*  $4:2::6:3$ , as the antecedent of the first ratio is to its consequent, so is the antecedent of the second to its consequent: and as the consequent of the first is to another number 8, so is the consequent of the second to another number 12; viz.  $2:8::3:12$ ; then will the antecedent of the first be to 8, as the antecedent of the second to 12; viz.  $4:8::6:12$ .

13. If in a *proportion*  $8:4::12:6$ , as the antecedent of the first ratio is to its consequent, so is the antecedent of the second to its consequent; and as the consequent of the first is to another number 16, so is another number 3 to the antecedent of the second, viz.  $4:16::12:48$ ; then will the antecedent of the first be to 16, as 3 to the consequent of the second; viz.  $8:16::3:6$ .

14. Suppose any four proportional quantities, viz.  $3:6::12:24$ , and any other four proportional quantities  $1:3::9:27$ ; if you multiply the several terms of the latter into those of the former, the products will likewise be *proportional*, viz.  $3:18::108:648$ .

15. If there be several quantities continually *proportional*, A, B, C, D, &c. the first A is to the third C, in a duplicate ratio; to the fourth D, in a triplicate ratio, &c. of the first A to the second B.

16. If there be three numbers in continual *proportion*, the difference of the first and second will be a mean *proportional* between the difference of the first and second term, and the difference of the second and third, and the first term.

*Harmonical* or *musical* PROPORTION is a third kind of proportion formed out of the other two, thus: of three numbers, if the first be to the third as the difference of the first and second to the difference of the second and third; the three numbers are in *harmonical proportion*. See HARMONICAL.

Thus  $2:3:6$  are harmonical, because  $2:6::1:3$ . So also four numbers are harmonical, when the first is to the fourth, as the difference of the first and second to the difference of the third and fourth.

Thus  $24:16::12:9$  are harmonical, because  $24:9::8:3$ . By continuing the *proportional* terms in the first case, there arises an harmonical progression, or series. See SERIES.

1. If three or four numbers in *harmonical proportion* be multiplied or divided by the same number; the products, or quotients, will also be in *harmonical proportion*: thus, if 6, 8, 12, which are harmonical, be divided by 2, the quotients 3, 4, 6, are also harmonical; and reciprocally their products by 2; viz. 6, 8, 12.

2. To find an harmonical mean between two numbers given: Divide double the product of the two numbers by their sum, the quotient is the mean required; thus, suppose 3 and 6 the extremes, the product of these is 18, which doubled, gives 36; this divided by 9 (the sum of 3 and 6) gives the quotient 4. Whence  $3:4:6$  are harmonical.

3. To find a third *harmonical proportional* to two numbers given.

Call one of them the first term, and the other the second; multiply them together, and divide the product by the number remaining after the second is subtracted from double the first; the quotient is a third *harmonical proportional*: thus, suppose the given terms 3:4, their product 12 divided by 2, (the remainder after 4 is taken from 6, the double of the first) the quotient is 6, the harmonical third sought.

4. To find a fourth *harmonical proportion* to three terms given: Multiply the first into the third, and divide the product by the number remaining after the middle or second is subtracted from double the first; the quotient is a third *harmonical proportional*: thus, supposing the numbers 9:12:16; a fourth will be found by the rule to be 24.

5. If there be four numbers disposed in order, whereof one extreme and the two middle terms are in arithmetical *proportion*; and the same middle terms with the other extreme, are in *harmonical proportion*; the four are in *geometrical proportion*: as here,  $2:3::4:6$ , which are geometrical; whereof  $2:3:4$  are arithmetical, and  $3:4:6$  harmonical.

6. If betwixt any two numbers you put an arithmetical mean, and also an harmonical one, the four will be in *geometrical proportion*: thus, betwixt 2 and 6, an arithmetical mean is 4, and an harmonical one 3; and the four  $2:3::4:6$  are *geometrical*.

We have this notable difference between the three kinds of *proportion*; that from any given number we can raise a continued arithmetical series increasing in *infinitum*, but not decreasing; the *harmonical* is decreasable in *infinitum*, but not increasable; the *geometrical* is both. See SERIES.

*Contra-harmonical* PROPORTION is that relation of three terms, wherein the difference of the first and second is to the difference of the second and third, as the third to the first.

Thus, 3, 5, 6, are numbers in *contra-harmonical proportion*, because  $2:1::6:3$ .

To find a mean in *contra-harmonical proportion* between two numbers: divide the sum of the two squared by the sum of the roots, the quotient is the mean required: thus, the sum of the squares of 3 and 6, viz. 45, divided by 9, the sum of the roots, gives 5.

Extreme and mean PROPORTION,	} See	EXTREME.
Inordinate PROPORTION,		INORDINATE.
Reciprocal PROPORTION,		RECIPROCAL.
PROPORTION of equality,		EQUALITY.
Composition of PROPORTION,		COMPOSITION.
Rule of PROPORTION,		RULE.
Terms of PROPORTION,		TERM.

PROPORTION is also used for the relation between unequal things of the same kind, whereby their several parts correspond to each other with an equal augmentation or diminution.

Thus, in reducing a figure into little, or in enlarging it, care is taken to observe an equal diminution, or enlargement, through all its parts; so that if one line, *e. gr.* be contracted by one third of its length; all the rest shall be contracted in the same *proportion*.

The making of reductions of this kind is the great use of the proportional compasses. See COMPASSES. See also REDUCTION, DRAUGHT, &c.

PROPORTION, in law. See PRO RATA and ONERANDA.

PROPORTION, in architecture, denotes the just magnitude of the members of each part of a building, and the relation of the several parts to the whole; *e. gr.* of the dimensions of a column, &c. with regard to the ordonnance of the whole building. See SYMMETRY and BUILDING.

One of the greatest differences among architects, M. Perrault observes, is in the *proportions* of the heights of entablatures with respect to the thickness of the columns, to which they are always to be accommodated. See ENTABLATURE.

In effect, there is scarce any work, either of the ancients or moderns, wherein this *proportion* is not different; some entablatures are even near twice as high as others:—yet it is certain, this *proportion* ought of all others to be most regulated; none being of greater importance, as there is none wherein a defect is sooner spied, nor any wherein it is more shocking. See COLUMN.

PROPORTION is likewise understood of the magnitudes of the members of architectures, statues, or the like, with regard to the distance whence they are to be viewed.

The most celebrated architects are much divided in their opinions on this subject: some will have it, that the parts ought to be enlarged in *proportion* to their elevation; and others, that they ought to remain in their natural dimensions. See STATUE.

PROPORTION, in painting, is the just magnitude of the several members of a figure, a groupe, &c. with regard to one another, to the whole figure, the groupe, and the intire piece. See PAINTING.

*Proportion* makes one of the most important articles in the art of painting, the principal subject it is employed in being the human body; for which reason, the curious in that art will not be displeased with the following scheme of the rules and laws thereof.

By the way, let it be observed, 1. That to measure and set off *proportions*, they either divide the module into twelve parts, and subdivide each of these into four; or divide the face into three lengths of the nose, subdividing each length into twelve; or, lastly, divide the whole face into three, and subdivide each of those into four: which last method is what we shall here follow.

2. That the multiplicity of little measures are to be studiously avoided, because they confound, and because they require great skill in osteology to hit justly.

3. That in measuring there be a regard had to the relieve, or juttings out of figures.

*Rules of PROPORTION in painting.*—In the *proportions* of a human figure, regard is had to the age, sex, and quality.

As to age; we consider the stages thereof, infancy, youth, and manhood. For the first, at three years of age, we count five lengths of the face from top to toe; viz. from the tip of the head to the bottom of the belly, three; thence to the foot, two; breadth about the shoulders, one face, one eighth; and in the place of the hips, one face.

At four years, the height is six faces  $\frac{1}{2}$ ; viz. from the top of the head to the bottom of the belly, three faces  $\frac{1}{2}$ ; thence to the sole of the foot, three faces; the breadth about the shoulders, one face  $\frac{1}{2}$ ; about the haunches, one face  $\frac{1}{2}$ .

At five years, the height is six faces  $\frac{1}{2}$ ,  $\frac{1}{2}$  abated, the lower being shorter.

In youth at twelve years, we have two *proportions*; the one from nature, which gives nine faces for the height; the breadth about

about the shoulders, two faces; about the haunches, one face  $\frac{1}{2}$ . The other from the antique statues, as that of Laocoon, &c. which give the height, ten faces  $\frac{1}{2}$ ; the breadth from one shoulder to another, one face  $\frac{1}{2}$ ; at the haunches,  $1\frac{1}{2}$ ; at the place of the muscle called *vastus externus*, 2; at the thigh, 1; the knee,  $\frac{2}{3}$  and  $\frac{1}{3}$ , a subdivision; and at the ancles,  $\frac{1}{2}$ .

In the state of manhood, when the proportions are arrived at perfection, we reckon the height ten faces: the first, from the top of the head to the nostril; the second to the hole in the neck between the clavicles; the third, to the pit of the stomach, called *cartilago ensiformis*; the fourth, to the navel; the fifth, to the pyramidal muscles; thence to the knee,  $2\frac{1}{2}$ ; and as much to the sole of the foot.—The extent of the arms is the same with the height; viz. from the tip of the long finger to the joint of the wrist, one face; thence to the elbow,  $1\frac{1}{2}$ ; thence to the juncture of the shoulders,  $1\frac{1}{2}$ ; thence to the hole in the neck,  $1\frac{1}{2}$ ; in all, five heads; which, with the five of the other arm, gives ten: the thickness of the arms to be adjusted by the quality or character.

As to the breadth of the figure seen frontwise, the width of the shoulders across the deltoides is 2 faces  $\frac{2}{3}$ ; breadth of the pectoral muscle, to the juncture of the arm, 2. About the haunches, where the obliqui externi are,  $1\frac{1}{2}$ , and the subdivisions. The thighs, at the biggest place, 1. The knee,  $\frac{1}{2}$ , three subdivisions  $\frac{1}{2}$ . The leg, at the thickest,  $\frac{2}{3}$ , and one subdivision. The extreme of the ancle,  $\frac{1}{2}$ , one subdivision  $\frac{1}{2}$ . The feet,  $\frac{1}{2}$ , and one half a subdivision. Their length, 1 face  $\frac{1}{2}$ , one subdivision.

Others, measuring by the length of the whole head, make only eight heads in height and breadth; thus: The head, one; thence to the bottom of the breasts, one; thence to the navel, one; thence to the yard, one; thence to the middle of the thigh, one; thence to the lower parts of the knee, one; thence to the small of the leg, one; thence to the bottom of the foot, one.

The breadth thus: From the end of the long finger to the wrist, one; thence to the bend of the arm, one; thence to the bottom of the shoulder, one; thence over to the other shoulder, two; thence to the end of the other long finger, three.

To these general proportions may be added others, which usually obtain; as, that the hand is the length of the face; the thumb the length of the nose; and the great toe the same: the two nipples, and the hole in the neck, make a just equilateral triangle: the space between the eyes is the breadth of an eye: the breadth of the thigh, at the thickest, is double that of the thickest part of the leg, and treble that of the smallest: from the top of the head to the nose, the same as from the top of the nose to the chin. The distance from the chin to the throat-pit, is the breadth of the throat; the distance of the centre of the eye to the eye-brow, the same as the prominence of the nostrils, and the space between them and the upper lip: the length of the fore-finger, the same as the space thence to the wrist; the space from the tip of the fore-finger to the wrist, the length of the face.

For the sex: The proportions of man and woman differ in height, in that the woman has a longer neck; the parts at the breasts, and the lower parts of the belly, bigger by half a part; which makes the space from the breast to the navel less by one part; and the thigh shorter by a third part.

As to breadth, a woman has her breasts and shoulders narrower, and haunches larger; and thighs, at the place of their articulation, larger; arms and legs thicker, feet straiter; and because women are more fat and fleshy, their muscles are less seen, and therefore the contours more smooth and even.

Young maids have little heads, long necks, low or down shoulders, slender bodies, haunches big, legs and thighs long, feet little.

Young men have the neck thicker than women, the shoulders and breasts larger, the belly and haunches narrower, legs and thighs slenderer, and feet larger.

As to the quality of subjects, we are either to follow simple nature, or fine and agreeable nature, or to chuse nature, or exceed it. In following simple nature, in common and country subjects, men of dull wit, and a moist temperament, are to be of an heavier and rougher proportion, the muscles appearing but little distinguished, the head big, neck short, shoulders high, stomach little, knees and thighs thick, and feet large.

In nature, as fine and agreeable, for serious histories, &c. the figures of the heroes to be well shaped, the haunches high and upright, the joints well knit, little and compact, free from flesh and fat.

Military men, to have the head little, neck thick and nervous, shoulders large and high, body and paps elevated, haunches and belly little, thighs muscly, principal muscles raised up and knit together at the heads; the legs smooth, feet slender, soles hollow.

Nature is sometimes to be selected, i. e. made up of parts from various good originals, to form extraordinary and perfect figures for great and heroic subjects, as in Roman histories; giving, thus, a character of force sufficient to execute actions agreeable to the descriptions the poets, &c. make.

Lastly, sometimes nature is to be exceeded, as in representations of fabulous deities, of heroes and giants: in these the great pieces, which serve to form the body, are to be set out

in measures agreeable to the height; only diversifying them by their bigness.

In the rule of proportions, it is to be observed, that there is a difference in the contours of some parts, when put in different postures: thus, when the arm is bent, it is larger than when strait; the same is true of the foot and knee, as is shewn by Leonardo da Vinci.

**Rule of PROPORTION**, in arithmetic, a rule whereby we find a fourth proportional to three numbers given.

This is popularly called the *golden rule*, and sometimes the *rule of three*. See **RULE**.

**Compass of PROPORTION**, a name by which the French, and after them some English authors, call the *juster*.—See its construction and use under the article **SECTOR**.

**PROPORTIONAL**, relating to proportion. Thus we say, proportional compasses, parts, scales, spirals, &c. See **COMPASSES**, &c.

**PROPORTIONALS**, in geometry, are quantities, either linear or numeral, which bear the same ratio, or relation to each other. See **RATIO** and **PROPORTION**.

Thus, if 3, 6, 12, be proportionals, then will 3 : 6 :: 6 : 12.

To find a fourth PROPORTIONAL to three given lines, A B, A C, and B D, (tab. geom. fig. 62.) draw an angle FAG at pleasure; from A set off the first of the lines to B; from A, the second, to C; and from B, to D, the third: draw B C; and in D make an angle equal to ABC: then is CE the fourth proportional sought; and A B : A C :: B D : C E.

If a third proportional be required to two given lines, A B and A C; make B D equal to A C, i. e. let A C be repeated twice: then A B : A C :: A C : C E.

To find a mean proportional between two given lines, A B and B E, (fig. 63.) join the two given lines into one continued right line, and bisect it in C. From C, with the interval of A C, describe a semicircle A D E; and from B erect a perpendicular B D; this is the mean proportional sought; and A B : B D :: B D : B E.

The geometricians have been these two thousand years in search of a method for finding two mean proportionals. See **MEAN**.

The ancients performed it mechanically, by the mesolabe described by Eutocius; and many of them attempted to give the demonstration; some by the solid loci, as Menechmus; others by the plain loci, as Nicomedes, Diocles, and, in our times, Viety; and others by implicit motions, as Plato, Archytas, Pappus, and Sporus; others tentatively, by the description of circles, as Hero and Apollonius, &c. but all in vain. See **PROBLEM** and **QUADRATURE**.

To find a mean proportional between two numbers: Half the sum of the two given numbers is an arithmetical mean proportional, and the square root of their product a geometrical mean proportional. See **PROPORTION** arithmetical and geometrical.

To find a mean harmonical proportional. See **PROPORTION** harmonical.

**PROPORTIONALS**, in grammar. See **NUMERALS**.

**PROPORTIONAL compasses**, an instrument for the ready drawing of lines and figures, in any given ratio to other lines or figures.—See their construction and use under the article **COMPASSES**.

**PROPORTIONAL part**. See the article **PART**.

**PROPORTIONAL scales**, called also logarithmical scales, are the artificial numbers or logarithms, placed on lines, for the ease and advantage of multiplying, dividing, &c. by means of compasses, or of sliding-rules. See **LOGARITHM** and **SCALE**.

They are, in effect, only so many lines of numbers, as they are called by Gunter, but made single, double, triple, or quadruple; beyond which they seldom go. See **GUNTER'S scale**, &c.

**PROPORTIONAL spirals**. See the article **SPIRAL**.

**PROPORTIONALITY**, a term used by Gregory de St. Vincent, for the proportion that is between the exponents of four ratios. See **EXPONENT** and **RATIO**.

**PROPORTUM**, or **PURPORT**, in our law-books, the intention or meaning of any thing.—*Secundum propositum dicti chi-rographi inter eos confecti*.

**PROPOSITION**, **PROPOSITIO**, in logic, part of an argument, wherein some quality, either negative or positive, is attributed to a subject. See **ENUNCIATION**, **ATTRIBUTE**, &c.

Chauvin defines *proposition*, a complete, consistent sentence indicating or expressing something either true or false, without ambiguity: As, *Xanthippe is a bad wife*.—If an ass fly, he must have wings.

Others, more philosophically, define *proposition*, a speech uttered or produced, to signify some judgment of the mind. See **JUDGMENT**.

A *proposition* consists of two terms; the one, that whereof we affirm or deny, called the *subject*: the other, the thing affirmed or denied, called the *attribute* or *predicate*. See **SUBJECT** and **PREDICATE**.

These two are either joined, or separated, by the intervention of some copula or disjunctive. See **COPULA**.

Thus in the *proposition*, *God is just*; the subject, *God*, is joined with the attribute, *just*, by the verb substantive, *is*.

The schoolmen call the two terms the *matter*, and the copula the *form* of the *proposition*. See **FORM**, &c.

Now,

Now, as terms may be either singular, or common and universal, if the subject of a *proposition* be a common term, taken in all its extent, the *proposition* is called *universal*: as, *Every atheist is blind*. See **UNIVERSAL**.  
If the common term be only taken in an indeterminate part of its extent, the *proposition* is called *particular*: as, *Some atheists are wicked*.  
If the subject of the *proposition* be singular, the *proposition* is called *singular*: as *George is king of England*.  
Those *propositions* which have only one subject, and one attribute, are called *simple*;—those that have several subjects, or attributes, are called *compound*.  
A syllogism consists of three *propositions*, major, minor, and conclusion. See **SYLLOGISM**.—An enthymeme, of two. See **ENTHYME**.  
The schoolmen make several other species and divisions of *proposition*; as, a  
**PROPOSITION de primo adjacente**, where the subject and predicate are both included under the verb: such are, *veni, vidi, vici*.  
**PROPOSITION de secundo adjacente** is, where either the subject or predicate is included in the verb: as, *I love*,—or, *I write*.  
**PROPOSITION de tertio adjacente** is, where both the subject and predicate are express, and stand distinct from the verb: as, *The king is just*.  
This *proposition* is the rule or standard of all the other; so that whatever *proposition* can be reduced thereto, is legitimate; and what cannot, is not.  
*Propositions*, again, are divided into three classes: the first regarding the *matter*; the second, the *form*; the third, the *thought*.  
Those of the first class are subdivided into *finite* and *infinite*, *direct* and *indirect*, *single* and *manifold*.  
**Finite or definite PROPOSITION** is that which declares something determinate on a subject: as, *Man is biped*.—*The wind is not visible*.  
**Infinite or indefinite PROPOSITION** is that where either one or both of the terms are *infinite*, or have a negative prefixed to them: as, *Non homo est albus*.—*Homo est non albus*.  
**Direct PROPOSITION** is that wherein a higher or more general thing is predicated of a lower and more particular: as, *Man is an animal*.  
Others will have it that, wherein the subject stands as a matter receiving, and the predicate, as a form received: as, *Peter is learned*.  
**Indirect PROPOSITION**, according to some, is that wherein an inferior is predicated of a higher: as, *An animal is man*.—According to others, it is that wherein the subject stands as the form, and the predicate as the matter: as, *Every rational is man*.  
**Single PROPOSITION** is such, either simply, or by conjunction:—Simply, when it affirms and denies one thing of one other thing: as, *The sun shines*.—By *conjunction*, when several *propositions* are joined and coupled together. Thus, *The sun shines, and it is day*, are two *propositions*, which conjoined, make this one, *If the sun shines, it is day*.  
Of such *conjunct propositions* there are divers kinds, viz. *hypothetical*, *disjunctive*, *copulative*, &c.  
**Hypothetical PROPOSITION** is that consisting of several simple ones, affected with some conditional one: as, *If the sun be set, it is night*. See **HYPOTHETICAL** and **CONDITIONAL**.  
**Disjunctive PROPOSITION** is that consisting of several, affected with a disjunctive copula: as, *It is either day, or night*. See **DISJUNCTIVE**.  
**Copulative PROPOSITION** is that consisting of several affected with a conjunction copulative: as, *Peter does not stand, and sit*. See **COPULATIVE**.  
Some add *discrete* or *adversative proposition*: as, *He is rich, but covetous*. See **DISCRETIVE**.  
**Compound PROPOSITION** is that where one and both the terms excite several ideas in the mind: as, *A man is body and soul, and both together*; or, *a foundation, walls, and roof, are a house*.  
**Manifold PROPOSITION** is that consisting of several subjects; as, *Peter and Paul preached*; or several predicates; as, *Simon reads and walks*; or both, as, *Peter and Paul preach and pray*.  
In respect of *form*, *propositions* are divided into *affirmative* and *negative*; *true* and *false*, *pure* and *modal*.  
**Affirmative PROPOSITION** is that whose attribute is joined to the subject; as, *God is a spirit*.  
**Negative PROPOSITION** is that whose attribute is separated from the subject; as, *Man is not a stone*.  
**True PROPOSITION** is that which declares a thing to be what it really is; or not to be what it is not. See **TRUTH**.  
**False PROPOSITION** is that which signifies a thing to be what it is not; or not to be what it is. See **FALSHOOD**.  
The truth of a *proposition*, therefore, depends on the connecting of the subject with the attribute, which is done by that act of the mind, called *judgment*. See **JUDGMENT**, **ERROR**, &c.  
**PROPOSITIONS** are said to be *pure*, when they imply or involve nothing besides their matter and form: as, *Man is rational*.  
**Modal PROPOSITION** is that which, beside the pure matter and form, involves some mode, or manner of disposition: as, *It is necessary man be rational*.  
Hence such *proposition* is said to consist of a mode, and a dictum; the mode denotes some circumstance which affects the *proposition*; as, *It is necessary*: the dictum is the rest of the *proposition*, that man be rational.

There are four of these modes very famous, viz. *necessary*, *possible*, *impossible*, and *contingent*. See **NECESSARY**, **POSSIBLE**, &c. Others produce other modes, as *true*, *false*, *certain*, *uncertain*, *probable*, &c.  
To modal *propositions*, the philosophers refer *exclusive*, *exceptive*, and *restrictive propositions*; all which are denoted by a common name, *exponible propositions*, because requiring some explanation to make them clearly understood.  
**Exclusive PROPOSITION** is that denoted by a sign, or character of exclusion: as, *only*, *solely*, *alone*; as, *God alone is eternal*; which is expounded thus, *God is eternal, and no other being beside him is so*: *Peter only plays*; which we expound, *Peter plays, and does nothing else*. See **EXCLUSIVE**.  
Every *exclusive proposition* is expounded by two *propositions*, one of which is affirmed, and the other denied.  
**Exceptive PROPOSITION** is that denoted by an exceptive sign; as, *beside*, *unless*, &c.—Thus, *Every animal, beside man, is irrational*. See **EXCEPTIVE**.  
Every *exceptive proposition* is to be resolved, or expounded by three *propositions*; as that, e. g. above-mentioned, by these: *Every animal that is not man is irrational: every man is an animal: no man is irrational*.  
**Restrictive, or limitative PROPOSITION**, is that affected with a restrictive sign; as, *according to*, *so far as*, *considered as*, *quatenus*, &c. Thus, *man, quatenus an animal, perceives*.  
**Complex PROPOSITION**,  
**Reduplicative PROPOSITIONS**,  
**Relative PROPOSITION**,  
**Reduction of PROPOSITIONS**.  
See the articles { **COMPLEX**,  
                                  { **REDUPLICATIVE**,  
                                  { **RELATIVE**,  
                                  { **REDUCTION**.  
**PROPOSITION**, in mathematics, is either some truth advanced, and shewn to be such by demonstration; or some operation proposed, and its solution shewn.  
If the *proposition* be deduced from several theoretical definitions compared together, as this; A parallelogram is double of a triangle, standing on the same base, and of the same altitude: it is called a *theorem*. See **THEOREM**.  
If it be deduced from a praxis or series of operations, it is called a *problem*: as, to find a third proportional to two given quantities. See **PROBLEM**.  
Indeed, in strictness, the *proposition* is only part of a theorem, viz. that which shews what agrees to such a thing under such conditions, and what not: in which sense it is distinguished from the *demonstration*, which shews the reasons why the understanding conceives that to agree to it. See **DEMONSTRATION**.  
Again, strictly speaking, the *proposition* is only a member of a problem, viz. that which shews what is required to be done: in which sense it is distinguished from the *solution*, which rehearces the several things to be done in order to effect what is required; and from the *demonstration*, which proves, that by doing the things enjoined in the solution, the thing required in the *proposition* is truly done. See **RESOLUTION**.  
**PROPOSITION**, in poetry, denotes the first part of an epic poem, wherein the author proposes, or lays down, briefly and in general, what he has to say in the course of his work. See **POEM**, **EPIC**, &c.  
The *proposition*, F. Bossu observes, is to contain the bare matter of the poem, i. e. the action, and the persons that are to execute it, both human and divine.  
This is what we have both in the *Iliad*, the *Odysee*, and the *Æneid*. The action proposed in the *Iliad*, is the wrath of Achilles; that of the *Odysee*, the return of Ulysses; and that of the *Æneid*, the translation of the Trojan empire into Italy. The same author observes, that the divine persons are named in all the three *propositions*. Homer, e. gr. declares, that what happens in the *Iliad*, is by the will of Jupiter; and that Apollo was the cause of the quarrel between Agamemnon and Achilles: the same poet says, it was Apollo prevented the return of Ulysses's companions; and Virgil mentions the destinies, the will of the gods, and the anger of Juno.—But they all three dwell chiefly on the person of the hero, as if he were the matter of the poem. See **HERO**.  
Yet there is some difference, in this respect, in the three poems; in that Achilles is named in the *Iliad*; but Ulysses and Æneas are not: they are only pointed at, and that in such general terms, as if it were supposed they were known before.  
This Practice seems to fall in with the first intention of the poet; who is to feign an action without names, and who, as Aristotle says, does not relate the action of Achilles, nor Ulysses, nor Æneas, nor any particular person, but of an universal, general, and allegorical person. See **FABLE** and **ACTION**.  
Add to this, that the character which the poet is to give his hero, and his whole work, is expressed in the *proposition*, both by Homer and Virgil. See **CHARACTER**.  
The whole *Iliad* is anger and violence; it is Achilles's character, and it is what the poet commences with: *Μῆνιν ἄειδε*. The *Odysee* presents us in the first verse with the prudence, dissimulation, and address, which make the character of Ulysses, and the business of the poem: *Ἀνδρᾶ ἀποδείξοντο*. And we see the piety and mildness of Æneas in the beginning of the Latin poem: *Insignem pietate virum*.  
As to the manner of the *proposition*, Horace contents himself to prescribe modesty and simplicity; not to promise much, nor raise great expectations in the reader. *Do not begin*, says he, *like that wretched poet, who set out with*, *Fortunam Priami cantabo*,

*cantabo, & nobile bellum. How much better is that of Homer, Dic mihi, musa, virum! &c. He does not spend all his fire, at once, and leave nothing but smoke: from this feeble beginning, you shall soon see him rise to the wonders of Antiphates, Scylla, Charybdis, and Polypheme.*

The same modesty we find in the *proposition* of the *Æneid*: if that of the *Iliad* be a little more furious, it is, perhaps, in conformity to the character of the poem, which is a series of violences and extravagances.

Add, that if the poet be to speak with modesty of his hero; much more is he to do so of himself: thus Virgil only says, *I sing the action of Æneas*. Homer begs his muse to say, or sing. How far does Claudian swerve from these examples?

*Audaci promere cantu*

*Mens congesta jubet; gressus remove, profani:*

*Jam furor humanos nostra de pectore sensus*

*Expulit, & totum spirant præcordia Phæbum.*

A short poem, *e. gr.* an ode, &c. wherein the violent strain could be pursued to the end, might admit of such a pompous beginning. Thus we find Horace begin an ode much after the manner of Claudian:

*Odi profanum vulgus, & arceo*

*Carmina non prius*

*Audita Musarum sacerdos*

*Virginibus puerisque canto.*

But the length of an epic poem quite excludes all pompous *propositions*.

There is scarce any fault we have yet observed a *proposition* liable to, but there is an instance of in the *proposition* of Statius's *Achilleid*: he bids his muse rehearse the deeds of the magnanimous son of *Æacus*, who was formidable even to the thunderer. He adds, *That he has worthily discharged a former undertaking; and that Thebes esteems him a second Amphion.*

*Magnanimum Æacidem, formidatamque Tonanti*

*Progeniem, & patrio vetitam succedere cælo,*

*Diva, refer.*

*Tu modo, si veteres digno deplevimus haustu,*

*Da fontes mihi, Phæbe, novos, &c.*

**PROPRÆFECT**, **PROPRÆFECTUS**, among the Romans, the prefect's lieutenant; or an officer whom the prefect of the pretorium commissioned to do any part of his duty in his place. See **PREFECT**.

In Gruter, p. CCCLXX. the third inscription mentions *propræfects* of the pretorium under Gratian, in the city of Rome, and the neighbouring parts. See **PRETORIUM**.

**PROPRETOR**, or **PROPRÆTOR**, a Roman magistrate, who having discharged the office of pretor at home, was sent into a province to command there with his former pretorial authority. See **PRETOR**.

**PROPRETOR** was also an appellation given to those, who, without having been pretors at Rome, were sent extraordinarily into the provinces, to administer justice with the authority of pretors.

**PROPRETOR** is also a denomination given by some to those sent by the emperors into the provinces, which, upon partition in Augustus's time, fell to their lot: as the name *proconsul* was given to those sent into the provinces that fell to the people's share. See **PROCONSUL**.

**PROPRIETARY monks**, were such as had reserved goods and effects to themselves, notwithstanding their former renunciation of all at the time of their profession.

They are frequently mentioned in the *Monast. Anglic. &c.* and were to be very severely dealt withal; to be excommunicated, deprived of burial, &c.—*Monachi proprietarii excommunicentur ab abbatibus, & si in morte proprietarii inventus fuerit, ecclesiastica careat sepultura, &c.* Addit. ad Matt. Par.

**PROPRIETATE probanda** is a writ to the sheriff to enquire of the property of goods distrained, when a defendant claims a property upon a replevin sued.

Where a property is proved by the defendant, a replegiari properly lyes not. See **REPLEVIN** and **DISTRESS**.

**PROPRIETATIS elixir**. See the article **ELIXIR**.

**PROPRIETOR**, or **PROPRIETARY**, he who has the property or propriety of any thing. See **PROPERTY**.

**PROPRIETOR**, in law, is strictly such a one as has or possesses any thing as his own in the utmost degree: *Quæ nullius arbitrio est obnoxia.*

The term was formerly applied in a particular manner to him who had the fruits of a benefice to himself and his successors; as in ancient time abbots and priors had.

**PROPRIETY**, in grammar, is where the direct and immediate signification of a word agrees to the thing it is applied to. See **PROPER** and **IMPROPRIETY**.

In which sense *propriety* is used in opposition to a figurative or remote signification. See **FIGURATIVE**, &c.

**PROPYLÆUM**\*, the porch of a temple, or great hall. See **PORCH**.

\* The word is Greek, *προπυλαίον*, which signifies the same.

Hence *propylæum* is also used figuratively in matters of learning, for an introduction, apparatus, or prodromus to some greater work.—In this sense we say, the *propylæum* of the Jesuits at Antwerp, &c.

**PROQUESTOR**, **PROQUÆSTOR**, the questor's lieutenant, or a person who discharged the office of questor in his stead. See **QUESTOR**.

The word is chiefly applied to an officer appointed by the

governor of a province to discharge the questure after the decease of the questor, till the senate and people should send a new one.

**PRORÆ** os, in anatomy, a bone of the cranium, called also *os occipitis*. See **os OCCIPITIS**.

**PRO RATA**, in commerce, a term sometimes used among merchants, for *in proportion*. See **PROPORTION**.

Thus, when speaking of any undertaking they say, Each person must reap the profit, or sustain the loss, *pro rata* to his interest; it is meant, each shall gain or lose, in proportion to the sum he put in stock.

**PRO RATA portionis**, in law. See **ONERANDO pro rato portionis**.

**PROROGANDA assisa**. See the article **ASSISA**.

**PROROGATION**, **PROROGATIO**, the act of prolonging, adjourning, or putting off to another time.

The difference between a *prorogation* and an *adjournment* of parliament is, that by *prorogation* the session is ended; and such bills as passed in either house, or both houses, and had not the royal assent, must at the next assembly begin again; for that every session of parliament is, in law, a several parliament: whereas, if the parliament be only *adjourned*, there is no new session; and consequently, all things continue in the same state they were in before the adjournment. See **ADJOURNMENT**.—But this difference between *prorogation* and *adjournment* is of no long standing: anciently they were used as synonymous, *Prorogetur curia de hora in horam, quousque placitum terminetur. MS. de L. L.*

To *prorogue* the parliament, the king goes in person, with his crown on his head, and sends the black rod for the house of commons to attend him at the bar of the house of lords; where, after giving an answer to each bill signified to him, he makes a speech; and the lord chancellor by command, signifies the parliament to be *prorogued*. See **PARLIAMENT**.

The *proroguing* of the lower house of convocation is a power vested in the archbishop with the consent of the suffragans. See *Life of Queen Anne*, p. 87.

**PROSAIC numbers**. See the article **NUMBER**.

**PROSCENIUM**, in the ancient theatre, an eminence whereon the actors performed their parts. See **THEATRE**.

The *proscenium* answered to our stage.—It consisted of two parts among the Greeks; one particularly so called, where the actors performed: the other was the *logeion*, where the singers and the mimics acted their parts.—Among the Romans, the *proscenium* and *pulpitum* were the same thing. See **PULPITUM**.

**PROSCRIPTION**, **PROSCRIPTIO**, a publication made in the name of the chief or leader of a party, whereby he promises a reward to any one who shall bring him the head of one of his enemies.

Sylla and Marius by turns *proscribed* each other's adherents.—Under the triumvirate, a great part of the best and bravest of the Romans fell by *proscription*.

The term took its rise from the practice of writing down a list of the persons names, and posting it in public: from *pro*, and *scribo*; I write.

**PROSE**\*, **PROSA**, the natural language of mankind, loose, and unconfined by poetical measures, rhymes, &c.—In which sense it stands opposed to *verse*. See **VERSE**.

\* The word comes from the Latin *prosa*, which some will have derived from the Hebrew *poras*, which signifies *expendit*: others deduce it from the Latin *prosa*, of *prosum*, going forwards; by way of opposition to *versa*, or turning backwards, as is necessary in writing.

Though *prose* have its connexions, which sustain it, and a structure, which renders it numerous; it ought still to appear free: its character consists in running easy and unconstrained. See **STYLE**, **NUMBERS**, &c.

Poets very rarely have the talent of *prose*: the habit of wearing chains sits fast upon them, even when the chains are off.

St. Evremond compares *prose* writers to foot-travellers, who walk with less noise, but more security, than the cavaliers.

**PROSECUTOR**, in law, is he that pursues a cause in another's name. See **PROMOTER**.

**PROSELYTE**\*, **PROSELYTUS**, a new convert to the faith.

\* The word is pure Greek, *προσηλύτος*, which, in Latin, signifies *advena*; in English, *stranger*, or one arrived out of another country.

The term was much used in the primitive church.—The Jews too had their *proselytes*, who from Gentiles embraced Judaism. See **NEOPHYTE** and **CATECHUMEN**.

**PROSODY**\*, **PROSODIA**, that part of grammar which teaches and directs the pronunciation and manner of rehearsal; marks the accents, and distinguishes the long and short syllables. See **GRAMMAR**, **PRONUNCIATION**, &c.

\* The word is formed from the Greek *προσῳδία*, compounded of *προσ*, and *ὠδή*, *cantus*, singing.

*Prosody* is properly that branch of grammar which relates to syllables; treating of their true pronunciation in respect of accent, and time or quantity. See **SYLLABLE** and **ACCENT**, &c.

The English *prosody* turns chiefly on two things: *numbers*, that is, a certain number of feet or syllables; see **NUMBERS**:—and *rhyme*, or a similitude of sound between the last syllables of words. See **RHYME**

The Greek and Roman *profodies* were unacquainted with rhyme; but in lieu thereof had something to make their verse harmonious, without, viz. *quantity*. See *QUANTITY*.

**PROSONOMASIA**, *προσωνομασία*, a figure in rhetoric, whereby allusion is made to the likeness of a sound in several names or words; much the same with *paronomasia*, or *agnominatio*. See *PARONOMASIA*.

**PROSOPOPOEIA**\*, *προσωποποιία*, in rhetoric, a figure, whereby we make persons that are absent, or dead, or even things which are inanimate, as cities, &c. to speak. See *FIGURE*.

\* The word is formed from the Greek, *προσωπον*, *person*, and *ποιω*, *I make*, or *feign*.

The poets, in their fictions, make frequent use of the *proso-popeia*; as also do the orators, in their painting of violent passions, which seem to transport, and make them forget themselves.

There are two kinds of *prosopepeia*'s; the one *direct*, the other *indirect*.—For an instance of the latter: *Just gods, protectors of the innocent, permit the order of nature to be interrupted for one moment, and let this carcase resume the use of speech*, &c.

Instances of the former are found every-where among the orators and poets: that which follows is a very beautiful one, found by way of epitaph on a tomb-stone: the dead wife addresses her surviving husband thus:

*Immatura peri: sed tu felicior, annos  
Vive tuos, conjux optime, vive meos.*

**PROSPECT**, } See } **PERSPECTIVE**.  
**PROSPECTIVE glass**, } See } **PERSPECTIVE glass**.  
**PROSPHYSIS**, see **ADHESION**.

**PROSTATÆ**, *προστάται*, in anatomy, two white, spongy, glandulous bodies situate at the root of the penis, or just below the neck of the bladder, and about the size of walnuts.—See *tab. anat. (planch.) fig. 8. lit. pp. fig. 15. lit. cc.* See also **GLAND** and **PENIS**.

Authors ascribe two kinds of substance to the *prostatæ*, the one, glandulous, the other spongy, or porous; which last seems nothing but a congeries of minute vessels and cells, through the middle of which pass the vesiculæ feminales, without any communication therewith.

The *prostatæ* have excretory ducts of their own, pretty numerous: De Graaf does not remember to have known them fewer than ten in the *prostatæ* of a man; in dogs they are sometimes an hundred, each of which discharges itself into the urethra, some above, some below the caput gallinaceum; each having its proper caruncle.

Out of these issues a whitish, slimy humour, secreted in the glandular part of the *prostatæ*, and conveyed into the cavity of the urethra.

The use of this humour is to line and lubricate the cavity of the urethra, and prevent it from being annoyed with the acrimony of the urine in its passage through it; and to serve as a vehicle to the seed, in the time of ejaculation. See **URINE**, **URETHRA**, &c.

Some take it for a third kind of seed, but without much reason. See **SEED**.—Boerhaave thinks it may serve to nourish the animalcule during the first moments after coition.—This humour, he adds, remains after castration, but is not prolific.

The same author, from the memoirs of the French academy, makes the *prostatæ* to consist of an aggregate of twelve glands, each of which terminates by its excretory duct in a little bag, into which it discharges its humour. These twelve bags open by as many excretory ducts into the cavity of the urethra, so as to encompass the exit of the vesiculæ; whence the seed and the humour of the *prostatæ* are the more accurately mixed.

**PROSTHAPHÆRESIS**\*, in astronomy, the difference between the true and mean motion, or true and mean place, of a planet; called also *equation of the orbit*, or *of the centre*, and simply *the equation*. See **EQUATION**.

\* The word is formed from the Greek, *προσθις*, *ante*, *super*; and *ἀφαιρέσις*, *ademptio*.

*Prosthaphæresis* amounts to the difference between the mean and equated anomaly. See **ANOMALY**.

Thus, suppose the circle **ALMPNR** (*tab. astron. fig. 51.*) the orbit of the earth, surrounded by the ecliptic  $\gamma$ ,  $\delta$ ,  $\epsilon$ , &c. and suppose **S** the sun, and the earth in **R**, the mean anomaly will be the arch **APR**, or, casting away the semicircle, the arch **PR**, or the angle **PCR**; and the true anomaly, rejecting the semicircle, will be **PSR**, which is equal to **PCR** and **CRS**: if then to the mean anomaly, we add the angle **CRS**, we shall have the true anomaly **PSR**, and the earth's place, in the ecliptic. See **PLACE**, &c.

And here the angle **CLS**, or **CRS**, is called the *prosthaphæresis* or *equation*, by reason it is sometimes to be added, and sometimes to be subtracted from the mean motion, that we may have the true motion or place of the earth. See **EARTH**.

**PROSTHESIS**, *προσθήκη*, in grammar, a species of metaplasm; being the prefixing of some letter or syllable at the beginning of a word:—As in, *gnavus*, *pro navus*.

This is also called *apposition*. See **APPOSITION**.

**PROSTHESIS**, among surgeons, is the filling up of what was before wanting, by the apposition of new matter.

Such, *e. gr.* is the filling up of fistulous ulcers with new flesh. See **INCARNATION**, &c.

**PROSTYLE**\*, *προστυλῶς*, in the ancient Greek architecture, a range of columns in the front of a temple. See **TEMPLE** and **AMPHIPROSTYLE**.

\* The word is formed from the Greek *προ*, *before*, and *τυλῶ*, *column*.

**PROSYLLOGISM**, **PROSYLLOGISM**, is used by some school-writers, for a reason or argument produced to strengthen or confirm one of the premises of a syllogism. See **SYLLOGISM** and **PREMISE**.

Others define *prosyllogism*, an argument composed of two syllogisms, so disposed, as that the conclusion of the former is the major or minor of the latter.—*e. gr.* Every rational is risible: but every man is rational, therefore every man is risible; but no ass is risible, therefore no ass is a man.

The major, or the second syllogism, may be omitted or understood; and some even contend that it ought to be so: so that on their principle, a *prosyllogism*, or redundant syllogism, is when two syllogisms are so contained in five propositions, as that the conclusion of the former is the major or minor of the latter. See **SYLLOGISM**.

**PROTASIS**\*, *πρωτασίς*, in the ancient drama, the first part of a comic or tragic piece; wherein the several persons of the play are shewn, their characters and manners intimated, and the action, which is to make the subject of the piece, proposed, and entered upon. See **DRAMA**, **TRAGEDY**, &c.

\* The word is formed from the Greek *πρωτων*, *porrigo*, *I bold forth*.

The ancient *protasis* might go about as far as our two first acts. See **ACT**.—Where the *protasis* ended, the *epitasis* commenced. See **EPITASIS**.

**PROTATICUS**, *πρωτατικός*, in the ancient drama, a person who never appeared but in the *protasis*, or first part of the play; as *Sofia* in Terence's *Andria*, &c.

**PROTECTION**, **PROTECTIO**, the shelter, defence, authority, and aid, employed by any one in behalf of the helpless or unhappy. See **PROTECTOR**.

*Active protection* supposes power, interest, favour, &c. in the person that protects.—*Passive protection*, on the contrary, implies necessity, weakness, and dependence, in the person protected. See **SAFEGUARD**.

**PROTECTION** is also used for a privilege belonging to ambassadors, members of parliament, &c. whereby they and their domestics are secur'd from arrests, &c. See **PRIVILEGE**, &c.

**PROTECTION** is sometimes also understood of the person of the protector. Such a cardinal has the *protection* of France.—The *protection* of Spain is become vacant by the death of such a cardinal. See **PROTECTOR**.

**PROTECTION**, in law, in its general sense, denotes that benefit and safety which every subject, denizen or alien, specially secured, hath by the laws. See **LAW**.

**PROTECTION**, in a more special sense, is used for an exemption, or immunity, given by the king to a person, to secure him against suits in law, or other vexations, upon reasonable causes moving him thereunto, and for a certain time.

Of this, Fitzherbert makes two kinds: the first he calls a *protection*, *cum clausula volumus*; whereof he mentions four cases:—1°. A *protection*, *quia profecturus*, for him that is to pass over-sea in the king's service.—2°. A *protection*, *quia moraturus*, for him who is already abroad in the king's service; as an ambassador, &c.—3°. A *protection* for the king's debtor, that he be not sued or attached, till the king be paid his debt.—4°. A *protection* for a person in the king's service beyond sea, or in the marches of Scotland.

The second form of *protection* is *cum clausula nolimus*, which is most commonly granted to a spiritual company, for their immunity from having their cattle taken by the king's ministers.—But it may be also granted to a single person, either spiritual or temporal.

*Protection* extends not to pleas of dower, quare impedit, affize of novel disseisin, darrein presentment, attainments, nor pleas before justices in eyre.

**PROTECTOR**, a person who undertakes to shelter and defend the weak, helpless, or distressed. See **PROTECTOR** and **PATRON**.

God, and the magistrate, are the *protectors* of the widow and orphan.—Among the heathens, *Minerva* was esteemed the *protectors* of arts.

Every catholic nation, and every religious order, has a *protector* residing at the court of Rome, who is a cardinal, and called the *cardinal protector*. See **CARDINAL**.

**PROTECTOR** is sometimes also used for a regent of a kingdom, made choice of to govern it during the minority of a prince.—Cromwell assumed the title and quality of *lord protector of the commonwealth of England*.

**PROTEST**, in law, is used for a caution, or call of witness, or an open affirmation, that a person does either not at all, or but conditionally, yield his consent to any act; or to the proceeding of any judge in a court, wherein his jurisdiction is doubtful; or to answer upon his oath farther than by law he is bound. See **PROTESTATION**.

Any of the lords in parliament have a right to *protest* their dissent to any bill passed by a majority; which *protest* is entered in form.—This privilege is said not to be very ancient: the commons have no right to *protest*. See **PARLIAMENT**.

**PROTEST**, in commerce, is a summons made by a notary public to a merchant, banker, or the like, to accept or discharge a bill of exchange drawn on him, after his having refused either to accept or pay the same. See *BILL of exchange*.

It is called a *protest*, because containing a protestation, that the party will return the bill, and even take up money at interest; and charge all costs, damages, carriage and recarriage, on the refuser.

There are two kinds of *protests*; the one for want of acceptance, the other for want of payment. See *ACCEPTANCE*, &c.

The first, to be made by the bearer of the bill at the time of presenting it, in case the person, on whom it is drawn, refuse to accept it for the time, or the sum there expressed.—The latter is made as the bill falls due, whether it have been accepted or not. See *EXCHANGE*.

The bearers of bills of exchange, that have been accepted, or which become payable at a certain day, are obliged to have them either paid or *protested* within three days after due; on the penalty of answering for the omission: and it must be observed, that if the third day happen to be a holy-day, the *protest* is to be made on the eve thereof.

At Paris and Hambourg, the *protest* is to be made within ten days: at Venice, where all bills are paid in banco, the *protest* for want of payment is to be made within six days; but then the bank is supposed open, otherwise no *protest* to be made: at Rome, *protests* for want of payment are to be made within fifteen days: at Leghorn, Milan, and Bologna, there is no time fixed: at Amsterdam, they are to be made within five days: at Venice, the third day.

The negotiants of some places, as those of Rome, M. Savary observes, do not look on themselves as obliged to *protest* in default of payment; but this opinion is contrary to universal custom, and natural reason; since, till after *protestation*, they have no remedy or resource against the drawer or indorser, nor any title to be reimbursed.

M. Ricard adds, that bills of exchange drawn from Amsterdam, or Antwerp, or Spain, are to be *protested*, in default of payment within fourteen days after they fall due; after which time the bearer stands the risk and chance of the *non-protested* bill, not the drawer or indorser, in case the party happens to fail after the said fourteenth day.

**PROTESTANT**, a name first given in Germany to those who adhered to the doctrine of Luther; because in 1529. they *protested* against a decree of the emperor Charles V. and the diet of Spire; and declared, that they appealed to a general council. See *REFORMATION*.

The name has been since also given to those who adhere to the sentiments of Calvin, and is now become a common denomination for all those of the reformed churches. See *LUTHERAN*, *CALVINIST*, *PRESBYTERIAN*, &c.

Great endeavours have been made to unite the Lutheran *protestants* with the Calvinists; but hitherto in vain.

**PROTESTATION**, a solemn declaration made by some judiciary act or proceeding, against an oppression, violence, or injustice; or against the legality of a sentence, judgment, decree, or other procedure; importing, that the party is determined to oppose it at the proper time, &c. See *PROTEST*.

*Protestation* is defined by justice Walfh, a defence or safeguard to the party that makes it, from being concluded by the act he is about to do; so that issue cannot be joined upon it.

*Protestation* is defined by Plowden, a form of pleading, when one does not either directly affirm or deny any thing alledged by another, or which he himself alleges. Plowd. fol. 276.

**PROTHESIS**, a little altar in the Greek churches, whereon a ceremony is performed, called by the same name *προthesis*. See *ALTAR*.

On this altar the priest, with the other ministers, prepares every thing necessary to the celebration of mass; viz. the bread, wine, &c.—After which they go in procession from this to the great altar, to begin mass, carrying with them the species thus prepared.

**PROTHONOTARY**, **PROTONOTARIUS**, **PROTONOTARY**, a term properly signifying *first notary*, and which was anciently the title of the principal notaries of the emperors of Constantinople. See *NOTARY*.

With us, *prothonotary*, called also *preignatory*, is used for an officer in the courts of king's-bench and common-pleas; the latter whereof has three, the former one. See *COURT*, &c.

**PROTHONOTARY of the king's-bench** records all actions civil sued in that court; as the clerk of the crown-office doth all criminal causes. See *KING's bench*, *RECORD*, &c.

**PROTHONOTARIES of the common-pleas** enter and inrol all declarations, pleadings, assizes, judgments, and actions: they also make out all judicial writs; as the *venire facias*, after issue joined; *habeas corpus*, for bringing in of the jury; *distringas jurator*; writs of execution and seisin, of superfeudais, of privilege, &c. they inrol all recognizances acknowledged in that court, all common recoveries; make exemplifications of records, &c.

**PROTHONOTARY**, or **PROTONOTARY**, is also an officer in the court of Rome, who has a degree of pre-eminence over the other notaries. See *NOTARY*.

There is a college of twelve *prothonotaries*, called *participantes*, because partaking in the fees of the expeditions in chancery. See *PARTICIPATION*.

They are ranked among the numbers of prelates, wear the violet rochet, the hat, &c. They assist at all grand ceremonies, and have a place in the pope's chapel.

Their office is to dispatch the acts in grand causes, which the simple apostolical notaries dispatch in lesser causes: they may create apostolical notaries and doctors, to officiate out of the city.

Those out of the college have none of the privileges of the others, except the habit.

The *prothonotaries* were first established at Rome by pope Clement I. with design to write the lives of the martyrs. See *NOTARY*.

**PROTHYRIS**, in the ancient architecture, is sometimes used for a quoin, or corner of a wall; otherwise called *anco*. See *ANCO*.

Sometimes also for a cross-beam, or over-thwart rafter.

**PROTHYRIS** is also used by Vignola for a particular sort of key of an arch, an instance of which we have in his Ionic order, consisting of a roll of water-leaves, between two reglets and two fillets, crowned with a Doric cymatium; its figure being much like that of a modillion.

**PROTHYRUM**, *προθυρον*, a porch at the outward door of an house, or portal. See *PORCH* and *VESTIBLE*.

**PROTO\***, a word used in composition with divers terms in our language, to express a relation of priority; as in *protomartyr*, *proto-type*, &c.

\* It is formed of the Greek *πρῶτος*, *primus*, first.

**PROTOCOLLUM**, *πρωτοκολλιον*, a term used in the ancient jurisprudence, for the first leaf of a book, wherein was the mark of the paper or parchment.

It was even sometimes used for the mark itself; which was usually in the margin, but sometimes at the top of the page.

The xlvth novel of Justinian forbids cutting the *protocolum* of charters, which shew the year wherein the paper or parchment were made, and the officer commissioned for the delivery of them; by means whereof frauds were frequently detected.

**PROTOCOLLUM** was also used for the first minute, draught, or summary, of an act to be passed; which the notary drew up in short, in little table-books, to be afterwards enlarged at leisure. See *NOTARY*.

**PROTO-FORESTARIUS** was he whom our ancient kings made chief of Windsor-forest, to take cognizance of all causes of death or mayhem there; after the manner of a lord chief justice in eyre. See *FOREST*, *FORESTER*, *JUSTICE*, &c.

**PROTO-MARTYR\***, the *first martyr*, or witness, who suffered death in testimony of the truth; as Abel in the old testament, and St. Stephen in the new. See *MARTYR*.

\* The word is compounded of *πρῶτος*, *first*, and *μαρτυρ*, *witness*.

**PROTONOTARY**. See *PROTHONOTARY*.

**PROTOPLAST**, **PROTOPLASTUS**, a title sometimes given to our first father Adam; from the Greek *πρωτοπλαστης*, *q. d.* first formed. See *PLASTIC*.

**PROTOTYPE**, *πρωτοτυπον*, the original or model, whereby a thing is formed. See *TYPE* and *ARCHETYPE*.

It is used chiefly for the patterns of things to be engraven, moulded, or cast. See *MODEL*, *MOULD*, &c.

**PROTOTYPON**, *πρωτοτυπον*, in grammar, is sometimes used for a primitive or original word. See *PRIMITIVE*.

**PROTRACTING**, or **PROTRACTION**, in surveying, the act of plotting, or laying down the dimensions taken in the field, by means of a *protractor*, &c. See *PROTRACTOR* and *PLOTTING*.

*Protracting* makes one half of surveying. See *SURVEYING*.

**PROTRACTING pin**, a mathematical instrument; or rather, an appendage of an instrument called a *protractor*.

The *protracting pin* is a fine needle, fitted into a handle, used to pick off degrees and minutes from the limb of the *protractor*. See *PROTRACTOR*.

**PROTRACTOR**, an instrument used in surgery, to draw out any foreign or disagreeable bodies from a wound or ulcer; in like manner as the forceps. See *FORCEPS*.

**PROTRACTOR** is also an instrument used in surveying; whereby the angles taken in the field with a theodolite, circumferentor, or the like, are plotted or laid down on paper. See *PLOTTING*.

The *protractor* consists of a semicircular limb B A G (*tab. SURVEYING*, fig. 29.) of brass, silver, horn, or the like, divided into 180°, and subtended by a diameter B A; in the middle whereof is a little notch or lip, *o*, called the *centre of the protractor*.

On the limb of the *protractor* are sometimes also placed numbers, denoting the angles at the centres of regular polygons: thus, against the number 5, denoting the sides of a pentagon, is found 72, the angle at the centre of a pentagon. See *POLYGON*.

*Use of the PROTRACTOR*.—1. To lay down an angle of any given quantity, or number of degrees. Suppose, *e. gr.* an angle of 50° with the line A o B, required on the point *o*. Lay the centre of the *protractor* on the given point, and the diameter of the *protractor* on the given line. Make a mark against the given degree 50, on the limb of the *protractor*; through which, from the given point, draw a line *o p*; this gives the angle required.

2. To find the quantity of a given angle: e. gr. the angle *p o A*. Lay the centre of the *protractor* on the point of the angle *o*, and the diameter on the line. The degree of the limb cut by the other line *o p*, viz. 50, is the number of degrees of the angle required.

3. To inscribe any given regular polygon, e. gr. a pentagon in a circle. Lay the centre and diameter of the *protractor* on the centre and diameter of the circle; and make a dot against the number of degrees of the angle at the centre, viz. 72. Through this dot, and the centre of the circle, draw a line cutting the circumference of the circle. To the point of intersection, from the point where the diameter cuts the circumference, draw a right line: this line will be a side of the pentagon, which being taken in the compasses, and set off as often as it will go in the circumference, will give points, which being connected by lines, will form the pentagon required. See POLYGON.

4. To describe any regular polygon, e. gr. an octagon on a given line. Subtract the angle at the centre, which the *protractor* gives, 45° from 180, the remainder 135 degrees is the angle included between two sides of the octagon; one half whereof is 67½. Applying then the diameter of the *protractor* over the given line, with the centre over one extreme; make a dot against 67½, to which from the centre draw a line. Apply the *protractor* to the other end of the line, so as the centre be over the extreme, and there set off another angle of 67½. From the point where the two lines thus drawn intersect as a centre, describe a circle with the interval of the given line. The given line will be one side of the octagon, which being set off as often as it will go in the circumference thus drawn, will give points, which being connected, will form the octagon required.

**PROTRACTOR improved**, is an instrument much like the former, only furnished with a little more apparatus, whereby we are enabled to set off an angle to a minute; which is impracticable in the other.

The chief addition is an index fitted on the centre, and moveable thereon; so as to play freely and steadily over the limb. Beyond the limb the index is divided, on both edges, into 60 equal parts of the portions of circles, intercepted by two other right lines drawn from the centre; so as each makes an angle of one degree with lines drawn to the assumed points from the centre.

To set off an angle of any number of degrees and minutes with this *protractor*. Move the index, so that one of the lines drawn on the limb, from one of the fore-mentioned points, may fall upon the number of degrees given; and prick off as many of the equal parts on the proper edge of the index, as there are minutes given: thus, drawing a line from the centre to that point so pricked off, you have an angle with the diameter of the *protractor*, of the proposed number of degrees and minutes.

Indeed, it may be of good use to lay down an angle to a minute, when we are able to take it to a minute: but till we have other-guise needles, and juster theodolites, than are yet made, the old *protractor* may serve very well. See THEODOLITE.

**PROTUBERANCE**, **PROTUBERANTIA**, in anatomy, any eminence, whether natural or preternatural, that projects, or advances out beyond the rest. See APOPHYSIS, PROCESS, &c. The orbicular protuberances of the third ventricle of the brain are called *nates*: and the apophyses of the orbicular protuberances are called *testes*. See NATES and TESTES.

The annular protuberance is a process of the medulla oblongata, in form of a ring; whence its name, first given it by Willis. See MEDULLA oblongata and ANNULAR.

**PROVEDITOR**, **PROVEDITOUR**, or **PROVEDITORE**, an officer in several parts of Italy, particularly at Venice.

There are various kinds of *proveditors* in Venice: as *proveditor of the commons*, who is nearly the same with *ædile* among the Romans, consul in Languedoc, and *eschevin* in other cities.—Of these *proveditors* there are three:

The *proveditores alle ragioni vecchie, alla biava, alla giustizia*; &c. have the direction of matters relating to policy throughout the signory.

**PROVEDITOR general of the sea**, is an officer whose authority extends over the whole fleet, when the captain-general is absent.—He has, particularly, the disposal of the cash, and pays the seamen and soldiers.

The captain-general and *proveditor* are mutually spies over one another: though the *proveditor* be inferior to the general, yet is the power so divided, that one has authority without strength, the other strength without authority.

**PROVEND\***, or **PROVENDOR**, is properly a sort of vessel containing the measure of gains daily given to a horse, or other beast of labour for his daily subsistence.

\* Some derive the word from the Latin *præbenda*, or *prebend*. See PREBEND.

Hence, *provender* is also become a general name for all food of cattle.—In monasteries, when the religious go to meals, they are said to go to *provend*.

**PROVER**, in law, *probator*, an approver, or person who, confessing felony, appeals, or accuses another of the same. See PROBATOR and APPROVER.

He is thus called, because he must prove what he alleges in his appeal; which proof is either by battle, or by the country, at his election who is appealed. See TRIAL, COMBAT, &c.

39. *Edw. 3. coram rege, rot. 97. Suff.* a man became an *approver*, and appealed five, who all joined battle with him, and he overcame them all: four of them were accordingly hanged, and the fifth pleaded he was a clerk. The *prover* was pardoned.

**PROVERB**, **PROVERBIUM**, is defined by Camden, a concise, witty and wise speech, grounded upon long experience, and containing, for the most part, some useful caveat. See ADAGE. Such are, A close mouth catches no flies.—An high building, a low foundation.—A carrion kite will never be a good hawk.—A short horse is soon curried.—A man may love his house well, though he ride not on the ridge.—A false knave needs no broker.—Better to spare at brim than at bottom, &c.

**PROVIDENCE**, **PROVIDENTIA**, the conduct and direction or the several parts of the universe, by a superior, intelligent being. See UNIVERSE.

The notion of a *providence* is very ancient, even in the heathen theology: we find Thales mentions it.—It is founded on this supposition, That the creator has not so fixed and ascertained the laws of nature, nor so connected the chain of second causes, as to leave the world to itself; but that he still preserves the reins in his own hands, and occasionally intervenes, alters, restrains, enforces, suspends, &c. those laws by a particular *providence*. See MIRACLE.

Some use the word *providence* in a more general sense, signifying by it, that power or action whereby the several parts of the creation are ordinarily directed.

Thus, Damascenus defines *providence* to be the divine will, whereby all things are ordered and directed to the proper end.—Which notion of *providence* supposes no laws at all fixed by the author of nature at the creation; but that he reserved it at large to be governed by himself occasionally. See NATURE and LAW.

The ancients called *providence* by the names of *fate, fortune, nature, destiny, necessity*, &c. See FATE, FORTUNE, &c.

The ancient Egyptians seem to have been the first who had the notion of a divine *providence*. Arnobius observes they reasoned thus:—“*Providence* is so essential to a prince, that without it he cannot be, nor even be called, a prince; and the more august a prince is, the more perfect ought his *providence* to be. Since then God is the greatest and most august of all princes, to him must belong the most perfect *providence*.”

The Epicureans deny any divine *providence*, as thinking it inconsistent with the ease and repose of the divine nature to meddle with human affairs. See EPICUREAN.

Others deny the existence of a *providence* from the seemingly unjust distribution of good and evil, which appear to fall indiscriminately on the just and unjust.

Simplicius argues thus for a *providence*: If God do not look to the affairs of the world, it is either because he cannot, or will not: but the first is absurd; since to govern cannot be difficult, where to create was easy: the latter is both absurd and blasphemous. See GOD.

**PROVIDENTLÆ\***, in old law-books, were provisions of meat and drink. See PURVEYANCE.

\* *Providentia vini ante adventum suum in cellaria erat centum doliorum.* Knighton, anno 1354.

**PROVINCE\***, **PROVINCIA**, among the Romans, was a country conquered by them, without the bounds of Italy; governed by a deputy or lieutenant, and having peculiar laws and privileges. See PROCONSUL, &c.

\* Nicod derives the word à *procul vivendo*, living afar off; but it is better deduced from *pro* and *vinco*, I overcome.

Of these countries that part of France next the Alps was one, and still retains the name *Provence*.

**PROVINCE** is now chiefly used for a canton or division of a kingdom or commonwealth, comprehending several cities, towns, &c. all under the same government, and usually distinguished by the extent either of the civil or ecclesiastical jurisdiction.

The *provinces* were anciently duchies, counties, &c. which have been since all re-united under the same chief. See DUKE, COUNT, &c.

The church distinguishes its *provinces* by archbishopricks, each containing a certain number of bishopricks. See ARCHBISHOP. In this sense England is divided into two *provinces*, Canterbury and York.

The monks make particular divisions of *provinces*, according to the antiquity and number of convents in each. See PROVINCIAL, ORDER, &c.

The United *Provinces* are the seven northern provinces of the Low-countries, who, revolting from the Spanish dominion, made a firm and perpetual alliance, offensive and defensive, at Utrecht, in the year 1579. See STATES General.

**PROVINCIAL**, **PROVINCIALIS**, something relating to a province. See PROVINCE.

Thus we say, a *provincial council* or *synod*, &c. See SYNOD and COUNCIL.

**PROVINCIAL**, in the monastic sense, denotes a person who has the direction and superintendency of the several convents of a province, according to the division established in that order. See ORDER, &c.

The general of the order has several provinces under him; the provincial several priors, abbots, &c. See GENERAL, ABBOT, &c.

PRO-

**PROVINE, PROVIN**, a branch of a vine laid in the ground to take root. See **VINE, PROPAGATION, &c.**

**PROVISION, PROVISIO**, any thing got or procured, as necessary for the subsistence of life. See **PROVIDENTIAE**.

**PROVISION**, in traffick, is sometimes used for the wages due to a factor. See **FACTORAGE**.

**Commissary of PROVISIONS**. See the article **COMMISSARY**.

**Park of PROVISIONS**. See the article **PARK**.

**PROVISION**, in the canon law, the title or instrument by virtue whereof an incumbent holds, or is *provided* of a benefice, bishoprick, or the like. See **TITLE, BENEFICE, &c.**

Ordinary collators give *provisions* in case of vacancy by death, pure and simple demission and permutation. See **COLLATION**.

The court of Rome grants *provisions* by resignation, devolution, and prevention.

**PROVISIONS by prevention** are also called *gratia expectativa*, and *mandata de providendo*; of the great abuse whereof throughout England frequent complaint was made in our ancient statutes, and a remedy provided for the same by the statute of premunire. See **PREVENTION, PREMUNIRE, &c.**

*Provisions* of small benefices, in the court of Rome, are only simple signatures, which are, as it were, minutes of the bull; because the bulls themselves dispatched on parchment would be too expensive. The signature is no more than the petition of the impetrant answered by the pope in these words, *Concessum uti petitur in presentia D. N. papæ*, wrote in the hand of the prelate who presides over the signature. See **BULL**.

Extraordinary *provisions* are signed by the pope himself, in these words, *fiat ut petitur*, with the first letter of his name. See **SIGNATURE**.

**PROVISO**, in law, a condition inserted in a deed, upon the observance whereof the validity of the deed depends. See **CONDITION, &c.**

**PROVISO**, in judicial matters, is where the plaintiff desists from prosecuting an action, by bringing it to trial in due time; in which case, the defendant may take out a venire facias to the sheriff, having it in these words, *Proviso quod*, &c. to the end that, if the plaintiff take out any writ to that purpose, the sheriff shall summon but one jury upon them both.—In which case it is called *going to trial by proviso*.

**Casu PROVISO**. See the article **CASU**.

**PROVISO** is also a sea-term. — A ship is said to moor a *proviso*, when she has an anchor out, and also a hawser athore; and so is moored with her head to the shore with two cables at least. See **MOORING**.

**PROVISOR** is generally taken for him who hath the care of providing things necessary; in which sense it coincides with *purveyor*. See **PURVEYOR**.

**PROVISOR monasterii** is used for the steward or treasurer of a religious house.

**PROVISOR \***, in our statutes, also denotes a person who sued to the court of Rome for a *provision*, or expectative grace. See **PROVISION and PREMUNIRE**.

\* *Provisores dicuntur, qui vel episcopatum, vel ecclesiasticam aliam dignitatem in Romana curia sibi ambiebant de futuro, quod ex gratia expectativa nuncuparunt, quia usque dum vacaret expectandum esset.* Spelm.

**PROVOCATIVE**, in physic, a medicine which strengthens nature, and stimulates or incites to venery. See **PRIAPISM**. Such are cantharides, satyrion, &c. See the article **CANTHARIDES, &c.**

**PROVOST, PRÆPOSITUS**, an officer, whereof there are divers kinds; civil, military, &c.

**PROVOST of the city, or of the merchants**, is the chief municipal magistrate in several considerable trading cities, particularly Edinburgh, Paris, and Lyons; much the same with the *mayor* in other places. See **MAYOR**.

The *provost* presides at the city-courts, and together with the sheriffs, or bailiffs, decides all differences relating to trade and merchandize; takes cognizance of the affairs of officers of policy of the city with regard to their functions; of the delinquencies of merchants, commissioners, and factors; inspects the ports, rivers, duties, imposts, &c.

Authors attribute the institution of *provost of the merchants of Paris* to Philip Auguste. Du Haillan refers its epocha to the year 1190.

The *provost of Edinburgh* has the title of *lord*: the bailiffs are his deputies. He calls conventions of the boroughs by his own missives.

**PROVOST, or PREVOT royal**, also denotes a sort of inferior judge established throughout France, for the taking cognizance of all civil, personal, real, and mixt causes, among the people; but without any jurisdiction in the causes of nobles.

These in the Bourbonnois, Auvergne, &c. are called *chate-lains*; in Normandy, *vicomptes*; in Languedoc and Provence, *viguers*.

**Grand PROVOST of France, or of the household**, has jurisdiction in the king's house, and over the officers therein; looks to the policy and regulation thereof, the rates of provisions following the court, &c. — He was anciently called *roi des ribauds*.

**Grand PROVOST of the constable**, a judge of the sword, who manages processes against the soldiers in the army, who have committed any crime.

VOL. II.

He has four lieutenants distributed throughout the armies, called *provosts of the army*; and particularly *provosts* in the several regiments.

**PROVOST marshal of an army** is an officer appointed to seize and secure deserters, and all other Criminals. See **MARSHAL**.

The *provost marshal* is to go often abroad round the army to hinder the soldiers from pillaging: it is his office to indict offenders, and to see the sentence passed upon them executed.

He likewise regulates the weights and measures, and the price of all provisions, &c. in the army.—For the discharge of his office, he has a lieutenant, a clerk, and a troop of *provosts* or marshals men on horseback; as also an executioner.

There is also a *provost marshal* in the navy, who hath charge of the prisoners taken at sea.

The French have a *provost general of the marines*, who is to prosecute the marines when guilty of any crime, and make report thereof to the council of war; besides a *marine provost* in every vessel, who is a kind of gaoler, and takes the prisoners into his care, and keeps the vessel clean.

**PROVOSTS of the marshals** are a kind of lieutenants of the marshals of France, established for the security of the country against rogues, vagabonds, and deserters.

They take cognizance of royal causes; which, for this reason, are called *prevotal causes*: such are all crimes committed by strollers, or people without any fixed abode; robberies on the high-way, infraction of safeguard, burnings, &c. They pronounce *en dernier ressort*.

There are 180 seats of these *provosts* in France: their chief jurisdiction regards highwaymen, foot-pads, house-breakers, &c. They correspond to the officers established by Augustus and Tiberius, called, as Cujas tells us, *latrunculares*, to shew that their office was to pursue thieves.

**PROVOST of the mint** is a particular judge instituted for the apprehending and prosecuting of false coiners. See **MINT**.

**PROW\***, **PRORA**, in navigation, denotes the head or forepart of a ship, being that which is opposite to the *poop* or *stern*. See **POOP and STERN**.

\* The word is formed from the Latin *prora* which signifies the same thing.

In the front hereof is the beak that cuts the water to make way for the vessel. See **CUT-WATER**.

The *pro* is lower than the *poop*, and contains fewer stories or decks. On the beak is usually some figure or hieroglyphic, which often gives name to the vessel.

**Prow**, in strictness, is only that part of the fore-castle which is aloof, and not in the hold, particularly that between the chafe and the loof. See **SHIP and FORECASTLE**.

The ancients represented beaks of birds in the *prows* of their ships, whence they were called *rostra*. See **ROSTRA**.

**PROXENETA\***, or **PROXENETES**, a kind of broker or agent, who transacts between two persons. See **BROKER and AGENT**.

\* The word is Greek, *προξενος*, *q. d. conciliator*, or *pararius*, reconciler or mediator. The Latins give them a more honourable appellation, calling them *interpreters*. See **INTERPRETER**.

The term *proxeneta* is chiefly applied to those who negotiate offices, marriages, &c. See **PROXY**.

The Roman law grants the *proxeneta* an action for recovery of their hire or wages.

These made a kind of office or college in Rome: to them the fathers addressed themselves, to sound and examine the inclinations of the young men they intended for their daughters.

A commentator on the Digest accounts it a great defect in the modern policy, that there are not now any of these *proxeneta* or match-makers established by public authority.

**PROXIMITY, PROXIMITAS**, denotes the relation of nearness either in respect of place, or blood, or alliance. See **VENUE, CONSANGUINITY, &c.**

**PROXY, PROCURATOR**, a deputy, or person who officiates in the room of another. See **PROCURATOR**.

Princes are usually married by *proxies* or representatives.

**PROXY, PROCURACY**, among civilians, also denotes a commission given to a proctor by a client to manage a cause in his behalf. See **PROCTOR**.

**PRUINA**, in physiology, *hoar-frost*, a concretion of the dew made by the violence of the external cold. See **DEW and FREEZING**.

**PRUNELLA**, a name given by some physicians to a driness of the tongue and throat, happening in continued fevers, especially acute ones, accompanied with a heat and redness of the throat, and a scurf covering the tongue; sometimes whitish, and sometimes blackish. See **FEVER**.

Some also give the name *prunella* to the quincy, and others to the aphthæ. See **QUINZY and APHTHÆ**.

**PRUNELLÆ sal**, in pharmacy, is a preparation of purified salt-petre; called also *lapis prunellæ*, and *crystal mineral*. See **SALT-PETRE, CRYSTAL, &c.**

It is prepared by separating and absorbing some of the more volatile parts of the salt-petre, which is done by burning upon it, when melted in a crucible over the fire, about a thirtieth part of its weight of flower of brimstone.

It is given to cool and provoke urine in fevers and quinzies; though some think, that salt-petre, purified three or four times, would be a better medicine. See **NITRE and SALT-PETRE**.

The *sal prunella* is frequently adulterated with alum; the deceit is known by its whiteness and glittering.

**PRUNES\***, *PRUNA*, are plums dried and baked in an oven, or in the sun.

\* The word comes from the Latin, *prunum*, plum.

The *prunes* chiefly used among us are black and large, brought from Bourdeaux: great quantities are used by the English and Dutch.—The juice of *prunes* is esteemed laxative.

**PRUNIFEROUS** *trees*, or *shrubs*, the *plum-bearing kind*, are those whose fruit is pretty large and soft, with a stone in the middle. See **TREE** and **FRUIT**.

In this kind, the flower adheres to the bottom of the base of the fruit.

**PRUNING**, in gardening and agriculture, the operation of lopping or cutting off the superfluous branches of trees; either to dispose them to bear better, to grow higher, or appear more regular. See **TREE**, &c.

*Pruning* is one of the most important branches of the gardeners province, and that whereon the weal or woe of his fruit-trees, as well as the form and regularity of his garden, in great measure depends. See **GARDEN**.

It is sometimes practised purely for the trimming or adjusting of trees to the eye, by taking away irregular branches; as in box, holly, yew, &c.

Sometimes to make the stem grow fairer, and rise higher, by taking off all the large branches arising out of it, and thus sending the sap, which would otherwise be expended by them, to the top of the tree, to nourish and prolong the same.

But its more ordinary use is to render the tree more fertile, and to mend its fruit, by retrenching such useless branches as might impoverish the trunk, and consume the juice necessary to nourish the branches that bear. See **VEGETATION**.

*Pruning* is an annual operation; the amputation is usually made sloping, sometimes stump-wise. Its best season is about the end of February, though it may be begun as soon as the leaves are off, *viz.* in November, and continued to the time fresh leaves come on, *viz.* in April.

As the gardiner has usually three kinds of trees to manage, *viz.* some too weak, others too strong, and others in a just plight, he will find *pruning* work through all that space; it being proper to *prune* some sooner, and some later. The weaker and more languishing a tree is, the sooner it ought to be *pruned*, to ease it of its offensive branches; and the more vigorous the tree is, the longer may the *pruning* be deferred. See **PINCHING** and **BRANCH**.

For **PRUNING** a tree of the first year, *i. e.* a tree planted the year before: if it have only shot one fine branch from the middle of the stem, it must be cut to that branch, and the branch shortened to four or five eyes or buds; the effect of which is, that the next year there will be at least two fine branches opposite to each other.

If the tree produce two fine branches well-placed, with weak ones among them, all required is to shorten them equally, to the compass of five or six inches in length; care, however being taken, that the two last eyes or buds of the extremes of the branches thus shortened, look on the right and left to the two bare sides, that each may bring forth at least two new ones, and the four be so well placed, that they may be all preserved. If one of the two branches be much lower than the other, or both on one side, or the like, only one is to be preserved: and that the fittest to begin a fine figure; the other to be cut off so close, as that it may never be able to produce thick ones in the same place.—If a tree have put forth three or four branches, all in the extremity, or a little beneath, they must be all *pruned* by the same laws as the two above-mentioned: if they be equally thick, they are to be used alike; if some of them be smaller than the rest, they must only be *pruned* with a prospect of getting a single branch each, taking care to have it on that side which shall be found empty; in order to which they should be shortened to an eye or bud that looks on that side; and the same care to be taken in the larger, in order to begin to fill up the better: if these fine branches shoot a little below the extremity, it is but shortening the stem to them: on the contrary, if the branches be most of them ill ones, two at least, if possible, are to be preserved, and *pruned* in the same manner as the two fine ones above. Good weak branches are to be carefully preserved for fruit; only cutting them a little at the extremity, when they appear too weak for their length, not failing to take away all the sapless branches.—If the tree have produced five, six, or seven branches, it is sufficient to preserve three or four of the best: the rest to be cut quite off, at least if they be thick; for if they be weak, *i. e.* fit for fruit branches, they should be kept till they have performed what they are capable of doing; and if among the great ones there happen to be many small ones, two or three of the best only to be preserved, pinching off the ends of the longest.

**PRUNING** of a tree of the second year.—If, having put out two fine wood-branches, and one or two small ones, for fruit the first year, the sap have altered its course in the second year, from the thick branches to the small ones, so that the small become wood, and the large fruit-branches, the productions of the former must be quite cut off to the mother-branch, and those of the latter used as fruit-branches.—If a tree, from the first year's *pruning*, have produced four or five branches,

or more, it must needs be very vigorous; for which reason it may be sometimes advisable to preserve those branches, even though they be not necessary to the figure of the tree, but only to consume part of the sap, which might otherwise be prejudicial to the fruit-branches. These superfluous branches may be left long, without much ill consequence; but those essential to the beauty of the tree, must be all *pruned* a little longer than those of the preceding year, *i. e.* about two, or at most three eyes, or a good foot. This is making an advantage of the figure of the tree, which, without this, would not yield fruit in a long time, the redundant sap converting all the eyes into wood-branches, which, with a more spare diet, would have been fruit-branches. In these vigorous trees, some branches cut stump wise are to be left on, and even some thick ones, though of false wood, especially where there are any necessary to the form of the tree, to employ the excess of sap, and prevent its doing mischief. Still more to allay its violence, it may be necessary to preserve many long, good, weak branches, when placed so as to occasion no confusion; and even on the thick branches, a good number of outlets for the sap to range in.—Be it a general rule rather to spare the lower branches, and cut off the higher, than the contrary: by this means the tree spreads more easily to the bottom of the wall.

**PRUNING** of a tree of the third year.—In a tree that has been planted three years, and *pruned* twice, if it be vigorous, as many old branches as possible are to be preserved, especially for fruit: if it be weak, it must be eased of the burden of old branches, as well those for fruit as wood. It must likewise be cut short, to enable it to shoot out new ones; which if it cannot do with vigour, let it be pulled up, and a new one, with fresh earth, planted in its place.

In all *pruning*, provision is to be made for branches to proceed from those now under the *pruning-knife*, to prepare such as may be proper for the form; with this assurance, that when the high branch is taken down from over the lower, this latter being reinforced with the sap that would have gone to the former, will certainly produce more branches, than it would have done without such reinforcement.

**General rules of PRUNING fruit-trees.**—1. The more the branches shoot horizontally, the apter and better disposed the tree is to bear fruit; consequently the more upright the branches, the more inclined is the tree to increase in wood, and the less in fruit.

Hence, ever take care to keep the middle of a tree from wood or thick branches; and as those increase and grow upon you, cut them out intirely; for there is no danger but the place will be soon filled with better and more fruitful wood.

In dwarfs you are to *prune* all open, and clear of wood, leaving none but horizontal branches: and in wall-trees, if you do but furnish your walls with horizontal branches, nature will provide for the middle. Chuse therefore such shoots as are not vigorous, to furnish bearing branches.

2. Take care the tree be not left over-full of wood, not even of bearing branches; as is frequently seen in the management of peaches, nectarines, and cherries.

Nature cannot supply them all with juice enough; whence none will be supplied well: the consequence of which is, that either the blossoms will fall off, or the fruit dwindle. It is certain, a multitude of branches crowding on one another, produces neither so good, nor so much fruit as where there is a convenient space, beside the disagreeable effect of crossing one another.

3. All strong and vigorous branches are to be left longer on the same tree than weak and feeble ones; consequently the branches of a sickly tree must be *pruned* shorter, and fewer in number, than those of a strong healthy tree.

4. All branches shooting directly forward from trees that grow against a wall, are to be *pruned* close to the branch whence they spring, &c.

5. When a branch well-placed either against a wall, or in a dwarf, has shot some false wood, neither fit for the figure nor the fruit, *prune* it off within the thickness of a crown piece, or slopingly; though this is best *pinched* off in the beginning of summer.

6. Cut off all branches arising from hard knobs, whereon pear-stalks grew; or from short strait branches like spurs.

7. If a tree, in its years, have produced branches of moderate vigour, and afterwards puts forth strong ones, well-placed, though of false wood; the latter may be used as the foundation of the figure, and the other kept a time for bearing fruit.

8. When an old tree shoots stronger branches towards the bottom than the top, and the top is in ill case; cut it off, and form a new figure from the lower ones. If the top be vigorous, cut off the lower ones, unless well-placed.

9. The order of nature in the production of roots and branches, is, that a branch is always less than that out of which it shoots: if this order be inverted, use them as false wood.

10. Regard to be always had to the effects of former *pruning*, in order to correct its defects, or continue its beauties.

11. In vigorous trees, the weaker branches are the fruit-bearers. In weak trees, the stronger chiefly; therefore, in the latter, *prune* off the feeble and small.

12. In vigorous trees, three good branches may put forth at one eye or bud: in which case the two sides branches are generally

nerally to be preserved, and the middlemost cut off in May or June.

13. It is difficult to strengthen a weak branch without cutting off others above it: sometimes it can scarce be done without cutting off the end of the branch it shoots out of.

14. The *pruning* of vigorous peach-trees to be deferred till they are ready to blossom, the better to know which are likely to bear fruit.

15. Fruit-buds next the ends of branches are commonly thicker and better fed than others. In weak trees, therefore, it may be best to *prune* them early, that the sap may not waste itself in such parts as are to be retrenched.

16. The farther a weak branch is from the trunk, the less nourishment it receives; and therefore the more it is to be shortened: but thick branches, the more distant they are from the heart, the more they receive; and are therefore to be removed, that the vigour may extend it self to the middle or lower part.

17. A branch for wood must never be *pruned* without especial occasion; as where it annoys others.

18. If an old well-liking tree be disordered with false wood, through ill *pruning*, or want of *pruning*; take it lower, by cutting off a branch or two yearly, till it be sufficiently reduced. Some trees put forth so vigorously, that they cannot be reduced to compass in one year; but must be allowed to extend themselves, otherwise they will produce false wood.

19. All trees have a predominant branch or two, if not more; yet the more equably the vigour is divided, the better: where it runs much on one side, it is faulty.

20. The buds of all stone-fruit frequently form themselves the same year in which the branch they grow on is formed: the same holds of pears and apples; though it is, generally, at least two or three years ere the latter come to perfection.

21. All shoots put forth in autumn, are to be *pruned* off, as naught: the same may be said of all sapless branches.

22. When a tree puts forth much stronger shoots on one side than the other, a great part of the strong ones must be cut off close to the body, or some of them stump-wise.

23. In all trees, less length to be allowed the weak than strong branches.

24. Upper branches to be cut off close to others, that they may heal over; lower branches are to be cut sloping, or at a little distance, that new ones may grow out of them.

25. If a young crooked tree produce a fine branch beneath the crook, cut the head off close to the branch.

26. Though five, six, or seven inches, be the ordinary lengths wood-branches are left at; yet must this be varied on occasion of the vigour or weakness of the tree, thickness or smallness of the branch, the fullness or vacuity of the place, &c.

27. Be careful not to prune many thick branches standing over weak ones; lest the sap, which fed the larger, flow so plentifully into the less, as to occasion them to put forth much ill wood and suckers.

28. Branches shot from the ends of others are usually good wood; sometimes it happens otherwise, and then they must be *pruned*.

As to the grand yearly *prunings*:—Fruit-branches being of short continuance, and perishing the first year wherein they produce fruit, are to be cut off, unless they put forth shoots for blossoms the succeeding year. In the second *pruning*, about the middle of May, where the fruit is so close as to be like to obstruct each other, some of them and their branches to be taken off, as must also the multitude of young shoots that cause confusion. Branches more luxurious than others to be cut clear off. To preserve old trees, they must be disburdened by leaving few branches for wood on them, and those to be shortened to five or six inches; and very few weak ones, and none dry, and nigh wasted.

**PRUNING of forest or timber trees.**—For large trees, it is best not to prune them at all; yet if there be an absolute necessity for it, avoid taking off large boughs as much as possible; and observe the following rules.

1. If the bough be small, cut it smooth and close, that the bark may soon cover it; and sloping, that the water may run off.

2. If the branch be large, and the tree old, cut it off at three or four foot from the stem, or where any young shoots are found issuing out of it.

3. Boughs growing upright, not to be cut cross over, but sloping upwards. In boughs leaning from the head, the slope to be on the lower side.

4. If the tree grow crooked, cut it off at the crook, sloping upwards; and nurse up one of the most promising shoots for a new stem. Indeed, in trees that have great piths, as the ash, walnut, &c. we must be cautious of cutting off the heads.

5. If the tree grow top-heavy, its head must be lightened; and that rather by thinning the boughs that grow out of the main branches, than by cutting off the main branches themselves. But if you would have them spring, it is best done by rubbing off the buds, as they put out in the spring, and shrouding up the side-shoots.

6. If the side-bough still break out, and the top be able to sustain itself, give the boughs that put forth in spring a *pruning* after Midsummer; cutting them close. This will cause the bark to cover and kill them, so as never to shoot out again; and is the only method to make a tree grow with a fine, strait, handfom body. See SHROWDING.

**PRUNING of vines.** See the article VINE.

**PRURITUS**, a painful, pleasurable kind of sensation of the skin, popularly called *itching*; which is supposed to arise hence, that the extremities of the capillary veins, being obstructed, cannot take up the redundant blood of the members, to carry it back again to the heart; whence as there is a fresh stock of blood continually sent into the part by the incessant pulsation of the heart, the fibres become preternaturally stretched or distended.—And hence the usually titillating sense of itching.

**PRYTANEUM**, Πρύτανιον, in antiquity, a considerable building in Athens, where the council of *prytanes* assembled, and where those who had rendered any signal services to the commonwealth, were maintained at the public expence. See PRYTANIS.

**PRYTANIS**, or PRYTANES, in antiquity, the first magistrate in most of the cities of Greece.

At Athens there were fifty *prytanes*; at Corinth there was but one, who was the same with what the *archon* was at Athens. See ARCHON.

The *prytanes* of Athens were the senators who composed the grand council that governed the state; and corresponded to what we now call, the *states general of the united Provinces*.

Fifty of these were chose each year out of each tribe; and to these were nominated fifty more, to supply the places of the former, in case of death or male-administration.

The tribes took the government by turns, each after other, for the space of thirty-five days.—This was an establishment of Solon. Scaliger is mistaken, when he says the tribes took their turns every day. See TRIBE.

All the fifty *prytanes* of the tribe did not govern together during those five weeks; but in companies, ten at a time, chosen by lot; seven days each company: after which another tribe came into play, and had its five weeks after the same manner.

**PSALM**\*, ψαλμὸς, a divine song, or hymn. See SONG and HYMN.

\* The word is formed from the Greek, ψαλλω, *I sing*.

The denomination *psalm* is now appropriated to the cl. *psalms* of David; and the name *canticle*, or *song*, given to other pieces of the same kind, composed by other prophets and patriarchs.

The ancients, as is observed by St. Augustin, made this difference between a *canticle* or song, and a *psalm*, that the former was sung solitarily, or by the voice alone, but the latter accompanied with a musical instrument.

The *psalms*, in the ancient editions, are divided into five books; nor is David's name found at the head of more than seventy-three of them; though some, and among the rest, St. Augustin and St. Chrysostom, attribute all the hundred and fifty to him without exception.

The Jews, however, were always of another sentiment; and it is certain there are some few, at least, that are not his.—St. Jerom observes, among the number, several that were composed long time after David. Du Pin adds, that it is difficult to ascertain the authors; all we know of the book is, that it is a collection of songs, made by Esdras.

*Gradual psalms* were those anciently sung on the steps of the temple.—The *penitential psalms* were not formerly the same with those now called by that name. See GRADUAL, &c.

**PSALMODY**, ψαλμωδία, the art of singing psalms. See PSALM and SINGING.

**PSALTER**, ψαλτήριον, the book or collection of psalms, ascribed to David. See PSALM.

There are a multitude of editions of the *psalter*.—Augustin, Justinian, a Dominican, and bishop of Nebo, published a *polyglot psalter* at Genoa, 1516. Contarinus published the *psalter* in Hebrew, Greek, Chaldee, and Arabic, with Latin notes and glosses. See POLYGLOT.

**PSALTER** is also used among religious for a large chaplet or rosary, consisting of 150 beads; the number of psalms in the *psalter*.

St. Dominic is said to have been the inventor of the *psalter*. See CHAPLET and ROSARY.

**PSALTERY**, PSALTERION, also denotes a musical instrument much in use among the ancient Hebrews, who called it *nebel*. We know but little of the precise form of the ancient *psalter*: that now in use, is a flat instrument, in form of a pezium, or a triangle truncated at-top.

It is strung with thirteen wire chords, set to unison or octave, and mounted on two bridges on the two sides.—It is struck with a *plectrum* or little iron rod, or sometimes a crooked stick; whence it is usually ranked among the instruments of percussion.

Its chest, or body, is like that of a spinet. It has its name à *psallendo*; some call it *nablum*, or *nablium*.

Papias also gives the name *psalter* to a kind of flute, used in churches, to accompany the singing; in Latin, *sambucus*.

**PSAMMISMUS**\*, ψαμμισμός, in medicine, a term sometimes used for a bath of dry and warm sand, to dry the feet of dropical persons upon. See BATH, &c.

\* The word is formed from the Greek ψαμμος, *sand* or *gravel*.

**PSATYRIANS**, PSATYRIANI, a sect of Arians, who in the council of Antioch, held in the year 360, maintained that the Son was not like the Father, as to will; that he was taken from nothing, or made of nothing; and that in God, generation was not to be distinguished from creation. See ARIAN.

PSUEDO,

**PSEUDO**\*, a term, or particle, used in the composition of divers Latin and English words; in the sense of *false* or *spurious*.

\* The word is formed from the Greek *ψευδος*, *lye*, *falsehood*, of *ψευδω*, *decipio*, *false*, I deceive.

We say a *pseudo-martyr*, *q. d.* a false witness; *pseudo-prophet*, *pseudo-apostle*, *pseudo-christ*, &c.

**PSEUDO-DIPTERE**, *ψευδοδιπτερες*, in the ancient architecture, a temple with eight columns in front, and a single row of columns all around. See **TEMPLE**.

The word signifies *false* or *imperfect diptere*; and is used to distinguish this from the *diptere*; which had two rows of columns all around. See **DIPTERE**.

**PSEUDONYMUS**\*, *ψευδωνυμος* a name given by the critics to those authors who publish books under false or feigned names.—Much as the name *cryptonymus* is given to those who publish under secret and disguised names: and *anonymus*, to those who publish without any names at all. See **ANONYMOUS**.

\* The word is formed from the Greek *ψευδη*, *lye*; and *ονομα*, *name*.

The apostolical constitutions, the greater epistles of St. Ignatius, &c. are usually supposed to be *pseudonymous*. See **CONSTITUTIONS**.

**PSEUDO-STELLA**, in astronomy, any kind of meteor or phenomenon, newly appearing in the heavens, and resembling a star. See **PHENOMENON**, **METEOR**, &c.

**PSILOTHRON**\*, *ψιλωθρον* in medicine, *depilatory*; an external form of medicine proper to make the hair fall. See **DEPILATORY**.

\* The word is formed from the Greek *ψιλω*, *deglabro*, I make bald, or bare; and *θρον*, *hair*.

Such are strong *lixiviums*, quick-lime, ants eggs, sandarac, orpiment, and arsenic.

**PSOAS magnus**, or *lumbaris*, in anatomy, a round, hard, fleshy, muscle, which arises from the internal side of the transverse processes of the vertebrae of the loins, within the abdomen; and descending upon part of the internal side of the ilium, is inserted into the lower part of the little trochanter.—It is the first of the flexors of the thigh. See **FLEXOR** and **THIGH**.

**PSOAS parvus**, arises fleshy from the inside of the upper vertebrae of the loins, and hath a thin and broad tendon, which embraces the *psaos magnus*; and which is inserted into the os innominatum, where the os pubis and ilium join together.—This, tho' ordinarily reckoned among the muscles of the thigh, properly belongs to the lower venter.

**PSORA**, *ψορα*, in medicine, a cutaneous disease, called by the Latins, *scabies*; by the English, *itch*. See **ITCH**.

The *psora* is described by Celsus as a reddish hardness and roughness of the skin, from an eruption of pustules thereon; some drier, others moister; and oozing out a sanious matter, which occasions a continual *pruritus* or itching.

These eruptions are most frequent about the junctures of the limbs, and between the fingers: in some they spread over the whole body; in others they soon cease; and in some return at certain seasons of the year.

In youth, this disease frequently prevents others, or cures them.

—It sometimes degenerates into a leprosy. See **LEPROSY**.

The *dry* is much more difficultly cured than the *moist*, which arises from a disorder in the humours or viscera. Willis derives the disease from a sharp, saline humour, occasioning an itching.

Some of the later physicians will have it to consist in a number of little animals preying on the skin: and hence it is that it becomes so very contagious.—Willis observes, that in this respect it is second to no other disease but the plague, which many conjecture to arise in like manner from animalcules.

For the cure, Borelli recommends a lotion of black soap, to poor people, &c. But the soap to be soon washed off, lest it excoriate the skin. Where the disease is inveterate, recourse is had to salivation. See **SALIVATION**.

**PSORICA**, *ψωρικα*, medicines good against the itch, scabs, and other cutaneous eruptions, especially of the eye-lids.

**PSOROPHTHALMIA**\*, *ψωροφθαλμια*, a scurfy eruption of the eye-brows, attended with a *pruritus*, or itching of the part.

\* The word is formed from *ψωρα*, *itch*; and *οφθαλμος*, *eye*.

**PSYCHOLOGY**\*, *ψυχολογια*, the doctrine of the soul. See **SOUL**.

\* The word is formed from the Greek *ψυχη*, *soul*; and *λογος*, *discourse*.

Anthropology, or the science which considers man, consists of two parts: the first treating of the body, and the parts belonging thereto, called *anatomy*: and the second of the soul, called *psychology*. See **ANTHROPOLOGY**, &c.

**PSYCHOMANCY**\*, a kind of magic, or divination, performed by raising the souls of persons deceased. See **DIVINATION**.

\* The word is formed of *ψυχη*, *soul*; and *μαντις*, *divination*.

**PSYCHROMETER**\*, an instrument for measuring the degree of coldness of the air; more usually called *thermometer*. See **THERMOMETER**.

\* The word is formed from the Greek *ψυχρος*, *cold*; and *μετρον*, *measure*.

**PTARMICA**\* *πταρμικα*, medicines proper to promote sneezing; more usually called *errhines* and *sternutatories*. See **STERNUTATORY**.

\* The word is formed of the Greek, *πταρμις*, *sternutamentum*, sneezing.

**PTERYGIUM**\*, *πτερυγιον*, in medicine, a disease of the eye, much of the same nature with what the Latins call *unguis*, nail; and sometimes, though improperly, *pannus*, web. See **UNGUIS** and **PANNUS**.

\* The word is formed by diminution from the Greek *πτερυξ*, *ala*, a wing; *q. d.* a little wing.

The cure is much the same as that of the *ophthalmia*. See **OPHTHALMIA**.

**PTERYGIUM** is also the name given to a *whitlow*, when seated at the root of the nail. See **PANARIS**.

**PTERYGOIDES**\* *πτερυγοειδης*, in anatomy, two apophyses of the os sphenoides; so called from their resembling the wings of a bat. See **SPHENOIDES**.

\* From the Greek *πτερυξ*, *πτερυγος*, wing, and *ειδος*, *form*.

**PTERYGOIDEUS internus**, is a muscle of the jaw which arises from the internal part of the *pterygoides* process, and descends to be inserted into the inferior part of the internal side of the lower jaw, near its angle.—When it acts, it draws the jaw to one side.

**PTERYGOIDEUS externus**, is a muscle which arises from the external part of the same process, and goes backward to be inserted between the condyloid process, and the corone, on the inside of the lower jaw. This pulls the lower jaw forwards, and makes it shoot beyond the upper.

**PTEROPHORI**, *πτεροφοροι*, in antiquity, a name given to such of the Roman couriers as brought tidings of any declaration of war, a battle lost, or any mishap befallen the Roman armies.

They were so called, because they bore wings on the points of their pikes: from the Greek *πτερον*, wing, and *φερο*, I bear.

**PTERYGOPHARYNGÆUS**, a pair of muscles arising from the process *pterygoides*, where the tendon of the *pterygostaphylinus* is reflected.—Some fleshy fibres of it do likewise arise from the upper jaw-bone, behind the farthest grinder, and some from the sides of the tongue, and os hyoides.

From all these places its fleshy fibres pass semicircularly, and meet with those of the opposite side in the middle line on the back side of the pharynx externally.

In the inner surface of the fauces is another order of fleshy fibres, decussating each other at acute angles.—They arise both from the sides of the uvula, and from the root of the cartilage; and descend obliquely to their insertions in the glandulous membrane of the pharynx.

This muscle serves both to constrict the pharynx, and to compress the tonsils, and force out the mucus; whence its use in hawking.

The various originations of the several parts of this muscle have caused its being generally divided into several muscles.—Thus Valsalva calls that part springing from the tongue, the *glossopharyngæus*; that immediately below it, the *hyopharyngæus*.—Hence, in like manner, come the *cephalopharyngæus*, *sphenopharyngæus*, &c.

**PTERYGOSTAPHYLINUS**\*, in anatomy, the internal muscle of the uvula; called by Valsalva, *novus tubæ musculus*; as being unknown to the ancient anatomists.

\* The word is formed from the Greek *πτερον*, wing, and *σταφυλη*, *uvula*.

It arises fleshy, near the sphenostaphylinus, from the os petrosum, where the tube from the palate enters that, near an acute process of the sphenoides; and ascending to the process *pterygoides*, becomes a broad flat tendon, which expands itself on the fore part of the uvula.

Some of the tendinous fibres ascend to the lower edge of the os palati, others descend down the sides of the fauces; the middle series either unites with those of the other side, or is lost in two fleshy bodies that compose the uvula. See **UVULA**.

This muscle, with its partner, draws the uvula upwards and forwards, and also raises the amygdalæ.

**PTISAN**, **PTISANA**, *πτισανη*, in medicine, a cooling potion, usually made of barley boiled in water, and sweetened with liquorice, &c.

To these are sometimes added the herb quich-grass, and *sena*, to render it laxative.—Most of the decoctions of physicians are in *ptisans*. See **DECOCTION**.—Feverish patients are prohibited wine, &c. and reduced to *ptisans*.

**PTOLEMAIC system**, or *hypothesis*, the order or disposition of the heavens and heavenly bodies, wherein the earth is supposed to be at rest, in the centre, and the heavens to revolve round it, from east to west, carrying with them the sun, planets, and fixed stars, each in their respective spheres. See **SUN**, **EARTH**, **PLANET**, &c.

This hypothesis took its name from Ptolemy, the great Alexandrian astronomer, because maintained and illustrated by him: not that it was his invention, for it was much older, as having been held by Aristotle, Hipparchus, &c. See it further illustrated under the article **SYSTEM**.

**PTOLEMAIC sphere**. See the article **SPHERE**.

**PTOLEMAIGES**, a branch of the ancient Gnostics, so called from their leader Ptolemy, a man of considerable learning, who

who improved greatly on the system of the Gnostics his predecessors, and enlarged it with a number of notions and visions of his own. See Gnostics.

St. Epiphanius is very ample on the subject of the *Ptolemaïtes* and produces a letter of Ptolemy to Flora, wherein that heretic lays down his doctrine.—He maintained, that in the law of Moses there were three things to be considered, inasmuch as it did not all come from the same hand; but part of it, said he, from God, part of it from Moses, and part of it from neither of them, but from the pure traditions of the ancient doctors: on which last part it was that he founded his dreams.

**PTYALISM\***, **PTYALISMUS**, in medicine, a *spitting*; or a discharge of saliva by the glands of the mouth; whether it amount to an absolute salivation, or not. See SALIVATION.

\* The word is Greek, πτυαλισμός, formed from πτυω, *spuo*, *spuo*, I spit.

**PUBERTY**, **PUBERTAS**, in the civil law, a natural majority, or the age wherein a person is allowed to contract marriage. See MAJORITY, &c.

Boys arrive at *puberty* at fourteen years of age, maids at twelve. — *Full puberty* is accounted at eighteen. See AGE.

**PUBES**, a term used for the external parts of the *pudenda*, or parts of generation, in both sexes.

This, from the age of *puberty*, is supposed to be covered, more or less, with hair; whence the name. See HAIR.

**PUBIS** *os*, or *os PECTINIS*, in anatomy, a bone of the hip, situate in the fore and middle part of the trunk, and making the lower and inner part of the *os innominatum*. See *tab. anat. (Splanchn.) fig. 1. lit. y. (osteol.) fig. 3. n. 18. fig. 7. n. 19. fig. 12. lit. d.* See also *INNOMINATUM os*.

It is joined to the other part by a cartilage, thicker, but looser in women than men; in the former whereof, the *os pubis* recedes, or gives a little in time of travail, to make way for the foetus. See DELIVERY.

It has a large foramen, which makes room for the passage of two muscles of the thigh, besides a sinus, whereby the crural veins and arteries pass to the thighs.—See *tab. anat. (osteol.) fig. 3. lit. S. S.*

**PUBLIC buildings**. See the article BUILDING.

**PUBLIC road**. See the article ROAD.

**PUBLIC notary**. See NOTARY public.

**PUBLICAN**, **PUBLICANUS**, among the Romans, a person who farmed the imposts, taxes, and public revenues.

The appellation appears to have been odious to the Jews, &c. apparently, because of the exactions of this sort of people.

**PUBLICANS** was also a name given to the *Arnoldists* and *Albigenses*.

**PUBLICANDIS**—*Regula de PUBLICANDIS*. See RULE.

**PUBLICATION**, **PUBLICATIO**, the act of *promulgating*, or making a thing known to the world. See PROMULGATION.

By the canons, *publication* is to be made of the banns of marriage three times ere the ceremony can be solemnized; without especial licence to the contrary. See MARRIAGE, BANNES, &c.

**PUCELLAGE**, **PUCELLAGIUM**, in an ancient manuscript written *PUELLAGIUM*, denotes the state of virginity, or maidenhead. See VIRGINITY.

**PUDENDUM** denotes a thing to be ashamed of. Hence, *pudendum virile* signifies the penis, and *pudendum muliebre*, the cunnus. See GENITAL, &c.

**PUDICA planta**. See SENSITIVE plant.

**PUERI alimentarii**. See the article ALIMENTARII.

**PUERILE style**. See the article STYLE.

**PUERILITY**, in discourse, is by Longinus defined to be a thought, which, by being too far fetched, becomes flat and insipid.—*Puerility*, heads, is the common fault of those who affect to say nothing but what is brilliant and extraordinary. See SUBLIME.

**PUERORUM episcopus**. See the article EPISCOPUS.

**PUGIL\***, among physicians, &c. a measure of flowers, seeds, or the like matters, containing so much as may be taken up between the thumb and two fore-fingers. See MEASURE.

\* The word comes from the Latin, *pugillus*, little hand.

The *pugil* is esteemed the eighth part of the manipule or handful; though some confound *pugil* with *manipulus*, and use it for a handful.—The French frequently call it *pince*, pinch. See MANIPULUS.

**PUISNE\***, **PUNY**, in law, a younger-born; or a child born after another. See MULIER.

\* The word is pure French, in which language it bears the same signification.

*Puisne* is not only applied to the second, third, fourth, &c. with regard to the first; but to the third with regard to the second, &c.—The last of all is called absolutely *cadet*. See CADET.

In the like sense we say a *puisne judge*, a *puisne counsellor*. See JUDGE and JUSTICE.

**PUKING**, a cant word for a nausea, or disposition to vomit. See NAUSEA and VOMITING.

**PUL**, in commerce, a general name which the Persians give to all the copper-moneys current in that empire; particularly the *kabesqui* and *demi-kabesqui*. See MONEY and COIN.

Olearius, who was at Ispahan in 1637. in the retinue of the ambassador of Holstein, assures us, That each city in Persia has its several copper-money, marked with its particular badge, which is only current in that district, and changed every year.—At

VOL. II.

No. 125.

the beginning of each year, which is at the vernal equinox, all the old money is cried down, and the new appears in its place. Both the emperor and the state find their interest in this frequent change: the first, in that he only gives at the rate of 17 d. sterling per pound for copper; yet delivers it out coined in *kabesqui* and *demi-kabesqui* at above 2 s. per pound: the second, in that the copper-money is by this means less abundant, being reduced each year so nearly the same quantity.

The same author adds, that at the time when he was in Persia, the *kabesqui* at Ispahan were struck with the image of a lion, at Scamachia with a devil, at Kalchan with a cock, and at Kilan with a fish.

**PULLEY**, in mechanics, one of the five mechanical powers; consisting of a little wheel, or rundle, having a channel around it, and turning on an axis; serving, by means of a rope, which slides in its channel, for the raising of weights. See MECHANICAL power.

The Latins call it *trochlea*; and the seamen, when fitted with a rope, a *tackle*.—An assemblage of several pulleys is called a *polypaston*.

The moveable wheel or rundle, is called the *sheave* or *shiver*; the axis on which it turns, the *gudgeon*; and the fixed piece of wood or iron, into which it is put, the *block*.

*Deduction of the PULLEY*. —1°. If a power P, (*tab. MECHANICS, fig. 49.*) sustain a weight Q, by means of a single pulley AB, in such manner as that the line of direction of each is a tangent to the periphery of the rundle; the weight and the power are equal.

Hence, a single pulley, if the lines of direction of the power and the weight be tangents to the periphery, neither assists nor impedes the power, but only changes its direction.

The use of the pulley, therefore, is, when the vertical direction of a power is to be changed into an horizontal one; or an ascending direction into a descending one; and on the contrary.

This is found a good provision for the safety of the workmen employed in drawing with the pulley.—For suppose a large weight EFG required to be raised to a great height by workmen pulling a rope AB: if now the rope should chance to break, the workmens heads underneath would be in immediate danger; but if by means of the pulley B, the vertical direction AB be changed into an horizontal one BC, there is no danger from a breaking of the rope.

This change of direction by means of a pulley has this further advantage; that if any power can exert more force in one direction than another, we are here able to employ it in its greatest force.

Thus, e. gr. an horse cannot draw in a vertical direction, but draws with all its advantage in an horizontal one. By changing the vertical draught, therefore, into an horizontal one, an horse becomes qualified to raise a weight.

But the grand use of the pulley is, where several of them are combined; thus forming what Vitruvius, and others after him, call *polypastas*; the advantages whereof are, that the machine takes up but little room, is easily removed, and raises a very great weight with a very moderate force.

2°. If a power applied in E, (*fig. 50.*) according to the line of direction BE, which is a tangent to the pulley in B, and parallel to the rope AD, sustain the weight F suspended from the centre of the pulley C; the power is subduple of the weight.

3°. The effect of *polypastas* is founded on the following theorem:—If a power applied in B, (*fig. 51.*) sustain (by means of a *polypaston*) a weight F, so as all the ropes AB, HI, GF, EL, CD, are parallel to each other; the power will be to the weight as unity to the number of ropes, HI, GF, EL, CD, drawn by the weight F; and therefore as unity to the number of pulleys, higher and lower, taken together.

Hence the number of pulleys and the power being given, it is easy to find the weight that will be sustained thereby: or, the number of pulleys and weight to be sustained, being given, the power is found: or, the weight and power being given, the number of pulleys the *polypaston* is to consist of, is found. See POLYPASTON.

4°. If a power move a weight by means of several pulleys; the space passed over by the power will be to the space passed over by the weight, as the weight to the power.

Hence, the smaller the force that sustains a weight by means of pulleys is, the slower is the weight raised: so that what is saved in force, is spent in time.

**PULMO**, in anatomy. See LUNGS.

**PULMO marinus**, *sea-lungs*, among naturalists, a light spongy body, of a shining colour, like crystal, intermixed with blue, and usually of a figure resembling the human lungs: whence its name.—It is also called *urtica marina*, the sea-nettle.

It swims at-top of the water, and is popularly reputed to presage a storm.—It is commonly supposed to be only a viscous excrement of the sea, hardened by the sun: but Sir Robert Sibbald and Dr. Merret rank it among the zoophytes.

It shines in the night-time, and communicates its luminous property to a stick rubbed therewith. Being applied to the skin, it raises an itching, and takes off the hair.

**PULMONARY vessels**, in anatomy, are those which carry the blood from the heart to the lungs, and back again from the lungs to the heart.

There are two in number, viz. the *pulmonary artery* and *vein*.

**PULMONARY artery**, which the ancients called *vena arteriosa*, the *arterial vein*, is, in reality, an artery, and composed, like the rest, of several tunics.—It arises from the right ventricle of the heart, and divides into two large branches; which subdividing into several smaller, diffuses itself throughout the whole substance of the lungs.—See *tab. anat. (Angeiol.) fig. 8. lit. dd. &c. bb. fig. 12. lit. I.* See also LUNGS.

**PULMONARY vein**, which the ancients called *arteria venosa*, the *venous artery*, consists of four membranes like the other veins. It arises in the lungs from an infinity of little branches, which uniting in one trunk, opens into the left ventricle of the heart.—See *tab. anat. (Angeiol.) fig. 9. lit. a. b. c. d. d. d.* See also HEART.

For the office of these vessels, see CIRCULATION. See also RESPIRATION, HEART, BLOOD, &c.

Mr. Cowper gives us an instance of a polypus in the *pulmonary vein*. See POLYPUS.

**PULMONARY consumption**, or consumption of the lungs, is what we properly call a *phthisis*. See PHTHISIS and CONSUMPTION.

**PULMONUM anima**. See the article ANIMA.

**PULP, PULPA**, in fruits, the *flesh*; or that soft and succulent part between the rind and the nucleus or seed. See FRUIT.

The *pulp* of a tree or plant, is the parenchyma, which grows and swells by means of a juice, at first very coarse and disagreeable, at length sweeter and more delicate. See PARENCHYMA; see also VEGETABLE, PLANT, &c.

**PULP**, in pharmacy, denotes the soft part of fruits, roots, or other bodies, extracted by infusion or boiling, and passed through a sieve.

**PULP**, in medicine, denotes the fattest, fullest, and most solid part of the flesh. See FLESH.

Physicians apply the word particularly to the upper part of the belly, because fleshy; and because it is here that they feel animals\*, to examine whether they be fat.

\* This part the Latins call *pulpa*, from *palpare*, to feel, handle.

**PULPIT\***, **PULPITUM**, a term now restrained to an elevation, or apartment in a church, whence sermons are delivered.

\* Some authors derive the word from *publicum*, because people are there exposed to open view.

**PULPITUM**, among the Romans, was a part of the theatre, called also *proscenium*, or what we now call the *stage*, whereon the actors trod.

Tho' some say it was properly an eminence on the stage for the music, or a suggestum whence declamations, &c. were spoken.

The French use the word *pulpit*, *pupitre*, for a reading-desk in a church, library, or the like: those large ones in churches they properly call *lutrins*.

**PULSATION, PULSATIO**, in medicine, the motion of the pulse, or the beating of an artery. See PULSE.

**PULSE, PULSUS**, in the animal oeconomy, denotes the beating or throbbing of the heart and arteries. See ARTERY.

The *pulse* is that reciprocal motion of the heart and arteries, whereby the warm blood, thrown out of the left ventricle of the heart, is so impelled into the arteries, to be by them distributed throughout the body, as to be perceivable by the finger. See BLOOD.

The pulsation of the arteries arises from that of the heart; and has, like it, a systole and diastole; the systole of the one corresponding to the diastole of the other. See HEART, SYSTOLE, &c.

Galen tells us, that Hippocrates was the first who observed the motion of the *pulse*.—M. Homberg mentions the case of a woman in Paris, who had a *pulse* in the veins, perfectly like that we commonly observe in the arteries. He adds, that he is the first author that ever mentioned such a thing. See VEIN.

The *pulse* is thus accounted for.—When the left ventricle of the heart contracts, and throws its blood into the great artery; the blood in that artery is not only thrust forwards towards the extremities, but the channel of the artery is likewise dilated; because fluids, when they are pressed, press again towards all sides, and their pressure is always perpendicular to the sides of the containing vessels; but the coats of the artery, by any small impetus, may be distended; therefore, upon the contraction of the heart, the blood from the left ventricle will not only press the blood in the artery forwards, but both together will distend the sides of the artery: and thus is a motion of dilatation effected. And when the impetus of the blood against the sides of the artery ceases, that is, when the left ventricle ceases to contract, then the spiral fibres of the artery, by their natural elasticity, return again to their former state, and contract the channel of the artery, till it is again dilated by the systole of the heart: so that here is a motion of contraction effected.

The diastole or dilatation of the artery is called its *pulse*, and the time of the spiral fibres returning to their natural state, is the distance between two *pulses*.

This *pulse* is in all the arteries of the body at the same time: for while the blood is thrust out of the heart into the aorta, that artery being full, the blood must be propelled in all the arteries at the same time; and because the arteries are conical, and the blood moves from the basis of the cone to the apex, therefore the blood is continually pressing against the sides of the vessels; and consequently every point of the artery must be dilated, at the same time that the blood is thrown out of the left ventricle of the heart; and as soon as the elasticity of the spiral

fibres can overcome the impetus of the blood, the arteries are again contracted.

Thus, two causes operating alternately, the heart and fibres of the arteries keep the blood in a continual motion. See CIRCULATION.

The observation of the *pulse* is of the last importance to a physician; both as it discovers the state of the heart, the first mover in the animal frame; and as it shews the nature, quantity and motion of the blood, that universal humour whereon all the rest depend; and as it indicates the condition of the artery, the primary vessel of the whole body.

A *strong PULSE*, then, denotes, 1. A great muscular force of the contracting heart; and, consequently, the strength of the contracting cause; *i. e.* 2. A brisk and copious influx of the nervous juice into the villi of the heart. 3. Plenty of blood. 4. A laudable secretion and circulation of humours.

A *strong pulse*, therefore, is a good presage, if it be alike throughout the whole body. Indeed it is frequently fallacious in apoplectic, and some other diseases, where the passage between the heart and the brain is free; and in other parts, especially the viscera, obstructed.

A *weak PULSE* denotes the contrary of the former; though this sometimes deceives, particularly in fat people.

A *hard PULSE* signifies, 1. That the membrane of the artery is drier than ordinary: and therefore, 2. Obstructions in the minute vesicles, whereof the membranes of the artery are woven. 3. That the arteries are full: but, 4. That their capillary extremities are obstructed with an inflammatory viscosity. 5. That the blood is very dense and compact: hence, 6. That the circulations, secretions and excretions are depraved.

A *soft PULSE* denotes the contrary to all these; yet is very fallacious in an acute peripneumonia.

A *slow PULSE* denotes, 1. That the contractions of the heart are slow; and therefore, 2. A slowness of the influxes of the nervous juice from the brain into the villi of the heart. 3. That the blood has circulated a great number of times. 4. That all the humours circulate easily through their vessel. Indeed, if the *pulse* be thus from weakness, it is an ill sign.

A *quick PULSE* denotes the contrary to all these; as acrimonies, spirits agitated, fevers, phrensy.

An *equable PULSE* denotes a constant tenor of the vital functions; an uneven one the contrary.

An *intermitting PULSE* shews life in a slippery situation.

An *intermitting pulse* is either owing to a fault in the nervous juice, which flows unequally into the heart; or in the vessel which transmits the blood and humours; or to the humours themselves.

The cause of this disorder is various, as convulsions, polypus's, cacochymia's, inflammations, want of blood, bony or cartilaginous arteries, &c.

A strong, equable, and, at the same time, slow *pulse*, is of all others the best. A strong and great, or strong and slow *pulse*, together, are good. A weak, small, hard, unequal, intermitting, quick *pulse*, is of all others the worst.

Yet in all these things, regard must be had to the nature of the particular artery, the age, sex, temperament, affections of the mind, the six non-naturals, habit of body, season, country, &c. all which have an influence on the *pulse*.

A diminution or total suspension of the *pulse*, is reducible either to a *lipothymia*, where it fails to such degree, as that there is scarce strength left to sustain the body. See LIPOTHYMIA.

Or to a *lipopsychia*, when it is attended with a sensible diminution of the natural heat.

Or to a *syncope*, when the heart fails, so as the heat, motions, senses and all, are almost destroyed.

Or, lastly, to an *asphyxia*, where those are all absolutely destroyed as to sense, and death itself seems in possession. See SYNCOPE, &c.

**PULSE** is also used for the stroke with which any medium is affected by the motion of light, sound, &c. through it. See LIGHT and SOUND.

Sir Isaac Newton demonstrates, *lib. 2. prop. 48. Princip.* That the velocities of the *pulses* in an elastic fluid medium (whose elasticity is proportionable to its density) are in a ratio compounded of half the ratio of the elastic force directly, and half the ratio of the density inversely: so that in a medium whose elasticity is equal to its density, all *pulses* will be equally swift. See MEDIUM, FLUID, &c.

**PULSE, legumen**, in botany, is a term applied to those grains or seeds which are gathered with the hand; in contradistinction to corns, &c. which are reaped or mowed.

*Pulse* is the seed of the leguminous species of plants. See LEGUMINOUS.

The word is primarily understood of grains that grow in pods; as beans, peas, vetches, &c. but is also used by extension for artichokes, asparagus, and other kitchen roots and herbs.

**PULSION\***, *trufion*, the act of driving or impelling a thing forwards. See TRUSION and REPULSION.

\* The word comes from *pelle*, I drive. See ATTRACTION and ELECTRICITY.

**PULTURA\***, in our old law-books, denotes a previous demand or examination:—on account of the monks, who, ere they were admitted into the monasteries, *pulsabant ad fores*, knocked at the doors for several days.—*Et volo ut sint quieti*

## P U M

*de omnibus causis, & querelis, & placitis ballivorum & præpositorum hundredi, & a pultura serjanorum, i. e. from the examination of serjeants; & de rewardo forestarum, i. e. the visitation of the forests.*

\* The word is formed from the Latin *pulsare*, to knock, to ask.

**PULVERIZATION, PULVERIZATIO**, the art of *pulverizing*, or reducing a dry body into a fine powder. See **POWDER**.

This is performed, in friable bodies, by pounding or beating in a mortar; but to *pulverize* malleable ones, other methods must be taken. See **FRIABLE** and **MALLEABLE**.

To *pulverize* lead, or tin, the method is thus: Rub a round wooden box all over the inside with chalk; pour a little of the melted metal nimbly into the box, when, shutting the lid, and shaking the box briskly, the metal will be reduced into powder. See **TRITURATION**.

**PULVINATED, PULVINATUS**, in the ancient architecture, a term applied to a freeze, which swells, or bulges out, in manner of a pillow, *pulvinus*: whence the name. See **FREEZE**.

**PULVIS fulminans**, or the thundering powder. See **FULMINANS pulvis**.

**PULVIS patrum**, the Jesuits powder. See **CORTEX** and **QUINAQUINA**.

**PUMICE stone, PUMEX**, a kind of spongy stone, very porous and friable. See **STONE**.

Naturalists are not agreed about the nature and origin of *pumice*.—Some look on it as pieces of rock half-burnt and calcined, cast up in eruptions of volcanoes, particularly *Ætna* and *Vesuvius*, into the sea; and which, by being there washed in the salt-water, lays aside the black colour that the impression of the subterranean fires had given it, and becomes whitish, or sometimes only greyish, according as it has floated more or less in the sea.

Dr. Woodward considers *pumice* as only a sort of slag or cinder; and affirms, it is only found either where forges of metals have anciently been, or near some volcano, or burning mountain.

Other authors will have the *pumice* to rise from the bottom of the sea; whence they suppose it detached by subterranean fires: and hence account both for its lightness and porosity, and its saline taste; alledging, in confirmation hereof, that *pumice* is frequently found in parts of the sea far remote from all volcanoes; and adding, that several parts of the Archipelago are frequently found covered with it, all at once, after a few inward shakes and heavings of the bottom of the sea.

*Pumice* makes a very considerable article in commerce, and is much used in the arts and manufactures, to polish and smooth several works. See **POLISHING**, &c.

Its pieces are of several sizes: the parchment-makers and marblers use the largest and lightest;—the carriers the heaviest and flattest;—pewterers the smallest.

Pliny observes, that the ancients made considerable use of *pumice* in medicine; but it is out of the present practice.

**PUMMEL**. See the article **POMMEL**.

**PUMP, ANTLIA**, in hydraulics, a machine formed in the model of a syringe, for the raising of water. See **SYRINGE**. Vitruvius ascribes the first invention of pumps to Ctesibius the Athenian; whence the Latins call it *machina Ctesibiana*, or *organum Ctesibicum*.

Pumps are distinguished into several kinds, with regard to the several manners of their acting.—As the

**Common**, sometimes called the *sucking PUMP*, which acts by the pressure of the air, and whereby water is raised out of a lower into a higher place, not exceeding thirty-two feet.—Its structure and action may be conceived from what follows:

1. A hollow cylinder, or barrel, ABCD, (*tab. hydrostat. fig. 27.*) is provided of any solid matter, usually wood, and erected perpendicularly in a spring, or other source of water; the lower base of the cylinder being first fitted with a valve I, which opens upwards.

2. A piston or embolus, called the *sucker*, EK, furnished with a valve L, which likewise opens upwards, is let down the cylinder; and for the more easy working upwards and downwards, furnished with a lever or handle, as GH. See **EMBOLUS** and **VALVE**.

Now, the embolus EL, being drawn up from I to L, will leave the space LI void of air, at least in a great measure so: the pressure, therefore, of the air on the surface of the stagnant water prevailing, will, by the laws of hydrostatics, lift up the valve I, and raise it to fill the cavity LI. See **AIR** and **SIPHON**.

If, then, the embolus be again let down, the lower valve being now fast closed with the weight of the incumbent water, upon pressing the piston, the water must open the upper valve, and get into the embolus, by which it is raised up and discharged out at the spout H.

Thus is the embolus alternately raised and depressed, &c. See the theory of the pump more accurately laid down under the article **SYRINGE**.

The **forcing PUMP**, which acts by mere impulse or protrusion, and raises water to an height at pleasure.—Its structure is as follows:—1. A cylinder AB, (*fig. 28.*) is divided by a diaphragm, or transverse piece, CD, fitted with a valve E, opening upwards; and thus immersed in water,

## P U N

2. An embolus F, furnished with a valve G, is so fitted to an iron rod IH, moveable on a hinge at each, as that it may be conveniently raised and depressed by the hand applied in K.

Now, upon depressing the embolus F, the water will open the valve G, and thus ascend into the cavity of the cylinder BC: but upon raising it again, the valve G is shut, so that there is no passage for it that way: the valve E therefore becomes opened, and the water mounts through it; and, by repeating the agitation of the embolus, is at length driven out through the spout M.

The great difficulty of rectifying this *pump*, when it happens to be out of order, on account of the chief seat of action's being under water, makes people decline the use of it when they can do well without it, notwithstanding its advantage of raising the water to any given height.

**Ctesibius's PUMP**, the first and finest of all the kinds, acts both by suction and pulsion.—Its structure and action are as follow:—

1. A brass cylinder ABCD, (*fig. 29.*) furnished with a valve in L, is placed in the water. 2. In this is fitted the embolus MK, made of green wood, which will not swell in the water, and adjusted to the aperture of the cylinder with a covering of leather; but without any valve. In H is fitted on another tube NH, with a valve that opens upwards in I.

Now, the embolus EK being raised, the water opens the valve in L, and rises into the cavity of the cylinder:—and when the same embolus is again depressed, the valve I is opened, and the water driven out through the tube HN.

This is the *pump* used among the ancients, and that from which both the others are deduced.—Sir S. Morland has endeavoured to increase its force by lessening the friction; which he has done to good effect, inasmuch as to make it work without almost any friction at all.

**PUMPS** used in ships are of several kinds: as the

**Chain PUMP**, used by the English in large vessels, is double; one of which rises as the other falls: this yields a great quantity of water, works easily, and is easily mended; but takes up a great deal of room, and makes a disagreeable noise.—See *tab. ship. fig. 2. n. 59.*

**Bare PUMPS** are small ones made of cane, or a piece of wood, bored through, used in lieu of cocks, &c. to pump beer or water out of the casks.

**Bur PUMPS**, called also *bildge pumps*, are chiefly used by the Dutch, who have them by their ships-sides. In these is a long staff, with a bur at the end like a gunner's sponge, to pump up the bildge water. See **BILDGE**.

**Air PUMP**, in pneumatics, is a machine, by means whereof the air is emptied out of vessels, and a sort of vacuum produced therein. See **AIR** and **VACUUM**.—For the invention, structure and use of this pump, see **AIR pump**.

**PUN, or PUNN**, a lusus verborum, the wit whereof depends on a resemblance between the sounds or syllables of two words, which have different, and perhaps, contrary significations. See **WIT**.

Such are,—*Cane de cane, cane.*—*Far mole mole mola.*—*Lex Dei, lux dici.*—All houses are ale-houses.—The holy state of matrimony, is become matter of money.—Some mens paradise is a pair of dice.—Was it so in the time of Noah? Ah no.—*L'ordre tiré du désordre, ou désordre ordonné*, is the title of a French book.

**Puns**, when they come easily, and are very ingenious, poignant, and apposite, are allowed of in conversation, letters, epigrams, madrigals, and the like compositions; but are absolutely banished out of the grave, serious, and sublime, by reason they weaken its force, and diminish its beauty, which consists in something great and elevated. The Greeks and Romans, it is true, sometimes indulged themselves the practice, and used puns as ornaments in the most serious discourses: but the more severe and philosophical genius of our age is by no means satisfied with such an outside of wit.—Devises, symbols, rebus's, motto's, &c. are their proper sphere, where they shine to most advantage. See **DEVISE**, **REBUS**, &c.

**PUNCH**, an instrument of iron or steel, used in several arts, for the piercing or stamping holes in plates of metals, &c. being so contrived, as not only to perforate, but to cut out and take away the piece: whence the French call it, *emporte-pièce*, p. d. take-off piece.

The *punch* is a principal instrument of the metal-button-makers; wafer-makers, patch-makers, shoe-makers, &c.—The *punch* of the makers of plate-buttons serves to cut and parcel out the plates of gold and silver, wherewith they cover their moulds.—It is large, round, four or five inches high, the bottom hollow for about half an inch, well steeled, and the edge very sharp.

To use it, they extend the plate of metal on a leaden table or block, and with a pretty heavy hammer strike the head of the *punch*, &c. See **BUTTON making**.

**PUNCH horse**, in the manage, is a well-set, well-knit horse, short-backed, and thick-shouldered, with a broad neck, and well lined with flesh.

**PUNCH** is also a sort of compound drink frequent in England, and particularly about the maritime parts thereof; though little known elsewhere. See **DRINK**.

Its basis is spring-water, which being rendered cooler, brisker, and more acid, with lemon-juice, and sweetened again to the palate with fine sugar, makes what they call *sherbet*; to which

a pro-

a proper quantity of a spirituous liquor, as brandy, rum, or arrac, being superadded, the liquor commences *punch*. Several authors condemn the use of *punch*, as prejudicial to the brain and nervous system.—Dr. Cheyne insists that there is but one wholesome ingredient in it, which some now begin to leave out, viz. the mere element. See WATER, BRANDY, RUM, ARRAC, SUGAR, &c.

The proportions of the ingredients are various; usually the brandy and water are in equal quantities.—Some, instead of lemon-juice, use lime-juice, which makes what they call *punch royal*, found less liable to affect the head, as well as more grateful to the stomach.

Some also make *milk punch*, by adding near as much milk to the sherbet as there is water, which tempers the acrimony of the lemon.—Others prefer *tea punch*, made of green tea instead of water, and drank hot.

Lastly, What they call *punch for chamber-maids* is made without any water, of lime-juice, sharpened with a little orange and lemon-juice; twice as much white-wine as lime-juice, and four times as much brandy, with sugar.

PUNCHEON. See the article PUNCHION.

PUNCHIN, or PUNCHION, in building. See the article PUNCHION.

PUNCHION, or PUNCHEON, a little block, or piece of steel, on one end whereof is some figure, letter, or mark, engraved either in creux, or in relievō; impressions whereof are taken on metal, or some other matter, by striking it with a hammer on the end not engraved. See ENGRAVING, &c.

There are various kinds of these *punchions* used in the mechanical arts.—Such, for instance, are those of the gold-smiths, cutlers, pewterers, &c. See MARK.

PUNCHION, in coining, is a piece of iron steeled, whereon the engraver has cut, in relievō, the several figures, arms, effigy, inscription, &c. that are to be in the matrices wherewith the species are to be marked. See MATRICE, &c.

Minters distinguish three kinds of *punchions*, according to the three kinds of matrices to be made; that of the effigy, that of the cross or arms, and that of the legend or inscription.

The first includes the whole portrait in relievō.—The second are small, each only containing a piece of the cross or arms, v. gr. a fleur-de-lys, a harp, a coronet, &c. by the assemblage of all which the entire matrice is formed.—The *punchions* of the legend only contain each a letter, and serve equally for the legend on the effigy-side, and the cross-side. See COINING.

For the manner of engraving, tempering, and stamping these *punchions*, to form the matrices, see ENGRAVING on steel, MATRICE, &c.

PUNCHIONS, in printing, are those used in stamping the matrices, wherein the types of printing characters are cast. See letter FOUNDRY.

PUNCHION is also used for several iron tools of various sizes and figures, used by the engravers in creux on metals.—Seal-gravers particularly use a great number, for the several pieces of arms, &c. to be engraved;—and many stamp the whole seal from a single *punchion*. See ENGRAVING.

PUNCHION is also a common name for all the iron instruments used by stone-cutters, sculptors, lock-smiths, &c. for the cutting, incising, or piercing their several matters.

Those of sculptors and statuaries serve for the repairing statues, when take out of the moulds. See STATUE, FOUNDRY, &c.

The lock-smiths use the greatest variety of *punchions*; some for piercing hot, others for piercing cold; some flat, some square, some round, others oval; each to pierce holes of its respective figure in the several parts of locks.

PUNCHION, or PUNCHIN, in carpentry, is a piece of timber placed upright between two posts, whose bearing is too great, serving, together with them, to sustain some large weight. See BEARING, &c.

The *punchion* is usually lower and slighter than either prick-posts, or principal posts, and is joined by a brace, or the like, of iron. See POST.—Those on each side of a door are called *door punchions*. See DOOR.

PUNCHION is also a piece of timber raised upright under the ridge of a building, wherein the little forces, &c. are jointed.—Vitruvius calls the *punchion*, *columen*.

PUNCHION is also used for the arbour or principal part of a machine, whereon it turns vertically: as that of a crane, &c. See CRANE.

PUNCHION is also a measure for liquids, containing a hoghead and  $\frac{1}{2}$ , or 84 gallons, or  $\frac{1}{4}$  of a tun. See MEASURE.

The Paris *punchion* is the same with their demi-queue: at Rouen it is three bushels, &c.

PUNCTA lachrymalia. See the article LACHRYMALIA.

PUNCTATED hyperbola, in the higher geometry, an hyperbola whose oval conjugate is infinitely small, i. e. a point. See CURVE and HYPERBOLA.

PUNCTION, or PUNCTURE, in chirurgery, an aperture made in the lower belly, in dropical persons, to discharge the water; called also *paracentesis*. See PARACENTESIS and DROPSY.

PUNCTUATION, in grammar, the art of pointing; or of dividing a discourse into periods, and members of periods, by points expressing the pauses to be made in the reading thereof. See SENTENCE, PERIOD, &c.

The points used herein are four, viz. the *period*, *colon*, *semi-colon*, and *comma*. See the particular use of each under its proper article, COMMA, COLON, PERIOD, and SEMI-COLON. Punctuation is a modern art: the ancients were entirely unacquainted with the use of our commas, colons, &c. and wrote not only without any distinction of members and periods, but also without distinction of words; which custom, Lipsius observes, continued till the hundred and fourth olympiad; during which time the sense alone divided the discourse. See POINT.

There is much more difficulty in *pointing*, than people are generally aware of.—In effect, there is scarce any thing in the province of the grammarians so little fixed and ascertained as this. The rules usually laid down are impertinent, dark, and deficient; and the practice, at present, perfectly capricious, authors varying not only from one another, but from themselves too.

Indeed F. Buffier, and since him, Mr. Ward, have done something towards a fixed and precise system of *pointing*, from the reason and analogy of things. Their doctrine the reader will find under the articles COMMA, COLON, &c.

In the general, we shall only here observe, that the comma is to distinguish nouns from nouns, verbs from verbs, and such other parts of a period as are not necessarily joined together.—The semi-colon serves to suspend and sustain the period when too long:—the colon, to add some new, supernumerary reason, or consequence, to what is already said:—and the period, to close the sense and construction, and release the voice.

PUNCTUM, in geometry, &c. See the article POINT.

In the schools they have three

PUNCTUM terminans, which is the indivisible extreme of a line, beyond which no part of the line extends. See LINE.

PUNCTUM continuans, an indivisible magnitude between contiguous points of a line, whereby they are connected, and from whence arises a continuity. See CONTINUITY.

PUNCTUM initians, an indivisible, from which the line begins.

PUNCTUM formatum or generatum, in conics, is a point determined by the intersection of a right line drawn through the vertex of a cone to a point in the plane of the base that constitutes the conic section. See CONE and CONIC.

PUNCTUM ex comparatione denotes either of the foci of an ellipsis and hyperbola; thus called by Apollonius, because the rectangles under the segment of the transverse diameter in the ellipsis, and under that and the distance between the vertex and the focus in the hyperbola, are equal to one fourth part of what he calls the figure thereof. See ELLIPSIS and HYPERBOLA.

PUNCTUM lineans, in geometry, is a term used by some authors for that point of the generating circle of a cycloid, or epicycloid, which in the genesis produces any part of the cycloidal line. See CYCLOID, &c.

PUNCTUM saliens, in anatomy, the first rudiments of the heart, in the formation of the foetus, where a throbbing motion is perceived. See CONCEPTION, HEART, and EMBRYO.

This is easily observed with a microscope in a brood-egg, wherein, after conception, we see a little speck or cloud; in the middle whereof is a spot that appears to beat, or leap a considerable time, ere the foetus be formed ready for hatching. See EGG, GENERATION, and EMBRYO.

PUNCTUM lachrymale, in anatomy, a little hole in the edge of each eye-lid, opening into a bag called *glandula lachrymalis*. See LACHRYMAL.

PUNCTURE, PUNCTURA, in chirurgery, &c. any wound made by a pointed instrument. See WOUND.

In phlebotomy, people are sometimes brought in danger of the loss of a limb, and even of life, by the *puncture of a tendon*.

—The patient here does not immediately feel any pain; but twelve hours after the operation, complains thereof; not in the puncture itself, but in the parts tending towards the armpit.—The wounded part swells to the size of a filbert, and distils an aqueous humour, or ichor, which is the chief diagnostic of the *punctura tendinis*. See TENDON.

PUND-BRECH\*, or POUND-BREACH, denotes the illegal taking of cattle out of the pound; either by breaking the pound, picking the lock, or otherwise. See POUND.

\* The word is compounded of the Saxon, *pund*, pound, and *brech*, fracture, breaking.

—Si pund-brech fiat in curia regis, plena wyta sit: alibi quinque mancae. Leg. Hen. 1.

PUNISHMENT, a penalty imposed upon the commission of some crime or offence against the law. See CRIME.

It is essential to the nature of a law, that it import or decree a *punishment* to the transgressors thereof. See LAW.

The forms and manners of *punishment* are various in various countries and ages, and for various crimes; as treason, felony, adultery, parricide, &c. See ADULTERY, &c.

Among the Romans, the pecuniary punishments were the *multa* and *confiscatio*.—The corporal punishments were *capitis diminutio*, *aqua* & *ignis interdictio*, *proscriptio*, *deportatio*, *relegatio*, *furca*, *crux*, *carcer*, *culcus*, *equuleus*, *scala gemonica*, *damnatio ad gladium*, *ad metallum*, *flagellatio*, *talis*, &c. most of which see described under their respective articles.

Among us, the principal civil punishments are *fines*, *imprisonments*, *the stocks*, *pillory*, *burning in the hand*, *whipping*, *ducking-stool*, *hanging*, *beheading*, *quartering*, *burning*, *transportation*, &c. See FINE, PILLORY, DUCKING-STOOL, GALLOWS, GIBBET, &c.

The ecclesiastical punishments are *censures*, *suspensions*, *deprivations*,

tions, degradations, excommunications, anathemas, penances, &c. See CENSURE, SUSPENSION, DEPRIVATION, DEGRADATION, EXCOMMUNICATION, ANATHEMA, PENANCE, &c. The military punishments are, *being shot, running the gantlope, riding the wooden horse, bilboes, &c.*—Among the Turks, &c. *impaling, bastinadoes on the soles of the feet, &c.* obtain. See EMPALEMENT, &c.

**PUNITORY interest**, in the civil law, such interest of money as is due for delay of payment, breach of promise, &c. See INTEREST.

**PUNN**. See the article PUN.

**PUPIL**, **PUPILLUS**, in the civil law, a boy or girl not yet arrived at the age of puberty, *i. e.* under fourteen years of age the boy, and twelve the girl. See PUBERTY and AGE.

While a minor remained under the direction of a tutor, he was called *pupil*; after puberty, a curator being assigned him, he ceased to be called a *pupil*. See TUTOR and CURATOR.

A tutor is obliged to pay interest for what moneys of his *pupil* lie idle and unemployed.—A tutor is allowed to do any thing for his *pupil*, but nothing against him.

**PUPIL** is also used by way of extension in universities, &c. in the sense of *alumnus*, for a youth under the education or discipline of any one.

**PUPIL**, **PUPILLA**, in anatomy, denotes a little aperture in the middle of the uvea and iris of the eye, through which the rays of light pass to the crystalline, in order to be painted on the retina, and cause vision. See EYE and VISION.

It is observed, that as we are forced to use various apertures to our optic glasses, so nature has made a like provision in the eyes of animals, whereby to shut out too much, and admit sufficient light, by the changes in the aperture of the *pupil*. See APERTURE.

The structure of the uvea and iris is such, as that by their aperture the *pupil* is contractible and dilatable at pleasure, so as to accommodate itself to objects, and to admit more or fewer rays, as the object, being either more vivid and near, or more obscure and remote, requires more or less light:—it being a constant law, that the more luminous the object, the smaller the *pupil*; and again, the nearer the object, the smaller the *pupil*; and *vice versa*. See UVEA and RAY.

This alteration of the *pupil* is effected by certain muscular fibres on the outside of the uvea, which arise from nerves detached hither from the sclerotica.—These fibres, proceeding straight from their origin towards the centre, terminate in the orbicular limb or verge of the *pupil*, which consists of orbicular fibres, whereby the figure and space of the *pupil* are defined.—The first, or longitudinal fibres, dilate the aperture of the *pupilla*; the latter, or orbicular ones, constrict it.

Some authors, however, attribute the motions of the *pupilla* to the ligamentum ciliare; and others think, that both this, and the fibres of the uvea, concur herein.—Dr. Derham adds, that while the *pupil* opens and shuts, the ligamentum ciliare dilates or compresses the crystalline, and brings it nigher to, or farther from the retina, as the object is more or less remote. See CILIARE, &c.

The figure of the *pupil* in various animals is wonderfully adapted to their various circumstances and occasions: in some, *e. gr.* in man, it is round, that form being fittest for the position of our eyes, and the various use we make of them in all directions.

In others it is elliptical or oblong: in some of which, *e. gr.* the horse, sheep, ox, &c. the ellipsis is transverse, and the fissure large, to enable them to see laterally, and even with a little light; and thereby both to gather their food the better in the night, and to avoid dangers on either side.—In others, *e. gr.* the cat, the ellipsis is erect, and also capable of opening very wide, and shutting very close; by means of the latter of which, that animal can exclude all, but, as it were, a single ray of light, and so avoid all the inconveniences of the bright sun; and by the former can take in all the faintest rays, and thus, avoid the inconveniences of the night. An incomparable provision for these animals, which are to watch and way-lay their prey both by day and night; to see upwards and downwards, to climb, &c. See EYE.

**PUPILLARITY**, or **PUPILLAGE**, the state of a pupil; in opposition to *puberty*. See PUBERTY and PUPIL.

**PURA elemosyna**, **PURE alms**, denotes a tenure whereby the churchmen hold lands in Scotland, somewhat on the footing of the primitive clergy. See ALMS and TITHES.

**PURA hasta**, See the article HASTA.

**PURBECK stone**. See the article STONE.

**PURCELAIN**. See the article PORCELAIN.

**PURCHASE**, in law, the acquisition of goods, lands, tenements, or the like, by means of money; in contradistinction to those obtained by descent, or hereditary right. See GOODS.

**PURCHASE**, in the sea-language, has the same signification with *draw in*, at land.—Thus, they say, *The capstan purchases apace, i. e.* draws in the cable apace: and when they cannot draw or hale any thing in with the tackle, they say, *The tackle will not purchase*.

**PURE**, something free from any admixture of foreign or heterogeneous matters. See PURIFICATION and NET.

**PURE fire**. See the article FIRE.

**PURE hyperbola**, in conics, is an hyperbola without any oval, node, spike, or conjugate point. See CURVE.

**PURE mathematics**. See the article MATHEMATICS.

**PURE proposition**, **PURE quadratics**, **PURE resignation**, } See the articles { PROPOSITION, QUADRATIC, RESIGNATION.

**PURFLEW**, a term in heraldry, expressing ermines, peans, or any of the furs, when they compose a bordure round a coat of arms. See PEAN, BORDURE, &c.

Thus they say, he beareth gules a bordure *purflew*, *vairy*: meaning, that the bordure is *vairy*.

**PURGATION**, **PURGATIO**, the act of *purging*, scowring, or purifying a thing, by separating and carrying off any impurities found therein. See PURIFICATION.

**PURGATION**, in pharmacy, is the cleansing of a medicine by retrenching its superfluities; as the wood and seeds out of cassia, stones out of dates, tamarinds, and other fruits. See ABLUTION.

**PURGATION** is also used in chymistry for several preparations of metals and minerals, to clear them of their impurities; more usually, called *purification* and *refining*. See PURIFICATION and REFINING.

The *purgation* of mercury is performed by passing it through a chamois skin. See MERCURY.—Gold is *purged* by the coppel, cementation, &c. See GOLD, COPPEL, &c.—*Purgation* in other metals is performed by repeated fusion, &c. See METAL, FUSION, &c.

**PURGATION**, *catharsis*, in medicine, is an excretory motion, arising from a quick and orderly contraction of the fleshy fibres of the stomach and intestines; whereby the chyle, corrupted humours and excrements lodged therein, are protruded farther and farther, and at length quite excluded the body by stool. See EXCRETION, STOMACH, INTESTINES, &c.

*Purgation* is one of the principal species of *evacuation*. See EVACUATION.—For the means and manner wherein it is effected, see PURGATIVE.—See also SUPER-PURGATION.

**PURGATION**, in law, is the clearing one's self of a crime, wherein he is publicly suspected or accused before a judge, called also *judicium Dei*. See JUDICIUM DEI.

Of these *purgations* there was anciently much use in England, especially touching matters of felony charged on clerks; and there is something of them still retained in the ecclesiastical court in suspicion of incontinency, &c.

*Purgation* is either *canonical* or *vulgar*.

**Canonical PURGATION** is that prescribed in the canon law, the form whereof obtaining in the spiritual court, is, that the party shall take his oath he is clear of the fact objected; and bring so many of his honest neighbours, not above twelve, as the court shall assign him, to swear, on their consciences, they believe he swears truly.

**Vulgar PURGATION**, being the most ancient manner, was by fire, or water, or combat; used by infidels, and by christians too, till abolished by the canon law. See ORDEAL, WATER, DUEL, &c.

*Combat*, though now disused, may yet be still practised by the laws of the realm in cases where evidence is wanting, and the defendant rather chuses combat than any other trial. See SUTH-DURE, DUEL, CHAMPION, &c.

*Terris, bonis, &c. redhabendis post PURGATIONEM*. See TERRIS.

**PURGATION**, in tragedy, is a term which Aristotle uses for the effect of tragedy on the mind. See PASSION.

That philosopher observes, that tragedy, by means of the terror and compassion which it excites, *purges* those passions out of the soul.

Indeed, Corneille adds, that tragedy frequently creates those passions, instead of *purging* them; so that he takes Aristotle's *purgation* to be no more than a chimera. See TRAGEDY.

**Menstrual PURGATIONS**, the catamenia or menses of women. See MENSES.

**PURGATIVE**, or **PURGING medicine**, a medicament which evacuates the impurities of the body by stool; called also *cathartic*. See STOOL, PURGATION, and CATHARTIC.

*Purgatives* are divided, with regard to their effect, into *gentle*, *moderate*, and *violent*.—*Gentle purgatives* are such as operate very mildly, as tamarinds, cassia, manna, rhubarb, senna, and most of the mineral waters. See CASSIA, MANNA, RHUBARB, &c.—The moderate purge somewhat more briskly, as jalap, scammony, &c. See JALAP and SCAMMONY.—The *violent* operate excessively, as colocintida, hellebore, laureola, &c. See COLOQUINTIDA, HELLEBORE, &c.

*Purgatives* are, again, divided with regard to the humour they evacuate, into *phlegmagogues*, *cholagogues*, *melanagogues*, and *hydragogues*; each whereof see under its proper article, PHLEGMAGOGUE, CHOLAGOGUE, &c.

The modern physicians reject this division; and shew the operations of all *purgatives* to be alike.

*Purgatives* make one of the most important articles in medicine.

—Their effect is produced by vellicating and irritating the nervous fibres of the stomach and intestines, and thereby urging them to an expulsion. See STOMACH and INTESTINE.

An idea of the manner of their operation is thus given by Dr. Cheyne.—A *purgative* medicine being received into the stomach by the mouth, its particles do there vellicate or stimulate the fibres of the stomach, and thereby increase the digestive faculty, *i. e.* bring the muscular fibres of the stomach, and the muscles of the abdomen and diaphragma, into more frequent contractions than ordinary, till the medicine is admitted into

the intestines; the fibres and glands whereof being more sensible than those of the stomach, (whose parts, by the frequent rough contacts of one against another, and of the gross bodies often thrown into it, are, as it were, deadened) it easily moves and brings them into frequent forcible contractions, whereby these glands are squeezed, and so emit a fluid matter, which lubricates the passages, and which mixing with the feculent matter of the intestines, (which is rendered fluid by the same active and stimulating quality of the *purgative* medicine) renders it more fluid; by which, and by the uncommon contractions of the intestines, it passes more easily and plentifully into the intestine rectum, and is thence ejected by stool.

Thus do gentle *purges* act, and only cleanse the intestines, few of their particles entering in by the lacteal veins so as to affect the blood.—But in violent *purgatives* the stimulating particles are mixed with the blood, and produce there, many times, very great effects, by occasioning unnatural fermentations, by separating the natural cohesions of the fluids of the body; and do also by vellicating the spiral fibres of the veins and arteries, bring those into more forcible contractions, and thereby accelerate the motion of the blood:—all which may have sometimes a good, sometimes a bad effect.

As to the effects of *purgatives* on animal bodies, Dr. Quincy adds, that every irritation of the intestines either quickens the peristaltic motion in its natural direction, or occasions some little inversions of it.—Now, in both cases, any matters that but slightly adhere to the coats, or inner membranes, will be loosened, and shook off, and carried forward with the other contents; and they will also be more agitated, and thus rendered more fluid.

Hence is manifest how a *purging* medicine hastens and increases the discharges by stool; but the same manner of operation also carries its effects much farther, in proportion to the force of the stimulus: for where it is great, all the appendices of the bowels, and even all the viscera in the abdomen, will, by a consent of parts, be pulled or twitched so as to affect their respective juices in the same manner as the intestines themselves do their contents.—The consequence of which must be, that a great deal will be drained back into the intestines, and made a part of what they discharge.—And when we consider the vast number of glands in the intestines, with the outlets of those viscera opening thereunto, and particularly of the liver and pancreas, it will be no wonder, that vast quantities, especially in full constitutions, may be carried off by one *purge*.

As to those *purgatives* distinguished by the names of *cholagogues*, *hydragogues*, *phlegmagogues*, on a supposition of an elective quality therein, they may be accounted for upon more intelligible principles:—For when the discharges by stool discover an over-proportion of any particular humours, it is to be supposed there was a redundancy of such an humour, whose discharge any irritation would have occasioned. Thus, in proportion to the proximity of some humours in the intestinal tube, and the disposition of the passages to convey them that way, do they require greater or lesser vibrations or shakes of the fibres to fetch them out.

For this reason, the brisker cathartics, which vellicate the membranes, most of all, pump out, as it were, from all the mesenteric glands, and neighbouring parts, their contents, which, because they abound so much with lymphatics, and viscid watery humours, make the discharges thin and watery.

Those which act in a somewhat lower degree, yet irritate enough to deterge and draw out a great deal of mucous and viscid matter, which sometimes by lodgment and want of due motion, changing into various colours, occasions the different names of *phlegm* or *choler*: as the former therefore pass for *hydragogues*, so do the latter for *purgers* of *phlegm* and *choler*. See *PHLEGM*, *CHOLER*, &c.

But there is another principle besides that of a stimulus, whereby a *purging* medicine is enabled to answer its intentions, viz. by fusing the humours, and rendering them more fluid than before, whereby they are better fitted to pass off by their proper excretories.—Those which consist of very subtle, and active parts are not so sensible in the larger passages, because of the great quantities of matter, which lay too great a load upon them, and make them unheeded; but when they are got into the blood in any considerable number, they divide and fuse those cohesions which obstruct or move heavily along the capillaries, and scour the glands; insomuch that every pulsation throws something through the intestinal glands, which goes away by stool, that the reflux blood, had washed away and brought back from all parts of the body.

Of this kind are all those cathartics, which are said to *purge* the joints; and are prescribed in rheumatisms, and arthritic pains, as the *radix turpethi*, and all the aloetics.—And this is the reason why purging medicines of this sort are so easily changed into the most efficacious alteratives; for an alterative is a cathartic in a lower degree, or of a more remiss operation. Whatsoever brings such particles to a secretory orifice, which is fitted for its passage, oftener, either by accelerating the blood's motion, or breaking it into more particles of that particular size and disposition, will increase the secretion. According, therefore, to the difference of the parts where such secretions are enlarged, as the glands of the intestines, kidneys, or skin, are the medicines, which are the instruments therein,

called either *cathartics*, *diuretics*, or *diaphoretics*. See *ALTERATIVE*, *SECRETION*, &c.

Dr. Quincy has made some improvements in the doctrine of *purging* medicines, their nature, manner of action, effects, and analogy with other medicines; with the circumstances of their preparation, management, &c. in a discourse inserted in the *philosoph. transact.* The substance of which we cannot do better than here subjoin.

In order hereto, it is to be premised, 1. That all those parts of an animal body which are vascular, or through which any fluid passes from the intestines to the minutest fibre, are the seat of the operation of medicines. See *MEDICINES*.

2. That this whole course of circulation, or animal motion, is naturally distinguished into three different stages, by the different capacities of the vessels, and motions of their contents, each having its proper out-let; and that these are the seat of the three concoctions so often mentioned by physical writers: the first being the stomach and bowels, and having the anus for its excretory; the second all that space within the blood's motion, so far as it retains its red colour, having the kidneys; and the third, all beyond that circuit, having the skin for an excretory organ. See *CONCOCTION*, *EXCRETORY*, &c.

3. That every medicine which causes evacuation, is, in some sense, a *purge*. See *EVACUATION*.

4. That every *purge* operates either as a dissolvent, by fusing the juices, and increasing the quantity fit for expulsion; or as a stimulus, by accelerating their motions so as to bring the matter fit for expulsion oftener to the secretory out-let; or both.

These postulata are only premised, in order to prove this grand proposition, that a change in the bulks, figures, and motions of the component particles of a *purging* medicine, will change the seat of its operation, and fit it for exertion in the larger or smaller vessels, as those mechanical affections are intended, or remitted.

For illustration hereof, it may be convenient to attend to the common way of making a *purge* operate, more or less, than it otherwise would do.

Substances, then, which are gross and heavy, as those consisting chiefly of saline and earthy particles; such as tartar, manna, and the like, when reduced smaller by triture, or repeated solutions, operate more gently; but when acuated by acids, or any way made to expose their angles more plentifully to the membranes they become rougher, and sooner take effect.

Resinous medicines, as scammony, gamboge, jalap, and most vegetable productions, are more violent, and operate sooner, when they are more tenacious and adhesive, as in their extracts; but gentler, when divided by hard brittle substances, such as salt of tartar, sugar, &c.

Medicines, which have in their composition sulphur and salt, are more or less rough and speedy in their operation, in proportion to their greater or lesser participation of the saline ingredient, and the asperity of its angles.—Of this kind are most minerals, and their preparations; it may be sufficient to instance in the management of antimony and mercury; the first of these is by chymical analysis known to be a composition of a subtle sulphur and salt; and the more the saline part is set loose by preparation, and opening the sulphur, as it is commonly termed, the speedier, and with the greater vehemence will it operate; whereas, in its more imperfect preparations, when the salts are closely wrapped up in their native sulphur, it will hardly work at all, till it reaches the farthest stages of circulation. See *ANTIMONY*.

Mercury *per se* is little known as a medicine; and its first preparation, which makes it into a sublimate, so loads it with saline spicula, that it amounts even to a poison; but the more those spicula are broken by triture, sublimation, &c. the milder doth it operate, and if to the comminution of its points be added a sulphur subtle enough to join it, it may be reduced to so mild a medicine, as not to be felt but in the last stage of operation. See *MERCURY*, *SALIVATION*, &c.

This short view may be sufficient to shew, 1. That it is the too great asperity and motion in a medicine, that will not suffer it to pass the stomach, without irritating it into such convulsions, as will throw it up again by vomit. See *EMETIC* and *VOMITING*.

2. That a farther comminution, and smoothing its figure, will gain it admittance into the bowels, and cause it to operate, as a proper *purgative*, by stool.

3. That a yet farther remission of these properties will convey it into the blood, and allow it there to promote evacuation by urine. See *URINE* and *DIURETIC*.

And, lastly, that a still farther comminution will pass it into the minutest canals, where, by the same properties, only in a lower degree, it will cause sweat, or increase perspiration. See *PERSPIRATION*, *SWEAT*, *DIAPHORETIC*, &c.

Hence it appears, that the more subtle medicines operate in the capillaries, and smallest fibres, by the same mechanism that the more gross ones do in the common stream of the blood, when they go off by urine; or as the grossest of all do in the greater passages, when they promote evacuation by stool.

Hence it is evident, that the skill of preparing and administering of medicines consists in proportioning their manifest and known properties to the capacity and circumstances of the part they are to operate in; and to intend or remit their mechanical affections,

affections, as they are sooner or later to take place in the greater or smaller vessels.

Of the first class there are few can be reduced small enough to go beyond the larger passages, and none of them are worth the pains they require, to fit them farther than for diuretics: besides, their natural disposition to attract, and join with the serous part of the blood, whenever they get into that stage of motion, runs them off by the kidneys, before they can undergo comminution enough to get farther: but if by frequent repetitions of such medicines, and an uncommon laxity of the passages, any parts are passed into the habit, their grossness fouls the delicate strainers, which are destined for their expulsion; and they lodge upon the glands and capillaries in such manner, as to induce intermittents; which are observable in many persons, after a long use of cream of tartar, the common cathartic salts, and the purging waters, especially at the latter end of the summer, when the heat of the preceding season has debilitated the solids, and left them under too great a relaxation.

Among the resinous purges, there are many very powerful ones; but where their operation is desired in the viscera, blood, and remoter parts, they must be extremely divided; and this we find spirituous menstruums will do, by taking up the most subtle parts only, and carrying them into the very small passages, where they operate chiefly by fusion; because the softness of such substances cannot enable them, hardly in any degree, to act as stimuli, farther, at least, than ordinary detergents. And thus we find that aloë, the chief of this tribe, goes farthest into the habit, and continues longest ere it operates, when managed with a spirituous menstruum, as in the tinctura sacra. The rad. turpethi, and colocynth likewise, with all of the vegetable kind, that will yield to a spirituous liquor, may, by that means, be carried into the farthest scenes of animal action; where they will prove efficacious medicines in cases, which, with other management, they would never be able to reach: and on this account it must undoubtedly have been, that we frequently meet, in practical writers, with many materials of this sort mentioned as alterants; the colocynth particularly by Helmont: for all medicines which operate in the farthest passages, they commonly include under that general appellation.

But the most efficacious purges, and those which require the most skill, are procured from the mineral kingdom; these abound in solidity beyond any other materials, and therefore where-ever they are brought into action, necessarily excel in the quantity of impulse: many of these therefore want not only the utmost comminution to carry them into the farther scenes of operation, but also some restraint of their asperities and motions, to fit them for many intentions.—Thus sublimate is not only to be much sweetened, that is, smoothed in its points, to make it a safe purge in the larger vessels; but if it be intended to go farther than the blood, and those glands, which in that circuit it is most apt to be lodged upon when it salivates, it must not only be rendered very fine, but also be covered with such substances as weaken its points, and make it pass into the last subdivisions of the constitution. To this purpose, the common practice wisely contrives in distempers, which, according to the course of circulation, lie most remote, to wrap up the basis of this medicine in sulphurs, and such-like substances, as follow it into its last division, without giving it any asperities to make it act as a stimulus. Thus, for all cutaneous foulnesses, and habitual taints, the cinnabar, the æthiops, and all of that sortment, are in readiness; and that ordinary sulphur will cover and deaden the efficacies of mercurial preparations, so that they shall not operate, but in such parts only, and in certain circumstances, is demonstrable in ordinary salivations, which are to be lowered by sulphureous medicines.

Medicines from such minerals where a salt and sulphur are united by nature, as they are in some mercurials by art, as antimony, the native cinnabar, steel, &c. are manageable only upon the same principles; and the more they are designed to be carried into the habit, the more are they to be restrained by their natural or adventitious sulphurs: steel, when opened by, and joined with, the points of acid liquors, operates the sooner; and will sometimes prove even emetic; but when it is covered with an additional sulphur, it will go farther, and answer intentions much more remote; as is manifest in the common preparations of steel with tartar or vinegar, and with sulphur.

This way of reasoning on these occasions seems the more just, from considering the texture of those substances, which by a natural preparation are fitted for operation in the minutest part of an animal body; such as those of the aromack kind, all which, more or less, according to their greater or lesser degree of subtilty and smoothness, promote a diaphoresis: for these consist of exquisitely fine salts, covered with a most subtle sulphur, as is demonstrable by chymical analysis; and the common sal volatile oleosum is an admirable contrivance upon the same foundation, where a very volatile animal salt is covered with a most exalted vegetable oil; whereby it is fitted to pass into the minutest fibres, and make, as it were, a part of the animal spirits themselves.

And here it may not be amiss to observe, that all animal salts are very volatile, or easily rendered so; but when bare and naked, just as the fire draws them out, with a mixture also of its own particles in their composition, they are too pungent to be felt without painful sensations; and when softened with a fine

portion of somewhat of an opposite texture, which is smooth and yielding, they become most efficacious and safe sudorifics. On these considerations it likewise ceases to be a wonder, why the subtle salts of cantharides are more sensibly injurious to the bladder than any other parts, and why camphire prevents those injuries; for the exquisite smallness of those spicula makes them imperceptible but in the most minute canals, into which the fibres composing the membranes of the bladder are known to be divided; and camphire blunts their irritations, because its extreme subtilty enables it to follow them into those meanders, and sheath their asperities.

To this purpose is very remarkable what many now commonly practise in guarding even mercurials against their stimulating properties, and sending them into the finest passages to operate by fusion, and the bare force of impulse: for not only calomel and the mercurius dulcis may be restrained from manifest operation in the wider passages, and the glands about the mouth; but even the mineral turbith, which of itself, in a small dose, will operate powerfully by vomit and stool, will not, when mixed with camphor, be so much felt in those respects; but go into the farthest circuit of motion, and promote the cutaneous discharge in a more efficacious manner, than any medicine of less specific gravity.—In this management, the camphor is to be mixed but a very little while before taking, otherwise it has not the effect; which appears to proceed from its great volatility, which makes it in a great measure exhale while it stands mixed in a medicine.

As to the doses of purgatives, Dr. Cockburn attempts to determine them on the following suppositions.—1°. That no part of them operate but in the blood.—2°. That they operate there, by changing the blood, and other circulating fluids derived from it.

From which postulata he concludes, that in the same constitution of blood, the dose required to produce the like effects, must be proportionable to the blood's quantity; so that where a certain dose is required to alter one pound of blood, for instance, to a certain degree, there will be required a double dose to alter two pounds to the same degree, and a triple dose to three pounds, &c. And universally, if the quantity of blood *b* require the dose *d*, the quantity *m b* requires the dose *m d*. For as *b : d :: m b : m d*. See DOSE.

PURGATORY, PURGATORIUM, in the Romish church, a place where the just are supposed to suffer the pains due to their sins, for which they have not satisfied in this world. See MERITS, ABSOLUTION, &c.

It is by the mercy of God, the indulgencies of the church, and the prayers of the faithful, that people are supposed to be delivered out of purgatory. See INDULGENCE, &c.

In Ireland is a place called St. Patrick's purgatory, where, as the legend has it, at the prayers of St. Patrick, bishop of the place, there was made a visible representation of the pains which the wicked undergo after death, in order to deter sinners, &c.

PURGE, in medicine, a term frequently used for a dose of some purgative medicine. See PURGATION and PURGATIVE.

Butler's PURGING *ale*. See ALE.

PURIFICATION, in chymistry, &c. the act of purifying or refining natural bodies; or of separating the feces and impurities therefrom. See PURGATION, REFINING, &c.

For the methods of purifying metals, gold, silver, iron, copper, tin, &c. See METAL, GOLD, SILVER, &c.

For the purification of semi-metals, minerals, and other matters, as antimony, sulphur, camphor, saltpetre, &c. See ANTIMONY, SULPHUR, CAMPHOR, &c.

PURIFICATION, in matters of religion, denotes an offering made the priest by women rising out of child-bed; ere they be re-admitted into the church.

By the law of Moses, a woman, after bringing forth a male child, was unclean forty days; after a female, eighty days: during which time she was not to touch anything holy, nor to go near the temple; but to continue within doors, separate from all company and commerce of others.

This term expired, she was to present herself at the temple, and at the door of the tabernacle to offer a lamb, as a holocaust, and a pigeon or a turtle, which the priest taking, offered to God, and prayed for her, that she might be purified.

This ceremony, which consisted of two things, a holocaust, and a sacrifice of expiation, was called טהרת נדה, purification, *purificatio*.

The holy Virgin, though, according to the fathers, exempt from the terms of the law, yet complied therewith; and at the time prescribed went to the temple, and accomplished the law: in commemoration whereof, the church yearly solemnizes the feast of the purification of the Virgin, on the second of February; called also the feast of candlemas. See CANDLEMAS.

The feast of the PURIFICATION seems to be very ancient. It is ordinarily said to have been instituted in the time of Justinian, in the year 542. and this, on occasion of a mortality which that year dispeopled almost the whole city of Constantinople. Yet there are some who imagine it to have been observed before, though in another manner, and on a different day, from that fixed by Justinian, viz. between the circumcision and epiphany.—The same day is the presentation of our Saviour in the temple. See PRESENTATION.

PURIM,

**PURIM**, a solemn feast held among the Jews on the 14th of March, in memory of their deliverance from the conspiracy of Haman by Esther. See **ESTHER**.

\* The word is Hebrew, פורים, *p. d. lots*.

**PURITANS**, a term anciently used for the Calvinists of Great Britain, from their professing to follow the pure word of God, in opposition to all traditions, human constitutions, and other authorities. See **CALVINISM**, **PRESBYTERIAN**, **NON-CONFORMIST**, **SEPARATIST**, **TORY**, **WHIG**, &c.

**PURLIEU**. See the article **PURLUE**.

**PURLINS**, in building, those pieces of timber that lye across the rafters on the inside, to keep them from sinking in the middle of their length. See **RAFTER**.

By the act of parliament for rebuilding London, it is provided, That all *purlins* from fifteen foot six inches to eighteen foot six inches long, be in their square nine inches and eight inches.—And all in length from eighteen foot six inches to twenty-one foot six inches, be in their square twelve inches and nine inches.

**PURLUE**, **PURLIEU**, or **POURALLEE**, is all that ground near any forest, which being added to the ancient forest by our kings, was, by perambulation granted by some of their successors, severed again from the same, and made *purlieu*, i. e. pure and free from the laws and obedience of the forest. See **FOREST**.

\* The word is formed from the French *pur*, pure; and *lieu*, place.

A *purlieu*, or *pourallee*, is defined a circuit of ground adjoining to the forest, and circumscribed with immoveable boundaries, known only by matter of record; which compass of ground was once forest, and afterwards disafforested by the perambulations made for severing the new forest from the old. See **PERAMBULATION**.

*Purlieus* or *pourallees* commenced after the manner following:—King Henry I. at his accession to the crown in 1154. took so much delight in the forests of this kingdom, that, not being contented with those he found here, though many and large, he began to enlarge divers of them, and to afforest the lands of his subjects near adjoining to the same. See **AFFORESTING**.

His successors Richard I. and Henry II. far from retrenching or restoring any thing, made still further incroachments: and thus did the lands continue till the 17th year of king John; at which time the grievance being grown notorious, and generally felt by all degrees of people; divers noblemen and gentlemen besought the king to grant, that they might have all those new afforestations, made by his predecessors aforesaid and himself, disafforested again; and the king, after much solicitation, was at length prevailed on to subscribe and seal such articles concerning the liberties of the forest, as they then demanded; being for the most part such as are now contained in the charter of the forest. See **FOREST**.

Hereupon, choice was made of divers noblemen, &c. to the number of twenty-five, who were sworn, with others their assistants, to see the said liberties, so granted and confirmed by the king, to be in every point observed.

But ere any thing was done to the purpose, king John died; and king Henry III. succeeding, fresh solicitations were made to him; who for the better accomplishing of the said disafforestation, ordered inquisitions to be made by substantial juries for severing all the new forests from the old: upon which two commissioners were sent to take those inquisitions; in virtue whereof, many great woods and lands were not only disafforested, but improved to arable land by the owners thereof. See **DEAFFORESTED**.

After this charter was made and confirmed, some of these new afforestations were perambulated, and proper inquisitions taken, and the certainty determined by matter of record, which were the old, and which the new: though it appears, that the greatest part of the new afforestations were still remaining during the life of king Henry III.

Under Edward I. fresh petitions and solicitations being set on foot, three bishops, three earls, and three barons, were at length appointed to see those perambulations performed and continued; who caused them to be made accordingly, and inquisitions to be taken thereupon, and returned into the court of chancery; and all those that were ancient forest, to be meered, and bounded with immoveable boundaries, to be known by matter of record for ever.

Those woods and lands that had been newly afforested, the king likewise caused to be separated from the old, and to be returned into the chancery by marks, meres, and bounds to be known, in like manner, by matter of record for ever.

Thus it appears how the *purlieus*, or *pourallees* had their first beginning; for all such woods and lands as were afforested by Henry II. Richard I. or king John, and by perambulations severed from the ancient forests, were, and yet are called *pourallees*, *q. d.* woods and lands severed from the old forests, and disafforested by perambulation; *pourallee* being the same as *perambulation* in Latin. See **PERAMBULATION**.

But notwithstanding such new afforestations were disafforested by perambulation, whereby the same became *pourallees*, or *purlieus*; yet they were not thereby so disafforested as to every man, but that they do in some sense continue forest still, as to others.—For by the words of *charta de foresta*, if the king has affo-

rested any woods or lands of his subjects, to the damage of the proprietors, they should forthwith be disafforested again; that is, only as to those persons whose woods and lands they were; who, as the proper owners thereof, might fell and cut down their woods at their own pleasure, without any licence from the king; as also convert their meadows and pastures into tillage, or otherwise improve their ground to the best advantage. So also they might hunt and chase the wild beast of the forest towards the same, &c. But no other person might claim such benefit of hunting in the *pourallee*, beside the proper owner of the soil thereof; who is left at liberty to suffer the *pourallee* to remain forest still; as some, in effect, have thought most expedient, because hereby intitled to the benefit of the common within the forest, which otherwise they were excluded from. Hence, if the beasts chance to wander out of the forest into the *pourallee*, the king hath a property to them still, against every man, but the owner of the ground wherein they are, who hath a special property in them, *ratione soli*; yet so as he may only take them by hunting, or chasing with his greyhounds or dogs, without any forestalling or forestetting them in their course again towards the forest. See **HUNTING**, **FORESTALLING**, &c.

Beside what has been hitherto said of the difference between forest and *purlieu*, or *pourallee*, there is this farther diversity, that all the woods and lands within the regard of the forest, are absolutely within the bondage and charge of the forest, as well in respect of the owners thereof, as of any other person; for no one may cut down his own woods, or improve his own lands, within the regard of the forest, without licence from the king, or his chief justice in the eyre of the forest.—Neither shall any person hunt, chase, or molest the wild beast of the forest in his own ground, within the regard of the forest, without licence or warrant from the king, or his chief justice of the forest, so to do. See **REGARD**.

But those whose grounds are within the *pourallees*, are not subject to these restrictions.—Yet are not the woods and lands in the *pourallees* absolutely freed from the bondage of the forest in respect of the wild beasts having their haunts therein, when they happen to stray out of the forest; but as they were once absolutely forest, so they are still conditionally so.

**PURLUE MAN**, or **PURLIEU MAN**, or **POURALLEE MAN**, is one who has land within the *purlieu*; and is allowed or qualified to hunt or course within the same, though under certain restrictions. See **PURLUE**.

By stat. 13 Ric. II. he who may lawfully hunt in any *pourallee*, ought to have woods or lands of freehold within the *pourallee*, to the yearly value of 40*l.*—By stat. Jac. I. he ought to have lands of inheritance of the yearly value of 10*l.* or lands of freehold of the yearly value of 30*l.* or have goods worth 200*l.* or be the son of a knight, or baron, or person of a higher degree, or son and heir apparent of an esquire.—But by a later act, Car. II. no man may keep greyhounds within the *pourallee*, or elsewhere within England or Wales, unless he have a free warrant, or be lord of a manor, or such a freeholder as is seized in his own right, or in right of his wife, lands, tenements, hereditaments, of the clear yearly value of 40*l.* over and above all charges and reprises of such estate of inheritance; or of lands, tenements, or hereditaments, in his own right, or in right of his wife, for term of life or lives, of the yearly value of 80*l.* over and above all charges and reprises, or that is worth in goods or chattels 400*l.* See **GAME**.

The *pourallee*, or *purlieu*, then, is said to be for him that is so qualified: others, not qualified, and therefore not *purlieu-men*, yet having land in the *pourallee*, may, if they find any wild beast of the forest in their own grounds within the *pourallee*, chase them thereout with little dogs, but not with greyhounds or other dogs.

Nor is the *purlieu-man* left at large to hunt at his own discretion; but tied down to several rules: as,

1. That he always begin his chase in his own ground; and that though he find such wild beasts in his own *pourallee*, and in respect thereof, hath a property in them, *ratione soli*, against all persons but the king; yet such his property is only on this condition, that he can slay them with his dogs in chase, without forestalling, before they can recover the forest.—Though they be within the list of the forest, before the dogs fasten on them; they are the king's, or other owner of the forest.

But if the *pourallee-man* first make his chase in his own freehold, he may pursue the same through every man's ground within the *pourallee*, provided he enter not into the forest.

2. If a *purlieu-man* begin his course in another man's ground, within the *pourallee*, and his dogs fasten on a wild beast, before it can get within the bounds of the forest, and the beast draws the dogs into the forest, and is there slain by them; here the *pourallee-man* shall not enter into the forest, nor take the beast so killed, because his course was irregular from the beginning, as he could claim no property in the beast, *ratione soli*.

3. A *pourallee-man* may hunt in his own *pourallee*, with no more company than his own servants; neither may he appoint, license, or warrant any other person, except his servants, to hunt by his commandment in his *pourallee*.

4. Every *pourallee-man* is forbidden by the laws of the forest, to hunt in his own grounds within the *pourallee*, every day, or oftener than three days in any one week, Sunday excepted.

5. Nor

5. Nor is any man to disturb, or make a course after any deer found in his *pourallee*, within forty days after the king hath made a general hunting in the forest adjoining thereunto; because then the wild beasts of the forest come not into the *pourallees* of their own accord; but as they are forced into the same by the hunters, with clamours and blowing of horns: so that they fly thither for refuge.

6. No man shall hunt within seven miles of the borders of the forest, or in his own *pourallee*, within forty days next before the king hath issued out his proclamation, declaring his royal will and pleasure to make a general hunting in that forest.

Inasmuch as the *pourallees* were once, and in some sense still are, forest, it was necessary to have officers to attend, and take on them the charge of the preservation of the game that may happen to wander out of the forest, into the *pourallees*; since otherwise the laws of the *pourallees* could not be executed, but the forest would soon be destroyed by the *pourallee-men*.

For this reason rangers were first appointed, who, though not officers in the forest, yet appertain thereto; for all officers in the forest have charge of the vert and venison of the forest; but a ranger hath no charge of vert, but only of venison coming out of the forest into the *pourallees*, his place of charge; from whence his office is to conduct the same back again into the forest. See RANGER.

This officer is appointed by the king, or his chief justice in eyre, and made by patent, with a fee commonly of 20, 30, or 40*l.* or more, by the year, payable out of the exchequer, as also certain fee-deer, both red and fallow, to be taken annually, at proper seasons, out of the forest.

The substance of his oath is, to chase, and with his hounds drive back, the wild beasts of the forest, as often as they range out of the same into his *pourallee*; to prevent all unlawful hunting and hunters of wild beasts of venery and chase, as well within the *pourallees*, as within the forest; and to prevent those and other offences, at the next court of attachments or swanimote, which shall first happen.

Rangers, it is to be observed, belong only to such *pourallees* as were once the woods and lands of the subject, and were afterwards disafforested again, and so became *pourallees*. Hence, as there are some forests in England, which never had any inclosure by new afforestations, and therefore have no *pourallees* at this day; there can be no rangers belonging to them.

**PURPLE**, **PURPURA**, *πορφύρα*, a red colour, bordering on violet; dyed chiefly with cochineal, or scarlet in grain. See COLOUR; see also RED, SCARLET, COCHINEAL, &c.

Purple was much esteemed among the ancients; especially the Tyrian purple, which underwent more dyes than the rest, and which was almost peculiar to emperors and kings. Yet this purple did not exceed that now in use; the chief reasons why the former has been disused, are, that the latter is both cheaper and finer.

The ancient purple was tinged or given with the blood or juice of a precious turbinated testaceous sea-fish, called by the Greeks *πορφυρα*, and by the Latins *purpura*; whereof we have descriptions in several authors, and shells in most of the cabinets of the curious. See DYING.

In the seas of the Spanish West-Indies about Nicoya, is found a shell-fish, which perfectly resembles the ancient *purpura*, and in all probability is the very same: this fish, Gage tells us, usually lives seven years; it hides itself a little before the dog-days, and continues to disappear for 300 days running.

They are gathered plentifully in the spring, and by rubbing one against another, yield a kind of saliva or thick glair, resembling soft wax: but the purple dye is in the throat of the fish; and the finest part in a little white vein;—the rest of the body is of no use.—He adds, that the chief riches of Nicoya consist in this fish. Cloth of Segovia, dyed with it, is sold for twenty crowns the ell; and none but the greatest Spanish lords use it.

Besides the Indian purple fishes, we have others much nearer home. In the *Philosoph. Transact.* we have an account of a purple fish discovered in 1686. by Mr. W. Cole, on the coasts of Somersetshire, South-Whales, &c, where it is found in great abundance.

The fish, M. Reaumur observes, is a kind of buccinum, a name given by the ancients to all fishes whose shell bears any resemblance to a hunting-horn; and it appears from Pliny, that part of the ancient purple was taken from this kind of shell-fish: so that this may be esteemed a recovery of what had been supposed intirely lost.

The method of obtaining the colour, the author describes thus:—The shell, which is very hard, being broken, (with the mouth of the fish downwards, so as not to crush the body) and the broken pieces being picked off, there appears a white vein lying transversely in a little furrow or cleft next the head of the fish.

In this vein is the purple matter lodged; some of which being laid on linen, appears at first of a light green colour; and if exposed to the sun, soon changes into a deep green, and in a few minutes into a sea-green, and in a few more into a blue; thence it soon becomes of a purplish red, and in an hour more of a deep purple red.

And here the sun's action terminates; but by washing in scalding water and soap, and drying it, the colour ripens to a most bright

beautiful crimson, which will bear washing admirably without any stypic. See CRIMSON.

The fish, he observes, is good food; and adds, that there are several kinds differing in size and shell, and also in the colour of the tinging liquor.—There are some found on the coasts of Poictou.

M. Reaumur has discovered another very different kind of purple.—It is produced in oval grains about a quarter of an inch long, and about one thick, full of a white liquor bordering on yellow, which cover certain stones or sands, about which the buccina of Poictou usually assemble.

By the experiments M. Reaumur has made, it appears that these grains are neither the eggs of the buccinum, nor the seeds of any sea-plants, nor any rising plants, but the eggs of some other unknown fish.

These grains being bruised on a white linen, at first only tinge it yellow and that insensibly; but in three or four minutes give it a very beautiful purple red, provided the linen be exposed to the open air; for the air of a room, even though the windows be open, will not do.—This colour fades a little by repeated washings.

M. Reaumur concludes from some experiments he made, that the effect of the air on the liquor does not consist in its taking away any particles thereof, nor in giving it any new ones, but only in its agitating it, and changing the arrangement of the parts that compose it.—He adds, that the liquor of the buccinum, and that of the grains, seem to be nearly of the same nature; except that the later is more watry, and only saline; whereas the other is hot and pungent.

The Caribbee islands have likewise their purple fish.—It is called *burgan*, being of the size of the end of the finger, and resembling our periwinkles: its shell is of a brownish azure, its flesh white, its intestines of a very bright red, the colour whereof appears through the body, and it is this that dyes the froth, which it casts when taken, and which is at first of a violet hue, bordering on blue.

To oblige them to yield the greater quantity of froth, they lay them on a plate, shake and beat them against one another; upon which the plate is immediately covered with the froth, which is received on a linen cloth, and becomes purple in proportion as it dries.

P. Labat observes, that if this be the real Tyrian purple, the secret of preparing and fixing it is lost: this colour being found to dwindle and dissipate, in proportion as the linen dyed with it is washed.

The same author gives us the description of another purple dye produced by a plant growing in the Antilles.—The juice of this tree, when cut standing, is of a blood-red, and communicates the same colour to cloths; though, like the former, it loses much in washing.

**PURPLE**, in medicine.—The purple fever, *febris purpurea*, is a kind of plague, or a malignant fever discovering itself in eruptions on the skin like the bites of bugs or fleas, or like grains of millet, or the small-pox; whence it is sometimes also called the spotted and millary fever. See FEVER and MILLIARY.

The eruptions are red, orange, violet, azure, livid, or black; and when they rise in great quantity, it is esteemed a good sign.—Sometimes they spread to a great extent, like erysipelas's according to the quality of the poison. See PLAGUE.

**PURPRESTURE**, in our ancient law-book. See POURPRESTURE.

**PURPRISUM**\*, of the French *pourpris*, denotes a close, or inclosure:—also the whole compass or extent of a manor or place.

\*—*Donatus eis meum purprisum de Kirkeham, & domos meas, & molendinum, & prata, &c.* Charta Walteri Espec. Priorat. de Kirkeham.

**PURPURE**, **POURPRE**, or **PURPLE**, in heraldry, according to some, is one of the five colours of armories, mixed or compounded of gules and azure bordering on violet; according to others, of a little black and much red colour. See COLOUR.

It is supposed a symbol of temperance, liberality, dignity, authority, faith, and piety.—Most authors in heraldry, as Favyn, Geliot, Monet, and Menestrier, do not allow purple for a colour in regard it is not simple, but composed of an equal mixture of four other colours.—They rather esteem it a kind of intermediate tincture, sometimes metal, and sometimes colour: hence the Spaniards call it *una mission*: so that one cannot lay it on metal and colour without falsifying the arms.

Add, that many take the purple, as it is accounted, on many ancient bearings, by which some of the moderns would evince the regularity and legitimacy of this colour in armory, to be no other than silver tarnished.

Spelman, however, in his *Aspilologia*, allows purple the preference before all other colours, as having been an ensign of royalty for many ages; yet he allows it to have been excluded by the ancient heralds as only an imperfect colour.

It is represented in graving by diagonal lines drawn from the sinister chief to the dexter base point.—*Id. tab. heral. fig. 81.* In the coats of noblemen it is called *amethyst*, and in those of princes, *mercury*.

**PURPURATI**, in our ancient historians, denote the sons of emperors and kings. Neubrig. *lib. 3. cap. 4.* Mahmsb. *lib. 3. PURREL*, anno 35. Eliz. cap. 10. a list ordained to be made at the ends of kerseys, to prevent deceit in diminishing their length.

**PURSE**, a manner of accounting; or, as some call it, a species of money of account, much used in the Levant; particularly at Constantinople. See **MONEY of account**.

The *purse* consists of about 500 dollars, or 120 pounds sterling. It is so called, because all the grand signior's treasure in the seraglio is kept in leather bags of this value.

This method of accounting the Turks derive from the Greeks, and they from the Romans; the emperors whereof brought it to Constantinople, as appears from a letter of Constantine to Cecilian bishop of Carthage, quoted by Eusebius and Nicephorus, wherein is this passage:—"Being resolved to give something for the support of the ministers of the catholic religion throughout the provinces of Africa, Numidia, and Mauritania; I have written to Vesus, treasurer-general of Africa; and given him orders to pay you three thousand *folles*," i. e. *purfes*: for, as M. Fleury observes, we may call that *purse* which the Latins called *follis*, which was a sum of 250 silver denarii, amounting to about seven pounds sixteen shillings, our money.

**PURSER**, an officer aboard a man of war, who receives her victuals from the victualler, and is to take care that it be in good condition, and well laid up, and stowed.

He is also to keep a list of the men and boys belonging to the ship, and to set down exactly the day of each man's admittance into pay; that the pay-master or treasurer of the navy may issue out his disbursements, and pay off the men according to the *purser's* book.

**PURSIVENESS**, or **PURSYNES**, among farriers, *thickness of wind*, a name common to all those diseases in horses which arise from obstructions in the passages of the lungs. See **WIND**.

*Pursiveness*, sometimes also called *broken wind*, may proceed from an ulcer, or some inward wasting of the lungs, wherein the small vessels are worn or abraded by the sharpness or acrimony of the common discharges. See **PHTHISIS**.

The like disorder may also arise from a stagnation, hindering the air from penetrating so as to lift up the lungs in the act of respiration; or from tough and mucilaginous matter separated in the branches of the wind-pipe.

The usual occasions are cold, surfeits, and other diseases not thoroughly carried off.—*Pursive* disorders may also arise from unwholesome food, bad air, and hard riding when a horse is full. The signs are commonly a heaving and beating of the flanks; a wheezing and rattling. Sometimes the kernels about the throat will swell, and there will be a glandulous running at the nose, which is the utmost stage of the disease, and usually reputed desperate. See **GLANDERS**.

**PURSUIVANT**. See the article **POURSUIVANT**.

**PURVEYANCE**. See the article **POURVEYANCE**.

**PURVEYOR**. See the article **POURVEYOR**.

**PURVIEW**\*, a term frequently used by Sir Edward Coke for the body of an act of parliament, or that part which begins with *Be it enacted*, &c. as contradicting distinguished from the *preamble*. See **STATUTE**.

\* The word comes from the French *pourveu*, a gift, grant, provision, &c.

The statute of 3 Hen. 7. stands upon a *preamble* and a *purview*. 12 Rep.

**PURULENT**, **PURULENTUS**, in medicine, sometimes mixed with, or partaking of, pus. See **PUS** and **SUPPURATION**.

Phthical people frequently spit a *purulent* matter. See **PHTHISIS**.—In a dysentery, the stools are *purulent*; when there is an ulcer in the reins or bladder, the urine is *purulent*.

**PUS**\*, in medicine, a putrid matter, white and thick, formed of blood corrupted in a wound or ulcer, and issuing out of the lips thereof. See **WOUND** and **ULCER**.

\* The word is Latin, *pus*, literally denoting snout, &c. formed of the Greek *πυρ*, which signifies the same.

Wounds are always to be kept open while they suppurate, i. e. while they generate *pus*; for fear of shutting up the wolf in the sheep-fold. See **SUPPURATION**.

**PUSTULE**, **PUSTULA**, a little pimple, or eruption, on the skin, full of pus; especially arising in the small and great pox. See **EXANTHEMA**.

**PUTAGE**\*, **PUTAGIUM**, in our old-law-books, denotes whoredom or fornication on the part of the woman. See **FORNICATION**.

\* The word is formed from the French *putte*, whore; *putagium*, q. d. *putam agere*.—*Quod autem generaliter solet dici, putagium hereditatem non admittit; illud intelligendum est de putagio matris; quia filius hares legitimus est, quem nuptiæ demonstrant.* Glanv. lib. 7. cap. 12.

**PUTANISM**, **PUTANISMO**, an Italian term, naturalized by some English writers, signifying whoredom, or the life and condition of a courtesan. See **COURTESAN**.

The word we borrow immediately from the French, *putanisme*, and they from the Italian, *puttana*, whore; of *putta*, girl.

**PUTATIVE**, *suppositive*, something reputed to be what it really is not.

The word is seldom used but in the phrase *putative father*.—Thus we say Joseph was the *putative father* of Jesus Christ. See **FATHER**.

**PUTLOGS**, or **PUTLOCKS**, in building, short pieces of timber, about seven feet long, used in building scaffolds.—They lie at right angles to the wall, with one of their ends bearing upon it, and the other upon the ledgers or poles which lie parallel to the side of the wall of the building.

**PUTREFACTION**, or **PUTRIFACTION**, in physics, a flow sort of corruption produced in natural bodies, generally by the moisture of the air, or some other ambient fluid, which penetrating the pores, and being agitated therein, dissolves and sets at liberty some of the most subtle parts, particularly the salts and oils; and thus loosens and dislocates the compages, quite changes the texture, and sometimes the figure of the mixt. See **CORRUPTION**.

How much the air contributes to *putrefaction*, is evident hence, that bodies buried deep under earth, or in water out of any reach of air, shall remain for ages intire; which yet being exposed to the open air, shall soon rot and moulder away. See **SUBTERRANEOUS**.

The like appears from succulent fruits, and other vegetable matters, which, for all their aptness to *putrefy*, will remain a long time unchanged in *vacuo*. See **VACUUM**.

The perpetual oscillations of so elastic a fluid contained or shut up in the pores of a body, may be conceived sufficient to induce this alteration in their form and texture; yet should it rather seem, that the water or vapoury matter wherewith the proper air is impregnated, is the more immediate agent. Hence Acoffa observes, that in Peru, and others have observed the same in Egypt, where it very rarely rains, every thing will continue a long time uncorrupted; unless we will rather ascribe the effect to the abundance of nitrous salt in the air of those places, which is known to resist *putrefaction*. See **AIR**, **WATER**, **SALT**, &c.

In effect, all *putrefactions*, both of animal and vegetable bodies, are affirmed by the learned Boerhaave to be performed by means of water alone: Take (says he) a pound of fresh flesh, and keep it in a heat like that of our body, and in few days the *putrefaction* will be completed; but if you first drain out or exhale all the watry part from the same in some chymical vessel; though the salt and oil remain, the flesh will harden like a stone, and may be kept for ages without *putrefaction*.—I thought when thus hardened, water poured on it, or even the common dew, will soon set it a *putrefying*.

By such means, bread, flesh, or the like foods, may be preserved for ages; provided regard be had to the place: hence it is, that in dry countries, as Egypt, dead carcases never *putrefy*, but dry and harden uncorrupted; as we see in the mummies found buried under the sand. See **MUMMY**.

Even human blood, which naturally is so prone to *putrefaction*, if you deprive it of its watry part, may be kept for fifty years: Goat's blood we actually find kept so long in the shops, without corrupting; though if you dissolve it in water, and expose it to a gentle warmth, it *putrefies* immediately.

**PUTREFACTION**, in chymistry, denotes a spontaneous kind of operation, whereby vegetable or other substances, in virtue of their own heat and moisture, are dissolved, and turned into substances of a higher, i. gr. and animal nature. See **ANIMAL** and **VEGETABLE**.

*Process of vegetable PUTREFACTION*.—Throw together any of the tender, green, and succulent parts of recent vegetables, whether acid or alkaline, in a large heap, in the warm open air, and press them down with an additional weight, if their own be inconsiderable; and the middle part of the heap will in a little time spontaneously conceive a small degree of heat, and pass successively through the other degrees, till it arrive at a state of ebullition, and be perfectly *putrefied*.

In the space of three days, from the first putting them together, they will yield a heat, perceivable by the hand, equal to that of a human body in a healthy state; by the fifth the heat will be too great for the hand to bear without pain; and, lastly, by the sixth, seventh, or eighth day, the juices will generally appear ready to boil, and sometimes the matter will even flame and burn away.

By this spontaneous operation, the vegetable acquires an abominably putrid, stercoraceous, or cadaverous taste and odour; and turns intirely into one soft, similar, pappy mass, or crassamentum, greatly resembling fetid human excrement in the scent, and *putrefied* flesh in the taste.

If now this fetid matter, thus obtained, be directly, whilst it remains in its fetid state, committed to a glass retort, and distilled with proper degrees of fire, there will come over, 1. A water impregnated with an urinous spirit, perfectly like that obtainable from animal subjects, and separable by a fresh distillation slowly made in a tall glass, into elementary water, and a large quantity of pure, white, volatile, dry, alkaline salt, not to be distinguished from animal salts. 2. A volatile, alkaline, oily salt, that shoots into gleebs. 3. An exceedingly volatile and a thick fetid oil, both which are intirely like those of animals. And, lastly, the remainder being calcined in an open fire, affords not the least particle of fixt salt: just as if the subject had really been of the animal, and not of the vegetable kingdom. See **SALT**.

This process is truly universal, and holds equally in all kinds of vegetables, though ever so different in their nature and virtue. Experiments have been made in the coldest and most succulent or watry plants, such as purslain, sorrel, &c. as well as with the hottest or most acrimonious, such as the sparges, &c. and it was always found to succeed; but the sooner, as the vegetable employed contained the greater quantity of oil: though with the same phenomena.

It will likewise succeed with dry vegetables, provided they be moistened with water before they are thrown into heaps: and thus we sometimes see, that stacks of hay will spontaneously take fire, and blaze away; especially if it was not well dried in the making.

It is surprising to consider, that by this means the difference betwixt vegetables may be intirely taken away, and the whole kingdom thereof reduced to the same common nature; so that wormwood and tansy, for instance, or sorrel and scurvygrass, shall appear as one and the same thing; and this thing appear no otherwise than *putrefied* flesh.

Though sorrel be famed for its power of preserving the animal fluids uncorrupted whilst they are circulating in the body, and seordium for its embalming virtue, as continuing it in a state of incorruption after death; yet even these plants are themselves thus easily corrupted and changed into such a kind of *putrefied* flesh, as it is their virtue to prevent.

This Boerhaave considers as a general law of nature, wisely established to produce wonderful changes in the world, and prevent the inaction and decrease of matter in our globe; this active principle or medium giving an easy and reciprocal transition of vegetable into animal substances, and animal into vegetable.

Hence we are given to understand the nature and uses of *putrefaction*, with its difference from *fermentation*, both in regard of the subject, cause, and effect.—Vegetables alone are the subject of fermentation; but both vegetables and animals of *putrefaction*. Fermentation also requires, that its subject be first reduced to the form of a liquid, or at least made capable of floating in one, before it can obtain; whereas *putrefaction* only succeeds when its subject is half dry, or barely moist: which is the reason why must, put up in a wooden vessel, does not *putrefy*; whilst the grapes from which it was expressed, being thrown in heaps, would presently conceive heat, and run into a state of *putrefaction*.

We see also, that vegetable *putrefaction* is begun and promoted with heat, and finished with coction, which requires a degree of heat much greater than that excited by fermentation, as being capable of causing an ebullition in the plant, and even of turning it into flame: as, indeed, the immediate cause of fermentation is the motion of the air intercepted between the fluid and viscous parts of the fermenting liquor; but the cause of *putrefaction* is fire itself, collected or included within the *putrefying* subject. See FIRE and HEAT.

Again, the effects of fermentation are the production of flowers or yeast, the conversion of the saline part of the fermenting body into tartar, or an acrimonious, acid, and fixed kind of salt, and of oils, into an inflammable spirit retaining something of the nature of the vegetable; but *putrefaction* makes all the acid salts volatile and alkaline; renders the oils not spirituous, but abominably fetid; utterly destroys what makes the specific difference between one subject and another; and converts them wholly into a soft pulpy mass, of an animal nature, without the least signs of any fixed salt, though the recent vegetable would, by calcination at the first, have afforded a large proportion. *Putrefaction*, in fine, makes nearly the same kind of alteration in the whole subject, as it would undergo by passing through a sound animal body, suffering all the actions thereof, and being at length turned into the form of excrement. See FERMENTATION.

This operation may let us a little into the nature of animal digestion, or the change which the aliment suffers in the human body.—For the change our vegetable foods undergo in the body, being such as brings them to be of the same nature, and afford the same principles with the change induced by *putrefaction*, is a presumption, that digestion is nothing else; at least, it apparently comes nearer thereto, than to fermentation. See DIGESTION.

**PUTRID**, **PUTRIDUS**, something rotten or putrefied. See PUTREFACTION.

Thus we say, *putrid* flesh:—a *putrid* humour:—*putrid* limbs, i. e. mortified ones, are to be cut off. See MORTIFICATION.

**PUTRID fever** is a kind of fever, wherein the humours, or part of them, have so little circular motion, that they fall into an intestine one, and putrefy. See FEVER.

This is frequently the case after great evacuation, or excessive heat; where there is such a scarcity of spirits, that the solids do not vibrate sufficiently to keep the fluids in their due velocity.—In these cases the pulse is low, and the flesh cooler than natural at first.

**PUTRID ulcer**. See the article ULCER.

**PUTTY** sometimes denotes powder of calcined tin, used in polishing, and giving the last gloss to works of iron and steel. See TIN and EMERY.

**PUTTY** is also used to denote *spodium*. See SPODIUM.

**PUTTY**, in its popular sense, denotes a cineritious kind of paste, compounded of whiting and linseed-oil beaten together to the consistence of a tough dough:—used by glaziers for fastening the squares of glass in sash-windows, &c. and by painters, to stop up the crevices and cliffs in timber and wainscot, to prevent the wet from getting in, and ruining the work.

**PUTURA**\*, a custom claimed by the keepers of forests, and sometimes bailiffs of hundreds, to take man's meat, horse's meat, and dog's meat, of the tenants and inhabitants, gratis, within the perambulation of the forest, hundred, &c. See PURLIEU, PERAMBULATION, &c.

\* *Johannes clamat unam puturam in prioratu de Penewestham, qui est quedam cella abbacie de Evesham pro se & ministris, equis & garcionibus suis, per unum diem & duas noctes, de tribus septimanis in tres septimanas, viz. de victualibus, ut & fiscalibus & pudentis, ad costas prioratus predicti indubite.*—Placit. apud Preston. 17. Edv. 3.

This custom within the liberty of Knaresburg was long since turned into the payment of four pence, *pro putura*.

The land subject to this service, is called *terra puturata*. The learned Somner erred in his exposition of this word.

**PYANEPSIA**, *πυανηψια*, in antiquity, a feast celebrated by the Athenians in the month *pyanepsion*, which, according to the generality of the critics, was their fourth month, and corresponding to our September. See FEAST.

Plutarch refers the institution of this feast to Theseus, who, at his arrival from Crete, made a kind of sacrifice to Apollo of all the provisions remaining in his vessel; putting them all into a kettle, boiling them together, and eating them with his six companions; which custom was afterwards continued.—The scholiast of Aristophanes says, it was to acquit himself of a vow he made to Apollo in a tempest.

M. Baudelot writes the word *pyanepsia*; and takes it to be a feast instituted in memory of Theseus's return after killing the Minotaur. See MINOTAUR.

The Greeks vary as to the origin and signification of the word *pyanepsion*, whence the feast is denominated.—Harpocration calls it *paenopsia*; he adds, that others call it *panepsia*, because then the fruits all appear to the eye.—Hesychius writes *pyanepsia*; and derives it from *πυανος*, bean, and *ψω*, coquo: because in this feast the Athenians gathered their beans, and made a kind of broth of them.

**PYCNOTYL**\*, *πυκνотυλ*, in the ancient architecture, a building where the columns stand very close to one another; one diameter and a half of the column being only allowed for the intercolumnation. See INTERCOLUMNATION.

\* The word is formed from the Greek *πυκνотυλ*, close, dense, and *τυλ*, column.

The *pycnostyle*, is the smallest of all the intercolumnations mentioned by Vitruvius.—Some make it the same with *sylyle*; others distinguish the latter, by its allowing half a module more in the Corinthian intercolumnation.

The *pycnostyle*, Mr. Evelyn observes, chiefly belonged to the composite order, and was used before the most magnificent buildings; as at present in the peristyle of St. Peter's at Rome, consisting of near 300 columns, and such as yet remain of the ancients among the late discovered ruins of Palmyra.

**PYCNOTICKS**\*, *πυκνотικα*, or medicines of an aqueous nature, which have the faculty of cooling and condensing, or thickening the humours. See CONDENSATION.

\* The word in the original Greek, *πυκнотικα*, signifies something that has the power of thickening.

Purflain, the nenuphar or water-lily, solanum, &c. are ranked among *pycnotics*.

**PYGME**, *πυγμα*, the length or extent between the elbow and extremity of the hand, the first being shut; called also *cubit*. See CUBIT.

**PYGMY**\*, **PYGMÆUS**, *πυγμαίος*, dwarf, or person of exceeding small stature, not exceeding a cubit in height. See DWARF and GIANT. See also PIGMY.

\* The word is formed from the Greek *πυγμα*, cubit. See CUBIT.

The appellation is given among the ancients to a fabulous nation said to have inhabited Thrace, who generated and brought forth young at five years of age, and were old at eight; famous for the bloody war they waged with the cranes.

**PYLING** the ground for foundations. See FOUNDATION and PALLIFICATION.

**PYLORUS**\*, in anatomy, the right and lower orifice of the stomach, whereby it discharges itself into the intestines.—See tab. anat. (Splanchn.) fig. 2. lit. c, e. See also STOMACH and INTESTINES.

\* The word is Greek, *πυλорος*, where it primarily signifies janitor, or door-keeper.

The *pylorus* is situate on the right side of the stomach, and passes by an oblique ascent to the duodenum, to prevent the too precipitate passage of the aliment out of the stomach. See DUODENUM.

For this end it is likewise furnished with an extraordinary series of fibres, to constrict it more than any other part: these running round it serve as a kind of sphincter, which is opened by the contraction of the stomach, and the appulse of the chyle. See DIGESTION, CHYLIFICATION, &c.

At the bottom of the *pylorus* is a large cavity, which Willis calls *antrum pylori*, and conceives its use to be, to keep the food first digested, till the latter taken into the stomach be digested; though, if what Wharton observes be true, viz. that there are lacteals in the bottom of the stomach, such a provision should seem unnecessary. See LACTEAL.

**PYONY water**. See the article WATER.

**PYRAMID**, *πυραμις*, in geometry, a solid standing on a square, triangular, or polygonal basis, and terminating, at-top, in a point; or a body whose base is a regular rectilinear figure, and whose sides are plain triangles; their several vertices meeting together in one point. See SOLID.

Euclid defines it a solid figure, consisting of several triangles, whose

whose bases are all in the same plane, and have one common vertex. See TRIANGLE and VERTEX.

Wolffius defines it a solid, bounded by as many triangles, ABC, DCB, and ADB, terminating in one point D; as the base ABC has sides, *Tab. geomet. fig. 78.*

The pyramid is said to be *triangular, quadrangular, quinquangular, &c.* as the base is triangular, quadrangular, &c.—The pyramid may be called a square, triangular, &c. cone; or the cone, a round pyramid. See CONE.

**Properties of the PYRAMID.**—1. All pyramids and cones standing on the same base, and having the same altitude, are demonstrated to be equal.

2. A triangular pyramid is the third part of a prism, standing on the same base, and of the same altitude. See PRISM.

3. Hence, since every multangular may be divided into triangles; every pyramid is the third part of a prism, standing on the same basis, and of the same altitude.

4. If a pyramid be cut by a plane, *abc*, parallel to its base ABC; the former plane or base will be similar to the latter.

5. All pyramids, prisms, cylinders, &c. are in a ratio compounded of their bases and altitudes: the bases, therefore, being equal, they are in proportion to their altitudes; and the altitudes being equal, in proportion to their bases.

6. Pyramids, prisms, cylinders, cones, and other similar bodies, are in a triplicate ratio of their homologous sides.

7. Equal pyramids, &c. reciprocate their bases and altitudes, *i. e.* the altitude of the one is to that of the other, as the base of the one to that of the other, &c.

8. A sphere is equal to a pyramid, whose base is equal to the surface, and its height to the radius of the sphere.

**To measure the surface and solidity of a PYRAMID.**—Find the solidity of a prism, that has the same base with the given pyramid. See PRISM.—And divide this by three; the quotient will be the solidity of the pyramid.

Suppose, *v. gr.* the solidity of the prism be found 67010328, the solidity of the pyramid will be thus found 22336770.

The surface of a pyramid is had, by finding the areas both of the base ABC, and of the lateral triangles ACD, CBD, BDA. See TRIANGLE. The sum of these is the area of the pyramid.

The external surface of a right pyramid, standing on a regular polygonal base, is equal to the altitude of one of the triangles which compose it, multiplied by the whole circumference of the base of the pyramid.

**To describe a PYRAMID on a plane.**—1. Draw the base, *v. gr.* the triangle ABC (if the pyramid required be triangular); so as that the side AB, supposed to be turned behind, be not expressed. 2. On AC and CB, construct the triangles ADC, and CDB, meeting in any assumed or determined point, *v. gr.* D; and draw AD, CD, BD: then will ADBC be a triangular pyramid.

**To construct a PYRAMID of past-board, &c.**—Suppose, *v. gr.* a triangular pyramid required. 1. With the radius AB, describe an arch BE, (*fig. 79.*) and thereto apply three equal chords, BC, CD, and DE. 2. On CD construct an equilateral triangle DFC; and draw the right lines AD and AC. This past-board, &c. being cut off by the contour of the figure, what remains within will turn up into a pyramid.

**Truncated PYRAMID.** See the article TRUNCATED.

**Frustum of a PYRAMID.** See the article FRUSTUM.

**PYRAMID\***, in architecture, denotes a solid massive edifice, which from a square, triangular, or other base, rises diminishing to a point or vortex.

\* Some derive the word from *πυρος*, wheat, and *αμωω*, colligo; pretending that the first pyramids were built by the Patriarch Joseph for granaries.—But Villalpandus, with much better reason, derives the word from *πυρ*, fire; because ending in a point like flame.

When they are very narrow at bottom, *i. e.* their base very small, they are called *obelisks*, and *needles*. See OBELISK.

Pyramids are sometimes erected to preserve the memory of singular events, and sometimes to transmit to posterity the glory and magnificence of princes; but as they are the symbol of immortality, they are more commonly used as funeral monuments. See MONUMENT.

Such is that of Cestius at Rome; and those other celebrated ones of Egypt, as famous for the hugeness of their size, as their antiquity.

These last are all square in their bases; and it is a thing has been frequently proposed, to establish a fixed measure from them, to be thereby transmitted to posterity.—See their descriptions, measures, &c. in Thevenot, Pietro della Valle, Graves, &c.

Among the Egyptians, the pyramid is said to have been a symbol of human life; the beginning whereof is represented by the base, and the end by the apex: on which account it was, they used to erect them on sepulchres. Herodotus.

**Scenography of a PYRAMID.** See the article SCENOGRAPHY.

**Optic PYRAMID.** See the article OPTIC pyramid.

**PYRAMIDAL fountain.** See the article FOUNTAIN.

**PYRAMIDAL mirrors.** See the article MIRROR.

**PYRAMIDAL numbers** are the sums of polygonal numbers, collected after the same manner as the polygonal numbers, themselves are extracted from arithmetical progressions. See POLYGONAL number, &c. See also NUMBER.

These are particularly called *first pyramids*.—The sums of first pyramids are called *second pyramids*.—The sums of those third pyramids, &c. ad infinitum.

Particularly, those arising from triangular numbers are called *prima triangular pyramids*; those arising from pentagonal numbers are called *prime pentagonal pyramids*, &c.

From the manner of summing up pentagonal numbers, it appears evidently, how the prime pyramidal numbers are found;

$$(a-2)n^3 + 3n^2 - (a-5)n,$$
  
*viz.* 
$$\frac{(a-2)n^3 + 3n^2 - (a-5)n}{6}$$
 expresses all the prime

pyramids.

**PYRAMIDALE corpus**, in anatomy, a plexus of blood-vessels on the back of the testicles; thus called from its form; and from its structure also called *corpus varicosum* and *pampiniforme*. See CORPUS and VARICOSUM.

It consists of innumerable little veins, communicating with each other, and forming a kind of net-work; which, at length uniting, terminate in one vein, by which the blood is conveyed into them all.

The origin of this plexus is from the spermatic veins, which, a little above the testicles, split into several branches; which again uniting several times, form the *corpus pyramidale*. See TESTICLE and SPERMATIC.

**PYRAMIDALES papillæ.** See the article PAPILLÆ pyramidales.

**PYRAMIDALIS**, in anatomy, denotes a small muscle of the abdomen, lying on the lower part of the rectus.—It has its name from its figure, and its origin from the margin of the os pubis, with a pretty broad fleshy head, whence it grows gradually narrower, till it end in a small round tendon in the linea alba; sometimes almost at the navel.—See *tab. anat. (Myol.) fig. 1. n. 46. fig. 2. n. 31.*

This muscle is sometimes single, sometimes it has its fellow, and sometimes they are both wanting.

**PYRAMIDOID**, called also *parabolic spindle*, a solid figure formed by the revolution of a semi-parabola round one of its ordinates.

According to the method of indivisibles, this may be conceived to consist of an infinite series of circles, whose diameters are all parallel to the axis of the revolving parabola.

The *parabolic spindle* is equal to  $\frac{1}{3}$  of its circumscribing cylinder.

**PYRATE.** See the article PIRATE.

**PYRENOIDES\***, *processus*, in anatomy, a process of the second vertebra of the neck; called also *odontoides* and *dentiformis*, or the tooth-like process. See VERTEBRA and ODONTOIDES.

\* The word is Greek, *πυρηνόειδης* formed of *πυρην*, nucleus, kernel or berry, and *ειδης*, figure.

**PYRETHRUM**, *pellitory of Spain*, an acrid medicinal root, brought from Tunis and Italy; of an hot, discutient quality: used as an alexipharmic and phlegmagogue; as also to assuage the tooth-ach, and in the composition of vinegar.

It is of a moderate length, the thickness of the little finger, greyish without, whitish within, and of a sharp burning taste. It is pretended it took its name from Pyrrhus king of Epirus; but there is no great occasion for having recourse to a mystery, its burning quality being sufficient to give it the name *pyrethrum*, from the Greek, *πυρ*, fire.—It must be chosen new, dry, hard to break, &c.

It is called a salivary root, because, being held in the mouth, its pungency promotes the evacuation of saliva.

**PYRETICS\***, medicines good against fevers. See FEVER.

\* The word is formed from the Greek *πυρετικός*, fever, of *πυρ*, fire.

**PYRIFORMIS**, in anatomy, a muscle of the thigh, receiving its name from its figure, which resembles that of a pear.—It is also called *iliacus externus*, from its situation.—See *tab. anat. (Myol.) fig. 7. n. 21. 22.* See ILIACUS.

Its beginning is round and fleshy, from the inferior and internal part of the os sacrum, where it respects the pelvis of the abdomen; and descending obliquely along the great sinus of the os ilium, above the acute process of the ischium, and joining with the glutæus medius, is inserted by a round tendon into the superior part of the root of the great trochanter.—This moves the os femoris somewhat upwards, and turns it outwards.

**PYRITES\***, in physiology, a sulphurous inflammable kind of stone or mineral, composed of an acid salt, incorporated with an oily or bituminous matter. See MINERAL.

\* The word is Greek, *πυρίτης*, *q. d.* firestone, formed of *πυρ*, fire; a denomination given it on account of its inflammability, which is such that by collision it will yield sparks of fire.

*Pyrites* bears a near affinity to marcasite, with which the generality of authors confound it.—Dr. Woodward makes this distinction between the two, that *pyrites* is restrained to the nodules, or those pieces found lodged in strata of another kind; and marcasite to those found in strata of the same kind.—Add, that the marcasite frequently contains arsenic, which the *pyrites* does rarely, if ever. See MARCASITE.

*Pyrites* has always a metalline part in it, and sometimes a cretaceous or okerous part.—In proportion as any of these prevails, the body commences a sulphur, alum, or vitriol. See VITRIOL, COPPERAS, SULPHUR, &c.

The metal in *pyrites* is chiefly iron; sometimes there is copper in it, and always a little gold, rarely silver, and never lead or tin. See METAL.

Dr. Slare tells us of a heap of *pyrites* consisting of two or three hundred tons, which being covered up from the air five or six months took fire, and burnt for a week. Some of it looked like melted metal, others like red-hot stones. He adds, it emitted a most noisom smoke.

Dr. Lister attributes thunder, earthquakes, &c. to the sulphurous and inflammable breath of the *pyrites*. See THUNDER, EARTHQUAKE, EXHALATION, &c.

**PYRITES** is applied by some authors to the marcasites of all metals; the names whereof are varied according to the metals they partake of. See MARCASITE.

Thus *chryssitis* is that of gold; *argyritis* that of silver; *sideritis* that of iron; *chalcitis* that of copper; *molybditis* that of lead, &c. See CHALCITIS, &c.

**PYROBOLGY**. See the article PYROTECHNIA.

**PYROENUS\*** is a term sometimes used for rectified spirit of wine; thus called because made by fire, or rather because rendered of a fiery nature. See SPIRIT and RECTIFICATION.

\* The word is of Greek composition, formed of πυρ, fire, and οίνος, wine.

**PYROET, PYROUET, or rather PIROUETTE**, in the manage. See PIROUETTE.

**PYROMANCY**, πυρομαντία, a kind of divination, performed by means of fire. See DIVINATION.

The ancients imagined, they could foretel futurity by inspecting fire and flame: to this end they considered its direction, or which way it turned.—Sometimes they added other matters to the fire, e. gr. a vessel full of urine, with its neck bound about with wool, watching narrowly on which side it burst, and thence taking their augury.

Sometimes they threw pitch on it, and if it took fire immediately, esteemed it a good augury.

**PYROTECHNY\***, πυροτεχνία, the art of fire, or a science which teaches the management and application of fire in several operations. See FIRE.

\* The word is formed from the Greek, πυρ, fire, and τεχνη, art.

*Pyrotechny* is of two kinds, military and chymical.

**Military PYROTECHNY** is the doctrine of artificial fire-works and fire-arms, teaching the structure and use both of those used in war for the attacking of fortifications, &c. as gun-powder, cannons, bombs, granadoes, carcasses, mines, fuses, &c. and those made for amusement-sake, as rockets, stars, serpents, &c. See FIRE arm, ORDINANCE, &c.

Some call *pyrotechny* by the name *artillery*; though that word is usually confined to the instruments used in war. See ARTILLERY.—Others chuse to call it *pyrobology*, or rather *pyrobology*, q. d. the art of missile fires; from the Greek πυρ, fire, and βάλλω, to cast, throw. See GUNNERY, PROJECTILE, &c.

Wolffius has reduced *pyrotechnia* into a kind of mixt-mathematical art: indeed it will not allow of geometrical demonstrations; but he brings it to tolerable rules and reasons: whereas before it had used to be treated by authors at random, and without regard to any reasons at all. See MATHEMATICS.

See the elements of *military pyrotechny* under the several instruments and operations; CANNON, BOMB, ROCKET, GUN-POWDER, &c.

**Chymical PYROTECHNIA** is the art of managing and applying fire in distillations, calcinations, and other operations of chymistry. See CHYMISTRY and OPERATION.

Some reckon a third kind of *pyrotechnia*, &c. the art of fusing, refining, and preparing metals. See METAL, FUSION, REFINING, &c.

**PYROTECHNICAL sponge**. See the article SPUNGE.

**PYROTICS\***, πυρωτικά, in medicine, remedies either actually or potentially hot; and which, accordingly, will burn the flesh, and raise an eschar. See CAUSTIC and ESCHAROTIC.

\* The word is formed from the Greek πυρ, fire.

**PYROUET**. See the article PIROUETTE.

**PYRRHICHA**, Πυρρική, in antiquity, a kind of exercise on horse-back; or a feigned combat, for the exercise of the cavalry. See EXERCISE.

It was thus called from its inventor Pyrrhichus, or Pyrrhus of Cydonia, who first taught the Cretans to march in measure and cadence to battle, and to observe the pace of the Pyrrhic foot.—Others derive the name from Pyrrhus son of Achilles, who instituted this exercise at the obsequies of his father. Aristotle says, that it was Achilles himself invented it.

The Romans also called it *ludus Trojanus*, the Trojan game; and Aulus Gellius, *decurfus*.—It is doubtless this exercise that we see represented on medals by two cavaliers in front running with lances, and the word *decurfus* in the exergum.

**PYRRICHIUS**, πυρρικός, in the Greek and Latin poetry, a foot consisting of two syllables, both short;—as *deus*. See FOOT.

Among the ancients this foot is also called *periambus*; by others *hegemonia*. Quintil. l. 9. c. 4. Plot. de metr. p. 2665.

**PYRRHONIANS, PYRRHONEANS, or PYRRHONISTS**, a sect of ancient philosophers, so called from their founder Pyrrho. See PHILOSOPHER.

The distinguishing character of this philosopher was, that he professed to doubt of every thing, maintaining, that men only

judge of truth and falshood from appearances which deceive. See DOUBTING.

On this principle he kept himself in continual suspension of mind, never determining on any thing; to avoid the inconveniences of error, and false judgments. See ERROR, FALSEHOOD, &c.

Those now distinguished by the name of *Pyrrhonians*, or *Sceptics*, are persons who, from the great number of things that are dark and obscure, and from the aversion they bear to popular credulity, maintain, that there is nothing certain in the world. See SCEPTICS.

The truth is, *Pyrrhonism* has some foundation in nature: we do not judge of things from their real essences, but from their relations to ourselves. Most of our ideas we receive by means of our senses; but our senses are not given us to judge of the essences, but of the relations of things to ourselves; i. e. how they may affect us so as to do us good or harm. See SENSATION, RELATION, SENSE, &c.

Thus, e. gr. our eyes do not give us the real magnitudes of objects, but their relative ones only. See VISION and VISIBLE.

See also BODY and MATTER.

The Academics differed from the *Pyrrhonians*, in that they owned there were some things more like or akin to truth than others, which the *Pyrrhonians* peremptorily denied. See ACADEMICS.

Le Clerc observes, that the *Pyrrhonians*, in affirming that there is nothing certain, were the most assuming and decisive of all philosophers; since they must have first examined all things, to be able to determine precisely, that all things are uncertain.

It may be added, that the very principle of the *Pyrrhonians* destroys itself: for if there be nothing certain, then must that dogma itself be precarious; and if no one thing be more probable, or liker to truth than another, why should the principle of the *Pyrrhonians* be believed preferably to the opposite one? since itself is come at in the same way as our other knowledge. See KNOWLEDGE, ACATALEPSIA, &c.

**PYTHAGORAS's table**. See the article TABLE.

**PYTHAGOREANS, or PYTHAGORIC system**, among the ancients, was the same with the Copernican system among the moderns. See SYSTEM.

It was thus called, as having been maintained and cultivated by Pythagoras and his followers; not that it was invented by him, for it was much older. See COPERNICAN system.

**PYTHOGAREANS**, a sect of ancient philosophers, who adhered to the doctrines of Pythagoras. See PHILOSOPHER.

The founder of this sect was of Samos, the son of a lapidary, and pupil of Pherecydes, who flourished about the seventh olympiad, i. e. about 500 years before Christ.

This sect was also called the *Italic sect*, or *Italic school*, because Pythagoras, after travelling into Egypt, Chaldea, and even into the Indies, to inform his understanding, returning home to his own country, and there unable to bear the tyranny of Polycrates, or Syloson, retired into the eastern part of Italy, then called the Greater Greece, and there taught and formed his sect. See ITALIC.

He is held to have excelled in every part of science: Lactantius says, among the Chaldees and Hebrews he learnt divination, and the interpreting of dreams; in Egypt he learnt all the mysteries of the priests, and the whole system of symbolical knowledge, with all their theology.—Porphyry adds, that he learnt the mathematical sciences in his travels; geometry from the Egyptians, the doctrine of numbers and proportions from the Phcenicians, and astronomy from the Chaldeans; morality and theology he learnt chiefly from the magi.

He was the first who assumed the modest title *philosopher*; the sages till his time having borne the arrogant appellation σοφισται. See PHILOSOPHER and SOPHIST.

Jamblichus observes, that in Phcenicia he conversed with the prophets and philosophers, the successors of Mochus the physiologist; which Mochus Selden and some others will have to be Moses.

His school in Italy was at Crotona, where he is said to have been attended by no less than 600 scholars.—His house was called the temple of Ceres, and the street where it stood the museum. See MUSEUM.

Out of this school proceeded the greatest philosophers and legislators, Zaleucus, Charondas, Archytas.—Porphyry says, as soon as he arrived in Italy he had an auditory of two thousand people, to whom he explained the laws of nature, reason, and justice.

He endeavoured to assuage the passions of the mind with verses and numbers; and made a practice of composing his mind every morning by his harp, frequently singing the pæans of Thales. See MUSIC.—Exercises of the body also made a considerable part of his discipline. See GYMNASTICS, &c.

His school became so popular, that cities and people committed, their republics to the government of his scholars.—At length Porphyry adds, envy stirring up sedition against them, they were oppressed; and, in time, their learning, which they ever kept secret, was lost; except some difficult things learnt by rote by the crowd of hearers: for Pythagoras never committed any thing to writing.

Beside his public school, Pythagoras had a college in his own house, which he called *κοινόν*, *cœnobium*: in this were two orders or classes of scholars, *ἐξωτερικοί*, *exoterici*, called also *auscultantes*; and *ἐσωτερικοί*, *intrinseci*.—The former were novices and probationers, who were kept under a long examen, and even imposed a quinquennial silence, to teach them modesty and attention, according to Apuleius; or, according to Clemens Alexandrinus, to teach them to abstract their minds from sensible objects, and enure them to the pure contemplation of the deity.

The latter were called *genuini*, *perfecti*, *mathematici*, and *Pythagoreans* by way of eminence. These alone were let into the arcana and depths of the real Pythagoric discipline.

Clemens observes, that these orders corresponded very exactly to those among the Hebrews: for in the schools of the prophets were two classes, viz. the sons of the prophets, who were the scholars; and the doctors or masters, who were also called *perfecti*: and among the levites, the novices or tyro's, who had their quinquennial exercises, by way of preparation. Lastly, even among the profelytes there were two orders; *exoterici*, or profelytes of the gate; and *intrinseci* or *perfecti*, profelytes of the covenant. He adds, it is highly probable, that Pythagoras himself had been a profelyte of the gate, if not of the covenant.

Gale endeavours to prove, that Pythagoras borrowed his philosophy from that of the Jews; to this end producing the authorities of many of the fathers and ancient authors, and even pointing out the tracks and footsteps of Moses in several parts of Pythagoras's doctrine.

Pythagoras taught, that God is one; that he is a most simple, incorruptible, and invisible being; and therefore only to be worshipped with a pure mind, with the simplest rites, and those prescribed by himself.—Laetius observes, that he made unity the principle of all things; hence arose duality, &c. See UNITY, &c.

In his conversation with the Egyptians, he learnt abundance of secrets about numbers; to which he attributed so much, that he even attempted to explain all things in nature by numbers.—In effect it was the common opinion of the ancient philosophers, that the species of things have to each other the nature and relation of numbers; and that the universe and all things therein, were produced according to certain numbers, inherent in the Creator's mind. See ARITHMETIC.

Hence Porphyry observes, the *Pythagoreans* studied the doctrine of numbers with great attention: since the incorporeal forms, and first principles of things, i. e. the divine ideas, could not be delivered in words, they had recourse to demonstration by numbers; and thus called the common reason and cause of unity, identity, and equality, by the name *one*.

Pythagoras further taught, that there is a relation or kinship between the gods and man, and therefore that the gods take care of man.—Which, Clemens Alexandrinus says, is apparently borrowed from the Christian doctrine of providence. See PROVIDENCE.

Pythagoras also asserted a metempsychosis, or transmigration

of souls; and therefore the immortality of the soul. See METEMPSYCHOSIS.

He also taught, that virtue is harmony, health, and every good thing; and that God, and therefore all things, consist of harmony. See HARMONY.

PYTHAGORIC *theorem*, or *proposition*, is the 47th of the first book of Euclid. See TRIANGLE and HYPOTHENUSE.

PYTHAGORIC *tetractys*. See the article TETRACTYS.

PYTHAGORIC *abacus*. See the article ABACUS.

PYTHIA, or PYTHIAN, in antiquity, the priestess of Apollo, by whom he delivered oracles. See ORACLE.

She was thus called from the god himself, who was intitled *Apollo Pythius*, from his slaying the serpent Python; or, as others will have it, *απο τ' πυθιας*, because Apollo, the sun, is the cause of rottenness; or, according to others, from *πυθαίεμαι*, *I bear*, because people went to hear and consult his oracles.

The priestess was to be a pure virgin.—She sat on the covercle, or lid, of a brazen vessel, mounted on a tripod; and thence, after a violent enthusiasm, delivered her oracles, or rather explained those of the god; i. e. rehearsed a few ambiguous and obscure verses, which were taken for oracles.

All the *Pythias* did not seem to have had the same talent at poetry, or memory enough to retain their lesson.—Plutarch and Strabo make mention of poets, who were kept in pay, as interpreters of Jupiter, &c.

PYTHIA, or PYTHIAN *games*, were solemn games instituted in honour of Apollo, and in memory of his killing the serpent Python with his arrows. See GAMES.

The *pythia* were celebrated in Macedonia, in a place called *Pythium*.—They were the next in fame after the Olympic games, but were more ancient than they; for it is pretended they were instituted immediately after the defeat of the serpent.—They were held every two years, about the month Elaphebolion, which answered to our February.

The *pythia* were also celebrated at Delphos; and it was these were the most renowned.—A part of Pindar's poems were composed in praise of the victors in the Pythian games. See PINDARIC.

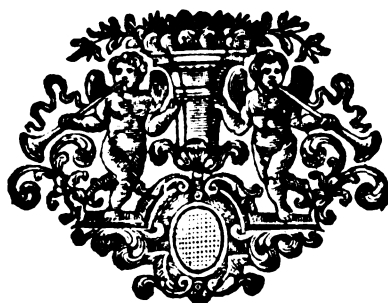

The critics are divided on the subject of the serpent Python.—The poets say, that Juno made use of it to persecute Latona, and prevent her bringing into the world Apollo and Diana, whom she had conceived of Jupiter; and that it was for this reason Apollo killed it.

Strabon says, it was no other than a famous villain, one Draco, that Apollo ridded the world of.—Dickinson, in his *Delphi Phœnicizantes*, maintains the Python of the Greeks to be the Typhon of the Phœnicians; and the Typhon of the Phœnicians to be the Og of scripture; and Apollo, who slew it, he will have to be Joshua.

PYXIS\*, *nautica*, in navigation, the seaman's compass. See COMPASS.

\* The word is Greek, *πυξίς*, where it literally signifies a box.

PYXIS, among anatomists, is also used for the cavity of the hip-bone. See ACETABULUM.

## QUA

Q

A consonant, and the sixteenth letter of the alphabet. See LETTER and ALPHABET.

The Q has this peculiar to it, that it is always followed by an U. See U.

The Q is formed from the Hebrew Q, *Qaph*; which most other languages have borrowed; though some of them have rejected it again, particularly the Greeks, who now only retain it as a numeral character, called *κοττα πικτημος*.

In effect, there is that resemblance between the Q and C, in some languages, and K in others; that many grammarians, in imitation of the Greeks, banish the Q as a superfluous letter. Papias even affirms, that all the Latin words now wrote with a Q, were wrote among the ancient Romans with a C: but we want better authorities. For though that may hold in many cases, inasmuch that we still write indifferently *quar* or *car*, *cum* or *quum*, *quotidie* or *cotidie*, &c. Yet does it not thence follow, that they wrote *cis*, *ca*, *cid*, for *quis*, *qua*, *quid*.—What inscriptions authorize such a reading?

Far from this, the ancients sometimes substituted Q for C; and wrote *qujus*, *quos*, for *cujus*, *cus*, &c. See C.

Varro, however, and some other grammarians, as we are told by Censorinus, &c. would never use the Q. The truth is, it's use or disuse seems to have been so little settled and agreed on, that the poets used the Q or C indifferently, as best suited their measures; it being a rule, that the Q joined the two following vowels into one syllable; and that the C imported them to be divided.

Hence it is, that Lucretius uses *cuiet* for three syllables, in lieu of *quist*; *acua* for *aqua*, and that Plautus uses *relicuum* for *reliquum*; as in *quod dedi datum non vellem relicuum non*; where the *cuum* must be two syllables, otherwise the Trochaic verse will be lame of a foot.

In the French the sound of the Q and K are so near akin, that some of their nicest authors think the former might be spared.—Ramus adds, that till the establishment of royal professors in the university of Paris under Francis I, they always used Q in the Latin the same as in the French; pronouncing *kis*, *kalis*, *kantus*, &c. for *quis*, *qualis*, *quantus*, See K.

Some very learned men make Q a double letter, as well as K, and X—According to them, Q is evidently a C and U joined together—It is not enough that the sound is the same; but they see the traces of the CU in the figure of the Q; the V being only laid obliquely, so as to come within the cavity of the C; as C <.

To confirm this, they say the ancients wrote *qi*, *qa*, *qid*. Though Jos. Scaliger, Littleton, &c. think this no proof of the point; for in Gruter's inscriptions, we find not only the Q, but also the C, put for QU; as *Cintus*, *Quintus*, *ficus* for *fiquis*, &c. Yet no body ever imagined the C a double letter. See DOUBLE LETTER.

Q among the ancients was a numeral letter, signifying 500; as in the verse,

*Q velut A cum D quingentos vult numerare.*

A dash over it, as Q̄ denoted it to signify five hundred thousand. See A.

Q is also used as an abbreviature in several arts—Q. Pl. in physicians bills, stand for *quantum placet*, or *quantum vis*, as much as you please of a thing.

Q. S. for *quantum sufficit*, or as much as is necessary.

Q. E. D. among mathematicians, signifies *quod erat demonstrandum*, which was to be demonstrated.

Q. E. F. *quod erat faciendum*, which was to be done.

Q. D. is also frequently used among grammarians, &c. for *quasi dictum*, as if it were said, &c. or as who should say.

QUACK, in medicine. See EMPIRIC.

QUADRA, in building, any square border, or frame, encompassing a basso-relievo, pannel, painters or other work.

The word is also used abusively for a frame or border of another form; as round, oval, or the like.

QUADRAGESIMA, a term sometimes used for the time of lent; because consisting of forty days. See LENT.

Hence, some monks are said to lead a *Quadragesimal* life; or to live on *Quadragesimal* food all the year.

QUADRAGESIMA sunday, is the first sunday in lent; so called because it is about the fortieth day before easter. See EASTER.

On the same account, the three preceding sundays, are called *Quinquagesima*, *Sexagesima*, and *Septuagesima*. See QUINQUAGESIMA, &c.

QUADRAGESIMALS, QUADRAGESIMALIA, denote *Mid-lent* contributions, or offerings. See OBLATION, &c.

It was an ancient custom for people to visit their mother-church on *Mid-lent* sunday, and to make their offerings at the high altar: and the like was also done in *Whitson-week*—But as these later oblations, &c. were sometimes commuted for by a payment of *Pentecostals*, or *Whitson-farthings*: so

VOL. II.

126.

## QUA

were the former also changed into a customary payment, called *Quadragesimals*, *Denarii Quadragesimales*, and sometimes *Latere Jerusalem*, from a hymn so called, sung on that day, beginning, *Jerusalem Mater omnium*, &c. See PENTECOSTAL, &c.

QUADRANGLE, in geometry, a quadrangular, or quadrilateral figure; or a figure which has four sides, or four angles. See FIGURE and QUADRILATERAL.

To the class of *Quadrangles*, or *Quadrangular figures*, belong the *Square*, *Parallelogram*, *Trapezium*, *Rhombus*, and *Rhomboides*. See SQUARE, PARALLELOGRAM, RHOMBUS, &c.

A Square, &c. is a regular *Quadrangle*—A Trapezium an irregular one. See TRAPEZIUM.

*Quadrangular* figures are not proper for fortification, the flanks and flanked angles being too small. See FORTIFICATION, BASTION, &c.

QUADRANTS, in antiquity, the fourth part of the As or Pound. See As and POUND.

QUADRANS, in our customs, is the fourth part of a penny; or, a farthing. See PENNY and FARTHING.

QUADRANT, QUADRANS, in geometry, an arch of a circle containing 90 degrees, or one fourth of the intire periphery. See ARCH and CIRCLE. See also DEGREE.

Sometimes, also, the space or area included between this arch and two radii, drawn from the centre to each extremity thereof, is called a *Quadrant*, or more properly *Quadrantal space*; as being a quarter of the intire circle. See SECTOR.

QUADRANT, also denotes a mathematical instrument, of great use in navigation and astronomy; for the taking of altitudes, angles, &c. See ALTITUDE and ANGLE.

The *Quadrant* is variously contrived, and furnished with various apparatus, according to the various uses it is intended for; but they all have this in common, that they consist of a *Quadrant*, or quarter of a circle, whose limb is divided into 90 degrees; that they have a plummet suspended from the centre, and are furnished with Pinnulæ, or sights, through which to look. See SIGHTS, &c.

The principal, most usual, and useful *Quadrants*, are the *Common* or *Surveying Quadrant*, *Astronomical Quadrant*, *Herodistical Quadrant*, *Gunter's Quadrant*, *Sutton's* or *Collins's Quadrant*, and the *Sinical Quadrant*.

The *common* or *Surveying QUADRANT*, (represented *Tab. Surveying*, fig. 30.) is made of brass, wood, or other matter; usually 12 or 15 inches radius—Its circular limb is divided into 90°, and each of those subdivided into as many equal parts as the space will allow; either diagonally, or otherwise—On one edge, or semidiameter, are fixed two immoveable sights; and in the angle, or centre, is hung a thread with a plummet. To the centre is likewise, sometimes, fixed a label, or moveable index, bearing two other sights like the index of a telescope—And in lieu of the immoveable sights, is sometimes fitted a telescope; though this more properly belongs to the astronomical *Quadrant*.

On the under side, or face of the instrument, is fitted a ball and socket; by means whereof, it may be put in any position for use. See BALL and SOCKET.

Besides the essentials of the *Quadrant*, there is frequently added on the face near the centre, a kind of compartment, called the *Quadrat*, or *Geometrical square*; as in the figure—This, in some measure, making a distinct instrument of itself; see its description and use under the article QUADRAT.

The *Quadrant* is to be used in different situations, according to the dimensions to be taken—To observe heights and depths, its plane is disposed at right angles to the horizon; to take horizontal distances, the plane is disposed parallel thereto.

Heights and distances, again, may be taken two ways: viz. by means of the fixed sights and plummet, and by the label.

Use of the surveying QUADRANT—To take the height, or depth of an object, with the fixed sights and plummet—Place the *Quadrant* vertically, and the eye under the sight next the arch of the *Quadrant*: thus direct the instrument to the object, v. gr. the top of a tower, till the visual rays thereof strike through the sights upon the eye.

This done, the portion of the arch intercepted between the thread and the semidiameter, whereon the sights are fastened, shews the complement of the object's height above the horizon, or its distance from the zenith; and the other portion of the arch intercepted between the thread and the other semidiameter, shews the height itself of the object above the horizon.

10 A

The

The same arch likewise gives the quantity of the angle made by the usual ray, and a horizontal line parallel to the base of the tower.

Note, to observe depths, the eye must be placed over that sight next the centre of the *Quadrant*.

From the height, or depth of the object, in degrees thus found, which suppose  $35^{\circ}$ ,  $35'$ , and the distance of the foot of the object from the place of observation carefully measured, which suppose 47 foot; its height or depth in feet, yards, &c. is easily determined by the most common case in trigonometry. See TRIANGLE.

For we have here, in a triangle, one side given, viz. the line measured; and we have all the angles: for that of the tower is always supposed a right angle; the other two therefore are equal to another right angle; but the angle observed is  $35^{\circ}$ ,  $35'$ ; therefore the other is  $54^{\circ}$ ,  $25'$ . See ANGLE.

The case then will be reduced to this; as the sine of  $54^{\circ}$ ,  $25'$ , is to 47 feet; so is the sine of  $35^{\circ}$ ,  $35'$ , to a 4th term, viz.  $33\frac{1}{2}$  feet: to which add the height of the observer's eye, supposed 5 foot, the sum  $38\frac{1}{2}$  feet, is the height of the tower required.

*The further Use of the QUADRANT in taking of altitudes of objects, both accessible and inaccessible; see under the article ALTITUDE.*

*Use of the QUADRANT in taking heights and distances by the index and sights.*—To take e. gr. a height, as that of a tower, whose base is accessible—Place the plane of the instrument at right angles to the plane of the horizon, and one of its edges parallel thereto, by means of the plummet, which in that case will hang down along the other—In this situation turn the index, till through the sight you see the top of the tower; and the arch of the limb of the *Quadrant* between that side thereof parallel to the horizon, and the index, will be the height of the tower in degrees: whence, and from the distance measured as before, its height in feet, &c. may be found by calculation, as in the former case; or without calculation, by drawing, from the data, on paper, a triangle similar to the great one, whose base is the distance, and its perpendicular measured on the scale, the height of the tower. See SCALE.

*Use of the QUADRANT in measuring horizontal distances.*—Though the *Quadrant* be a less proper instrument for this purpose than a theodolite, semi-circle, or the like, by reason angles greater than *Quadrants* cannot be taken hereby; yet necessity sometimes obliges persons to have recourse to it.

The manner of its application herein is the same with that of the semi-circle: all the difference between the two instruments consisting in this, that the one is an arch of  $180^{\circ}$ , and can therefore take an angle of any quantity; and the other only an arch of  $90^{\circ}$ , and therefore confined to angles of that quantity. See, therefore, SEMI-CIRCLE.

*Astronomical QUADRANT*, is a large *Quadrant*, usually made of brass, sometimes of wooden bars, only faced with plates of iron, or the like; having its limb curiously divided, diagonally or otherwise, into degrees and minutes, and even seconds, if possible; with plain sights fixed to one side of it, or instead thereof a telescope; and an index moving about the centre, carrying either plain sights, or a telescope.

These *Quadrants* are of principal use in taking observations of the sun, planets, or fixed stars. See OBSERVATION.

The ancients used only plain sights; but the moderns have found it of great benefit to use telescopes instead of them. See SIGHT and TELESCOPE.

Add, that the contrivance of moving the index, by the help of a screw on the edge of the limb, and of readily and easily directing it, and the *Quadrant* upon its pedestal, to any desired phenomenon, by means of the screws and dented wheels, is a still greater improvement of the instrument.

The particulars of the mechanism whereby this is effected, would afford a very dry and intricate, as well as useless detail; which we shall omit, as being sufficiently known among the instrument-makers: and in lieu thereof, content ourselves with giving a figure or representation. See *Tab. Astronomy*, fig. 53.

The use of this instrument is obvious—Being adjusted as above, and turned horizontally round on its axis, till through the moveable telescope the object be seen to fall in with the point of intersection of the cross bars; the degrees cut by the index give the altitude required. See TELESCOPE.

*Horodical QUADRANT*, is a pretty, commodious instrument, thus called from its use in telling the hour of the day. See HOUR and DIAL.

Its construction is so simple and easy, and its application so ready, that we shall describe both; for the use of some who may want other conveniences.

*Construction and use of the Horodical QUADRANT*—From the centre of the *Quadrant* C, (*Tab. Astron.* fig. 54.) whose limb AB is divided into  $90^{\circ}$ ; describe seven concentric circles at intervals at pleasure; and to these add the signs of the zodiac in the order they are represented in the

scheme. 2. Applying a ruler to the centre C, and the limb AB, mark upon the several parallels the degrees corresponding to the altitude of the sun when therein, for the given hours; connect the points belonging to the same hour with a curve line, to which add the number of the hour—To the radius CA, fit a couple of sights, and to the centre of the *Quadrant* C, tie a thread with a plummet, and upon the thread a bead to slide.

If now the bead be brought to the parallel wherein the sun is, and the *Quadrant* directed to the sun till a visual ray pass through the sights, the bead will shew the hour.

For the plummet in this situation cuts all the parallels in the degrees corresponding to the sun's altitude: since, then, the bead is in the parallel which the sun then describes, and through the degrees of altitude to which the sun is elevated every hour there pass hour lines; the bead must shew the present hour.—Some persons who are not mighty nice, represent the hour-lines by arches of circles, or even by straight lines; and that without any sensible error.

*Gunter's QUADRANT*, is a kind of *Quadrant* (represented *Tab. Astronomy*, fig. 55.) invented by our countryman Edm. Gunter.

This, beside the graduated limb, fixed sights, and a plummet, as the other *Quadrants*, has, likewise, a stereographical projection of the sphere on the plane of the equinoctial, with the eye placed on one of the poles; by which, besides the common uses of other *Quadrants*, several useful questions in astronomy, &c. are easily solved.

*Use of Gunter's QUADRANT.* 1. To find the sun's meridian altitude for any given day; or the day of the month for any given meridian altitude.—Lay the thread to the day of the month in the scale next the limb; the degree it cuts in the limb is the sun's meridian altitude.

Thus, the thread being laid on the 15 of May, cuts  $59^{\circ}$ ,  $30'$ , the altitude sought—And contrarily, the thread being set to the meridian altitude, will shew the day of the month.

2. To find the hour of the day—Having put the bead (which slides on the thread) to the sun's place in the ecliptic, observe the sun's altitude by the *Quadrant*; then, if the thread be laid over the same in the limb, the bead will fall upon the hour required.

Thus, suppose on the 10th of April, the sun being then in the beginning of Taurus, I observe the sun's altitude by the *Quadrant*, to be  $36^{\circ}$ ; I place the bead to the beginning of Taurus in the ecliptic, and lay the thread over  $36^{\circ}$  of the limb; and find the bead to fall upon the hour-line marked 3 and 9; accordingly the hour is either 9 in the morning, or three in the afternoon—Again, laying the bead on the hour given (having first rectified or put it to the sun's place) the degree cut by the thread on the limb, gives the altitude.

Note, the bead may be rectified otherwise, viz. by bringing the thread to the day of the month, and the bead to the hour-line of 12.

3. To find the sun's declination from his place given; and contrarily—Set the bead to the sun's place in the ecliptic; move the thread to the line of declination ET, and the bead will cut the degree of declination required—Contrarily, the bead being adjusted to a given declination, and the thread moved to the ecliptic, the bead will cut the sun's place.

4. The sun's place being given, to find his right ascension; or contrarily—Lay the thread on the sun's place in the ecliptic, and the degree it cuts on the limb is the right ascension sought—Contrarily, laying the thread on the right ascension, it cuts the sun's place in the ecliptic.

5. The sun's altitude being given, to find his azimuth; and contrarily—Rectify the bead for the time (as in the second article) and observe the sun's altitude: bring the thread to the complement of that altitude; thus the bead will give the azimuth sought, among the azimuth lines.

6. To find the hour of the night from some of the five stars laid down on the *Quadrant*—1. Put the bead to the star you intend to observe, and find how many hours it is off the meridian, (by article 2.) then from the right ascension of the star, subtract the sun's right ascension converted into hours; and mark the difference: which difference added to the observed hour of the star from the meridian, shews how many hours the sun is gone from the meridian, which is the hour of the night.

Suppose, e. gr. on the 15th of May, the sun's being in the fourth degree of Gemini, I set the bead to Arcturus; and observing his altitude, find him to be in the west about  $52^{\circ}$  high, and the bead to fall on the hour-line of two after noon: then will the hour be 11 hours 50 minutes past noon, or 10 minutes short of midnight.

For  $62^{\circ}$ , the sun's right ascension converted into time, makes 4 hours 8 minutes, which subtracted from 13 hours 58 minutes, the right ascension of Arcturus, the remainder will be 9 hours 50 minutes; which added to 2 hours, the observed distance of Arcturus from the meridian, shews the hour of the night to be 11 hours 50 minutes.

*Sutton's QUADRANT*, sometimes, also, called *Collins's pocket QUADRANT*

## Q U A

**QUADRANT**—One of the best of Mr. Sutton's *Quadrants*, (represented *Tab. Astronomy*, fig. 56) is a stereographic projection of one quarter of the sphere between the tropics, upon the plane of the equinoctial, the eye being in the north pole.

It is fitted to the latitude of London—The lines running from the right hand to the left are parallels of altitude, and those crossing them are azimuths: the less of the two circles bounding the projection is of the tropic of Capricorn, the greater  $\frac{1}{2}$  of that of Cancer—The two ecliptics are drawn from a point on the left edge of the *Quadrant*, with the characters of the signs upon them; and the two horizons are drawn from the same point—The limb is divided both into degrees, and time; and by having the sun's altitude, the hour of the day may be here found to a minute.

The quadrantal arches next the centre contain the calendar of months; and under them, in another arch, is the sun's declination.

On the projection are placed several of the most noted fixed stars between the tropics, and the next below the projection is the *Quadrat*, and line of shadows. See **QUADRAT**.

*Use of Sutton's or Collins's QUADRANT*—To find the time of sun-rising or setting, his amplitude, azimuth, hour of the day, &c.—Lay the thread over the day and the month, and bring the bead to the proper ecliptic, either that of summer or winter, according to the season; (which is called rectifying) then, moving the thread, bring the bead to the horizon; in which case the thread will cut the limb in the time of the sun's rising or setting, before, or after fix; and at the same time the bead will cut the horizon in the degrees of the sun's amplitude.

Again, observing the sun's altitude with the *Quadrant*, and supposing it found  $45^\circ$  on the 24th of April; lay the thread over the 24th of April; bring the bead to the summer ecliptic, and carry it to the parallel of altitude  $45^\circ$ . In which case the thread will cut the limb at  $55^\circ, 15'$ , and the hour will be seen among the hour-lines to be either  $41'$  past nine in the morning, or  $19'$  past two in the afternoon.

Lastly, the bead among the azimuths shews the sun's distance from the south, viz.  $50^\circ, 41'$ .

But note, that if the sun's altitude be less than what it is at six o'clock, the operation must be performed among those parallels above the upper horizon; the bead being rectified to the winter ecliptic.

**Sinical QUADRANT**, is an instrument of use in navigation—It is represented *Tab. Navigation*, fig. 18. and consists of several concentric quadrantal arches, divided into eight equal parts by radii with parallel right lines crossing each other at right angles.

Now, any of the arches, e. gr. BC may be accounted a *Quadrant* of any of the great circles of the sphere, chiefly of the horizon, and meridian; if, then, BC be taken for a *Quadrant*, e. gr. of the horizon; either of the sides, e. gr. AB, may represent the meridian; and the other, AC will represent a parallel, or line of east and west; and all the other lines parallel to AB will also be meridians; and all those parallel to AC, east and west parallels, or east and west lines.

Again, the eight spaces into which the arches are divided by the radii, represent the eight points of the compass in a quarter of the horizon; each containing  $11^\circ, 15'$ .

The arch BC is likewise divided into  $90^\circ$ , and each degree subdivided into  $12'$  diagonal-wise.

To the center is fixed a thread, as AL; which being laid over any degree of the *Quadrant*, serves to divide the horizon.

If the *Sinical Quadrant* be taken for a fourth part of the meridian; one side thereof, AB, may be taken for the common radius of the meridian and the equator; and then the other, AC, will be half the axis of the world—The degrees of the circumference BC will represent degrees of latitude, and the parallels to the side AB, assumed from every point of latitude to the axis AC, will be radii of the parallels of latitude, as likewise the sine complements of those latitudes.

Suppose, then, it be required to find the degrees of longitude contained in 83 of the lesser leagues, in the parallel of  $48^\circ$ —Lay the thread over  $48^\circ$  of latitude on the circumference, and count thence the 83 leagues, or AB, beginning at A: this will terminate in H, allowing every small interval, four leagues. Then tracing out the parallel HG, from the point H to the thread; the part AG of the thread shews that 125 greater, or equinoctial leagues, make  $6^\circ, 15'$ ; and therefore that the 83 lesser leagues AH which make the difference of longitude of the course, and are equal to the radius of the parallel GI, make  $6^\circ, 15'$  of the said parallel.

If the ship sail an oblique course, such course, besides the north and south greater leagues, gives lesser leagues easterly and westerly; to be reduced to degrees of longitude of the equator—But these leagues being made neither on the parallel of departure, nor on that of arrival, but in all the inter-

mediate ones; we must find a mean proportional parallel between them.

To find this, we have on the instrument a scale of *cross Latitudes*. Suppose, then, it were required to find a mean parallel between the parallels of  $40^\circ$  and  $60^\circ$ . With your compasses take the middle between the 40th and 60th degree on the scale: this middle point will terminate against the 51st degree, which is the mean parallel required.

*Use of the Sinical QUADRANT* is to form triangles upon, similar to those made by a ship's way, with the meridian and parallels; the sides of which triangles are measured by the equal intervals between the concentric *Quadrants*, and the lines N. and S. E. and W.

The lines and arches are distinguished, every fifth, by a broader line; so that if each interval be taken for one league, there will be five between one broad line and another.

Now, suppose a ship to have sailed 150 leagues north-east, one fourth north; which is the third point, and makes an angle of  $33^\circ, 45'$ , with the north part of the meridian—Here are given two things, viz. the course, and distance sailed, by which a triangle may be formed on the instrument, similar to that made by the ship's course, and her longitude and latitude; and hence may the unknown parts of the triangle be found. See **TRIANGLE**.

Thus, supposing the centre A to represent the place of departure; count, by means of the concentric arches, along the point the ship sailed in, as AD, 150 leagues from A to D: then is the point D the place the ship is arrived at; which note.—This done, let DE be parallel to the side; and then there will be formed a right angled triangle AED, similar to that of the ship's course, difference of longitude, and latitude: the side AE gives 125 leagues for the difference of latitude northwards, which makes  $6^\circ, 15'$ ; and the side DE gives 83 lesser leagues answering to the parallels; which being reduced, as shewn above, gives the difference of longitude—And thus is the whole triangle found.

**QUADRANT**, in Gunnery, called also the *Gunner's Square*, is an instrument serving to elevate or point cannons, mortars, &c. according to the places they are to be levelled or directed to. See **MORTAR**, **LEVEL**, &c.

It consists of two branches, made of brass or wood; one about a foot long, 8 lines broad, and one line in thickness; the other four inches long, and the same thickness and breadth as the former—Between these branches is a *Quadrant* divided into 90 degrees, beginning from the shorter branch, and furnished with thread and plummet. See its figure represented *Tab. Fortification*, fig. 4.

The use of this instrument is easy; nothing more being required but to place the longest branch in the mouth of the cannon or mortar, and elevate or lower it, till the thread cuts the degree necessary to hit a proposed object.

Sometimes, also, on one of the surfaces of the long branch is noted the division of diameters, and weights of iron bullets; as also the bores of pieces. See **ORDNANCE**, **CALIBER**, &c.

**QUADRANT of Altitude**, is an appendage of the artificial globe; consisting of a lamina, or slip of brass, the length of a *Quadrant* of one of the great circles of the globe; and divided into 90 degrees.

At the end where the division terminates, is a nut rivetted on and furnished with a screw, by means whereof the instrument is fitted on to the meridian; and moveable round upon the rivet, to all points of the horizon. See its figure in *Tab. Astronomy*, fig. 61.

Its use is to serve as a scale in measuring of altitudes, amplitudes, azimuths, &c. See the manner of it's application under the use of the globe.

**QUADRANTAL**, in antiquity, a vessel in use among the Romans for the measuring of liquids. See **MEASURE**.

It was at first called *Amphora*; afterwards *Quadrantal*, from its form, which was square every way, like a die. See **AMPHORA**.

Its capacity was 80 libræ, or pounds of water, which made 48 sextaries, 2 urnæ, or 8 congi. See **CONGIUS**.

**QUADRANTAL Space**, in geometry. See **QUADRANT**.

**QUADRANTAL Triangle**, is a spherical triangle, one of whose sides at least is a quadrant of a circle; and one of its angles a right angle. See **SPHERICAL Triangle**.

**QUADRANTATA Terra**, in our ancient law-books is used for a quarter of an acre; now called a *Rood*. See **ACRE** and **ROOD**. See also **FARDINGDEAL**.

**QUADRAT**, **QUADRATUM**, called also *Geometrical Square* or *Line of Shadows*, is an additional member on the face of the common Gunter's and Sutton's *Quadrants*; of some use in taking altitudes, &c. See **QUADRANT**.

The *Quadrat* KLH, (*Tab. Astronomy*, fig. 55.) has each of its sides divided into 100 equal parts, commencing from the extremes; so as the number 100 falls on the angle; and representing tangents to the arch of the limb.

The divisions are distinguished by little lines from 5 to 5, and by numbers from 10 to 10; and the divisions being occasionally

occasionally produced a-crofs, form a kind of lattice, consisting of 10000 little squares.

The proportion here, is, as radius is to the tangent of the angle of altitude at the place of observation (*i. e.* to the parts of the *Quadrat* cut by the thread) so is the distance between the station and foot of the object, to its height above the eye. See ALTITUDE.

*Use of the QUADRAT, geometrical square, or line of shadows*—1. The *Quadrant* being vertically placed, and the sights directed to the top of the tower, or other object whose height is required; if the thread cut the side of the *Quadrat* marked *right shadows*, the distance from the base of the tower to the point of station is less than the tower's height—If the thread fall on the diagonal of the square, the distance is just equal to the height—If it fall on that side marked *versed shadows*, the distance exceeds the height.

Hence, measuring the distance, the height is found by the *Rule of three*; inasmuch as there are three terms given—Indeed, their disposition is not always the same; for when the thread cuts the side of *right shadows*, the first term in the *Rule of three* ought to be that part of the side cut by the thread; the second the side of the square; and the third the distance measured—If the thread cut the other side, the first term is the whole side of the square, the second the parts of the side cut by the thread, and the third the distance.

For an instance of each—Suppose, *e. gr.* in looking at the top of a steeple the thread cut the side of *right shadows* in the point 40, and that the distance measures 20 poles; the case then will stand thus: as 40 is to 100, so is 20 to a fourth term, which I find to be 50; the height of the steeple in poles. Again, supposing the thread to fall on the other side, in the point 50, and the distance to measure 35 poles; the terms are to be disposed thus: as 100 is to 60; so is 35 to a fourth term, *viz.* 21, the height required.

*Use of the QUADRAT without calculation*—The preceding cases may be performed without calculation where the divisions of the square are produced both ways, so as to form the area into little squares.

Thus, suppose, 1. The thread to fall on 40 in the side of *right shadows*, and the distance be measured 20 poles; seek among the little squares for that perpendicular to the side which is 20 parts from the thread; this perpendicular will cut the side of the square next the centre, in the point 50, which is the height required in poles.

2. If the thread cut the side of the *versed shadows* in the point 60, and the distance be 35 poles; count 35 parts on the side of the *Quadrat* from the centre; count also the divisions of the perpendicular from the point 35 to the thread, which will be 21, the height of the tower in poles.

Note, in all cases, the height of the centre of the instrument is to be added. See farther under SHADOW.

QUADRAT, in astrology, called also QUARTILE, an aspect of the heavenly bodies, wherein they are distant from each other, a quadrant or ninety degrees. See ASPECT.

This is held a malignant aspect. See QUARTILE.

QUADRAT, in printing, is a sort of space; that is, a piece of metal, cast like the letters, to be used occasionally in composing, in order to form the intervals between words, at the ends of lines, &c. See PRINTING.

There are *Quadrats* of divers sizes, as *m Quadrats*, *n Quadrats*, &c. which are respectively of the dimensions of such letters.

QUADRATA *Legio*, among the Romans, was a legion consisting of 4000 men. See LEGION.

QUADRATIC Equation, is an equation wherein the unknown quantity is of two dimensions *i. e.* the square of the root, or number sought—As is,  $x^2 = a + b^2$ . See EQUATION.

*Quadratic equations* are of two kinds; *simple*, or *pure*; and *adfect*.

*Simple or pure QUADRATICS*, are those where the square of the unknown root is equal to the absolute number given: as in  $aa = 36$ ;  $ee = 146$ ;  $yy = 133225$ .

The resolution of these is easy; it being apparent that nothing more is required than to extract the square-root out of the number or known quantity. See EXTRACTION.

Thus the value of *a* in the first equation is equal to 6; in the second  $e = 12$ , and a little more, as being a surd root; and in the third example  $y = 365$ . See ROOT.

*Adfect* QUADRATICS, are those which between the highest power of the unknown number, and the absolute number given, have some intermediate power of the unknown number: as,  $aa + 2ba = 100$ . See ADFFECTED.

All equations of this rank are in one or other of the following forms: *viz.*  $aa + ad = R$ .  $aa - ad = R$ .  $ad - aa = R$ .

There are several methods of extracting the roots of *adfect* *Quadratics*; the most convenient is that of Harriot—Suppose  $x^2 + ax = +b^2$ ; here *x* being assumed as a part of the root; *a*, the known quantity of the second term, will be double the other part; and therefore half of *a* is the other part—The square thereof, will be completed by adding one fourth of

*aa*; which done, the root of the square may be extracted thus:

$$\begin{array}{r} x^2 + ax = b^2 \\ \frac{1}{4}aa \quad \frac{1}{4}aa \text{ add.} \\ \hline x^2. \quad ax. \quad \frac{1}{4}a^2 = \frac{1}{4}a^2. \quad b^2 \\ \hline x^2. \quad \frac{1}{2}a = \sqrt{(\frac{1}{4}a^2. \quad b^2)} \\ \hline x = \frac{1}{2}a. \sqrt{(\frac{1}{4}a^2. \quad b^2)} \end{array}$$

In lieu of the characters + and —, we here use points; to avoid the necessity of distinguishing several cases. See RESOLUTION.

*Construction of QUADRATIC Equations*; See CONSTRUCTION.

QUADRATING of a piece, among gunners, is the seeing that a piece of ordnance be duly placed, and poised in its carriages; that its wheels be of an equal height, &c. See CARRIAGE, ORDNANCE, CANNON, &c.

QUADRATO-CUBUS, QUADRATO-QUADRATO-CUBUS, and QUADRATO-CUBO-CUBUS, are names used by Diophantus, Vieta, Oughtred, and others, for the 5th, 7th, and 8th powers of numbers. See POWERS.

QUADRATO-QUADRATUM, or *Biquadratum*, the fourth power of numbers; or the product of the cube multiplied by the root. See POWER.

QUADRATRIX, in geometry, a mechanical line, by means whereof we can find right lines equal to the circumference of circles, or other curves, and of the several parts thereof. See CIRCLE, QUADRATURE, &c.

Or, more accurately, the *Quadratrix of a curve*, is a transcendental curve described on the same axis, the semiordinates whereof being given, the quadrature of the correspondent parts in the other curve, are likewise given. See CURVE.

Thus, *e. gr.* the curve AND, (*Tab. Analysis*, fig. 21.) may be called the *Quadratrix* of the Parabola AMC, since it is demonstrated that  $APMA = PN^2$ , or  $APMA = AP \cdot PN$ , or  $APMA = PN \cdot a$ , &c.

The most eminent of these *Quadratrices* are, that of Dinostrates, and that of Mr. Tschirnhausen for the circle; and that of Mr. Perks for the hyperbola.

QUADRATRIX of Dinostrates, is a curve, AM mm, (*Tab. Analysis*, fig. 22.) whereby the quadrature of the circle is effected, though not geometrically, but mechanically; thus called from its inventor Dinostrates.

Its genesis is thus—Divide the *Quadrantal* arch ANB into any number of equal parts; in N n, &c. by a continual bisection—divide the radius AC into the same number of parts in the points P p, &c. Draw radii CN, c n, &c.—Lastly, on the points P p, &c. erect perpendiculars PM, p m, &c. the curve formed by connecting these lines is the *Quadratrix* of Dinostrates.

Here, from the construction,  $AB : AN :: AC : AP$ ; and therefore, if  $AB = a$ ,  $AC = b$ ,  $AN = x$ ,  $AP = y$ ;  $ax = by$ . See QUADRATURE.

QUADRATRIX *Tschirnhausiana*, is a transcendental curve AM mm B, (*fig. 23.*) whereby the quadrature of the circle is likewise effected; invented by Mr. Tschirnhausen, in imitation of that of Dinostrates.

Its genesis is thus conceived—Divide the quadrant ANB, and its radius AC into equal parts, as in the former; and from the points P, p, &c. draw the right lines PM, p m, &c. parallel to CB; and from the points N, n, &c. the right lines NM, n m, &c. parallel to AC—The points AM m, &c. being connected, the *Quadratrix* is formed; wherein  $AB : AN :: AC : AP$ .

Here again, since  $AB : AN :: AC : AP$ ; if  $AB = a$ , and  $AC = b$ ,  $AN = x$ , and  $AP = y$ ;  $ax = by$ . See QUADRATURE.

QUADRATUM *Cubi*, QUADRATO-QUADRATO-QUADRATUM, and QUADRATUM *Surdesolidi*, &c. are names used by the Arabs for the 6th, 8th, and 10th powers of numbers. See POWERS.

QUADRATURE, QUADRATURA, in geometry, the act of squaring; or of reducing a figure to a square; or finding a square equal to a figure proposed. See FIGURE and SQUARE.

Thus, the finding of a square containing just as much surface, or area as a circle, an ellipsis, a triangle, or other figure, is called the *Quadrature* of a circle, an ellipsis, a triangle, or the like. See CIRCLE, &c.

The *Quadrature* of rectilinear figures comes under the common geometry; as amounting to no more than the finding their areas, or superficies; which are in effect their squares, See AREA.

Squares of equal areas are here easily had, by only extracting the roots of the areas thus found: and on such root as a side constructing a square. See SQUARE. See also the particular method of finding the areas or squares, under each particular figure, as TRIANGLE, PARALLELOGRAM, TRAPEZIUM, &c.

The *Quadrature of curves*, that is, the measuring of their area, or the finding a rectilinear space equal to a curvilinear

linear space, is a matter of much deeper speculation; and makes a part of the higher geometry. See GEOMETRY.

Though the *Quadrature*, especially of the circle, be a thing many of the first rate mathematicians among the ancients were very solicitous about, (see QUADRATURE of the circle) yet nothing in this kind has been done so considerable, as in and since the middle of the last century; when, viz. in the year 1657, Mr. Neil and my lord Brounker, and afterwards, in the same year, Sir Christopher Wren, geometrically demonstrated the quality of some curves to a straight line. Soon after this, others at home and abroad, did the like in other curves; and not long afterwards the thing was brought under an analytical calculus, the first specimen whereof ever published was given by Mercator in 1688, in a demonstration of my lord Brounker's *Quadrature* of the hyperbola by Dr. Wallis's reduction of a fraction into an infinite series by division. See QUADRATURE of the parabola.

Though it appears by the way that Sir Isaac Newton had before discovered a method of attaining the quantity of all quadrable curves analytically by his method of fluxions, before the year 1668. See FLUXIONS.

It is contested between Sir Christopher Wren and Mr. Huygens which of the two first found the *Quadrature* of any determinate cycloidal space—Mr. Leibnitz afterwards found that of another space; and Mr. Bernoulli in 1699, discovered the *Quadrature* of an infinity of cycloidal spaces, not only segments, but also sectors, &c. See QUADRATURE of the cycloid, QUADRATURE of the lune, &c.

QUADRATURE of the circle, or the finding a square equal to a given circle, is a problem that has employed the mathematicians of all ages; but still in vain. See CIRCLE.

It depends on the ratio of the diameter to the periphery, which was never yet determined in precise numbers. See DIAMETER, &c.

Were this ratio known, (which would imply the circumference's being expressed by some affection of the diameter; and, of consequence, that it were equal to a right line) the *Quadrature* of the circle were effected: it being demonstrated, that the area of a circle is equal to a rectangular triangle, whose two sides comprehending the right angle, are the radius, and a right line equal to the circumference—So that to square the circle, all that is required is to rectify it. See CIRCUMFERENCE and RECTIFICATION.

Many have approached very near this ratio—Archimedes seems to have been one of the first who attempted it; which he did by means of regular polygons inscribed and circumscribed; and by using polygons of 96 sides, fixed the ratio as 7 to 22. See POLYGON.

Some of the moderns have come nearer, particularly Lud. à Ceulen, who with infinite industry found, at length, that supposing the diameter 1, the circumference is less than 3.14159265358979323846264338387950; but yet greater than the same number, if the last cypher be turned into an unit.

Strict geometry here failing, authors have had recourse to other means; and particularly, to a sort of curves, called *Quadratrices*: but these being mechanical curves, instead of geometrical ones, or rather transcendental instead of algebraical ones, the problem is not fairly solved thereby. See TRANSCENDENTAL, MECHANICAL, &c. QUADRATRIX.

Hence, recourse has been had, by others, to analytics—and the problem attempted by three sorts of algebraic calculations—The first gives a kind of transcendental *Quadratures*, by equations of indefinite degrees: as if  $x^x + x$  be equal to 30, and  $x$  be sought, it will be found to be 3; because  $3^3 + 3$ , is  $27 + 3$ , or 30.—The second by vulgar numbers, though irrationally such; or by the roots of common equations, which for the general *Quadrature*, or its sectors, is impossible—The third by means of certain series, exhibiting the quantity of a circle by a progression of terms.

Arithmetic, in effect, affords us very accurate and intelligible expressions for all rational numbers; but it is defective as to irrationals; which are infinitely more numerous than the former: there being e. gr. an infinity of them between 1 and 2. The root of 2, which is a mean proportional between 1 and 2, is a very obscure idea; and its magnitude is such, as that if you would express it in rational numbers, which alone are clearly intelligible, you may still approach nearer and nearer its exact value, but never arise precisely at it.

Thus, if for the value of the root of 2, you first put 1, it is visibly too little; if, then, you add  $\frac{1}{2}$ , it is too much; for the square of  $1 + \frac{1}{2}$ , or of  $\frac{3}{2}$ , exceeds 2. If, again, you take away  $\frac{1}{4}$ , you will find you have taken too much; and if you will return  $\frac{1}{8}$ , the sum will be too great—Thus, may you proceed to infinity, without ever finding a number to stop at.

Now these numbers, thus found, being disposed in their proper order, what may we call an infinite series. See SERIES.

Farther, of infinite series's there are some which only yield a finite sum, as  $\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \&c.$  and in general all such as de-

crease in geometrical progression—And there are others, on the contrary, which make an infinite sum; as the harmonical progression,  $\frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \&c.$  See PROGRESSION.

But, here, we have only to do with the former, as expressing a finite magnitude; yet cannot even the sum of these be always found—Thus, we are certain, that it is impossible to find the sum of the series expressing the root of 2.

Geometry, however, is free from the impossibility arithmetic labours under, of expressing irrational numbers.—Thus, the diagonal of a square, whose side is 1, expresses the root of 2. See DIAGONAL.

Yet in other magnitudes, geometry itself may fall under the same difficulty with arithmetic—For it is possible there may be right lines which cannot be expressed but by an infinite series of similar lines, whose sum it may be impossible to find. In effect, the right lines which should be equal to curves, are frequently of this kind—In searching, e. gr. for a right line equal to the circumference of a circle, we find that the diameter being put 1, the circumference will be  $1 + \frac{1}{4}, 1 + \frac{1}{4} + \frac{1}{16}, 1 + \frac{1}{4} + \frac{1}{16} + \frac{1}{64}, \&c.$  making an infinite series of fractions, whose numerator is always 4, and the denominators in the natural series of the uneven numbers; and all these terms, alternately, too great, and too little.

Could the sum of this series be found, it would give the *Quadrature* of the circle; but this is not yet done; nor is it at all probable it ever will be done—That, however, is not yet demonstrated; nor of consequence, is the *Quadrature* of the circle yet demonstrated impossible.

To this it may be added, that as the same magnitude may be expressed by several different series, it is possible the circumference of the circle may be expressed in some other series, whose sum may be found—We have two infinite series, expressing the ratio of the circumference to the diameter, though indefinitely, as above—The first discovered by Sir Isaac Newton; where the diameter being but 1, the circumference, is  $4 - \frac{1}{5} + \frac{1}{70} - \frac{1}{420}, \&c.$ —The second, discovered by Mr. Leibnitz; where the diameter being one, the circumference, is  $4 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9}, \&c.$  The investigation of each of which series, by the calculus integralis, is as follows.

Sir Isaac Newton's QUADRATURE of the circle; or the investigation of his series, for squaring the circle—If the radius of the circle,  $AC = 1$  (Tab. Analysis, fig. 24.)  $CP = x$ ,  $y = \sqrt{1 - x^2}$  and  $\sqrt{1 - x^2} = 1 - \frac{1}{2}x^2 + \frac{1}{8}x^4 - \frac{1}{16}x^6 + \frac{5}{128}x^8 - \frac{7}{2048}x^{10} \&c.$  to infinity. Then will  $ydx = dx - \frac{1}{2}x^2 dx + \frac{1}{8}x^4 dx - \frac{1}{16}x^6 dx + \frac{5}{128}x^8 dx - \frac{7}{2048}x^{10} dx, \&c.$  to infinity.

When  $x$  becomes equal to the radius  $CA$ , the space  $DCPM$  degenerates into a quadrant. Substituting, therefore, 1 for  $x$ , the quadrant will be  $1 - \frac{1}{6} + \frac{1}{160} - \frac{1}{336} + \frac{5}{2416}, \&c.$  in infinitum.—Which same series will measure the entire area of the circle, the diameter being 1.

Mr. Leibnitz's QUADRATURE of the circle—Let the tangent  $KB$  (Tab. Analysis, fig. 25.)  $= x$ ,  $BC = 1$ ; and the secant  $AC$ , infinitely near another  $CK$ , and the little arch  $KL$  be drawn with the radius  $CK$ ; then will  $AK = dx$ ,  $KC = \sqrt{1 + x^2}$ . Now since the angles at  $B$  and  $L$ , are right angles; and by reason of the infinitely small angle  $KCL$ , the angle  $BKC = KAC$ ; we shall have

$$KC : BC :: KA : KL \\ \sqrt{1 + x^2} : 1 :: dx : \frac{dx}{\sqrt{1 + x^2}}$$

Farther,  $CK : KL :: CM : mM$

$$\sqrt{1 + x^2} : \frac{dx}{\sqrt{1 + x^2}} :: 1 : \frac{dx}{1 + x^2}$$

Therefore the sector  $CMm = \frac{1}{2} dx : (1 + x^2) = \frac{1}{2} (dx - x^2 dx + x^4 dx - x^6 dx + x^8 dx - x^{10} dx, \&c.)$  whence by the integral calculus, we find the sector  $BCM$ , whose tangent  $KB = x : x - \frac{1}{3}x^3 + \frac{1}{5}x^5 - \frac{1}{7}x^7 + \frac{1}{9}x^9 - \frac{1}{11}x^{11}, \&c.$  in infinitum. And therefore if  $BM$  be the octant of the circle, or an arch of  $45^\circ$ , the sector will be  $\frac{1}{2} - \frac{1}{6} + \frac{1}{160} - \frac{1}{336}, \&c.$  in infinitum. The double, therefore, of this series,  $1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \frac{1}{11}, \&c.$  in infinitum, is the quadrant of the circle; or if the diameter be  $= 1$ , the entire area of the circle.

QUADRATURE of the lunes—Though a definite *Quadrature* of the entire circle, was never yet given; yet there have been various portions of it squared—The first partial *Quadrature* was given by Hippocrates of Chio; who squared a portion called, from its figure, the lune, or lunule. See LUNE, where the *Quadrature* is shewn.

This *Quadrature* has no dependance on that of the circle; but then it only extends to the entire lune, or its half; if you would square any portion thereof, at pleasure, the *Quadrature* of the circle comes in the way.

Yet some of the modern geometers have found the *Quadrature* of any portion of the lune at pleasure, independently of the *Quadrature* of the circle; though still subject to a certain restriction which prevents the *Quadrature* from being perfect, and, as the geometricians call it, absolute and indefinite.

In 1701, the marquis de l'Hôpital published a new manner of squaring the parts of the lune taken different ways, and under different conditions—though this, too, is imperfect in the same manner as the others.

**QUADRATURE of the ellipsis**—The ellipsis, too, is a curve whose precise *Quadrature* in definite terms is not yet effected. We have here therefore, as before, recourse to a series.

Let AC (Tab. Analysis, fig. 26.) = a GC = c PC = x. Then will

$$y^2 = c^2 = (a^2 - x^2) : a^2$$

$$y = c \sqrt{(a^2 - x^2)} : a$$

But  $\sqrt{a^2 - x^2} = a - \frac{x^2}{2a} - \frac{x^4}{16a^3} - \frac{5x^6}{128a^5} - \frac{7x^8}{256a^7} \dots$  &c. in infinitum.

Therefore,  $ydx = cdx \frac{cx^2dx}{2a^2} - \frac{cx^4dx}{8a^4} - \frac{5cx^6dx}{16a^6} - \frac{7cx^8dx}{256a^8} \dots$  &c. in infinitum.

if then for x be put a; the quadrant of the ellipsis will be  $ac - \frac{1}{8}ac - \frac{1}{16}ac - \frac{1}{128}ac - \frac{1}{256}ac - \frac{1}{1024}ac - \frac{1}{2048}ac \dots$  &c. in infinitum. Which same series exhibits the entire area of the ellipsis, if a denote the intire axis.

Hence, 1. If  $\sqrt{ac} = 1$ ; the area of the ellipsis =  $1 - \frac{1}{8} - \frac{1}{16} - \frac{1}{128} - \frac{1}{256} - \frac{1}{1024} - \frac{1}{2048} \dots$  &c. in infinitum: whence it is evident that an ellipsis is equal to a circle whose diameter is a mean proportional between the conjugate axis of the ellipsis. 2. Hence, also, an ellipsis is to a circle whose diameter is equal to the greater axis, as  $ac$  to  $a^2$ ; that this, as  $c$  to  $a$ , or as the less axis to the greater. Hence, lastly, having the *Quadrature* of the circle, we shall likewise have that of the ellipsis, and on the contrary.

**QUADRATURE of the parabola**—For the parabola we have a *Quadratrix* or transcendent curve, which gives its squares. See QUADRATRIX.

But it may be likewise had thus:

$$ax = y^2 \text{ See PARABOLA.}$$

$$a^1 : 2x^1 : 2 = y$$

$$ydx = a^1 : 2x^1 : 2 dx$$

$$fydx = a^1 : 2x^1 : 2 = \frac{1}{2} \sqrt{ax^3} = \frac{1}{2} \sqrt{x^2 y^2} = \frac{1}{2} xy.$$

Hence, the parabolic space is to the rectangle of the semiordinate into the abscisse as  $\frac{1}{2} xy$  to  $xy$ ; that is, as 2 to 3.

Note, If a curve be not supposed described, but only an equation to it given, so as it does not appear *e. gr.* where the origin of  $x$  is to be fixed, we are to put  $x=0$  in the integral, and expunging what are multiplied by  $x$ , add to it the remainder, if there be any, under the contrary sign; to have the *Quadrature* sought.

**QUADRATURE of the hyperbola**—For this, too, we have a *Quadratrix*, invented by Mr. Perks. See QUADRATRIX.

The analytical *Quadrature* was first given by N. Mercator of Holstein, the first inventor of infinite series's. But Mercator finding his series by division; Sir Isaac Newton and Mr. Leibnitz improved upon his method; the one seeking them by the extraction of roots, the other by a series presupposed. See SERIES.

**Mercator's QUADRATURE of the hyperbola between its asymptotes**—Since in an hyperbola within the asymptotes,  $a^2 = by + xy$ ; or if  $a=b=1$ , (which may be supposed, since the determination of  $b$  is arbitrary.)

$$\text{Then will } \frac{1}{1+y+xy} = \frac{1}{1+x+y}$$

That is (the division being actually performed)

$$y = 1 - x + x^2 - x^3 + x^4 - x^5 + x^6, \text{ &c.}$$

$$ydx = dx - xdx + x^2dx - x^3dx + x^4dx - x^5dx + x^6dx, \text{ &c.}$$

$$fydx = x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4 + \frac{1}{5}x^5 - \frac{1}{6}x^6 + \frac{1}{7}x^7, \text{ &c.}$$

in infinitum.

**QUADRATURE of the cycloid**—Since TP (Tab. Analysis, fig. 27.) = PM; in the triangle PMT, the angles M and T will be equal; and consequently, TPQ = 2M. But the measure of the angle APQ is the half arch AP; which likewise measures the angle TPA. Therefore APQ = TMP = MmS, by reason MP and mq are parallel. Wherefore, since the angles at S and Q are right angles, we have

$$AQ : QP :: MS : mS$$

Let, then, AQ = x, AB = 1; then will PQ =  $\sqrt{(x-xx)}$  and mS =  $dx \sqrt{(x-xx)} : x$ . But it is shewn, that  $\sqrt{(x-xx)} = x^1 : 2 - \frac{1}{2}x^3 : 2 - \frac{1}{8}x^5 : 2 - \frac{1}{16}x^7 : 2 \dots$  &c. in infinitum. Therefore,  $dx \sqrt{(x-xx)} : x =$  (the numerators of the exponents being diminished by two units in the division by x)  $x^{-1} : 2dx - \frac{1}{2}x^1 : 2dx - \frac{1}{8}x^3 : 2dx - \frac{1}{16}x^5 : 2dx - \frac{1}{64}x^7 : 2dx - \frac{1}{256}x^9 : 2dx - \frac{1}{1024}x^{11} : 2dx - \frac{1}{4096}x^{13} : 2dx - \frac{1}{16384}x^{15} : 2dx - \frac{1}{65536}x^{17} : 2dx - \frac{1}{262144}x^{19} : 2dx - \frac{1}{1048576}x^{21} : 2dx - In the *Quadratures*, and within 35 degrees thereof, the ap-sides of the moon go backwards, or move in *antecedentia*; but forwards in the syzygies. See *APSIDES*.

The moon's orbit undergoes various alterations in each revolution—Its excentricity is the greatest when the line of the ap-sides is in the syzygies; least, when in the *Quadratures*. See *EXCENTRICITY*.

Considering one intire revolution, the nodes move slower and slower as the moon approaches the *Quadratures*, and rest when she is therein: but considering several revolutions, the nodes go back fastest in the *Quadratures*. See *NODE*.

The inclination of the plane of the moon's orbit increases as the nodes go from the syzygies, and is greatest when the nodes are in the *Quadratures*. See *INCLINATION*.

**QUADRATURE-lines**, or *lines of QUADRATURE*, are two lines frequently placed on Gunter's sector.

They are marked with the letter Q. and the figures, 5, 6, 7, 8, 9, 10; of which Q signifies the side of the square, and the other figures the sides of polygons of 5, 6, 7, &c. sides—S there stands for the semi-diameter of a circle, and 90 for a line equal to 90° in circumference. See *SECTOR*.

**QUADRATUS**, in anatomy, a name applied to several muscles, in respect of their square figure, as the *Palmaris* and *Pronators*.

—There is also a *QUADRATUS femoris*, a member of the muscle *Quadrigenus*, arising from the apophysis of the ischium, and maintaining an equal breadth and bulk to its insertion just below the great trochanter.—See *Tab. Anat. (Myol.) fig. 7. n. 25.*

This assists with the other muscles of the *Quadrigenus*, to turn the thigh outwards. See *QUADRIGEMINUS*.

**QUADRATUS genæ**, or *maxillæ inferioris*, called also *mentanus*, and (on account of its breadth) *platysma ragoïdes*, is a square muscle lying immediately under the skin of the neck, thence called also *subcutaneus*.—It arises thin and membranous from the upper part of the spines of the vertebrae of the neck and the skin of the superior parts of the cucularis and pectoral muscle; whence, spreading over the neck, it becomes fleshy, and is inserted partly into the os hyoides, and partly into the under edge of the lower jaw.—It adheres firmly to the panniculus carnosus; from which it is not separated without difficulty; and was not anciently distinguished from it.—It serves to pull the lower jaw downward and awry.

**QUADRELS**, in building, a kind of artificial stones, perfectly square, whence their name, made of a chalky, or whitish and pliable earth, &c. dried in the shade for two years. See *BRICK* and *STONE*.

They were formerly in great request among the Italian architects.

**QUADRIGA\***, in antiquity, a carr, or chariot drawn by four horses. See *CARR*.

\* The word is formed from the Latin, *quatuor*, four, and *jugum* yoke. See *BIGA*.

Various are the accounts we have of the author of the *Quadriga*—Cicero makes it the invention of Minerva.—Hyginus attributes it to Erichthonius IV. king of the Athenians; which sentiment Virgil follows in his *Georgics*, lib. iii. v. 113. Æschylus gives Prometheus the honour thereof—Tertullian, *de Spectac.* l. ix. says it was invented among the Argians, by Trochilus, in honour of Juno; and at Rome, by Romulus, in honour of Mars, or Quirinus. Ado of Vienne, *Chronic. Ait.* 3. will have it to have been invented by one Procidus, about the time of the establishment of the kingdom of Athens. Lazuardales, *Hist. Univers. Epitom.* l. xxiv. says the same of Triptolemus.—Lastly, if there be not opinions enough already, Herodotus gives us another; and says the Greeks borrowed it from the Lybians—Pliny tells us, that his seal was a *Quadriga*, lib. xvi. See *SEAL*.

On the reverses of medals we frequently see victory, or the emperor, in a *Quadriga*, holding the reins of the horses; whence these coins are called among the curious, *nummi Quadrigati* and *victoriat*. See *MEDAL*.

**QUADRIGEMINUS**, in anatomy, a muscle, or rather assemblage of four muscles; serving to turn the thigh outward. See *THIGH*.

The first of the constituent muscles of the *Quadrigenus*, is the pyriformis; the second and third the gemini; and the fourth quadratus femoris. See each described under its proper article, *PYRIFORMIS*, *GEMINI*, &c.

**QUADRILATERAL**, in geometry, a figure whose perimeter consists of four right lines, making four angles; whence it is also called a *Quadrangular* figure. See *QUADRANGULAR*.

If the several angles be right, the figure is a *rectangular Quadrilateral*—If oblique, an *oblique-angular Quadrilateral*. See *RECTANGULAR*, &c.

If the sides of a *Quadrilateral* be equal, and the angles right, the figure is a *square*. See *SQUARE*.

If the sides be equal, but the angles unequal, the figure is a *rhombus*. See *RHOMBUS*.

If the angles be equal, and the sides unequal, the figure is a *rectangle*. See *RECTANGLE*.

If only the opposite angles and sides be equal, the *Quadrilateral* is a *rhomboides*. See *RHOMBOIDES*.

If the opposite angles and sides be unequal, the *Quadrilateral* is a *trapezium*. See *TRAPEZIUM*.

The two opposite angles of any *Quadrilateral* figure inscribed in a circle, always make two right angles. See *INSCRIBED*.

**QUADRILL\***, *QUADRILLA*, a little troop or company of cavaliers, pompously dressed and mounted; for the performance of carroufals, jousts, tournaments, runnings at the ring, and other gallant diversifications. See *JOUST*, *TOURNAMENT*, &c.

\* The word is borrowed from the Italian, being a diminutive of *Squadra*, a company of soldiers ranged in a square: for *Squadrare* is, properly, to dispose any thing square; whence their *Quadrilla*, the French *Squadille* and *Quadrille*, and our *Quadrill*—It is not fifty years since the French wrote *Squadille* and *Esquadille*.

A regular carroufal is to have at least four, and at most twelve, *Quadrills*. See *CARROUSAL*.

Of these *Quadrills*, each is to consist of at least three cavaliers, and at most of twelve.

The *Quadrills* are distinguished by the form of their habits, or the diversity of their colours. See *COLOUR*, *LIVERY*, *FACTION*, &c.

**QUADRIPARTITION**, the dividing by four; or a taking of the fourth part of any number, or quantity. See *DIVISION*, *PARTITION*, &c.

Hence *Quadrupartite*, &c. something divided into four. See *DEED* and *INDENTURE*.

**QUADRIREME**, *QUADRIREMIS*, a galley, or vessel, with four oars on a side. See *GALLEY*.

**QUADRUGATA terræ**, in old law records, denotes a team-land; or so much as can be tilled with four horses. See *PLOUGH-LAND*.

**QUADRUPED**, *QUADRUPES*, in natural history, a four-footed beast: or a perfect, hairy, viviparous animal, having but four feet. See *ANIMAL*.

There is a great analogy between the structure of *Quadrupeds*, and that of man—The principal differences result from their different posture; and are seen in the legs, heads, necks, stomachs, hearts, and the nerves. See *FOOT*, *HEAD*, *NECK*, *STOMACH*, &c.

*Quadrupeds* are divided by Mr. Ray, into those which are hoofed, *ungulata*, and clawed or digitate, *unguiculata*.

*Hoofed QUADRUPEDS*, are either,

I. *Whole-hoofed, solidipeda*, *Μονοχηλα*, *Μονοχζ*, *solidungula*: as the horse, ass, the onager or wild ass; the mule and the zebra of Africa, or the fine striped Indian or African ass, almost like a mule in form and stature. See *HOOF*.

Of the whole-hoofed kind, Aristotle has observed, that no one hath two horns—he might have said any horns) no one hath the talus, or astragalus, nor have the males any appearance of breasts. See *HORN*.

II. *Cloven-footed*, and that either 1°. into two divisions only; as the *Διχηλα*, or bifurcate kind, which are again subdivided into such as are, first,

*Ruminant*, *Μηρυκαζοντα*, that is, such as chew the cud; and these either have hollow and perpetual horns, as the bull, sheep, and goat-kind; or deciduous horns, as the hart and deer-kind, which usually shed their horns annually. See *RUMINANT* and *HEAD*.

Of the *bull-kind* are reckoned these: the common *bos* or bullock, of which the male is *taurus*, the female *vacca*: the German *urus*, *urochs*, or *aurochs*: the *bison*: the *bonafus*: the *bubalus*, or *busalo*: the *bos Africanus* of Bellonius, *Obs.* l. ii. c. 50. which he takes to be the *bubalus* of the ancients.

Of the *sheep-kind*, besides the common sort, are reckoned the Arabian *ovis laticauda*, whose tail is sometimes of 30 pound weight; the *ovis strepsiceros cretica Bellonii*; the *ovis Africana*, with short hair instead of wool; the *ovis Guineensis*, or *Angelenis* of Marcgrave, *Hist. Brasil.* l. vi. c. x.

Of the *goat-kind*, are, beside the common *capra domestica*; the *ibex*, or German steinbock, found in the tops of the Alps; the *rupicapra*, French chamois, or German goms; the *gazella Africana*, or antelope; the *gazella Indica*; the *capra sylvestris Africana Grimmii*; the *capra mambrina*, or *Syriaca* of Gesner; the *buselaphus*, or *moschelaphus Caii* in Gesner; the *tragelaphus Caii* in Gesner; &c.

Of the *hart or deer-kind*, are reckoned, the *cervus*, *Ελαφος*, or red deer; the *cervus platyceros* or *palmatus*, the fallow deer; *alce* or the elk; *rangifer*, the rein-deer; the *axis Plinii*, according to Bellonius; the *caprea Plinii*, the *cuguacu-etc.*, and *cuguacu-zapara* of Marcgrave; the *caprea Groenlandica*.

Secondly, of *cloven-footed* animals into two parts only, and which do not chew the cud, there is only the hog and swine-kind: under this head, besides the common swine, are reckoned the wild boar, or swine; the *porcus Guineensis Marc-*

*gravii*:

*gravi*; the *porcus Indicus*, called *babyroussa*; the *tajaca* or *aper mexicanus moschiferus* of Dr. Tyson, called by Marcgrave, *tajaca cunagoara*, by others *quauhila coyalt*, and *quapizotl*, and by Acofta and some others *zaino*.

2°. There are some *Quadrupeds*, whose hoof is cloven into four divisions; and these seem to be not ruminant: as the rhinoceros, the hippopotamus, the tapijerete of Brasil, the capy-bara of Brasil, and the animal *moschiferum*.

**Clawed or digitate QUADRUPEDS**—Of this kind, there are, first, a sort whose claws are not divided or separated, but adhering to one another, covered with one common skin, but with obtuse nails, sticking out round the margin of the foot; as the elephant, which is anomalous, and not clearly referable to this kind, or to that of cloven-footed *Quadrupeds*. A second species of this *digitate-kind* of *Quadrupeds*, which has only two claws, is that of camels; and though these have no horns, they both ruminate, and have also the four stomachs of horned ruminant animals.

Of the Camel, or dromedary there are two sorts; one having but one bunch on the back, the other two.

To this kind also belong the Peruvian *glama*, which some have reckoned among the sheep-kind; as also the *pacos*, the *ovis Indica*, or *Peruviana vulgo*, much less than the *glama*.

A third species of this *unguiculate-kind* includes such animals, as the Greeks called *πλατυουχα*, and *ανθρωπομορφα*, which have the foot divided into many claws, with broad nails on them; as the ape and monkey kind.

Of these, some have no tails, and are called *simia*, or apes: others have tails, and are called monkeys, *cercopithec*; and such as has either long or short tails, if they are of a larger size, are called *papiones*, or baboons—There are great numbers and varieties of this species of *Quadrupeds*; of which naturalists have described these: viz. the *orang outang*, or *homo sylvestris* of Dr. Tyson, described by him in a particular discourse: the *guarita* of Brasil, *Marcgravi*; the *cagui* of Brasil, greater and lesser; the *cay* of the same region, described by Lerus; the *caitaia* of the same country; the *cercopithecus barbatus Guineensis*, two or three sorts of it; the *cercopithecus angolensis major*; the *cercopithecus non barbatus Clusii*; the *cercopithecus Clusii*, called *jagouin*: lastly, if apes and monkeys have their snouts very prominent like dogs, they are called *cynocephali*.

A fourth species of this *unguiculate-kind*, is when though the claws are many, yet they are not covered at the end with broad flat nails, like monkeys or apes; but are rather like the talons of hawks, &c. crooked, and sharp-pointed.

These, in respect of their teeth, may be divided into such as have many dentes primores, or incisores, (that is, cutting teeth) in each jaw, of which there are two sorts; a greater, which either have a short, round head, as the cat-kind; or a lesser sort, having a long slender body, with very short legs, as the weasel or vermin-kind.—There are also some of this species of *Quadrupeds*, which have only two large remarkable teeth in each jaw: these are the hare-kind, and live only upon herbs, grass, &c.

Of the *cat-kind* of *Quadrupeds* are reckoned to be the lion, the tyger, the *pardalis*, which male is *pardus*, and female *panthera*, the leopard; the *lupus cervarius*, or lynx; the *catus pardus*, or cat-a-mountain; the common cat; and the bear.

Of the *dog-kind* are reckoned the wolf; the *lupus aureus* or jackall; besides the common dog, of which kind they enumerate, the mastive; the *canis Venaticus graius*, *Græcus*, or *Scoticus*, the greyhound; *graius Hibernicus*, or the Irish greyhound; the *canis Venaticus sagax*, *indagator*, *speculator ferarum*, &c. the hound; *canis Venaticus Hispanicus* or *Aviarius*, the spaniel for land or water; *vertagus* or tumbler; *canis Okenf*, or *domesticus*, the house-dog; *canis melitæus*, or the lap-dog; *canis getulus* or *Islandicus*, the shcock; and of all these sorts there are many varieties of mongrels, and hybridous breeds.

Another sort of the dog-kind is the fox; the animal *zibeticum*, or civet-cat, as it is corruptly called, but by it's teeth and snout, is plainly of the dog-tribe; the *American coati*, or *raccoon*, or *rattoon*; the *yzquiepat*; the *carigueya*, *maritucaca*, *carigoy*, *ropoxa* or *possum*; the *taxus* or *meles*; the badger, grey, or pate; the *lutra* or otter; the *phoca*, sea-calf, or seal; the *equus marinus*, morse, or sea-horse, mistaken by some for the *hippopotamus*; the Dutch call him *walrus*, the Danes and Islanders *rosmarus*; lastly, the *manati* or *vacca marina*, the sea-cow.

Of the *vermin*, or *weasel-kind* of *Quadrupeds*, is, first, the *mustela vulgaris*, the common weasel, in Yorkshire called *foumart* or *fitcher*, *γάρτεν*; the *viverra Indica*, called *quel* and *quirpele*; and another sort called *mungo*, and *mungathia*, of a reddish grey: the *mustela*, *ermine*, or *float*, if white; and *mustela sylvestris*, the ferret; *putorius*, the pole-cat; *martes* or *fyena*, the martin or martlet; *mustela zibellina* the sable; lastly, the *genetta*; and the *ichneumon Belloni*.

Of the *hare-kind* of *Quadrupeds*, are first, *lepus*, or the common hare: *cuniculus*, the rabbit or coney; *tapeti*, or

Brasil coney, and the *aperea* of Brasil; the *hystrix*, or porcupine, and the *hystrix Americanus*, or *cuanda* of Brasil; castor, fiber, or the beaver; *sciurus vulg.* or squirrel: the Virginian, Zeylandic, Barbary, and American flying squirrel; *mus domesticus*, major and minor, the common rat and mouse: to these also may be referred *mus major aquaticus*, the water-rat; the musk-rat, *mus avellanarum*, major and minor; the dormouse or sleeper, *mus noricus*, *Cricetus*, *Alpinus seu Marmotta*; the *cavia cobaya*, or *cuniculus Americanus*, the Guinea-pig; the *agati*, and *paca* of Brasil; the *mus Norwegicus*, or *leming*; the *glis Gesneri*, or the *rell*; the *mus Indicus*, &c.

**Anomalous QUADRUPEDS**—To these several kinds, the following anomalous ones must also be added.

(1) Such four footed viviparous animals, as have a longish snout, with their feet divided into many claws, and toes, and having teeth; as the *echinus terrestris*, or common urchin, or hedge-hog; *erinaceus Indicus albus*; *tatu* or *armadillo prima* of Marcgrave; *tatuete* of Brasil, or the second species of the *armadillo*, according to Marcgrave; *tatu apara*, his third species of *armadillo*; *Tatu Mytilinus*, Soc. Reg. Mus. the weasel-headed *armadillo*; *talpa*, the mole, warp, or mold-warp; *mus araneus*, shrew, hardy shrew, shrew-mouse.

(2) *Quadrupedous* and viviparous animals with a longish snout, having their feet divided into many claws or toes, but without teeth; as the *tamandua-guacu* of Brasil, *Marcgravi*; *ursus formicarius Cardani*, the great ant-bear; the *tamanduais* of Brasil, or Marcgrave's lesser ant-bear.

(3) *Anomalous flying Quadrupeds*, with a shorter snout, and their feet divided as above; being of the bat-kind, or flitter-mice; of which there are several sizes and different forms.

(4) There is one very anomalous animal which has but three claws on each foot; and that is the ass, or *ignavus* of Marcgrave, the sloth or sluggard.

(5) Viviparous and sanguineous *Quadrupeds*, breathing with lungs, but having only one ventricle in the heart; as the *rana aquatica*, the frog or froth; *rana arborea*, seu *ranunculus viridis*, the small tree or green frog; *bufo*, seu *rubeta*, the toad; *testudo*, the tortoise, in Greek, *χιτάρι*; of these there are land and water ones, and many different species in foreign parts. See TORTOISE.

(6) *Oviparous Quadrupeds*, with a long tail stretched out horizontally, are the lizard-kind; as *lacertus omnium maximus*, the crocodile; *cordylus*, seu *caudiverbera*, *uramastix Græcis*, larger than the green lizard; *tapayaxin Novæ Hispaniæ*; *lacertus orbicularis* of Hernandez; *lacertus vulgaris*, the common eft, swift, or newt; *lacertus viridis*, the green lizard; *lacertus fucatanus Aldrovandi*, at Rome and Naples called the *tarantula*; *lacertus Indicus*, called *senembi* and *ingwana*; *lacertus Brasiliensis*, called *tejuguacu*, and *temapara* by Marcgrave; the *taraguira*, *ameira*, *toraguico*, *Acuraba*, *Americima*, *Curapopepa*, *Teiunbam*, &c. of Marcgrave; the *lacertus Indicus*; the *scincus*, or *crocodilus terrestris*; the *seps*, or *lacerta chacidica*, a kind of footed serpent; *stellio*, the swift, or spotted lizard; *salamandra terrestris*; *salamandra aquatica*, the water eft; *lacerta volans Indica*; and the *chamælion*, or camelion.

**QUADRUPLE**, a sum or number multiplied by four, or taken four times. See RATIO and MULTIPLE.

**QUADRUPLE** is particularly used for a gold coin, worth four times as much as that whereof it is the *Quadruple*.

The *Quadruple* of the Spanish pistole is a piece of four pistoles, worth about three pounds twelve shillings sterling, called also *double doubloon*.

The *Quadruple* of the louis d'or is only equal to two louis d'ors or French pistoles, or one pound thirteen shillings sterling. See PISTOLE.

**QUÆ plura**, a writ that anciently lay where inquisition had been made by an escheator, of such lands or tenements, as any man died seized of, and all was supposed not to be found by the office. See ESCHEATOR.

This writ was to enquire what more lands or tenements the party died seized of.—But it is now made useless by taking away the court of wards and offices.

**QUÆ servitia**. See PER quæ servitia.

**QUESTA**, in our ancient writers denotes an indulgence, or remission of penance; exposed to sale by the popes. See INDULGENCE and QUESTIONARI.

**QUESTIONARI**\*, in our ancient law-books, were people who went about with indulgences from door to door, desiring charity either for themselves or others. See INDULGENCE.

\* Matt. West, observes, 1240, that the king, *Terram suam per Papales Questionarios, depauperari &c. permittit*.

**QUÆSTUS**\*, in law, is that estate, or those effects which a man hath by acquisition, or purchase; in contradistinction to *hereditas*, which is what he hath by descent. See ACQUEST and GOODS.

\* Glanv. lib. vii. aut habet hereditatem tantum, vel quæstum tantum, aut hereditatem & quæstum,

**QUAKERS**, a religious sect, who made their appearance in

in England, during the time of the inter-regnum. See SECT.

They took their origin from George Fox, an illiterate person, born at Draiton in Leicestershire; and by profession a shoemaker.

The accounts of those times tell us, that as he wrought at his trade, he used to meditate much on the scriptures; which, with his solitary course of life, improving his natural melancholy, he began at length to have visions; and, in consequence thereof, set up for a preacher.

The new prophet proposed but few articles of faith; dwelt mostly on morality; preached mutual charity, the love of God, and a deep attention to the inner motions and secret workings of the spirit—He would have a simple worship, and religion without any ceremonies; making it a principal point to wait, in profound silence, the motion and direction of the holy spirit.

The genius of the times, the novelty of the doctrine, and the great appearance of devotion in the man, soon gained him disciples; and some unusual shakings and convulsions which they were seized withal at their first meetings, procured them the appellation *Quakers*.

They profess a great austerity of behaviour; a singular probity and uprightness in their dealings; a demureness and gravity of countenance; a coldness and sparingness of discourse, to have time to weigh what they say; a great deal of frugality in their tables, and of plainness in their dress.

They declaim much against the interested views of the English ministers; blame all war, and set aside all use of oaths, as prohibited under the gospel. See AFFIRMATION.

According to the genius of rising sects, an eager zeal at first led them to some extravagancies: they would run about the streets naked; and were frequently in prison for interrupting the ministers in service time.

One of their company, Naylor, is said to have had the impiety to allow his followers to call him son of God, son of justice, and king of Israel; to strew garments before him, and hale him at his entry into Bristol, with Hosanna son of David. He had his trial for the same, was whipped for blasphemy, and excommunicated by the rest.

Beside other penalties inflicted on them, they were laughed at, and rallied in writing, and exposed on the theatre: but they despised alike both the press and the prison, and formed their sect, maugre all opposition of both; and under the direction of Fox, Dewsbury, and others, grew from a loose, undisciplined multitude, into a regular body, with stated laws and polity; which they retain with great economy to this day.

The modern *Quakers* retain nothing of the extravagancies charged on their leaders; having approved themselves a sober, quiet people, of exemplary morals, and remarkably charitable and friendly to each other.

Their doctrines are not easily collected; at least, not easily represented out of their own terms, which appear somewhat ambiguous.

They hold Christ to be a light which hath lighted every man; and that whoever will soberly and seriously turn into himself with a sincere desire to know and practise his duty, will not fail to find there a sufficient director; a ray from the fountain of light illuminating the understanding, and assisting to distinguish good from evil.

They add, that such as follow the directions and convictions of this light, shall be holy and acceptable to God; and that this was the end of Christ's coming into the world—That so far as they follow this light, they shall be infallible; and that it is not opinions, or speculations, or notions of what is true, or subscription of articles or formula's of faith, how soundly soever worded, that make a man a true believer or christian; but a conformity of mind and practice to the will of God, according to the manifestation and dictates of this divine principle of light within them.

Our Saviour's injunction about baptism they understand, in a figurative sense, of a conversion and change of the heart; and wholly neglect the outward sign—Water-baptism they hold was only John's; that it was no more than a type or figure, fitted for the infant-state of the gospel; and therefore now useless, in a dispensation, which is spiritual and inward.

The same they hold of the supper; alledging, that both allude to old Jewish practices, and were used as types or significations of a near and accomplishing work—They add, that the communion of saints consists only in a participation of the same divine principle, shewing itself in an unity of spirit.

As to ministry and ordinances, they deny that any are to be used of man's wit, or will, or carnal invention, or imitation; or other than what the inward principle directs them to—Accordingly, they have no persons set apart for the ministry; but without distinction of quality or sex, every one who is of sober life, and approved conversation, and believes him or herself called or moved thereto, is permitted to speak and prophecy in their assemblies.

They own the scriptures to be given by divine inspiration, and allow them the appellation of the form of sound words; VOL. II.

but refuse to call them the *word of God*, as being a denomination properly attributed to Christ alone—They add, that what makes them more scrupulous in this respect, is, that people are apt to be hereby led to think that if they have the scriptures, they have all; and so look for no farther word or light.

They acknowledge the holy three that bear record in heaven, father, word, and spirit; but reject the school-terms, trinity, distinct, persons, hypostases, &c. as not scriptural, and as apt to convey too gross ideas.

They have been even charged with denying the incarnation, our Saviour's humanity, divinity, plenary satisfaction, and the resurrection of the dead: but this is injurious to them; and all that can be justly said, is, that they do not allow of them in the same sense, or speak of them in the same terms, as is commonly done among others—They allow the incarnation, and that the Godhead dwelt bodily in Jesus; and yet many of them say, there is no Christ but what is within them: whence it should seem their notion of the incarnation only implied this, that the light, which they call the Christ within, dwelt in the man Jesus Christ fully—Their reasoning, here, is, that Christ as God, not being divisible, the measure or manifestation of the spirit of Christ in us, is a manifestation of the same Christ which dwelt bodily and fully in the man Jesus Christ.

They are silent as to the hypostatical union; and some of them are charged with allegorizing away the whole history of the crucifixion, the resurrection, and ascension; though their best and most approved writers have been very explicit in their acknowledgment of the reality of the history.

They decline the use of modes or forms of civility; expressing their respect to their superiors no other way but by obeying all just laws under their government.

The system of *Quakerism* is laid down in fifteen theses, by Robert Barclay, in a well writ apology addressed to king Charles II. Their history, writ in low Dutch by William Sewel, and since translated into English, traces them from the beginning to the year 1717—A history of this people was also published An. 1695, by Gerard Croese; but that author is by them accused as having misrepresented facts, and in many respects done them injustice.

As to discipline and polity; the affairs of the communion are all managed under a democratical government, by rules established by common consent; and this principally at their meetings, whereof they have many kinds; viz. *monthly, quarterly, yearly, second day's meetings, meetings of sufferings, &c.*

Their *monthly* and *quarterly meetings* are held in their respective counties—To these deputies are sent from the several particular meetings—Here inquiry is made into the state of each meeting; who stand fast to the rules and orders, and who backslide; who pay tithes, and church rates, and who suffer for non-payment of either; who are married by priests, &c. and accordingly they proceed to censure, or encourage—Here, too, they excommunicate, and here receive again into communion; of all which things exact registers are kept.

From these meetings appeals lie to their yearly ones, which are always held in London, and consist of three orders or classes; viz. representatives sent from the quarterly meetings; correspondents for the several counties, and foreign countries; and ministers, or preachers.—Hither are transmitted accounts of what has been transacted in all the monthly and quarterly meetings over all the world—Here are measures concerted, and directions given as to behaviour about tithes, and rates, providing for the poor, composing differences, &c.—Here public accounts are audited, and proper instructions given to the deputies to be observed at their return, and a yearly epistle of admonitions dispatched to be read in all the monthly and quarterly meetings throughout the world.

The *second day's meeting*, is a standing committee consisting of the principal preachers in and about the city, who meet every monday, to concert particular cases, and exigencies relating to the body, happening between the yearly meetings; particularly to examine, approve, license, &c. all books printed in their behalf.

The *meeting of sufferings* is held every week, and consists of the correspondents for each county—Its business is to receive complaints from such as have suffered for non-payment of tithes and rates, and to procure them relief, either by sending them money, for which they have a settled fund, or by soliciting their causes above, or both.

**QUALE** *Jus*, was an ancient writ judicial, which lay where a religious person had judgment to recover land; before execution was made of the judgment.

This writ was issued forth to the escheator between judgment and execution, to enquire whether the religious person had right to recover, or whether the judgment were obtained by collusion between the demandant and tenant; to the intent that the true lords were not defrauded.

**QUALIFICATOR**, in the canon-law, a divine appointed to qualify, or declare the quality of, a proposition brought  
10 C before

before an ecclesiastical tribunal; chiefly before the inquisition.

The *Qualificators* of the office are not judges; they only give their sentiments on the propositions presented to them—It is the inquisitors that judge. See INQUISITION.

**QUALITY, QUALITAS**, that affection of a thing whence it is denominated such; or that which occasions a thing to affect our senses in this or that manner, and gives it this or that denomination. See AFFECTION.

Thus, that power in fire, whatever it be, whereby it excites in us the sensation of heat, since it is that whence the fire is denominated hot, is called the *Quality* of fire. See HEAT.

The word *Quality, Qualitas*, is said to have been first introduced into the Latin by Cicero: till his time the Romans studiously avoided using a term which denoted an abstract; and in lieu thereof, only considered the concrete, signified by *Quale*—The like is observed of the ancient Greeks, who did not use *ποιότης*, but *ποιόν*. See ABSTRACT and ABSTRACTION.

*Quality*, it is to be observed, is an ambiguous term; and has been applied to some things which ought rather to have been looked upon as states of matter, or assemblages of several *Qualities*; as life, health, beauty, &c.

There are, also, other attributes, as size, shape, motion, and the rest, usually reckoned among *Qualities*, which might more conveniently be ranked among the primary modes of the parts of matter; since from these simple attributes, all the *Qualities* are derived. See MODE.

The ancient school philosophers distinguish *Quality* in the general, which they call *metaphysical* and *prædicamental Quality*, into *essential* and *accidental*—The moderns, more usually, into *spiritual* and *corporeal*.

**Spiritual QUALITIES**, or **QUALITIES of the soul**, are affections of the mind, considered as in this, or that habitude or disposition—Of these, they make two kinds; the one belonging to the understanding, the other to the will: of the former kind are knowledge, opinion, certainty, doubting, &c. Of the latter, are all the moral virtues and vices. See UNDERSTANDING, WILL, KNOWLEDGE, IGNORANCE, OPINION, &c. See also VIRTUE, &c.

**Corporeal or physical QUALITIES**, are what we chiefly consider under this denomination, and to which the definition above laid down is accommodated.

Philosophers are divided as to the nature of these *Qualities*, or what they are in the body—The general language of the peripatetic school, is, that they are things distinct from the bodies themselves; are superadded to them, or flow from their substantial forms: on which principle, they hold *Qualities* to be real, and denominate them *accidents*; supposing them to be inherent in substances, though not in the relation of parts, but to be sustained thereby as in a subject, and incapable of subsisting without them—In effect, the Thomists define *Qualities* to be accidents following or arising from the form; in the same manner as quantity is an accident following or arising from the substance. See FORM, ACCIDENT, QUANTITY, &c.

The moderns absolutely explode the notion of *Qualities* distinct from the body; and insist, that the powers whereby bodies excite in us the ideas of such *Qualities* are no other than the mechanical affections of the bodies themselves, viz. the figure, magnitude, motion, &c. of the parts whereof they consist. See MECHANICAL.

The principal considerations insisted on by the retainers to real *Qualities* are, that these powers may be actually separated from the substances they inhere in; as we see in light, heat, &c. That from these very *Qualities* considered as so many determinations arises a very great diversity in bodies: and that bodies, according to the diversity of their *Qualities*, affect our senses differently.

The adherents to the experimental way, on the contrary, account for all the *Qualities* of bodies from mechanical causes.

Thus all the Phænomena of a clock, the motion of its wheels, its hands, &c. whereby it strikes the hour, points the minute, day, moon's age, &c. do all evidently arise from the single spring; which we never imagine to have any particular powers whereby it should be enabled to make such discoveries; nor any other principle but that one of elasticity—Again, when the smith who first invented locks and keys, had made his first lock, it was only a piece of iron, forged into a particular shape; and when, afterwards, he made a key to it, that also, considered in itself, was nothing but a piece of iron of a determinate figure; but as these two pieces of iron might now be applied to one another, after a certain manner, and, as there was a congruity betwixt the wards of the lock, and those of the key, they now each obtain a new capacity; and it became a principal part of the notion and definition of a lock, that it was capable of being made to open and shut, by that other piece of iron called a key; and it was looked on as a peculiar faculty and power in the key to be fit to open and shut the

lock—And yet by these new attributes there was not added any real or physical entity, either to the lock or the key; each of them remaining the same piece of iron, just so shaped, as it was before. And, again, when the smith made other keys of different sizes, or with different wards; though the first lock could not be opened with any of those keys, yet, that indisposition was nothing new in the lock, or distinct from the figure it had before these keys were made.

Why, then, may we not conceive, that sensible *Qualities*, though, by virtue of a certain congruity or incongruity in point of figure, texture, or other mechanical properties, the portions of matter they modify are enabled to produce various effects, on account whereof the bodies are said to be endowed with *Qualities*; yet, they are not in the bodies endowed with them, any real or distinct entities, or differing from the matter itself of such a determinate bigness, shape, and other mechanical modifications?

Thus, though the modern goldsmiths and refiners reckon it among the most distinguished *Qualities* of gold, that it is dissoluble in aqua regia, whilst aqua fortis will not work upon it; yet these attributes are not in the gold any thing distinct from its peculiar texture; nor is the gold we have now of any other nature than it was in Pliny's time, when aqua fortis and aqua regia were unknown.

If another menstruum, of which Mr. Boyle suggests he was possessed, should be invented to dissolve pure gold in part, and change it into a different metalline body; there would then arise another new property, whereby to distinguish this from other metals: yet the nature of gold is not at all different now from what it was before the discovery of this last menstruum.

There are bodies neither cathartic nor sudorific, with some of which gold being joined acquires a purgative virtue, and with others a power to procure sweat.—Nature herself sometimes produces things, that have no relation to others: and art, especially if assisted by chemistry, may cause so many new productions, that no man can tell, but the most familiar bodies may have multitudes of *Qualities* he dreams not of, which will hardly be imagined real physical entities.

We all know that the sun hath a power to harden clay, soften wax, melt butter, thaw ice, turn water into vapour, make air expand itself in weather-glasses, contribute to blanch linen, render the white skin of the face swarthy, and mowed grass yellow, ripen fruit, hatch the eggs of silk-worms, caterpillars, &c. and perform many other things, some of which seem contrary to others; yet these are not distinct powers, or faculties in the sun, but only the production of its heat, diversified by the different textures of the body it chances to work on, and the condition of the other substances concerned in the operation—And, therefore, whether or no the sun, in some cases, has any influence at all distinct from its light and heat, we see that all the phænomena mentioned are producible by the heat of common fire, duly applied and regulated.

*Boyle of Forms and Qualities.*

Some of the ancients, and particularly the Peripatetics, distinguished *Qualities* into *sensible* and *occult*.

**Sensible, or manifest QUALITIES**, are those arising from certain modifications of matter, and which become immediately objects of our senses—Such are all those above mentioned.

Though, in strictness, those only are said to be *sensible Qualities* which affect some one sense alone; as colour does the eye, sound the ear, &c.

These are sometimes, also, called *tangible Qualities*, by reason they only produce their effect, i. e. excite their ideas in us when contiguous, or in contact with the organ.

**Occult QUALITIES**, are certain latent powers arising from the specific forms of things, whereof no rational solution can be given on any principles of physics. See OCCULT.

*Sensible Qualities* are usually subdivided into *primary* and *secondary*.

**Primary, or general QUALITIES**, are such as are found in all bodies; or which agree to all matter, considered as matter, and therefore to the elements themselves—Such are extension, figure, motion, rest, solidity, impenetrability, and number. See BODY, FIGURE, SOLIDITY, &c.

**Secondary, or particular QUALITIES** are such as result from a composition or mixture of elements, and do not agree to body as body, but as a mixt—Such are light, heat, cold, colour, sound, taste, smell, hardness, softness, fluidity, firmness, roughness, smoothness, opacity, transparency, &c.

According to Aristotle and the Peripatetics, the primary, or elementary *Qualities*, are those of the four elements themselves; viz. heat, cold, moisture, and dryness. See ELEMENT.

The secondary *Qualities*, according to the same, are all the rest; which are combinations or assemblages of the former elementary ones; as colour, odour, taste, &c.

To give an idea of Aristotle's method of accounting for these secondary *Qualities* from his primary ones, we shall instance in his account of colour—All colours, then, says he, are generated of a mixture of the four elementary *Qualities*: white,

white, *e. gr.* is produced when the humidity surmounts the heat, as in old men, who grow grey: black is produced when the humidity dries off, as in walls, cisterns, &c. red, &c.

Among the school-philosophers we meet with other divisions of *Qualities*; as *active*, and *passive*; *real* and *intentional*.

*Active QUALITIES*, are those by virtue whereof effects and operations are actually produced on other bodies duly disposed with respect thereto—Such are the heat of fire, the moisture of water, &c.

*Passive QUALITIES* are those whereby bodies are disposed to receive the action of others—Such are inflammability in oil, &c.

*Real QUALITIES* are those which remain in the subject; and only act on things adjacent thereto—As fire in a piece of iron not ignited, &c.

*Intentional QUALITIES* are those which issue from the subject, and operate at a distance—Such is the light emitted from the sun, &c.

But the moderns are agreed that either all *Qualities* are real, or all alike intentional—So that the distinction is impertinent.

However ignorant we may be of the nature of *Qualities*, or the manner of their operation; yet we know the laws of their intention, and remission—Dr. Keil demonstrates that every *Quality*, which is propagated in *orbem*, such as light, heat, cold, odour, &c. has its efficacy increased, or abated in a duplicate ratio of the distances from the centre of radiation or exertion of the *Quality*, reciprocally.

Thus, let A (*Tab. Geometry, fig. 80.*) be a centre from whence any *Quality* exerts itself round about, according to the right lines A*e*, A*f*, &c. The efficacy of the *Quality*, be it heat, cold, odour, &c. will be (at equal distances from A) as the spissitude or density of the rays A*b*, A*c*, A*d*. But the rays within the inner circle, or rather spherical superficies, *b c d H*, when they come to be extended to the other spherical surface, *e f g K*, will be much less close than before, and that in the reciprocal proportion of the spaces they take up; that is, if the outer surface be double of the inner, the rays there will be but half as thick: But since spherical superficies are as the squares of their radii, therefore the efficacy of the *Quality* in the inner surface will be to that of the outer, As A*e* square, to A*b* square.

Q. E. D.

Sir Isaac Newton lays it down as one of the rules of philosophizing, that those *Qualities* of bodies which are incapable of being intended and remitted, and which are found to obtain in all bodies wherein the experiment could ever be tried, are to be esteemed universal *Qualities* of all bodies. See PHILOSOPHIZING.

*Chymical QUALITIES*—One may distinguish physical *Qualities*, with Mr. Boyle, into *first*, *second*, and *third*; to the two last of which may be referred several *Qualities* not treated of by the writers of physical systems; and these for distinction sake, may, some of them, be filed the *chymical Qualities* of things, because Aristotle and the schoolmen, being unacquainted with them, they have been principally introduced by means of chymical operations and experiments: as fumigation, amalgamation, cupellation, volatilization, precipitation, &c. See CHEMISTRY.

By these operations, among other means, corporeal things come to appear volatile or fixed, soluble or insoluble in some menstrua, amalgamable or unamalgamable, &c. which as well deserve the name of *Quality*, as several other attributes, to which it is allowed.

To these chymical *Qualities* some others might be added, which, because of the use that physicians principally make of them, may be called *medical Qualities*, whereby some substances received into the human body, are resolving, discutient, suppurating, absterfient, &c. For though some faculties of medicines, as those of heating, cooling, drying, attenuating, purging, &c. may be conveniently referred to the first, second, or third *Qualities*, mentioned by naturalists; whilst others are reckoned occult; yet as several of them ought not to be referred to the *Qualities* whereto they are often ascribed; so the handling of them may be looked upon as a desideratum, and deserves a distinct place in natural philosophy. See MEDICINE; see also PURGATIVE, &c.

*Cosmical QUALITIES*, see COSMICAL *Quality*.

*QUALITY* is also used for a kind of title given to certain persons in regard of their territories, signories, or other pretensions. See TITLE.

Thus the king of Great Britain takes the *Quality* of king of France: the king of Poland that of king of Sweden: the king of Sardinia that of king of Cyprus and Jerusalem: the czars of Russia and kings of Spain have whole pages of *Qualities*—The emperor of China assumes the *Quality* of son of the sun.

*QUAM diu se bene gesserit*, a clause frequent in letters patents, or grants of offices, to secure them so long as the per-

son they are granted to, shall not be guilty of abusing the same. See OFFICE, &c.

Thus, *e. gr.* we find it in those given to the barons of the exchequer; where it intimates that they shall hold the same as long as they shall behave themselves well: which is to be restrained to matters of their offices; and signifies no more than the law would have implied, had the office been granted expressly for life. See BARON.

A grant therefore with this clause, is equivalent to a grant for life. See JUDGE, JUSTICE, &c.

*QUANTITY*, *QUANTITAS*, any thing capable of estimation, or mensuration; or, which being compared with another thing of the same kind, may be said to be greater, or less, than it; equal, or unequal to, it. See MEASURE. Mathematics is the science or doctrine of *Quantity*. See MATHEMATICS.

*Quantity* is a general attribute, applied in a very different manner to things of very different nature; whence it is impossible to give any universal definition thereof.

*Quantity* is applied both to things, and to modes; and this either singularly, to one; or plurally to several—In the first case it is called *magnitude*, in the latter *multitude*. See MAGNITUDE, &c.

*Quantity* may be reduced to four classes, *viz.*

*Moral QUANTITY*, which depends on the manners of men, and the free determination of their wills—As the prices and values of things: degrees of dignity and power, good and evil, merit and demerit, rewards and punishments, &c.

*Notional QUANTITY*, arising from the operation of the understanding only—Such as the largeness or narrowness of the capacity of the mind, and its conceptions—In logic, universals, predicaments, &c.—In grammar, the *Quantity* and measure of syllables, accents, tones, &c.

*Physical, or natural QUANTITY*, which is of two kinds; 1. That which nature furnishes us with in matter, and its extension. See BODY and EXTENSION—And, 2. In the powers, and properties of natural bodies; as gravity, motion, light, heat, cold, rarity, density, &c. See MOTION, GRAVITY, &c.

*Transcendental QUANTITY*, as duration, the continuation of any being, existence, time, &c. See DURATION, TIME, &c.

*Quantity* is also popularly distinguished into *continued* and *discrete*.

*Continued QUANTITY*, is when the parts are connected together—This, again, is of two kinds; either *successive* and *improper*, as time. See TIME.

Or *permanent* and *proper*, as space See SPACE.

*Discrete QUANTITY*, is when the parts whereof it consists, exist distinctly and unconnected together; which makes what we call *number* \*. See DISCRETE.

\* The notion of continued quantity, and its difference from discrete, appears to some without foundation—Mr Machin considers all mathematical quantity, or that for which any symbol is put, as nothing else but number, with regard to some measure which is considered as one. For that we cannot know precisely how much any thing is but by means of number. The notion of continued quantity without regard to any measure is indistinct and confused: And tho' some species of such quantity considered physically, may be described by motion, as lines by the motion of points, and surfaces by the motion of lines; yet the magnitudes or mathematical quantities are not made by the motion, but by numbering according to a measure. *Vid. Phil. Transf. No. 447. p. 228.*

*Permanent Quantity* is farther distinguishable into length, breadth, and depth. See LINE, SURFACE, and SOLID.

Wolffius seems to give us a more precise notion of mathematical *Quantity*, and its two species of discrete and continued—Whatever is referred to unity in the same manner as one right line to another, is what we call *Quantity*, or number in general. See NUMBER.

If, now, the thing be referred to a given unit, as 3, it is called a determinate number: if to unity in the general, or at large, it is called a *Quantity*; which, on this principle, is the same with indeterminate number.

Thus, *e. gr.* the breadth of a river is accounted a *Quantity*: If, then, it be enquired how great it is? to conceive its *Quantity* we take some unit at pleasure, and seek the relation of the breadth hereto; and according to the different unit assumed, express the breadth of the river in a different determinate number.

The breadth of the river, therefore, is a *Quantity* considered as referred to a vague unit, or to unity at large; but the unit being determined, the thing is understood by a determinate number.

In this sense, algebra is the arithmetic of *Quantities*. See ALGEBRA.

*QUANTITY of motion*, in mechanics, is of two kinds, *viz.* of momentary motion, and of entire motion.

*QUANTITY of entire motion*—The Cartesians define the entire motion as the momentary one, by the factum of the mass,

or

or quantity of matter, into the velocity; but since motion is a successive being, and has no parts co-existing together, its *Quantity* ought to be estimated by the aggregate of the several parts existing successively; and is therefore equal to the factum of the momenta into the time.

**QUANTITY of momentary motion**, is the factum of the velocity into the mass; or a measure arising from the joint consideration of the *Quantity* of matter, and the velocity of the motion of the body; the motion of any whole being the sum or aggregate of the motion in all the several parts. See **MOTION**.

Hence, in a body twice as great as another, moved with an equal velocity, the *Quantity* of motion is double; if the velocity be double also, the *Quantity* of the motion will be quadruple. Hence the *Quantity* of momentary motion coincides with what we call momentum, or impetus of a moving body. See **MOMENTUM**.

In the collision of bodies, the *Quantity* of momentary motion, which is found by taking the sum of motions tending the same way, or their difference if they tend towards contrary parts; is not at all changed by any actions of the bodies on one another. See **PERCUSSION**.

**QUANTITY of matter** in any body, is the product of the density into the bulk; or a *Quantity* arising from the joint consideration of its magnitude and density. See **MATTER**.

As, if a body be twice as dense, and take up twice as much space as another, it will be four times as great.

This *Quantity* of matter is the best discoverable by the absolute weight of bodies. See **MASS**, **WEIGHT**, &c.

**QUANTITY infinite**—Though the idea of magnitude infinitely great, or such as exceeds any assignable *Quantity*, does include a negation of limits; yet are not all such magnitudes equal amongst themselves; but besides infinite length, and infinite area, there are no less than three several sorts of infinite solidity; all of which are quantities *sui generis*; and those of each species are in given proportions. See **INFINITE**.

Infinite length, or a line infinitely long, is to be considered, either as beginning at a point, and so infinitely extended one way; or else both ways from the same point: in which case the one, which is a beginning of infinity, is one half of the whole, which is the sum of the beginning and ceasing infinity, or infinity *à parte ante*, and *à parte post*, which is analogous to eternity in time or duration; in which there is always as much to follow, as is past any point or moment of time. See **ETERNITY**.

Nor does the addition or subtraction of time, length or space of time, alter the case, either as to infinity or eternity; since neither the one or the other can be any part of the whole.

As to infinite surface or area, any right line infinitely extended both ways on an infinite plane, divides that plane into equal parts, the one to the right, and the other to the left of the said line; but if from any point in such a plane, two right lines be infinitely extended, so as to make an angle; the infinite area, intercepted between these infinite right lines, is to the whole infinite plane, as the arch of a circle drawn on the point of concurrence of those lines as a centre, intercepted between the said lines, is to the circumference of the circle; or as the degrees of the angle to the 360 degrees of a circle.

For an example—Two infinite right lines meeting at a right angle on an infinite plane, do include a quarter part of the whole infinite area of such a plane: if two parallel infinite lines be supposed drawn on such an infinite plane, the area intercepted between them will be likewise infinite; but at the same time will be infinitely less than the space intercepted between two infinite lines, that are inclined, though with never so small an angle, for that in the one case the given finite distance of the parallel lines diminishes the infinity in one degree of dimension; whereas in a sector, there is infinity in both dimensions; and consequently the *Quantities* are one infinitely greater than the other, and there is no proportion between them.

From the same consideration arise three several species of infinite space or solidity; for a parallelepiped, or a cylinder infinitely long, is greater than any finite magnitude, how great soever; all such solids supposed to be formed on a given basis, are in proportion to one another, as those bases. But if two of those three dimensions are wanting, as in the space intercepted between two parallel planes infinitely extended, and at a finite distance; or with infinite length and breadth, have a finite thickness; all such solids shall be as the given finite distances one to another.

But these *Quantities*, though infinitely greater than the other, are yet infinitely less than any of those wherein all the three dimensions are infinite—Such are the spaces intercepted between two inclined planes infinitely extended; the space intercepted by the surface of a cone, or the sides of a pyramid, likewise infinitely continued, &c. of all which, notwithstanding the proportions one to another, and to the *vacua*, or vast abyss of infinite space (wherein is the locus of

all things that are, or can be; or to the solid of infinite length, breadth, and thickness taken all manner of ways) are easily assignable—For the space between two planes is to the whole, as the angle of those planes to the 360 degrees of the circle. As for cones and pyramids, they are as the spherical surface intercepted by them, is to the surface of the sphere; and therefore cones are as the versed sines of half their angles, to the diameter of the circle: these three sorts of infinite *Quantity* are analogous to a line, surface, and solid; and, like them, cannot be compared, or have any proportion one to another. See the article **INFINITE**.

**QUANTITIES**, in algebra, are indeterminate numbers, or things referred to unity in general. See **NUMBER**.

*Quantities* are properly the subject of algebra; which is wholly conversant in the computation of such *Quantities*. See **ALGEBRA**, and **CALCULUS**.

*Given Quantities* are used to be noted by the first letters of the alphabet *a, b, c, d*, &c. the *Quantities* sought by the last *z, y, x*, &c. See **CHARACTERS**.

*Algebraical Quantities* are chiefly of two kinds; *positive*, and *negative*.

*Positive* or *affirmative* **QUANTITIES** are those which are greater than nothing; and which are effected with the sign + prefixed; or supposed to be so. See **POSITIVE**.

*Negative*, or *privative* **QUANTITIES** are those less than nothing; which are affected with the sign — prefixed. See **NEGATIVE** and **PRIVATIVE**.

Hence, 1. Since + is the sign of addition, and — the sign of subtraction; a positive *Quantity* is produced by adding any real *Quantity* to nothing; *e. gr.*  $0 + 3 = +3$ ; and  $0 + a = +a$ . And a privative *Quantity* is produced by subtracting any real *Quantity* out of nothing; *e. gr.*  $0 - 3 = -3$ ; and  $0 - a = -a$ .

For an illustration—Suppose when you are quite destitute of money, somebody gives you an hundred pieces; you have then an hundred pieces more than nothing; which pieces constitute a positive *Quantity*.

On the contrary, suppose you have no money, yet owe an hundred pieces; you have then an hundred pieces less than nothing; for you must pay an hundred pieces to have just nothing. This debt is a negative *Quantity*.

Thus in local motion, progress may be called a positive *Quantity*, and regress a negative one; because the first increases, and the second diminishes the space passed over.

And in geometry, if a line drawn towards any part be accounted an affirmative *Quantity*; another the contrary way will be a negative one.

Privative *Quantities*, therefore, are the defects of the positive *Quantities* whereby they are understood; and, consequently are no real *Quantities*: for we measure the defect by the *Quantity* defective; and thus it becomes intelligible.

Since one defect may exceed another, (*e. gr.* if seven be wanting, the defect is greater than if only three be wanting) and since privative *Quantities* are the defect of real *Quantities*; one privative *Quantity* being taken a certain number of times, may exceed another. Wherefore privative *Quantities* are homogeneous to one another.

But since the defects of a positive *Quantity* taken any number of times can never exceed the positive *Quantity*, but grow still the more deficient; privative *Quantities* are heterogeneous to positive ones.

Since, then, privative *Quantities* are heterogeneous to positive ones, homogeneous to privative ones; there can be no ratio between a privative and a positive *Quantity*, but there is a ratio between privative ones. *E. gr.* —  $3^a : -5^a :: 3 : 5$ . The ratio, here, is the same as if the *Quantities* were positive. But it may be noted, that between 1 and — 1, and between — 1 and 1, the ratio is very different.

**Commensurable QUANTITIES**. See **COMMENSURABLE**.

**Compound QUANTITIES**. See the article **COMPOUND**.

**Exponential QUANTITY**. See the article **EXPONENTIAL**.

**Like QUANTITY**. See the article **LIKE**.

**Simple QUANTITIES**. See the article **SIMPLE**.

**Transcendental QUANTITIES**. See **TRANSCENDENTAL**.

**Variable QUANTITIES**. See the article **VARIABLE**.

**Addition of QUANTITIES**.—1°. If the *Quantities* denoted by the same letter be affected with the same sign, the numbers prefixed to them are added as in common arithmetic.

2°. If they be affected with different signs, the addition is changed into subtraction; and to the remainder is prefixed the sign of the greater.

3°. *Quantities* denoted by different letters, are added by means of the sign +, as in the following example:

$$\begin{array}{r} 4a + 2b - 2c - 5d - g \\ 5a - 2b + 6c + 2d - 3g \\ \hline 9a + 4c - 3d - 4g - a - b + c \end{array}$$

**Subtraction of QUANTITIES**. See **SUBTRACTION**.

**Multiplication and division of QUANTITIES**. See **MULTIPLICATION** and **DIVISION**.

**Combination of QUANTITIES**. See **COMBINATION**.

1. If a positive *Quantity* be multiplied, or divided by another positive *Quantity*, the result is a positive *Quantity*.
2. If a negative *Quantity* be multiplied, or divided by a positive, the result is a negative.
3. If a negative *Quantity* be multiplied, or divided by another negative, the result is a positive.
4. If a positive *Quantity* be multiplied, or divided by a negative, the result is a negative *Quantity*.

**QUANTITY**, in grammar, denotes the measure, or magnitude of the syllables; or, that which determines them to be called long, or short. See **MEASURE**, and **SYLLABLE**.

This *Quantity* is the object of prosody; and it is the regard to this that distinguishes verse from prose. See **VERSE** and **PROSODY**.

The oeconomy and arrangement of the *Quantities*, i. e. the distribution of long and short syllables, make what we call the *number*. See **NUMBERS**, **RHYTHMUS**, **CADENCE**, &c.

The *Quantities* are used to be distinguished among grammarians by the characters *U* short, and *—* long. See **CHARACTER** and **ACCENT**.

The proportion betwixt the long and short syllables may be generally fixed the same as between the crotchet and quaver in music; viz. as 2 to 1. See **TIME**.

In most languages there are some syllables whose *Quantities* vary, as the measure requires; as in the English record and record.

Some authors confound the *Quantities* with the accent: but the difference is glaring; the former being the length or shortness of a syllable, the latter the raising or falling of the voice. See **ACCENT**.

From two *Quantities*, viz. long and short syllables, arise all the varieties of poetic feet, which are very great. Horace alone uses no less than twenty-eight. Yet the Greeks went vastly beyond the Romans in this respect—In effect, as many ways as two *Quantities* may be varied by composition, and transposition from two to six syllables, so many different feet have the Greek poets contrived, and that under distinct names, to the number of 124. Though it is the opinion of some of the learned, that poetical numbers may be sufficiently explained from the feet of two or three syllables, into which the rest may be resolved. See **FOOT**.

The feet formed by the ancients of the long and short syllables immediately, are the *spondee*, consisting of two long syllables; the *pyrrhic*, of two short ones; the *trochee*, of a long and short syllable; and the *iambic*, of a short and long syllable. See **SPONDEE**, **TROCHEE**, **IAMBIC**, &c.

Those of two syllables are the *moleffus*, consisting of three long syllables; the *tribrach* of three short ones; the *daetyl* of one long and two short syllables; and the *anapest* of two short and one long syllable. See **DACTYL**, **ANAPEST**, **TRIBRACH**, &c.

The English tongue admits of no feet above two syllables, though both the Latin and Greek allow of six.

Our heroic verses consist of five long and five short syllables intermixed alternately; though not so strictly but that the order may be dispensed withal. Dryden varies them with admirable beauty; sometimes his heroic verse begins with a long syllable followed by two short ones.

The truth is, the *Quantity* of the syllables is but little fixed in the modern tongues; and there is still less regard had to it in the composition of modern verses—The want of feet or rather the shortness and uniformity of our feet, makes a world of difference between the numbers of the ancient and modern verse. Our poets are fettered, and their fetters are so short, but two poor links, that it is no wonder they can make no extraordinary motions.

The ancients subsisted by their *Quantities* alone; so well were they distinguished, and such a variety and harmony did they afford! Our *Quantities* make such poor music, that we are forced to call in the Gothic aids of rhyme to distinguish our verse from prose. See **ODE**.

Yet have attempts been made to settle our verse on the ancient and natural footing of *Quantities*, in exclusion of rhyme, and with such success too, (witness the immortal *Paradise Lost*) as seems to leave the practice of rhiming inexcusable—The French have likewise attempted the same in their tongue, particularly Jodelet, and after him Pasquier, Passerat, and Rapin; but they have all failed. See **RHIME**.

**QUANTITY of a Degree**. See the article **DEGREE**.

**QUANTITY of an eclipse**. See **ECLIPSE**.

**QUANTUM meruit** an action upon the case, grounded upon a promise to pay a man for doing so much as he should deserve or merit.

**QUARANTAIN\***, in old law-books wrote **QUARENTENE**, and **QUARENTENA**, denotes the space of forty days.

\* *Quaror Carucates terre arabilis, continentes in Longitudine 8 Quarentenas, & 8 Quarentenas in Latitudine.* Chart. Withlasi Reg. Merc. apud Ingulf.

*Quarantena in London ponitur pro respectu habend. pro 40 Dies post summationem per breve Regis ut consulant, &c. si sibi viderint expedire.* MS. de temp. Ed. 3.

The term is borrowed from the French *quarentain*; and is sometimes used for the time of lent. See **LENT**.

**QUARANTAIN of the king**, denotes a truce of forty days appointed by St. Louis, during which it was expressly forbid to take any revenge of the relation or friends of people who had fought, wounded, or affronted each other in words.

**QUARANTAIN** is more particularly used for the term of forty days, which vessels, coming from places suspected of contagion, are obliged to wait in certain places appointed, to air themselves before they come into port. See **PLAGUE**.

**QUARANTAIN**, or **QUARANTINE**, **QUARANTENA**, in law, denotes a benefit allowed by the laws of England to the widow of a man dying seized of land; whereby she may challenge to continue in his capital messuage, or chief mansion-house (so it be not a castle) for the space of forty days after his decease.

If the heir, or any other person attempt to eject her, she may have the writ *de quarantena habenda*; which lies for a widow to enjoy her *Quarantain*.

**QUARANTAIN** is also used for a measure or extent of land, containing forty perches.

**QUARANTIA**, in the Venetian polity, a court of judicature composed of forty judges.

The Venetians have an old civil *Quarantia*, new civil *Quarantia*, and criminal *Quarantia*.

The criminal *Quarantia* takes cognizance of all crimes except those against the state, which belong to the council of ten—The new civil *quarantia* judges of appeals made from sentences passed by judges out of the city—The old civil *Quarantia* takes cognizance of appeals from sentences of subaltern judges in the city.

**QUARE EJECIT infra terminum**, a writ which lies for a lessee in case he be cast out of his farm before his term be expired, against the lessor, or seoffee that ejects him. See **LEASE**.

It differs from *ejectione firmæ*, in that the former lies where the lessor, after the lease made, enfeoffes another who ejects the lessee; whereas the *ejectione firmæ* lies against any other stranger that ejects him.

The effect is the same in both, viz. the recovery of the residue of the term. See **EJECTIONE Firmæ**.

**QUARE IMPEDIT**, a writ which lies for him who has purchased an advowson, against him that disturbs him in the right thereof, by presenting a clerk thereto when the church is void. See **ADVOWSON**.

It differs from the assise of darrein presentment, *ultima presentationis*, which lies where a man or his ancestors formerly presented; this other lying for him who is the purchaser himself—Where a man may have the assise, he may have this writ; but not contrarywise. See **ASSISA**.

**QUARE INCUMBRAVIT**, a writ which lies against the bishop, who, within six months after the vacancy of a benefice, confers it on his clerk, while two others are contending at law for the right of presenting. See **PRESENTATION**, &c.

**QUARE NON ADMISIT**, a writ which lies against the bishop for refusing to admit his clerk who has recovered in a plea of advowson, on pretence of lapse, &c.

**QUARE NON PERMITTIT**, is a writ that lies for one who has a right to present for a turn against the proprietary.

**QUARE OBSTRUXIT**, a writ that lies for him who having right to pass through his neighbour's grounds, cannot enjoy the same by reason the owner has fenced it up.

**QUARERA**, or **QUARATIA**. See **QUARRY**.

**QUARREL**, **QUERELA**, in law. See **QUERELA**.

*Quarrel* seems properly to relate to personal actions, or at most to mixed, wherein the plaintiff is called *Querens*, and in all declarations of trespass it is said, *Queritur*. See **ACTION**, **PLAINTIFF**, &c.

Yet if a man release all *Quarrels* or *Querels* (a man's own deed being taken most strongly against himself) *Quarrel* includes all actions; and accordingly all actions, both real and personal are hereby released. See **RELEASE** and **DOUBLE**.

**QUARREL\***, of *glais*. See the article **QUARRY**.

\* The word is formed by diminution from the Latin *quadratum*, or the French *quarre*, square; or, perhaps, immediately from the Italian *quad-cillo*, little square.

**QUARRY**, a place under ground, out of which are dug marble, free-stone, slate, lime-stone, or other matters proper for building. See **STONE**, **MARBLE**, **SLATE**, &c.

For *quarries* of free-stone, they first open a hole in manner of a well, twelve or fourteen foot in diameter; and the rubbish drawn out with a windlass in large osher baskets, they heap up all around; placing their wheel, which is to draw up the stones, thereupon.

As the hole advances, and their common ladder becomes too short, they apply a particular ladder for the purpose—When they have got through the earth, and are arrived at the first bank, or stratum; they begin to apply their wheel and baskets to discharge the stones as fast as they dig through them. They usually find seven of these different strata, or beds of stones, of different heights, and serving for different purposes; though the number as well as order wherein they follow is various. See **STRATA**.

As to the drawing of the stone, *i. e.* the freeing it from the bed, they find that common stones, at least the softer kinds, as they lie, have two grains; a cleaving grain running parallel with the horizon, and a breaking grain perpendicular thereto—After uncoping, *i. e.* clearing the earth from off it, they observe by the grain where the stone will cleave, and there drive in a good number of wedges till they have thus cleft it from the rest of the rock.

This done, they proceed to break it: in order to which, applying the ruler to it at both ends, (ten, *e. gr.* or twelve inches apart, according to the uses the stone is intended for) they strike a line, and by this cut a little channel with their stone-ax; and in the channel set five or six wedges (supposing the stone three or four foot) driving them in very carefully, with gentle blows, and still keeping them equally forward.

Having thus broke the stone in length, (which they are able to do to half an inch of any size) applying a square to the straight side, they strike a line, and proceed as before to break it in breadth.

This method of drawing is found vastly preferable to that where the stones are broken at random—One load of the former is found to do the business of a load and an half of the latter.

But it may be observed, that this cleaving grain being generally wanting in the harder stones, to break up these in the Quarries, they have great heavy stone-axes wherewith they work down a deep channel into the stone, and into this channel, atop, lay two iron bars, driving their iron wedges between these bars.

Some in drawing of stone, especially the very hard kind, make use of gun-powder, and with very good effect—In order to which, making a small perforation pretty deep into the body of the rock, so as to have that thickness of rock over it judged proper to be blown up at once; at the farther end of the perforation they dispose a convenient quantity of gun-powder, filling up all the rest with stones and rubbish strongly rammed in, except a little space for the train—By this means is the rock blown in several pieces, most of them not too unweildy for a workman to manage. See GUN-POWDER.

QUARRY, QUARREL\*, in glazery, a pane, or piece of glass cut in a diamond form. See GLASS.

\* The word seems formed by corruption from *Quarrel*, (which see) unless we will suppose it to come immediately from the French *quarre*, square.

Quarries or Quarrels of glass are of two kinds, *viz.* square, and long; each whereof is of different sizes, expressed by the number of pieces which make a foot of glass, *viz.* 8ths, 10ths, 12ths, 15ths, 18ths, and 20ths; but all the sizes are cut to the same angle, the acute angle being  $77^{\circ} 19'$  in the square Quarries, and  $67^{\circ} 22'$  in the long ones. See GLASS.

QUARRY, in falconry, is the game or fowl which the hawk is in pursuit of, or has killed. See HAWK and HAWKING.

QUARRY, among hunters, is sometimes used for part of the viscera of the beast taken; given by way of reward to the hounds. See HUNTING.

QUART, *q. d.* fourth, in music, fencing, gaming, &c. See FOURTH, QUARTER, GUARD, PIQUET, &c.

QUART is particularly used for a diminutive measure, containing one fourth or quarter of some other measure. See MEASURE.

The English *Quart* is a fourth of a gallon, or two pints; the Roman *Quart*, or *Quartarius*, was the fourth part of a congius. See GALLON, PINT, CONGIUS, &c.

The French, from whom we borrow the word, besides their *Quart*, or *pot* of two pints, have various other *Quarts*, distinguished by the whole whereof they are quarters; as *Quart de Muid*, *Quart de Boisseau*. See MUID and BUSHEL. They have also their *Quart* of a yard, &c. See QUARTER.

QUARTAN, QUARTANA, in medicine, an intermitting fever, or ague, where the fit returns every third day. See FEVER, AGUE, &c.

It is called *Quartan*, that is, *fourth*, by reason the two sick days are reckoned, which, with the two intermitting ones, make four. See TERTIAN.

QUARTATION, among refiners, a method of purifying gold, by melting three parts of silver with one of gold; and then casting the mixture into aqua fortis; which dissolving the silver leaves the gold at bottom, in form of a black powder. See REFINING.

Quartation is what we more usually call *parting*, or the *de-part*. See DEPART; see also GOLD, &c.

QUARTELOIS, CARTELOIS, or *cotuca*, surtouts, or upper quarters with coats of arms quartered on them, wore by the ancient knights in their military expeditions. See COAT of arms, &c.

QUARTER, the fourth part of a whole, or integer divided into four equal portions. See FOURTH.

In working of fractions the *Quarter* is expressed by  $\frac{1}{4}$ , three *Quarters* by  $\frac{3}{4}$ . See FRACTION.

QUARTER, in weights, is a fourth part of the quintal, or hundred weight. See QUINTAL.

The *Quarter* is 28 pounds, avoirdupois. See HUNDRED Weight, POUND, AVOIRDUPOIS, &c.

QUARTER\* is also a dry measure containing of corn 8 bushels striked; of coals the fourth part of a chaldron. See MEASURE, BUSHEL, and CHALDRON.

\* *Quarterium frumenti constat ex octo Buffellis.* Fleta. l. 2.

QUARTER in law, QUARTERIUM anni, is the fourth part of a year. See YEAR.

Hence the days whereon those *Quarters* stately commence, are called *Quarter-days*. See DAY.

*Quarter-days* are the 25th of March called Lady-day; the 24th of June, called Midsummer-day; the 29th of September called, Michaelmas-day; and the 25th of December, or Christmas-day.

QUARTER in astronomy—The moon's period, or lunation, is divided into four stages, or *Quarters*; containing each from seven to eight days. See MOON and LUNATION.

The first *Quarter* is from the new moon to the quadrature; the second thence to the full moon, &c. See QUADRATURE, &c.

QUARTER in heraldry, is sometimes used for a scutcheon, or coat of arms. See ESCUTCHEON.

In this sense there are sixteen *Quarters* required to prove nobility, in companies or orders where none but nobles are admitted. See NOBILITY.

The word *Quarters*, required as a proof of nobility, is derived hence, that they used anciently to put the coats of arms of the father, mother, grand-father, and grand-mother, on the four corners of the tomb of the deceased—In Flanders and Germany we frequently see tombs that have eight, sixteen, and even thirty-two *Quarters*. See TOMB.

QUARTER is also applied to the parts, or members of the first division of a coat that is quartered, or divided into four *Quarters*; as in *Tab. Herald. fig. 45.* See QUARTERING.

The king of Great Britain in the first *Quarter* bears gules three lions passant or, &c.—In the second *Quarter* he bears azure three flowers de lys, &c.

Franc QUARTER, is a *Quarter* single, or alone; which is to possess one fourth part of the field.

This makes one of the honourable ordinaries of a coat. See ORDINARY.

QUARTER in navigation—A *Quarter* of a point, wind, or rhumb, is the fourth part of a cardinal point, wind or rhumb; or of the distance between two cardinal points, winds, &c. See POINT, WIND, and RHUMB.

The *Quarter* contains an arch of  $11^{\circ}$ ,  $15'$ .—The *Quarter* is what Wolfius, with regard to the other divisions, calls a secondary point of the second order. See CARDINAL point, &c.

QUARTER of a ship, is that part of the ship's hull, which lieth from the steerage-room to the transom. See SHIP.

QUARTER is also used for a canton, or division of a city; consisting of several ranges of buildings, &c. separated from some other *Quarter* by a river, a great street, or other boundary.

Such are the twenty *Quarters* of the city of Paris—Ancient Rome was divided several times, under its several augmentations, into *Quarters* called *regions*; as may be observed in the topographies of Aurelius Victor, Onuphrius Panvinius, Marillan, Pyrro Ligorio, Boissard, and other antiquaries.

In many cities there are commissaries of the *Quarter*, appointed to look to the policy thereof—The prior of the Caporions accounts himself the chief, and colonel of the fourteen regions, or *Quarters* of Rome. *Muscarat. p. 134.*

Franchise of QUARTERS. See the article FRANCHISE.

QUARTER in war, the place allotted to certain forces to live, lodge, and encamp upon, during a siege, or the like. See CAMP.

The general's *Quarter* is that where the general lodges and incamps in person—They used to make lines of communication, to join the several *Quarters* together, See LINE.

QUARTERS at a siege are the incampments on the principal passages about a place, serving to stop the avenues and prevent relief and convoys. See SIEGE.

QUARTER is also used for any lodgment made in the field or campaign out of a siege—Thus they say, the general has extended his *Quarters* a good way—The enemy coming by made him contract his *Quarters*.

Winter QUARTERS, is the place allotted troops to pass the winter season in—Wherein these differ from garrisons, see GARRISON.

Winter QUARTERS is also used for the time the troops continue in this lodgment; and for the advantage the captains make thereof—Thus they say, such a regiment was put to winter *Winter-quarters* in such a village—The *Winter-quarters* only held three months—Each captain will make at least a thousand crowns of his *Winter-quarters*.

In Spain they have also *Summer-quarters*.  
**QUARTER** of assembly, is the place of rendezvous, where the troops are to meet and draw up to march in a body. See RENDEZVOUS and PARADE.  
**QUARTERS** of refreshment, is some well provided fertile spot, to which troops that have been much fatigued and harassed, are sent to recover their strength, or health; even during the season of the campaign.  
 There are also *Quarters* assigned for the hucksters, and their equipage.  
**QUARTER** also denotes the safety, and good treatment promised to persons, or troops that surrender, and lay down their arms—Thus they say, the enemy begged *Quarter*.  
 The phrase took its rise from an agreement anciently made between the Dutch and Spaniards, that the ransom of an officer or soldier, should be a quarter of his pay—Hence, to beg *Quarter* was to offer a quarter of their pay for their safety; and to refuse *Quarter* was not to accept of that composition for their ransom. See RANSOM.  
**QUARTERS** in building, those slight upright pieces of timber, placed between the punchions and posts; used to lath upon. They are of two kinds, *single* and *double*—The *single Quarters* are sawn to two inches thick and four inches broad; the *double* four inches square.  
**QUARTERS** in a clock, are little bells which sound the *Quarters* of an hour. See CLOCK, HOUR, &c.  
**QUARTER-BULLET**, a bullet quartered into four or eight parts. See BULLET, SHOOT, &c.  
**QUARTER-DAY**, see the article **QUARTER**.  
**QUARTER-DECK**, of a ship, is that aloft the steerage, reaching to the round-house.—See *Tab. Ship. fig. 2. lit. O.* See also **DECK**.  
**QUARTERED Counter**. See the article **COUNTERQUARTERED**.  
**QUARTERIDGE**, money paid quarterly, or by the quarter.  
**QUARTERING**, in the sea-language—When a ship under sail goes at large, neither by a wind nor before a wind, but as it were betwixt both; she is said to go *Quartering*. See **SAILING**.  
 The term is also used when a ship sails with quarter winds. See *QUARTER-Wind*.  
**QUARTERING**, in gunnery, is when a piece of ordnance is so traversed, that it will shoot on the same line, or on the same point of the compass as the ship's quarter bears.  
**QUARTERING**, in heraldry, the act of dividing a coat into four or more quarters, or *Quarterings*; by parting, coupling, &c. *i. e.* by perpendicular and horizontal lines, &c. See **QUARTER** and **QUARTERLY**.  
 The king of Great Britain quarters with Great Britain, France, Ireland, Brunswick, &c. See **QUARTERLY**.  
 Colombiere reckons twelve sorts of *Quarterings*; but other authors give us more—*viz.* Party per pale, dividing the escutcheon from top to bottom. See **PALE**.—Party per cross, dividing it from side to side. See **CROSS**.—Party of six pieces, when the escutcheon is divided into six parts or quarters—Party of ten; of twelve; of sixteen; of twenty; and of thirty-two, when there are so many partitions respectively.  
 Others give the divisions in another manner: as—Party per cross—per pale—per chief—per pale inclave—per bend dexter—per bend sinister—per chevron—barry bendy of eight pieces—paleways of six pieces—barry of six pieces—barry of eight pieces—bendy of six—checky—fussily, or lozengy—paly bendy, or bendy lozengy—barry bendy lozengy, or bend lozengy—gyronny—barry lozengy counterchanged—waved of six pieces—barry nebule of six pieces—party per saltier—party per pale in point. See farther under their respective articles.  
**Counter QUARTERING** a coat, is when the quarters are quartered over again, or subdivided each into four.  
 There are *counter-quartered* coats which have twenty or twenty-five quarters.  
**QUARTERING** is also applied to the partitions or compartments themselves, that is, the several coats borne on an escutcheon, or the several divisions made in it, when the arms of several families are to be placed on the same shield, on account of intermarriages, or the like. See **QUARTER**, **ESCUTCHEON**, **SHIELD**, &c.  
 Colombiere observes, that thirty-two is the greatest number used in France, but that the English and Germans sometimes extend to forty; as a testimony of the truth whereof, he says, he saw the escutcheon of the earl of Leicester, ambassador extraordinary in France in the year 1639, divided into the number of forty; and some he affirms, do go on to sixty four several coats.  
 But a multitude of quarters makes a confusion; and accordingly all the writers of armory cry out against it as an abuse—The first instance of *Quartering* whereof we have any account, is said to be in the arms of Renatus, king of Sicily, &c. in the year 1435, who quartered the arms of Sicily, Aragon, Jerusalem, &c.

William Wickley observes, that such *Quarterings* are much properer for a pedigree to be locked up in a chest, and occasionally produced as an evidence for the clearing or ascertaining of alliances of families, or titles to lands, &c. than to be borne as a cognizance.  
 In blazoning, when the *Quartering* is performed per cross, the two quarters atop are numbered the first and second; and those at bottom the third and fourth; beginning to tell on the right side—When the *Quartering* is by a saltier, &c. the chief and point are the first and second quarters, the right side the third, the left the fourth.  
**QUARTERING** is sometimes also used for the distinguishing of younger brothers from elder. See **DIFFERENCE**.  
**QUARTERIZATION\***, **QUARTERING**, part of the punishment of a traitor, by dividing his body into four quarters.  
 \* *Walsingham in Ric. 2. Audium & confessum turpissima scelera tractationi, suspendio, decollationi, exenteracioni & Quarterizationi adjudicavit.*  
**QUARTERLY**, in heraldry. A person is said to bear *Quarterly*, when he bears arms quartered. See **QUARTERING**.  
 The king of Great Britain bears *Quarterly* of four; in the first quarter, gules, &c. Great Britain: in the second, azure, &c. Ireland, &c.  
**QUARTER-MASTER**, an Officer in the army, whose business is to look after the quarters of the soldiers, whereof there are several kinds; *viz.*—The  
**QUARTER-MASTER general**, whose business is to provide good quarters for the whole army. See **QUARTERS**.  
**QUARTER-MASTER of foot**, he who is to provide quarters for a regiment of foot. See **REGIMENT**.  
**QUARTER-MASTER, of horse**, he who is to provide quarters for a troop of horse. See **TROOP**.  
**QUARTER-MASTER**, is also an Officer aboard a ship of which there are more or fewer according to her burthens, Their business is to rummage in the hold on all occasion, to overlook the steward in his delivery of victuals to the cook, and in his pumping and drawing out the beer; and in general to take care there be no waste.  
 The *Quarter-master*, or *Quarter*, is also to mind the ship's loading, which is the business he is chiefly employed about. See **CARGO**, &c.  
**QUARTERN**, **QUARTERON**, a diminutive of *Quart*; signifying a quarter of a pint; as a quart does a quarter of a gallon. See **QUART**.  
**QUARTER-ROUND**, in architecture, is a term used by the workmen for any projecting moulding in general, whose contour is a perfect quadrant, or quarter of a circle, or approaches near that figure—See *Tab. Archit. Fig. 5.* See also **MOULDING**.  
 The architects usually call it *ovolo*; Vitruvius, the *ecbinus*. See **OVOLO**, **ECHINUS**, **BOULTIN**, &c.  
**QUARTER-SESSIONS**, a court held quarterly, by the justices of peace of each county, alternately in the chief town thereof as appointed by the *custos rotulorum*. See **SESSIONS**, **JUSTICE**, &c.  
 Hither the grand inquest, or jury of the county is summoned to appear, who upon oath are to enquire of all traitors, heretics, thieves, murderers, coiners, rioters, &c. See **INQUEST**.  
 Those who appear to be guilty are by the said justices committed to prison, to be tried at the next assizes, when the judges go their circuits. See **JUDGE**, **ASSIZE**, &c.  
**QUARTER-STAFF**, a long staff or pole, bore by foresters, park-keepers, &c. as a badge of their office; and occasionally used as a weapon.  
**QUARTER-WHEELING**, or **QUARTER of conversion** in the military art, is the motion whereby the front of a body of men turned round to where the flank was; this making a *quarter* of a circle. See **CONVERSION**, **WHEEL**, &c.  
 If it be done to the right, the man in the right hand angle keeps his ground, and faces about, while the rest wheel; if to the left, the left hand man keeps his place, &c. See **EVOLUTION**.  
**QUARTER-WIND**, at sea, is a lateral or side wind; or a wind which does not blow in stern, but a little aside of it. See **WIND**.  
 Properly the *Quarter-wind* is that which comes in abaft the main mast shrouds, even with the quarter of the ship.  
 The *Quarter-wind* is the best of all winds, as bearing into all the sails; whereas a wind blowing full in stern, is kept off by the sails of the mizzen. See **SAILING**.  
**QUARTILE**, an aspect of the planets when they are three signs or 90 degrees distant from each other. See **ASPECT** and **SEMI-QUARTILE**.  
 The *Quartile* aspect is marked thus □. See **CHARACTER**.  
**QUARTO**, or *4to*, a book whereof four leaves, or eight pages, make a sheet. See **VOLUME**, **BOOK-BINDING**, &c.  
**QUARTO-DECIMANS**, **QUARTO-DECIMANI**, an ancient sect in the church, who maintained that Easter was

was always to be celebrated conformably to the custom of the Jews, on the fourteenth day of the moon in the month of March, whensoever that day fell out. See EASTER. And hence their name *Quarto-decimani*, *q. d.* fourteenthers. See PASSOVER.

The Asiatics were mightily attached to this opinion, pretending it was built on the authority of St. John, who was their apostle; and pope Victor could never bring them to obedience in this point, though he was upon the point of excommunicating them—Some are of opinion he actually did excommunicate them, but it is more probable he contented himself with menaces.

Polycrates, bishop of Ephesus, wrote a long and warm letter, in the name of all the bishops of Asia, to Victor and the church of Rome, wherein he explained at large the usage of those churches with regard to the celebration of Easter; and maintained, that herein they only followed a constant tradition that had obtained immutably among them from the time of the apostle St. John, who died at Ephesus—But the pope not satisfied with this answer of Polycrates, had proceeded to excommunication, but that some of the most eminent bishops, among the rest Irenæus, interposed, and dissuaded him from disturbing the peace of the church by excommunicating a people for adhering to what they accounted a tradition.

**QUASHING**, in law, the overthrowing, and annulling a thing. See ANNULING.

An array returned by one that has no franchise, shall be *Quashed*. *Coke on Litt.* fol. 156.

**QUASI-CONTRACT**, in the civil-law, an act which has not the strict form of a contract, but yet has the force thereof. See CONTRACT.

In a contract there must be the mutual consent of both parties; whereas in a *Quasi-contract*, one party may be bound or obligated to the other without having given his consent to the act whereby he is obliged.

For an example—I have done your business, in your absence, without your procurator; and it has succeeded to your advantage: I have then an action against you for the recovery of what I have disbursed, and you an action against me to make me give an account of my administration: which amounts to a *Quasi-contract*.

**QUASI-CRIME**, or **QUASI-DELICT**, in the civil-law, the action of a person who does damage, or evil involuntarily.

The reparation of *Quasi-crimes* consists in making good the damages with interest.

**QUASI-MODO sUNDAY**, *low Easter-Sunday*, or the next Sunday after Easter; thus called from the initial words of the introit of the mass for the day, *Quasi modo geniti Infantes*. See SUNDAY.

In ancient deeds these words were signified by *q. m. g.*

**QUATER-COUSINS**, **QUATRE-COUSINS**; fourth cousins, or the last degree of kindred. See COUSIN, DEGREE, CONSANGUINITY, &c.

Hence, when persons are at variance, it is said they are not *Quater*, or *cater-cousins*.

**QUATRE-NATIONS**, *q. d.* four nations, the denomination of a college founded in 1661, by cardinal Mazarin; for the education and maintenance of sixty children, natives of the four countries conquered by the king, *viz.* fifteen for Pignerol and Italy, fifteen for Alsatia, twenty for Flanders, and ten for Roussillon. See COLLEGE.

**QUATUOR homines præpositi**. See PRÆPOSITI.

**QUATUOR-VIR**, in antiquity, frequently wrote IIII. VIR, a Roman magistrate who had three colleagues joined with him in the same administration. See DECEMVIR.

To the *Quatuor-viri* was committed the charge of conducting and settling the colonies sent into the provinces. See COLONY.

Upon unlucky accidents, and other dangerous affairs, it was usual to create *Quatuor-viri* with commission to take care *ne quid detrimenti Respublica caperet*, that the republic were not prejudiced.

There were also *Quatuor-viri* appointed to inspect and take care of repairs, &c.

**QUAVER**, in music, a measure of time, equal to one half of the crochet, or one eighth of the semibreve. See TIME and SEMIQUAVER.

The *Quaver* is marked by the character ♪. See CHARACTER.

The English *Quaver* makes what the French call *crochet* or *crotchet*; because of the hook at bottom. See CROTCHET.

The *Quaver* is divided into two semiquavers noted ♪, and four demisemiquavers marked ♪.

**QUAVERING**, in music, the act of trilling, or shaking; or the running a division with the voice. See DIVISION.

**QUAY**, *Kay*, a space of ground paved on the shore of a river, or port; destined for the loading and unloading of merchandise. See WHARF and KAY.

**QUEEN** \* *Regina*, a woman who holds the crown of a realm, singly and by right of blood. See CROWN.

\* The Word *Queen* is derived from the Saxon, *Cwen*, *cwen* *uxor*, the wife of any one, but applied by way of excellency to the wife of the king only; whence she was anciently called the *King's Queen*; the West-Saxons having no other name for a *Queen*, but the *king's wife*, *Affer. de Ælfred rebus*, &c.—She also was called *lady*, in Saxon, *lædige*; just as *madame*, or *mademoiselle*, are still used for the wife and daughter of the duke of Orleans—

The name *Queen* is also given by way of courtesy to her that is married to the king; called, by way of distinction, *Queen consort*—In respect whereof the former is called *Queen regnant*.

The widow of a king is also called *Queen*, but with the addition of *Dowager*. See DOWAGER.

In the first sense, *Queen* is in all construction the same with *king*, and has the same power and prerogative in all respects that the king has. See KING and PREROGATIVE.

The *Queen consort* is inferior, and a person distinct from and a subject of the king—In England, though she be a feme covert, yet may she sue, and be sued in her own name, may make leases, and grants, &c. as a feme sole. See WIFE and FEME.

She has several other prerogatives—Though an alien, she may purchase lands in fee-simple, without either naturalization, or denization; she may present to a benefice; nor is plenarty a bar against her more than against the king—She shall not be amerced if she be non-suited in any action; may not be impleaded till first petitioned.

To conspire her death, or violate her chastity is high-treason. She has an ancient peculiar revenue, called *Queen-gold*. See QUEEN-GOLD.—Besides a very large dower, with a royal court, and officers apart.

The *Queen dowager* has this particular, that she loses not her dignity though she marry a private gentleman—Thus queen Katherine, widow of Henry V. being married to Owen ap Theodore, Esq; maintained her action as *queen* of England—Much less does a *Queen regnant* follow her husband's condition, or is subject as other *Queens*, but is sovereign to her own husband, as queen Mary was to king Philip; unless it be otherwise appointed by parliament.

**QUEEN-GOLD**, *aurum reginae*, a royal revenue, belonging to the queen of England, during her marriage to the king, and payable by divers persons (upon several grants of the king) by way of oblation out of fines, amounting to ten marks, or upwards, *viz.* one full tenth part above the entire fine, or ten pounds for every hundred pounds fine, on pardons and contracts, or agreements. See FINE.

This becomes a real debt to the *Queen*, by the name of *aurum reginae*, upon the party's bare agreement with the king for a fine, and recording it; without any farther promise or contract for this tenth part extraordinary.

**QUEEN'S bench**. See KING'S bench, &c.

**QUE-ESTATE**, in law, a plea whereby a man entitling himself to land, &c. saith, that the same estate which another had, he now has from him.

Thus, *e. gr.* the plaintiff alledges, that such four persons were seized of lands, whereunto the advowson in question belonged in fee; and who did present to it, and that afterwards the church was vacant, *que estate*—i. e. *which estate* he now has, and by virtue thereof presents, &c.

**QUE-EST MEME**, in law, a term used in actions of trespass, &c. for a direct justification of the very act complained of by the plaintiff as a wrong. See TRESPASS.

Thus in an action upon the case, the plaintiff saying the lord threatened his tenants at will in such sort, as he forced them to give up their lands; the lord in his defence pleads, that he said to them, if they would not depart, he would sue them at law—*Que est meme*, i. e. this being the same threatening that he used, the defence his good.

**QUERELA**, *Quarrel*, in law, denotes an action or declaration preferred in any court of justice.

In an action where the plaintiff is called *Querens*, i. e. complainant, is brief, complaint, or declaration, is called *Querela*. See QUARREL.

**QUERELA audita**. See the article AUDITA.

**QUERELA coram rege & concilio**, a writ whereby one is called to justify a complaint of a trespass made to the king himself; before the king and his council.

**QUERPO**. See the article CUERPO.

**QUERRIES**, or **EQUERRIES**. See EQUERRY.

**Gentleman of the QUERRY**, is an officer appointed to hold the king's stirrup, when he mounts on horseback.

**QUEST**, or **INQUEST**, an inquisition, or inquiry made upon oath of an impannelled jury. See INQUEST and JURY.

\* The word is formed of the French *quête*, search, of the Latin *quæsitum*, a thing sought.

**QUEST**, in hunting, the seeking out of hounds; or the venting

venting and winding of spaniels. See HOUND, HUNTING, &c.

QUESTION, *QUÆSTIO*, in logic, &c. a proposition, whose truth a person being inquisitive about, proposes it, by way of interrogation, to another. See PROPOSITION, TRUTH, INTERROGATION, &c.

Logical questions are variously distributed; the ordinary division is into *first* or *primary* Questions; as, *quid est*, what is such a thing?—And *secondary*, which arise out of the former; as, how is it?

*Quodlibetical* QUESTION. See QUODLIBETICAL.

QUESTION, in law—The *Question de jure* is generally to be distinguished from the *Question de facto*. See DEFAC-TO, &c.

QUEST-MEN, persons chose yearly in each ward, to enquire into abuses, and misdemeanors, especially such as relate to weights, and measures.

QUESTOR\*, *QUÆSTOR*, an officer in ancient Rome, who had the care of the publick treasure. See TREASURE.

\* The word is formed à *quærendo*, seeking, searching.

The *Questor-ship*, *Quæstura*, is very ancient, as having been established under the kings—In the time of the republic, the senate appointed *Questors* in each province, to assist the proconsuls, as lieutenants or treasurers, in the administration of the revenues: but under the emperors, there was properly but one *questor*, or treasurer general of the empire: those other inferior, or subordinate *questors* were then called assistants of the *questor*, *adjutores quæstoris*.

The *questors's* office was originally confined to the army.—They paid the soldiery, took charge of moneys coming by spoil and plunder, &c.

At length there were new ones erected to reside in the city, and receive the public money, taxes, tribute, &c.—Their number was increased as the empire encreased: Sylla augmented it to twenty.

There was also another kind of *questors* whose office was to enquire into and take cognizance of capital crimes.

QUESTOR *sacri palatii*, or of the *sacred palace*, was one of the first dignities under the emperors of Constantinople.

It was this *questor* that subscribed the rescripts of the emperor, and the answers to the petitions and supplications presented to him—He drew up and signed the laws and constitutions which the emperor thought fit to publish; and took care of the administration of justice.

Some compare his function to that of our lord high chancellor—It was usually one of the *juris consulti* that was charged with this office; it being required that he should know the laws of the empire, be able to prescribe and see them executed, and judge of causes brought by way of appeal before the emperor.

Constantine was the first who erected *questors* of the sacred palace. See PALACE.

QUESTUS, or *QUÆSTUS*. See QUÆSTUS.

QUESTUS *est nobis*, a writ of nuisance, which by Stat. 15. Edw. I. lies against him to whom a house, or other thing that breeds a nuisance is descended, or alienated; whereas before that statute, the action lay only against him who first levied, or caused the nuisance, to the damage of his neighbour. See NUISANCE.

QUEUE, in heraldry, the tail of a beast. See TAIL.

If a lion have a forked tail, he is blazoned by *double-queued*.

QUEUE D'ARONDE, *q. d.* *Swallow's-tail*, in fortification, a term applied to outworks, when narrower at the george than the face or front; *i. e.* where the sides open towards the campaign, and contract towards the george. See HORNWORK and TENAILLE.

The name is occasioned by its resemblance in figure to a swallow's tail, which the French call *queue d'aronde*.

Of this kind are some single as well as double tenailles; and some horn-works whose sides are not parallel. See TENAILLE.

On the contrary, when the sides are less than the george, the work is called *contre queue d'aronde*.

QUEUE D'ARONDE, in carpentry, a method of jointing. See DOVE-TAIL.

QUIA, in logic. See the article REASON.

QUIA *improvidè*, a supersedeas granted in many cases where a writ is erroneously sued out, or mis-awarded. See WRIT. Such is that granted in behalf of a clerk of the chancery sued against the privilege of the court, in the common-pleas, and pursued to the exigent.

QUICKEST *descent*, *line*. See DESCENT.

QUICK-lime. See LIME.

QUICK-pulse. See the article PULSE.

QUICKSET *hedge*. See the article HEDGE.

QUICKSILVER, a very ponderous fluid mineral, by the chemists called *mercury*—For the method of gaining, preparing it, &c. with its properties, uses, &c. See MERCURY.

Virgin QUICKSILVER. See the article VIRGIN.

QUID, *what*, in the schools, is used to denote the definition of a thing. See DEFINITION.

VOL. II.

127

It is thus called by reason the definition answers to the question, *quid est*, what is it? See QUESTION.

Hence we have two kinds of *quids*, nominal, *quid nominis*; and real, *quid rei*.

QUID *pro quo*, in law, *q. d.* what for what, denotes the giving one thing of value for another; or the mutual consideration and performance of both parties to a contract. *Kitchin*.

QUID *pro quo*, or *QUI pro q. o.* is also used in physic to express a mistake of an apothecary, in administering one medicine for another; or in using an ingredient in a composition different from that prescribed. See SUCCEDANEUM.

In propriety, *quid pro quo*, is a mistake in the physician's bill, where *quid* is wrote for *quo*, one thing for another; or of the apothecary in reading *quid* for *quo*, and giving the patient the wrong medicine. See PRESCRIPTION.

Hence the term is in the general extended to all blunders or mistakes committed in medicine, either in the prescription, the preparation, or application of remedies.

A northern physician in a printed thesis on *quid pro quo's* owns ingenuously, that they are very frequent—He distinguishes very accurately a great variety of kinds of *quid pro quo's*; some with regard to the operation, others with regard to the subject, and others with regard to their form, or effects.

The first comprehends the *quid pro quo's* of the physician, the second those of the patient, the third those of the apothecary.

He adds *quid pro quo's* of the surgeon, *quid pro quo's* of the cook; *quid pro quo's* of the nurse, &c. Nor does he omit that there are salutary *quid pro quo's*, dangerous *quid pro quo's*, indifferent *quid pro quo's*, &c.—God preserve us from *quid pro quo's*.

QUIDDANY, QUIDDENY, (of the Latin *cydonium*, or *cydoniatum*) a conserve of quinces. See MARMELADE.

QUIDDITY, QUIDDITAS, in the schools, a word of the same signification with *essence*. See ESSENCE.

The name is derived hence, that it is by the essence of a thing that it is *tale quid*, such a *quid*, or very thing; and not another—When upon seeing, or hearing the name of a thing, whose nature, &c. we are unacquainted withal, we ask, *quid est*? what is it? we mean no more by the interrogation, but that we desire to have its nature and essence explained by a Definition—Whence *quiddity* is usually defined the essence known or expressed in a Definition. See DEFINITION.

And hence what is essential to a thing is said to be *quiddative*—As *quiddative* knowledge, &c.

QUID PRO QUO. See the article QUID.

QUIESCENT, something at rest. See REST.

QUIETISM, the sentiments of the *Quietists*, a religious sect which made a great noise towards the close of the last century. See MYSTICKS, QUAKERS, &c.

Molinos, a Spanish priest, who died at Rome in the prison of the inquisition, passes for the author of *quietism*; and yet the Illuminati in Spain had taught something like it before. See ILLUMINED.

The name is taken from a sort of absolute rest, and inaction, which the soul is supposed to be in, when arrived at the state of perfection, which in their language is called *the unitive life*—To arrive at this, a man is first to pass through the purgative way; that is, through a course of obedience, inspired by the fear of hell: hence he is to proceed into the illuminative way, before he arrive at perfection; to go through cruel combats, and violent pains; *i. e.* not only the usual drudgeries of the soul, and the common privations of grace, but infernal pains: he believes himself damned; and the persuasion that he is so, continues upon him very strongly several years: St. Francis des Sales, say the *quietists*, was so fully convinced thereof, that he would not allow any body to contradict him therein—But the man is, at length, sufficiently paid for all this; by the embraces of God, and his own deification.

These sentiments of the *quietists*, with regard to God, are wonderfully pure, and disinterested—They love him for himself, on account of his own perfections, independently of any rewards or punishments: the soul acquiesces in the will of God, even at the time when he precipitates it into hell; inasmuch that instead of stopping him on this occasion, B. Angelo de Foligny cry'd out, *Haste, Lord, to cast me into hell: do not delay, if thou hast abandoned me, but finish my destruction, and plunge me into the abyss*.

At length, the soul, after long travail, enters into rest, into a perfect *quietude*—Here it is wholly employed in contemplating its God; it acts no more, thinks no more, desires no more; but lies perfectly open, and at large, to receive the grace of God, who by means thereof drives it where it will, and as he will.

In this state, it no longer needs prayers or hymns, or vows; prayers where the spirit labours, and the mouth opens, are the lot of the weak, and the imperfect: the soul of the faint is, as it were, laid in the bosom, and between the arms of its God, where, without making any motion, or exerting any action,

10 E

12

it waits, and receives the divine graces—It, then, becomes happy: quitting the existence it before had, it is now changed, it is transformed, and, as it were, sunk and swallowed up in the divine being, inasmuch as not to know or perceive its being distinguished from God himself. Fenel. *Max. des saints*.

**QUIETISTS**, the disciples of Mich. de Molinos; or the adherents to the opinions delivered in the article **QUIETISM**.

**QUIETUS**, *freed, or acquitted*; a term used by the clerk, of the pipe, and the auditors in the exchequer, in their acquittances or discharges given to accomptants; which usually conclude with the words *abinde recessit quietus*: which is called a *quietus est*.

A *quietus est* granted to a sheriff discharges him of all accounts due to the king. See **SHERIFF**, **ACCOUNT**, &c.

**QUINAQUINA**. See the article **QUINQUINA**.

**QUINARIUS**, **QUINARY**, in antiquity, a little roman coin, equal to half the denarius. See **COIN**.

The *quinarius* was properly the Roman half-penny. See **DENARIUS** and **PENNY**.

Medalists indeed use the term *quinarius* in the general for a medal of any matter, not exceeding the size of our sixpence; but F. Chamillart, in an express dissertation, shews this to be an abuse—The silver coins, current under the republick, he shews, were two: the one weighing a drachm, and called *denarius*, as containing ten as's, the other weighing half a drachm, and called *quinarius*, as containing five as's: which coins continued on the same footing under the emperors. See **AS**.

Hence the origin of the word *quinarius*; and hence, in propriety, it is only the silver medal of the weight of half a drachm that the name belongs to; the Romans having never given it to any other species of the same size therewith—It is only by way of analogy, therefore, that the moderns apply it to the medals of gold, or copper, of the same size with the silver *quinarius*; those of gold being fixed at a value much above, and those of brass much below five as's.

The only relation between these *quinarii*, is, that the gold *quinary* is the half of a gold medal as to weight and value, and the brass *quinary* half a brass medal, as the silver *quinary* is half a silver one.

Hence a series of *quinaries* should seem at least as necessary in the cabinets of the curious, as the series of great medals; they being all equally different species of money, which teach us how many kinds of pieces there were of any metal current in commerce. See **SERIES**.

Add to this, says our author, that the *quinaries* were of a finer and more finished coin than the other medals, being wrought by the hands of the masters; which seems owing to the nicety required in engraving whole figures in so small compass. He adds, that though *quinaries* are very scarce, yet M. the duke of Maine has almost a complete set of them.

**QUINCUNX**, *quinque unice*, denotes a thing that consists of five twelfth parts of another. See **UNCIA** and **AS**.

**QUINCUNX** is chiefly used in gardening, for a plantation of trees, disposed originally in a square; consisting of five trees, one at each corner, and a fifth in the middle; which disposition repeated again and again, forms a regular grove, wood, or wilderness, and then viewed by an angle of the square, or parallelogram, presents equal and parallel alleys.

Or, the *quincunx* is the figure of a plantation of trees disposed in several rows, both length and breadthwise; in such manner as that the first tree of the second row commences in the centre of the square formed by the two first trees of the first row, and the two first of the third: resembling the figure of a five at cards—The finest manner of planting trees to form a grove, is in the *quincunx*. See **GROVE**. It is of this kind of *quincunx* that Cicero speaks in his *Cato major*; and Quintilian, lib. 8. cap. 3.

The modern *quincunxs*, Daviler observes, are made like those of the ancients, except for the fifth tree, which is now generally disused; so that, being as it were, netted, and their allies viewed by the side of the rectangle, they form a perfect chequer.

**QUINCUNX**, in astronomy, &c. denotes a position, or aspect of the planets when distant from each other 150 degrees, or five signs. See **ASPECT**.

**QUINDECAGON**\*, in geometry, a plain figure which has fifteen sides and fifteen angles. See **FIGURE**.

\* The word is formed somewhat irregularly, from the Latin, *quinque*, five; and the Greek, *deka*, ten; and *γωνια*, angle—*Pentdecagon* would be more regular.

If the sides be all equal, it is a regular *quindecagon*. See **REGULAR**.

Euclid shews how to inscribe it in a circle, Prop. 16. l. 4. And the side of a regular *quindecagon* so described, is equal in power to the half-difference between the side of the equilateral triangle, and the side of the pentagon; and

also to the difference of the perpendiculars let fall on both sides, taken together.

**QUINDECIM-VIR**, **XV-VIR**, a Roman magistrate, who had fourteen colleagues joined with him in the same function.

Under Tarquin the Proud, there were first two magistrates erected to take care of the sacrifices to be performed; these were called *duumviri*. See **DUUMVIR**—Their number, at length, grew to ten, and then they were called *decemviri*. See **DECEMVIR**—In the time of Cicero it had reached to fifteen, when they assumed the name of *quindecimviri*: and though their number grew to forty afterwards, yet Servius observes, on the sixth of the *Æneid*, that their name never changed, but they still continued to be called *quindecimviri*.

It was they examined the Sibyls books, and were the interpreters thereof; yet they never did this but by express order of the senate, declared by a *senatus-consultum*—They also presided at the sacrifices, and other extraordinary ceremonies of religion. See **SIBYL** and **SACRIFICE**.

On medals, a dolphin joined with a tripod marks the priesthood of the *quindecimviri*; who, to publish their solemn sacrifices, used, the eve thereof, to carry a dolphin at the end of a pole, throughout the city; that fish being esteemed sacred to Apollo, as the crow was among birds.

**QUINI-SEXTA**, in ecclesiastical history, denotes a council held at Constantinople in the year 692; called also the council in *Trullo*, and by the Greeks *Penthekte*, *q. d.* five sixth; as intimating that it was only a supplement of the two preceding councils. Though, in propriety, Fleury observes, it was a council itself. See **COUNCIL**.

Marshall observes, that the fifth and sixth general councils having made no canons, the Orientals judged it necessary to supply that defect by this; so that the 102 canons falsely attributed to those, were, in reality, made here. See **TRULLO**.

**QUINQUAGENARIUS**, among the Romans, was an officer in the army who had the command of a company of fifty men.

**QUINQUAGENARIUS**, was also an officer of policy, who had the inspection of fifty houses, or families.

In the ancient monasteries, *quinquagenarius* was a superior who had fifty monks under his guidance.

**QUINQUAGESIMA-SUNDAY**, *shrove-sunday*; thus called, as being about the fiftieth day before easter. See **SHROVE-TIDE**.

Anciently they used *quingagesima* for whitsunday, and for the fifty days between easter and whitsunday; but to distinguish this *quingagesima* from that before easter, it was called the *pascal quingagesima*. See **WHITSUNDAY**.

**QUINQUANNION**, **QUINQUENNION**, in the French customs, a respite of five years which insolvent debtors formerly obtained by virtue of the king's letters, to have time for the payment of their debts. See **RESPITE**.

When the thing intended was only to prevent the sale of their effects at an under value, the term of one year was ordinarily granted, called the benefit of *annion*.

But when the debtor would avoid the surrendering of his effects upon proving that he was reduced by poverty, losses, &c. to make use of this expedient, the term of five years was granted, called the benefit of *quinquannion*.

**QUINQUATRIA**, in antiquity, a name given the feasts of Minerva, otherwise called *Panathæna*. See **PANATHENÆA**.

Some think they were termed *quinguatria* because they lasted five days; but others with more reason, because they fell out five days after the ides of the month.

**QUINQUENNALIA**, in antiquity, games, or feasts celebrated every five years, in honour of the deified emperors. See **GAME**, **FEAST**, **APOTHEOSIS**, &c.

The *quingennalia* began to be expressed on medals about the middle of the third century—F. Pagi produces a medal wherein are engraved those of the emperor Posthumus; they are not found in any medals of his predecessors.

**QUINQUENNALIS**, in antiquity, a magistrate in the colonies, and municipal cities of the Roman commonwealth; much the same with *ædile* at Rome. See **ÆDILE**, and **COLONY**, &c.

They were not thus called from their continuing in their office five years; but because they were elected every fifth year, to preside at the census, and to receive the declaration each citizen made of his effects. See **CENSUS**.

**QUINQUE Portus**, the five cinque ports; which are, Hastings, Romney, Hythe, Dover, and Sandwich—To the first hereof also belong Winchelsea and Rye, which are esteemed members of the cinque-ports. See **CINQUE-PORTS**.

\* *Servitum quod barones quinque portuum prescriptorum recognoscunt facere ad summationem regis per annum, si contigerit per 15 dies ad cultum eorum proprium; ita quod primus dies computatur a die quo vela navium erexerunt, usque partes ad quas tendere debent, vel ulterius quam diu rex voluerit ad cultum ejus.* Thorn.

QUIN-

QUINQUE-VIR, frequently wrote V-VIR, a Roman magistrate, who had four colleagues joined with him in the same function.

There were various kinds of officers thus denominated—Pomponius the lawyer mentions *quinqueviri* on this, and on that side of the Tiber, established for the administration of justice in the night time, in lieu of the ordinary magistrates, who were not judged proper to run up and down the streets in the dark.

Rofinus tells us, that it was sometimes the *quinqueviri* who conducted the colonies, and divided the lands assigned them, among the several families. See COLONY.

Sometimes the *Epulones* were five in number; in which case they were called *quinqueviri*. See EPULO.

QUINQUEVIRI *monetarii* were officers first erected under the consulate of Valerius Poplicola, to moderate the excessive usury, or interest, which creditors or bankers used to exact upon the people. See USURY.

QUINQUINA, QUINAQUINA, called also *China China*, and *Kin Kina*, a medicinal bark brought from the West Indies; called also by way of eminency, the *bark*; and *cortex Peruvianus*, the Peruvian bark, from the country whence it is brought; and popularly the *jesuits bark*, because at its first introduction chiefly sold and administered by the jesuits. See CORTEX.

The tree which yields this bark grows in divers provinces of Peru, but chiefly Quenca, Ayavaca, and Loxa. The best and finest comes from the mountains 14 leagues round the city of Loxa.

The tree that produces the *quinaquina* is tall, and its trunk thicker than a man's thigh, tapering from the root upwards, but without any branches till near its top, where they grow regular as if lopped by art, and with the leaves form an exact hemisphere—The bark is blackish on the outside, but sometimes mixed with white spots, where grows a kind of moss by the Spaniards called *Barbos*—Its leaves resemble the leaves of our plumb-trees.

The Spaniards distinguish four sorts of this precious bark, viz. the *Cascarilla colorada*, or reddish bark: *Amarylla*, or yellowish: *Crespilla* or curling: and *Blanca*, whitish.

The *Colorada*, and *Amarylla* are reckoned the best: The *Crespilla*\* is the produce of the same sort of tree only growing in a cold, frosty climate, which impairs the quality of the bark, and renders it whitish on the outside, the cinnamon coloured within, and unfit for medicinal use.—For the *blanca*, it is procured from another species of the tree, of a much bigger trunk, the leaves of a lighter green colour, and the bark of a very thick spongy substance, whitish on the outside; being withal so tough as to require the force of an ax to slice it from the tree—When first cut down it is as bitter as the best fort, and has then the same virtue in the cure of intermitting fevers; but when dry and kept any length of time it grows insipid and good for nothing. In reality, both sorts are found to have much surer and quicker effects when green, than when dry; so that the Europeans only come in for the second virtues: what is worse, the bad fort is in great plenty, and the good very scarce, and hard to come at: for which reason, with a little of the fine bark sent yearly to Panama for Europe, large quantities of the worse fort are mixed.

\* The small bark which curls up like sticks of cinnamon, and which in England is much esteemed as being supposed to be sent from the branches of the tree, and therefore more efficacious in the cure of Fevers, is only the bark of the younger trees; which being very thin curls in this manner—For the bark of the branches it is never gathered: It would not compensate the charge of cutting.

The season for cutting the bark is in August, the only dry time in the country. The cutters are Indians, provided each with a large knife and a bag. When they have sliced down the bark as high as they can reach, they fasten short sticks with withs to the tree at proper distances, like the steps of a ladder, and thus mount and slice to the very top; when the bag is full they carry it to the low country to a neighbouring hut to dry, which is done by spreading it in the open air, and frequently turning it—If it happen to have been cut wet, they carry it directly to the low country to dry; otherwise it loses its colour, turns black and rots—After a tree has been barked it requires 18 or 20 years to grow again.

Mr. Arrot, a Scotch surgeon, who had gathered the bark in the place where it grows, and from whom we received this account by means of Mr Gray, now at Carthagena, is of opinion that the better sort of bark will soon be at an end, or at least inaccessible, partly by reason of its distance from any inhabited place, and the impenetrability of the woods where it grows, and partly by the want of Indians to cut it, whose race through the cruelties of the Spaniards is like to be totally extinct. See *Philosoph. Transact.* No. 446. p. 81. seq. The *quinaquina* was but little known in Europe till the year 1640—The jesuits of Rome first brought it in vogue in Spain, and Italy in 1649; and in 1650, the cardinal de Lugo, of that order, brought it into France.

It was at first sold for its weight in gold: when reduced into

powder, it is by foreigners called the *cardinals powder*; among us usually, the *jesuits powder*, *pulvis patrum*.

It met with a world of opposition at first—Chiffet and Plempius distinguished themselves against it. But it is now almost universally allowed one of the greatest and best remedies within the whole province of medicine.

Some call the gentian-root the European *quinaquina*, because good against intermitting fevers. See GENTIAN.

QUINSEY, QUINZY, or QUINCY, in medicine. See ANGINA and QUINZY.

QUINSIEME, QUINZIEME, in our old law-books. See FIFTEENTH.

QUINT, a sequence of five cards of the same colour. See SEQUENCE, PICQUET, &c.

QUINTA ESSENTIA; see QUINTESSENCE.

QUINTAIN, QUINTENA, in ancient customs, a post driven into the ground, with a buckler fixed to it, for the performance of military exercises on horseback, throwing of darts, breaking of lances, &c.

Matth. Paris describes the *quintain* as a kind of mark, formed like a man from the navel upwards, holding a shield in his left hand, and in his right a sword or stick; the whole so fitted as to turn round on its foot, and so as that a cavalier running a-tilt against it with a lance, if he hit it in the breast, it whistled round, and, unless he were very dexterous, struck him with the sword held in the other hand.

In other places, a-top of a post, was erected a slender beam fitted to turn round a spindle; at one of whose ends was a soap or flat board, and at the other a bag of sand, or dirt—The sport was, with a long staff, or wooden lance, to ride a-tilt at the board, and to be either so skilful or lucky to escape the blow of the sand-bag.

This some take to be the same with the *arietum levatis*, frequently prohibited in our old synods and episcopal constitutions.

The custom is still retained in Shropshire, and some other counties, among the nuptial solemnities—He that breaks the most poles against the *quintain* has the prize, which was antiently a peacock, now a garland.

Some derive the word from an ancient game called *quintus*; others from a man of the name Quintus.

The Vallus and Passus mentioned in Cæsar, are taken, by Vigenere, for a kind of *quintain*, or wooden man fixed up as an adversary, or man of straw, to prove one's dexterity against.

Mention is made of this exercise in the code, *de aleatoribus*, and in the Paratitles of Cujas on the same—Juvenal speaks of women engaging therein:

*Aut quis non vidit vulnera Pali?*

QUINTAIN was also a right which the lord had to oblige all the millers, watermen, and other young people unmarried, to come before his castle every three year, and break several lances, or poles, against a post, or wooden man for his diversion.

QUINTAL, in commerce, the weight of an hundred pounds. See HUNDRED and WEIGHT.

The *quintal* admits of some difference in different places, according as the pound consists of more or fewer ounces, and as the ounce is lighter or heavier. See POUND and OUNCE.

Thus, *e. gr.* the Paris *quintal*, or hundred, yields 123 pounds at Montpellier; and the Montpellier hundred only 81 pounds at Paris—The *quintal* of Constantinople is esteemed the heaviest of all those used in the Levant. It contains 45 *ocquas*, the *ocquas* weighing two Dutch pounds  $\frac{1}{2}$ ; so that the *quintal* is equal to 112 pounds  $\frac{1}{2}$  of Amsterdam, 124 pounds of Venice, and 160 of Leghorn.

The English *quintal* usually consists of 112 pounds avoirdupois, and is divided into four quarters. See QUARTER.

QUINTAL was also formerly used for a weight of lead, iron, or other common metal, usually equal to an hundred pounds, at fixcore to the hundred.

QUINTESSENCE, QUINTA-ESSENTIA, in chemistry, a preparation consisting of the essential oil of some vegetable substance, mixed and incorporated with spirit of wine. See OIL, &c.

Thus, on a proper quantity, *e. gr.* of essential oil of fennel, pouring twelve times the quantity of pure alcohol prepared *per se*; they instantly unite into one similar liquor, which is the *quintessence* thereof.

The ancients were perfectly unacquainted with the method of dissolving oil in spirit of wine; and even some of the moderns have questioned its reality: but the certainty of the thing is easily proved from the instance above.

If such *quintessence* be several times digested, cohobated, &c. the oil will at length be broke so fine, as, like the spirit itself, perfectly to mix with water; which is one of the most extraordinary effects in all chemistry. See SPIRIT, SULPHUR, &c.

After the like manner is made a *quintessence* of camphor, by only reducing it into a powder, and pouring on it spirit of wine. See CAMPHOR.

*Quintessences* thus prepared are of great medicinal virtues; as may appear from the pure and potent ingredients used in the composition, which retain, in a great degree, all the virtues of the plants they are procured from: and hence their denomination. See *ESSENCE*.

Boerhaave thinks they might properly be called vegetable sulphurs made potable, and raised to their utmost degree of power and efficacy. See *SULPHUR*.

Dry *quintessences* may be made from the liquid ones, by adding to them some essential oil of the same vegetable from whence the liquid *quintessence* was procured, with a little sugar; all mixed together, and distilled by a gentle heat till all the moisture is come over: the matter remaining is a dry *quintessence*.

This form is principally used for travellers, sailors, &c. inasmuch as it renders the *quintessence* portable; so that the quantity, *e. gr.* of a pin's point, shall be an efficacious medicine.

*QUINTESENCE*, in alchymy, is a mysterious term signifying the fifth, or last and highest essence, or power of a natural body.

This is supposed to be, as it were, the soul drawn from the gross body and its four elements, by a most perfect distillation; and by means hereof, the thing is said to be spiritualized, *i. e.* rendered exceedingly pure, spirituous, and, as it were, incorruptible. *Dist. Hermetique.*

The ancients, who allowed nothing to be real but what has a body, would have the soul of man to be a fifth element, a kind of *quintessence* without a name, unknown here below, indivisible, immoveable, all celestial, and divine. *Fenelon.*

*QUINTESENCE of the elements*, is the hermetical mercury. See *MERCURY*.

*QUINT-EXACT*, in old law-books, the last call of the defendant sued to an outlawry—If he appear not to it, he is by the judgment of the coroners returned outlawed; if a feme, waived. See *EXIGENT*, *OUTLAWRY*, *W A I F*, &c.

*QUINTILE*, *QUINTILIS*, in astronomy, an aspect of the planets, when they are 72 degrees distant from one another, or a fifth part of the zodiac. See *ASPECT*, *CHARACTER*, *BIQUINTILE*, *SEMIQUINTILE*, and *SESQUIQUINTILE*.

*QUINTILIANS*, *QUINTILIANI*, a sect of ancient heretics, the same with *Pepuzians*; thus called from their prophetess *Quintilia*. See *PEPUSIAN*.

In this sect the women were admitted to perform the sacerdotal and episcopal functions; grounding their practice on that passage of St. Paul to the Galatians, where he says, *That in Christ there is no distinction of males and females.*

They attributed extraordinary gifts to Eve, for having first eaten of the tree of knowledge; told mighty things of Mary the sister of Moses, as having been a prophetess, &c. they added, that Philip the deacon had four daughters, who were all prophetesses, and doubtless of their sect.

In their assemblies, it was usual to see the virgins enter in white robes personating prophetesses—The *Quintilians* bore a good deal of resemblance to the modern quakers. See *QUAKER*.

*QUINZY\**, a disease which stops the freedom of respiration and deglutition. See *RESPIRATION*.

\* The word is formed from the French *squinance*, or Italian *squinantia*, or *esquinancia*; and these again from the Greek *συναγχο*, of *αἰσχο*, I suffocate.

The *quinzy*, by physicians also called *angina*, consists in an inflammation of the throat, and particularly of the muscles of the larynx or pharynx, which exactly closing the chinks thereof, prevent the air from passing in and out of the trachea, and the food from being swallowed and conveyed into the stomach. See *ANGINA*.

If any symptoms appear on the outside of the throat, the *quinzy* is said to be *external*—If none appear, *internal*.

The *quinzy* is also divided into *true* and *spurious*—the true is always accompanied with a fever: the bastard or spurious *quinzy* is free from it.

They are caused by a defluxion of blood, either pure or bilious, from the branches of the carotid arteries; and there causing a phlegmon, either a simple or an erisipelatous one. In the external *quinzy* before any suppuration appears, recourse is had to repeated venæsection in the jugulars—Vesicatories and cupping are also used with emollient gargles, &c.

The *quinzy* is of all others the most dangerous, when the tumour is neither perceivable on the inside nor the out. That appearing on the outside is the most curable. In violent *quinzies*, recourse should be had to laryngotomy or bronchotomy, which though rarely practised, may yet be used with safety. See *BRONCHOTOMY*, &c.

*QUIRE* of paper, of the French *Cabier*; the quantity of 24 or 25 sheets. See *PAPER*.

*QUIRISTER*, or *CHORISTER*, *Chorista*, a person appointed to sing in the quire, or choir of a cathedral. See

*CHOIR*, *CHANTOR*, *CATHEDRAL*, *ANTHEM*, &c.

*QUIRINALIA*, in antiquity, feasts celebrated among the Romans in honour of Romulus, who was called Quirinus. See *QUIRITES*.

The *quirinalia*, called also *stultorum feriæ*, were held on the 13th of the kalends of March, *i. e.* on our 17th of February.

*QUIRITES*, in antiquity, an appellation given to the people of Rome, chiefly the common citizens, as distinguished from the soldiery.

It took its rise from the *Curites*, the inhabitants of the Sabin town *Cures*; on this occasion Romulus, and Tatius king of the Sabins, having united their two people, and their two states into one; upon Romulus's death and deification, the Sabins, outdoing the Romans in number, became masters of the councils; and accordingly appointed that Romulus should be denominated *Quirinus*, from *Cures* a city of the Sabins, or rather from *Quirinus*, the name of a god worshipped in that city.

From the new *Quirinus*, all the people came afterwards to be called *quirites*; unless we will suppose that the same authority which denominated Romulus *Quirinus*, from *Cures*, did also denominate the people *quirites*; immediately from the *Curites*. Some authors derive the word *quirinus* from *curis*, which in the Sabin tongue signified a pike or halbert—Struvius adds, that Romulus was always painted with a pike in his hand.

*QUIRK*, in building, a piece of ground taken out of any regular ground-plat, or floor.

Thus, if the ground plat were square, or oblong; and a piece be taken out of a corner, to make a court, or yard, &c. the piece is called a *quirk*. See *REDUCT*.

*QUIS*, in natural history, a kind of marcasite of copper, from which the Roman vitriol is drawn. See *MARCASITE* and *VITRIOL*.

It is more frequently called *Pyrites*. See *PYRITES*.

*QUIT-CLAIM*, a release, or quitting one's claim or pretensions to a thing. See *CLAIM*.

*QUIT-RENT*, *q. d. quiet-rent*, a certain small rent, payable yearly, by the tenants of most manors in token of subjection; upon the payment whereof they are quiet and free. See *MANOR*, &c.

In some ancient records it is written *white-rent*; because paid in silver, to distinguish it from rent-corn, rent-pepper, &c. See *RENT*.

*QUITTANCE*. See the article *ACQUITTANCE*.

*QUITTER-BONE*, among farriers, a hard, round swelling, upon the coronet of a horse's foot; or between the heel and the quarter. See *HOOF*.

Or, it is an impostume breeding between the hoof and coffin-bone, on the upper part; and shewing it self by a swelling on the coronet.

Sometimes it is occasioned by gravel under the shoe, or by a bruise, stab, prick of a nail; or from peccant humours descending to that place; or a blow, strain, or over-reach, &c.

It occasions the horse to halt much, and the swelling grows visible, and comes to a head in four or five days, and breaks out with matter at a little deep hole, like a fistula.

*QUOD clerici non eligantur in officio*, is a writ that lies for a clerk, who by reason of some land he hath, is made, or like to be made, a bailiff, beadle, reeve, or such like officer. See *CLERICO infra sacros*, &c.

*QUOD medium*. See the article *MEDIUM*.

*QUOD non permittat*. See *CONSUETUDINIBUS & Servitiis*.

*QUOD persona nec præbendarii*, &c. a writ that lies for spiritual persons, when distrained in their spiritual possessions, for the payment of a fifteenth, with the rest of the parish. See *FIFTEENTH*.

*QUODLIBETICAL question*, *quæstio QUODLIBETICA*, a college term for a thesis, or problem anciently proposed to be debated in the schools, out of curiosity and entertainment, rather than for the settling of any useful point. See *THESIS*, *QUESTION*, &c.

The term is formed from the Latin *quodlibet*, any thing, what you please; and so well satisfied were the publick with the impertinencies of these questions, that the term *quodlibet* has been since retained to signify any little ridiculous quibble.

*QUOIL*, *QUOYL*, or *COILE*, in the sea-language—A cable is said to be *quiled*, when it is laid round in a ring, one turn over another on the deck of a ship. See *CABLE*.

In the middle of such a ring or *quile*, is a good place to lay shot in, more safe there than in lockers along the side, where the enemy's shot may not fall into it.

*QUOIN\**, or *COIN*, a-board a ship, is a wedge fastened on the deck, close to the breech of the carriage of a gun, to keep it firm up to the ship's side, and prevent its rolling. See *COIN*.

\* The word is formed from the French *coin*, of the Latin *cuneus*, wedge. See *WEDGE*.

*Cantic QUOINS* are short, three-legged *quoins*, put between casks to keep them steady.

*QUOINS*,

**QUOINS**, in architecture, denote the corners of brick or stone walls. See **WALL**.

The word is particularly used for the stones in the corners of brick-buildings—When these stand out beyond the brick-work (their edges being chamfered off) they are called *rustic quoins*. See **RUSTIC**.

**QUOITS**, a kind of exercise or game, known among ancients under the name of *discus*. See **DISC**; see also **EXERCISE** and **GAME**.

**QUO JURE**, a writ that lies for him who has land, wherein another challengeth common of pasture time out of mind: its design is to compel the party to shew by what right or title he challengeth it.

**QUO MINUS** is also a writ which lies for the king's farmer or debtor in the court of exchequer, against him to whom he selleth any thing by way of bargain, touching his farm; or against whom he hath any cause of personal action—For that by the vendee's detaining any due from him, the farmer is made less able to pay the king's rent.

*Quo minus*, is also a writ that lies for him who has a grant of house-bote in another man's wood, against the grantor making such waste, as that the grantee cannot enjoy his grant. See **HOUSE-bote**.

**QUORUM**, a term frequently mentioned in our statutes, and often used in commissions, both of peace, and others. See **COMMISSION**, **PEACE**, &c.

It is thus called from the words in the commission, *quorum A. B. unum esse volumus*.

For an example—Where a commission is directed to seven persons, or to any three of them, whereof A. B. and C. D. to be two; there A. B. and C. D. are said to be of the *quorum*, because the rest cannot proceed without them.

So a justice of the peace and *quorum*, is one, without whom the rest of the justices in some cases cannot proceed. See **JUSTICE**.

**QUOTATION**, in literature, a *citation*; or a passage rehearsed expressly in one author from another. See **CITATION**.

*Quotations* are used to be distinguished by inverted comma's, thus; "Half an age ago *quotations* were wonderfully common; and Ovid and Catullus came every day with the pandects to the assistance of the widow and the orphan."

—*La Bruyere*.

The manner of quoting by book, and chapter, or section, is chiefly affected by men of erudition: But it was abused: This method ought only to obtain where the whole chapter or section is expressly on the subject. On other occasions, quoting by page is more commodious; except in classics and other ancient writings, whereof there are many editions in different forms, where this method is of little use, unless the edition be also specified.

The *quotations from the old testament*, found in the new, have occasioned infinite doubt, dispute, and criticism—The apostles are frequently referring to the old testament, and quoting passages and prophecies thence as fulfilled in our Saviour; yet these passages, thus quoted, are frequently either not found in the old testament, or are not urged in the new according to the literal and obvious sense they seemed to bear in the old.

A late ingenious author, in an essay upon the truth of the christian religion, frankly owns, that the Evangelists sometimes apply to the Messiah passages of the old testament, which, as they lie in our present copies, plainly relate to some other person, or thing—This is evident, *e. gr.* in the passage, Matt. ii. 15. *Out of Egypt have I called my son*; which is quoted from Hosea xi. where it is plainly understood of the coming of the Israelites out of Egypt. See **PROPHECY**.

This proves a heavy obstacle in the way of christianity, which the divines, commentators, critics, &c. have long laboured to remove, though by very different means.

Some have recourse to a double completion; and imagine, that though the prophecies were primarily accomplished in other events, yet they might have a secondary one in the Messiah: but others set aside a double completion, except where the prophet himself declares as much, as making all prophecy useless. See **ACCOMPLISHMENT**.

The generality chuse therefore to have recourse to an allegorical, or typical, or spiritual meaning in the prophecies, &c. and suppose them to have been thus understood among the ancient Jews, thus fulfilled in our Saviour, and thus applied by the apostles. See **TYPE**.

In effect, the jewish rabbins, it is allowed, took a world of liberty in quoting and interpreting scripture; and it is supposed the apostles might follow those rules in their quotations. See **RABBIN**.

Accordingly, M. Surenhusius, Hebrew professor at Amsterdam, has endeavoured to retrieve those rules, long since lost, in an express treatise on this subject, published in 1713. this author observes a great deal of difference implied in the

different forms of *quoting* used by the sacred writings: as, *It has been said; it is written, that it might be fulfilled which was spoken by the prophets; the scripture says; see what is said; the scripture foreseeing; is it not written, &c.*—He adds, that the books of the old testament having been disposed in a different order at different times, and having had different names, it is thence that a book or writer is sometimes confounded with another.

For the rules of *quoting* and interpreting practised among the rabbins, he gives us ten; recovered with much study from the Thalmud, and the ancient Jewish doctors: instances whereof he gives us in the writings of the apostles; and by those rules he endeavours to explain and justify all the *quotations* made from the old testament in the new.

The rules are, 1. reading the words not according to the points placed under them, but according to others substituted in their stead; as is done by St. Peter, Acts iii. 3. by Stephen, Acts vii. 43. and by Paul, 1 Cor. xv. 54. 2 Cor. viii. 15, &c.

The second is by changing the letters; as is done by Paul, Rom. ix. 33. 1 Cor. xi. 9. Heb. viii. 9. and x. 5. and by Stephen, Acts vii. 43.

The third is by changing both letters and points, as is done by Paul, Acts xiii. 41. and 2 Cor. viii. 15.—The fourth is adding some letters, and taking away others.

The fifth, transposing words and letters—The sixth is dividing one word into two—The seventh, adding other words to make the sense more clear—The eighth, changing the order of the words—The ninth, changing the order of the words, and adding other words. Both of which are done by the apostles—Lastly, changing the order of words, adding words, and retrenching words; which is a method often used by St. Paul.

Other authors, as bishop Kidder, M. le Clerc, M. Sykes, &c. solve the difficulty another way—That usual form of *quotation* among the evangelists, "That it might be fulfilled which was spoken by the prophets," according to these authors, means no more than an accommodation of the prophets words to the case in hand. See **ACCOMMODATION**.

The word *πληρωνη*, *fulfilled*, does not necessarily determine us to such a sense, as if the evangelists designed to speak of a prediction of future events *accomplished*; but may barely express an accommodation of borrowed words—In effect, says bishop Kidder, a scripture may be said to be *fulfilled* two ways; *properly*, as when that which was foretold comes to pass; and *improperly*, by way of accommodation, as when an event happens to any place or people like to what fell out some time before—And that it is thus St. Matthew says on occasion of the murder of the innocents, that, then was fulfilled what was spoken by the prophet in Jeremy, *In Rama was a voice heard, &c.*

This interpretation is confirmed by M. le Clerc. who observes that the Jews, in their language used to say, that a passage of scripture was *fulfilled*, as often as any thing happened which it might be applied to: so that the evangelist Matthew, who was a Hebrew, and wrote as it is commonly supposed, in that language, intended no more in the passage just cited, but that a thing happened to which one might apply what Jeremy had formerly said on another occasion.

Accordingly, says Mr. Sykes, the evangelists in citing that passage of Isaiah, *Behold a virgin shall be with child, &c.* only use it as words of that prophet remarkably agreeing to the miraculous birth of Jesus, and not as a prophecy of his birth. It may be added, that this way of speaking was not unknown among the heathen writers—Thus, in Ælian, Diogenes Sinopenis used continually to say of himself, that he fulfilled and underwent all the curses of tragedy.

**QUOTIDIAN**, **QUOTIDIANA**, in medicine, an intermitting fever, or ague, the access whereof returns every day. See **FEVER** and **AGUE**.

**QUOTIENT\***, **QUOTIENS**, in arithmetic, the number resulting from the division of a greater number by a smaller; and which shews how often the smaller is contained in the greater, or how oft the divisor is contained in the dividend. See **DIVISION**.

\* The word is formed from the Latin, *quoties, q. d.* How often is such a number contained in such another?

In division, as the divisor is to the dividend; so is unity to the *quotient*—Thus the *Quotient* of 12 divided by 3 is 4; which is thus disposed, 3) 12 (4 *Quotient*.

**QUOUSQUE**—*Execution with a* **QUOUSQUE**. See **EXECUTION**.

**QUO WARRANTO**, a writ that lies against him who usurps any franchise, or liberty against the king; as to have waste, stray, fair, market, court-baron, leet, or such like, without good title.

It also lies for mis-user or non-user of privileges granted—And even, according to Bracton, against him that intrudeth himself as heir into land. See **INTRUSION**.

**QUOYL**, see the article **QUOIL**.

# R,

## R A B

**R**, A liquid consonant, and the seventeenth letter of the alphabet. See LETTER and ALPHABET.

The grammarians hold it a semi-vowel; especially in the Greek, where, in common with the other vowels, it admits an asperate, &c. though whether the asperate should be founded before or after it, is some doubt. We find Instances of each.

Thus *ῥῆμα* the Latins wrote *rheda*; and *ῥόδον* the Æolians wrote *ῥοδον*.—The ancient Goths, and Teutones, Littleton observes, prefixed *h* to *r*. See H.

The Hebrews allow the *r* the privilege of a guttural, that is they never double it, which yet is done by the Arabs, Greeks, and Latins, &c. See GUTTURAL.

Perfius calls the *r*, *litera canina*, because the dogs seem to pronounce it in snarling: Yet it should seem to have had a softer sound among the Romans, than among us, by its being frequently interposed to prevent the clashing of vowels: as in *rarus* from *ῥαρος*, *nurus* from *ῥυρος*, *murex* from *ῥυαξ*, *mus murus* from *ῥυς ῥυος*; and this softness was such as frequently occasioned its being dropt as useless in writing.

Thus for *Hetrusci* they frequently wrote *Thusci*, and even *Tusci*; and for *sursum*, *rursus*, *prorsus*; *susum*, *rusus*, *profus*. In effect there was that agreement between the sound of the *s* and *r*, that as the Romans avoided the doubling of their consonants, it was no wonder they here dropped the *r*; the *s* supplying the place of both. Hence too it came to pass, that what they at first pronounced, *Asa*, *Asena*, *Casmen*, was afterwards, *Ara*, *Arena*, *Carmen*; and those first named *Fusii* and *Valesii* were afterwards called *Furii* and *Valerii*. Cicero tells us, the *Papirii* were first called *Papisii*; and even fixes the time when the change was made, viz. in the year of Rome 415. Festus adds, that *olera pignora plurima*, were anciently written *olefa*, *pignofa*, *plufima*. See S.

From the same softness of the sound of the *r*, it came to be used indifferently with the *l*, in many words, e. gr. *latiaris* and *latialis*, *palilia* and *parilia*, &c.

Though the *r* more frequently degenerated into *l*; thus *remures* became changed into *lemures*, *interlego*, *perluces* into *intelligo* and *pelluceo*, *frater* into *fratellus*, &c. and the same is sometimes done between *n* and *r*, as *areus* and *aneus*, &c. See L.

**R**, was anciently a numeral letter, signifying 80; according to the verse,

*Oftoginta dabit tibi R, si quis numerabit.*

When a dash was added a-top, as *R̄*, it signified 80 thousand. The Greek *ρ*, *ρ̄*, signified an hundred.

**R**, or **R** in medicinal prescription, stands for *recipe*, take. See RECIPE. See also CHARACTER.

**RABATE** in falconry—A hawk is sometimes said to *rabate*, when by the motion of the hand of the bearer, the lure, call, &c. she leaves pursuing her prey, or quarry; and recovers the fist. See RECLAIMING, HAWK, HAWKING, LURE, &c.

**RABATE** in commerce. **REBATE**.

**RABBETING**, in carpentry, the plaining or cutting of channels, or grooves, in boards. See PLANE.

In ship-carpentry, it signifies the letting in of the planks of the ship into the keel; which in the rake, and run of a ship, is hollowed away, that the planks may join the closer.

**RABBIT-plane**. See the article *Rabbit-PLANE*.

**RABBI**\*, or **RABBIN**, a doctor of the Jewish law. See DOCTOR, and RABBINIST.

\* The word in its original רב signifies *master*. See MASTER.

The words *rabbi* and *rabbīn*, have the same signification; yet is there some difference in their use.—When we speak absolutely, and without applying the term to any proper name, we say *rabbīn*, not *rabbi*. Thus, we say, it would be unjust to attribute to the ancient *rabbins* all the notions of the modern ones.

On the other hand, when we prefix the term to the proper name of some Jewish doctor, we say *rabbi*, not *rabbīn*: as *rabbi Saloman Jarchi* is of this opinion.

Yet *rabbi* having no plural, we say, the *rabbins* *Juda Ching*, and *Juda ben Chabin*, are the authors of two ancient Hebrew grammars.

The modern *rabbins* are entitled to a good deal of respect among the Jews: they have the first places in the synagogues; they determine all matters and controversies of religion, and very frequently pronounce upon civil affairs. They have even a power to excommunicate the disobedient.

They retain a vast number of superstitious traditions, from the writings of their predecessors; which they observe as scrupulously as the law of Moses. See TRADITION. See also TALMUD.

## R A C

The ancient *rabbins* were infinite dealers in allegories. Their writings are almost wholly allegorical, particularly their comments and interpretations of the scripture; See CABBALA.

They had a great number of rules, and forms of interpreting and quoting, which some modern writers suppose to have been followed by the apostles, in their interpretation, and quotation of the prophecies of the old testament, in the new. See PROPHECY.

The loss of these rules Dr. Stanhope, Dr. Jenkins, &c. lament, as what in all probability would reconcile the jarring passages in the old and new testament. Surenhusius, Hebrew professor at Amsterdam, imagines he has retrieved those rules from the ancient Jewish writers.

The *rabbins*, he observes, interpreted scripture in such a manner as to change the literal sense into a more noble and spiritual sense. To this end, he says, they used ten ways of quoting and explaining the old testament; instances of each whereof he gives in the writings of the apostles.

They consist in changing the points; the letters; both letters and points; adding and taking away letters; transposing words and letters; dividing one word one into two; adding words; changing the order, &c. See QUOTATION.

**RABBINICAL character**. See the article CHARACTER.

**RABBINICAL Hebrew**. See the article HEBREW.

**RABBINIST**, a follower of the doctrine of the rabbins; in contradiction to *caraites*. See CARAITE.

Father Simon contends for *rabbānist*, or *rabbānite*, instead of *rabbīnist*; in effect, the former are apparently preferable to the latter; the word being derived from the Hebrew *rabbānim*, which is the name of the sect, and which the Jews use to distinguish their doctors from those of the *caraites* Jews. See RABBI.

*Rabbīnist*, then, signifies a Jewish doctor who adheres to the traditions of his fathers; not simply a rabbin or doctor; for the *caraites* who oppose those traditions, have their rabbins as well as the other Jews. See TRADITION, and TALMUD.

**RABDOIDES**, } See { **RHABDOIDES**,  
**RABDOLOGY**, } { **RHABDOLOGY**,  
**RABDOMANCY**, } { **RHABDOMANCY**,

**RABINET**, a small piece of ordnance, between a falconet and a base. Its dimensions, &c. see under CANON.

**RACA**, or **RACHA**, a Syriac term, found in the gospel of St. Matthew, ch. v. 22. and preserved in most translations.

Father Simon observes that the Greek translator of St. Matthew's gospel retained the Syriac *raca* which he found in the original, by reason it was very common among the Jews. And St. Jerom, Luther, the English translators, those of Geneva, Louvain, Port-Royal, &c. still preserve it in their respective languages.

F. Bouhours chuses rather to express the sense thereof in a sort of paraphrase, thus: he that says to his brother *homme de peu de sene*, man of little understanding, shall deserve to be condemned by the tribunal of the council, &c.

Most translators, except the English, and F. Simon, for *raca* write *racha*: but the former orthography seems the best founded; all the Latin copies having *raca*, and all the Greek ones *ρακα*, or, with Hesychius, *ρακαα*, which is the same: all we mean, but St. Irenæus, and Beza's copy, now at Cambridge, which have *ραχα*—In effect, the origin of the word shews it should be *raca*; as coming from the Syriac ܪܟܐ, *raca*, of the Hebrew ִרְקַה, empty, shallow.

**RACCOURCY**, in heraldry, signifies the same as *coupy*, that is, cut off, or shortened; and denotes a cross or other ordinary, when it does not extend to the edges of the escutcheon, as they do when absolutely named, without such distinction. See COUPED.

**RACE**\*, in genealogy, lineage, or extraction continued from father to son. See LINE.

\* The word is French, formed from the Latin, *radix*, root; as intimating the root of the genealogical tree.

In several orders of knighthood, as in that of Malta, &c. the candidates must prove a nobility of four *racas*, or descents. See DESCENT.

In some republics the magistrates are to prove themselves of plebian *race*, to be qualified.

The French reckon their kings by *racas*; as, the first *race*, the second *race*, the third *race*. We also say the *race* of the Ottomans, the Arsacides, the Ptolemys, &c. See DYNASTY.

D'Hervieux observes that it is usual to put the female canary bird to the male goldfinch, linnet, or the like, to breed; but, for his part, he should chuse to put the male canary-bird to the

the female goldfinch, linnet, &c. because the male usually *rears* more than the female, i. e. the young ones take more after the male than after the female.

RACHA. See the article RACA.

RACHITIS, or rather RHACHITIS, in medicine, a disease affecting the bones of children; more usually called the *rickets*. See RICKETS.

RACK, an engine furnished with chords, &c. for extorting confession from delinquents. See TORTURE.

The duke of Exeter, constable of the tower under Henry VI. with the duke of Suffolk, and others, having a design to introduce the civil law into England; for a beginning, the *rack*, or *brake* allowed in many cases by the civil law, was first brought to the tower, where it is still preserved—In those days, the *rack* was called the duke of Exeter's daughter.

RACK, in the manage, a pace wherein a horse neither trots nor ambles, but shuffles as it were between both. See PACE.

The *racking pace* is much the same as the amble; only that it is a swifter time and a shorter tread. See AMBLE.

To *RACK wines*, &c. is to draw them from off their lees, after having stood long enough to clear and settle. See WINE.

Hence *RACK-vintage* is frequently used for the second voyage our wine merchants use to make into France for racked wines; whence they used to return about the end of December.

RACKET\*, a kind of bat, to strike the ball withal at tennis; consisting usually of a lattice, or net-work of cat-gut, strained very tight over a circle of wood, with a handle or shaft of a moderate length. See TENNIS.

\* The word is formed from the French, *raquette*, which *Ménage* derives from the Latin, *raketta*, a diminutive of *rete* net; whence also *reticum*, and *reticulum*.

Pasquier observes, that anciently they used no *rackets* at tennis, but plaid with the palm of the hand; and hence, he conjectures it is, that the French call tennis-play, *jeu de paume*—He adds, that *rackets* were not introduced till a little before his time.

RACKET, is also a machine, which the savages of Canada bind to their feet, to walk more commodiously over the snow; made much in the manner of a tennis-racket.

Its figure is a lozenge, whereof the two obtuse angles are rounded off. It is bound about with very fine thongs of leather, the meshes whereof are much smaller and closer than those of our rackets.

In the middle is fitted a kind of shoe, lined with wool, or hair; to be tied on to the ankle: by which means the feet are prevented from sinking in the snow.—*Rackets* oblige the person to take very long steps, and as we say, to walk a great pace, to keep them from knocking against each other.

RADIAL curves, is a denomination given by some authors to curves of the spiral kind, whose ordinates, if they may be so called, do all terminate in the centre of the including circle, and appear like so many *radii* of that circle; whence the name. See CURVE. See also SPIRAL.

RADIALIS, or *RADIÆUS extensor*, in anatomy. See EXTENSOR carpi.

RADIALIS, or *RADIÆUS flexor*. See FLEXOR carpi.

RADIANT point, or RADIATING point, is any point of a visible object, whence rays proceed. See RAY, and POINT. Every *radiant point* diffuses innumerable rays all around: but only those *radiants* are visible, from which right lines may be drawn to the pupil; because the rays are all right lines.

All the rays proceeding from the same *radiant* continually diverge; the chrysellin collects or reunites them again. See DIVERGING. See also CHRYSTALLIN, and VISION.

Every ray is supposed to carry with it the species, or image of the *radiant*. See SPECIES and IMAGE.

RADIATED, in botany, an epithet applied to round flat flowers, consisting of a disk, and a single row of longish pointed leaves, ranged all around it in manner of rays, or spokes. See FLOWER.

*Radiated flowers*, are properly such as have several semi-florets set round a disk, so as to resemble a *radiant star*: such are daisy, camomile-flowers, &c. These are sometimes also called *radiated discous-flowers*. See DISCOUS.

The word is also used in speaking of medals, and in heraldry, where the ancient crowns are called *radiated crowns*, *coronæ radiatæ*. See CROWN.

RADIATION, in physic, the action of a body diffusing rays of light, as from a center. See RAY.

Every visible body is a *radiating body*; it being purely by means of its rays that it affects the eye. See VISION.

Yet no body can *radiate*, unless it be either luminous or illuminated; since the rays it diffuses must either be its own, or it must receive them from another body. Therefore nobody is visible unless it be either luminous or illuminated. See VISIBLE, LIGHT, COLOUR, &c.

The surface of a *radiating body* may be conceived as consisting of radiant-points. See RADIANT-point.

Place of RADIATION is that space in a transparent body, or medium, through which a visible body *radiates*. See MEDIUM, &c. See also PLACE.

RADIATION, or IRRADIATION, is also used by some authors to express the manner of the motion of the animal spirits; on a supposition that they are diffused from the brain towards all parts of the body, through the little canals of the nerves, as light is from a lucid body. See SPIRIT, and IRRADIATION.

But in lieu of a *radiation*, many of the moderns rather incline to the opinion of the circulation of the spirits. See CIRCULATION.

RADICAL, RADICALIS, in physics, &c. something serving as a basis or foundation; or which, like a *root*, is the source, or principle whence any thing arises. See ROOT.

The schools talk much of a *radical moisture* inherent in the seeds of all animals, which nourishes and preserves the vital heat or flame, as oil does a lamp; and which when exhausted, life is extinguished. See FLAME, &c.

Dr. Quincy observes that this *radical moisture* is a mere chimaera; unless we thereby mean the mass of blood which is the promutary whence all the other juices and humours are derived; and which, while it circulates, sustains life, &c. See HEAT. See also LIFE, BLOOD, &c.

In grammar, we use the term, *radical words*, for roots and primitives; in opposition to compounds and derivatives. See ROOT and PRIMITIVE.

RADICAL sign, in algebra, the sign or character of the root of a quantity. See ROOT.

✓ is the character of radicality, and expresses the square root; √ the cube root, &c. See CHARACTER.

RADICATION, in physic, the action whereby plants take root, or shoot out roots. See ROOT.

The French royal academy of sciences have made a good number of curious observations on the germination and *radication* of plants. See VEGETATION, SEED, PLANTING, PERPENDICULARITY, &c.

RADICLE, RADICULA, *little root*; in botany, is a little point discovered by the microscope in all seeds, which in the growth of the plant becomes the root. See ROOT. See also SEED.

When, in sowing, the *radicle* happens to light lowest, it is no wonder the root should spread itself under ground, and the stem of the plant rise up perpendicularly: but when the *radicle* falls uppermost, by what means it is, that it changes its position to favour the ascent of the stem, is one of the wonders of vegetation: A more particular account whereof see under the article PERPENDICULARITY.

RADII *brevis*. See the article BREVIS.

RADIOMETER, a name which some writers give to the *radius Astronomicus*, or Jacob's staff. See CROSS-STAFF.

RADIUS\*, RAY, in geometry, the semidiameter of the circle; or a right line drawn from the center to the circumference. See SEMIDIAMETER, &c.

\* The word is derived from the Greeks *ῥαδός*, *rad*.—Fleta uses the word *radius*, for a furrow.

The *radius* is also called, especially in trigonometry, *sinus totus*, *whole sine*. See SINE.

It is implied in the definition of a circle, and it is apparent from its construction, that all the *radii* of the same circle are equal. See CIRCLE.

RADIUS, in the higher geometry—RADIUS of the *evoluta*, RADIUS *curvedinis*, or RADIUS *osculi*, is the right line CM, *Tab. Analysis*, fig. 12. representing a thread, by whose evolution from off the curve BC, whereon it was wound, the curve AMm is formed. See EVOLUTA and OSCULUM.

RADIUS *astronomicus*, an instrument properly called Jacob's staff, or *cross-staff*. See CROSS-STAFF.

RADIUS in optics. See the article RAY.

RADIUS, in mechanics, is applied to the spokes of a wheel; because issuing like rays from the centre thereof. See WHEEL.

RADIUS, in anatomy, is a long slender bone of the arm, descending along with the ulna from the elbow to the wrist; called also, *foecile minus*, the *lesser foecile*.—See *Tab. Anat. (Osteol.)* fig. 3. n. 7. 7. \*\* &c. fig. 7. n. 9. See also FOECILE.

The *radius* only touches the ulna at its extremities; at the upper whereof it is both received by, and also receives it; making by both articulations, an imperfect kind of ginglymus. See ULNA.

The upper end, rolling upon the ulna, is covered with a cartilage; and has a-top, a small round sinus, which receives the outer process of the humerus: the lower end is thicker than the upper, and has besides the lateral sinus, two other sinuses at its extremity, which receive the bones of the wrist.

The *radius* and ulna are both a little crooked; by which means they are kept a-part, excepting at their extremities; and are tied together by a strong membranous ligament. See ARM.

The *radius* has four proper muscles, besides the biceps common to it and the ulna: the proper are two pronators, and two supinators. See PRONATOR and SUPINATOR. See also BICEPS.

RADIX, *ῥίζα*, root. See the article ROOT.

**RADIX** is used among some anatomists, for the sole of the foot. See **FOOT**.

**RADIX**, among grammarians. See **RADICAL**.

**RAD KNIGHTS**. See the article **REDMANS**.

**RADMANS**. See the article **REDMANS**.

**RAFFLING**\*, a sort of game with three dice, wherein he who throws the greatest pair, or pair royal, in three casts, wins the prize or stake. See **GAME** and **GAMING**.

\* The word probably comes from the late Latin, *ruffare*, to rifle, plunder, take all away.

The *raffle* is properly the doublet or triple: a *raffle* of aces, or duces carries it against mere points.

**RAFFLING** is also used when a company of persons club to the purchase of a commodity; and he that throws the highest on three dice takes it.

**RAFTERS**, in building, are pieces of timber, which standing by pairs upon the reason, meet in an angle at the top, and form the roof of a building. See **ROOF**.

It is a rule in architecture, that no *rafters* should stand farther than twelve inches from one another.

For the sizes or scantlings of *rafters*, it is provided by act of parliament, that *principal rafters* from 12 foot 6 inches, to 14 foot 6 inches long, be 5 inches broad at top, and 8 at the bottom, and 6 inches thick—Those from 14 6, to 18 6 long, to be 9 inches broad at the foot, 7 a-top, and 7 thick—And those from 18 6, to 21 6, to be ten inches broad at the foot, 8 a-top, and 8 thick,

*Single rafters*, 6 foot 6 inches long, to be 4 and 3 inches in their square—Those 8 foot long must be 4  $\frac{1}{2}$  and 3  $\frac{1}{2}$  inches square.

**RAG**, or **RAKE**, among hunters, denotes a company, or herd of young colts.

**RAGGED hawk**, in falconry, is a hawk that hath it's feathers broken. See **HAWK**.

**RAGGED**, in heraldry. See the article **RAGULED**.

**RAGGULED**. See the article **RAGULED**.

**RAGMAN's-roll**, or **RAGIMUND's-roll**. See **ROLL**.

**RAGOÛT**, or **RAGOO**, a sauce, or seasoning, to rouse or recover the appetite when languishing, or lost.

The term is French, but naturalized—It is also used for any high-seasoned dish, prepared of flesh, fish, greens, or the like, by stewing them with the addition of bacon, salt, pepper, cloves and the like.

We have *ragoos* of beef, of cray-fish, of gibblets, of asparagus, of endive, of cocks-combs, of gammon, of celery, &c.

The ancients had a ragoût, called *garum*, made of the putrefied guts of a certain fish, which they kept till it dissolved by mere force of corruption into a sanies: this was held such a valuable dainty among them, that Pliny observes, it's price equalled that of the richest perfumes.

**RAGULED**, or **RAGGED**, in heraldry, is applied to an ordinary, *e. gr.* a cross, whose out-lines are jagged or knotted. (*Tab. Herald. fig. 48.*)

He beareth fable, a cross *raguled*, or, by the name of *Sloway*.

*Ragged* differs from indented, in that the latter is regular, and the former not. See **INDENTED**.

The bearing is very ancient: Julius Cæsar gave for his badge, a boar's head, on a *ragged* staff.

**RAGULED** is sometimes also used in the sense of *truncated*, or *couped*, and applied to a branch that is sawed from the tree; or a stock sawed from it's root.

**RAJA**, an Indian appellation given to a kind of idolatrous princes, the remains of those that ruled there before the conquest of the Moguls.

There are some *Rajas* who still retain a kind of sovereignty in the mountains: the Indians call them *Rai*; the Persians, plurally, *Raian*; our travellers *Rajas*, or *Ragias*.

The chief lords of the Moguls, *viz.* the vice-roys, governors of provinces, and chief ministers of state, F. Catrou observes, are called *Ombras*; and the idolatrous *Rajas*, or Indian lords who governed petty states before the conquest of their country, hold the same rank at court with the *Ombras*.

All the difference is, that the children of the *Rajas* succeed their fathers in the shew of the sovereignty left them; whereas the children of the Mahometan lords lose all in losing their fathers.

The Indians account four ages from the beginning of the world; and in the second, which lasted 1296000 years, they hold the *Rajas* or Kchatrys had their rise; a noble cast; though inferior to the Bramins. See **BRAMIN**.—Vice then began to creep into the world; men only lived to 300 years, and their stature was reduced, &c. *Lett. Edif. & Cur.* See **AGE**.

**RAIL**, in architecture, is applied variously; particularly, to those pieces of timber, which lie horizontally between the pannels of wainscot, over and under them. See **PANNEL**, **WAINSCOT**, &c.

The word is also applied to those pieces of timber which lie over and under ballusters in balconies, stair-cases, &c. See **BALLUSTER**.

Also, to the pieces of timber that lie horizontally from post to post in fences with pales or without.

**RAIN**, a very frequent and useful meteor, descending from above in form of drops of water. See **METEOR** and **DROP**.

*Rain* is, apparently, a precipitated cloud; as clouds are nothing but vapours raised from moisture, waters, &c. See **CLOUD**.

And vapours are demonstratively nothing else but little bubbles or vesiculæ detached from the waters, by the power of the solar, or subterraneous heat, or both. See **VAPOUR**.

These vesiculæ being specifically lighter than the atmosphere, are buoyed up thereby, until they arrive at a region where the air is a just balance with them; and here they float, till by some new agent they are converted into clouds, and thence either into rain, snow, hail, mist, or the like. See **SNOW**, **HAIL**, &c.

But the agent in this formation of the clouds into *rain*, &c. is a little controverted: the generality will have it the cold, which constantly occupying the superior regions of the air, chills and condenses the vesiculæ, at their arrival from a warmer quarter; congregates them together, and occasions several of them to coalesce into little masses: by this means their quantity of matter increasing in a greater proportion than their surface, they become an overload to the thin air, and accordingly descend in rain.

Mr. Derham accounts for the precipitation, hence; that the vesiculæ being full of air, when they meet with a colder air than that they contain, their air is contracted into a less space, and consequently the watery shell or case rendered thicker, so as to become heavier than the air, &c. See **COLD**.

Others only allow the cold a part in the action, and bring in the winds as sharers with it: indeed it is clear, that a wind blowing against a cloud will drive it's vesiculæ upon one another, by which means several of them coalescing as before, will be enabled to descend; and the effect will be still more considerable if two opposite winds blow towards the same place. Add to this, that clouds already formed, happening to be aggravated by fresh accessions of vapour continually ascending, may thence be enabled to descend. See **WIND**.

Yet, the grand cause, according to Rohault, is still behind: that author conceives it to be the heat of the air, which after continuing for some time near the earth, is at length carried up on high by a wind, and there thawing the snowy villi, or flocks of the half frozen vesiculæ, reduces them into drops; which coalescing, descend, and have their dissolution perfected in their progress through the lower and warmer stages of the atmosphere.

Others, as Dr. Clark, &c. ascribe this descent of the clouds rather to an alteration of the atmosphere, than of the vesiculæ; and suppose it to arise from a diminution of the spring or elastic force of the air. See **ELASTICITY**.

This elasticity, which depends chiefly or wholly on the terrene exhalations, being weakened, the atmosphere sinks under it's burthen; and the clouds fall, on the common principle of precipitation. See **PRECIPITATION**.

Now, the little vesiculæ by any, or all, these means, being once upon the descent, will persist therein, notwithstanding the increase of resistance they every moment meet withal in their progress through still denser and denser parts of the atmosphere.

For, as they all tend toward the same point, *viz.* the centre of the earth, the farther they fall, the more coalitions will they make; and the more coalitions, the more matter will there be under the same surface; the surface only increasing as the squares, but the solidity as the cubes; and the more matter under the same surface, the less friction or resistance there will be to the same matter. See **BAROMETER**.

Thus, if the cold, the wind, &c. happen to act early enough to precipitate the ascending vesiculæ, before they are arrived at any considerable height; the coalitions being few in so short a descent, the drops will be proportionably small: and thus is formed what we call *dew*. See **DEW**.

If the vapours prove more copious, and rise a little higher, we have a *mist* or *fog*. See **FOG**.

A little higher still, and they produce a *small rain*, &c.

If they neither meet with cold, nor wind enough to condense or dissipate them; they form a heavy, thick, dark sky; which lasts sometimes several weeks. See **WEATHER**.

Hence we may account for many of the phenomena of the weather: *e. gr.* why a cold is always a wet summer; and a warm, a dry one? because the principle of precipitation is had in the one case, and wanting in the other.

Why we have ordinarily most *rain* about the equinoxes? because the vapours arise more plentifully than ordinarily in the spring, as the earth becomes loosened from the brumal constipations; and because as the sun recedes from us in autumn; the cold increasing, the vapours that had lingered above during the summer heats, are now dispatched down, &c.

Why a settled, thick, close sky scarce ever *rains* till it have been

been first clear? because the equally diffused vapours must first be condensed, and congregated into separate clouds. to lay the foundations of rain; by which means the rest of the face of heaven is left open, and pervious to the rays of the sun, &c. See WEATHER.

For other phenomena of rain, as thy relate to the weather-glass, see BAROMETER.

As to the quantity of rain that falls; its proportion in several places at the same time, and in the same place at several times, we have store of observations, journals, &c. in the Memoirs of the French academy, the Philos. Transf. &c. an idea whereof will not be unacceptable.

Upon measuring, then, the rain falling yearly; its depth, at a medium, is found as in the following table:

Depth of RAIN falling yearly, and its proportion in several places.

	Inches.
At Townley in Lancashire, observed by Mr. Townley	42 $\frac{1}{2}$
Upminster in Essex, by Mr. Derham, - - -	19 $\frac{1}{2}$
Zurich in Switzerland, by Dr. Scheuchzer, - -	32 $\frac{1}{2}$
Pisa in Italy, by Dr. Mich. Ang. Tilli, - - -	43 $\frac{1}{2}$
Paris in France, by M. de la Hire, - - -	19

Præternatural-RAINS, or showers, as of blood, &c. are very frequent in our annals, and even natural histories; yet if strictly tried into, will be all found other things than rain.

Bloody-rains, Dr. Merret observes, are certainly nothing else but the excrements of insects.—Accordingly, Gassendus gives an instance of a bloody rain in France, which terrified the people; but which Peiresc found to be only red drops coming from a sort of butterfly that flew about in great numbers, as he concluded from seeing such red drops come from them, from the drops not being laid on buildings or the outer surface of stones, &c. but in cavities and holes, and from those walls only being tinged therewith that were next the fields, not those in the streets, and the former only to a little height, such as butterflies are used to fly to.

The same Dr. Merret adds, that it is most evident the rains of wheat are nothing but ivy-berries, swallowed by the starling, and again cast forth by stool—An instance of such a rain we have in the Philos. Transf. from the country about Bristol, by Mr. W. Cole; who, upon examining the drops, found them to be the seeds of ivy-berries, blown down by fierce winds from towers, churches, chimneys, walls, &c. where they had been left by birds, chiefly starlings and choughs.

The French have a tradition of a rain of stones, in a plain six or seven leagues long between Arles and Marseilles, called *la Crau*, which is now quite covered therewith—The fable has it, that Hercules in his engagement with Albion and Bregon, in favour of Neptune, wanting darts was assisted by Jupiter with a shower of these stones, seen to this day—Another account of their origin, see under the article STONE.

Freezing RAIN. See the article FREEZING.

RAINS, in the sea language, denotes all that tract of sea to the northward of the equator, between 4 and 10 degrees of latitude; and lying between the meridian of Cape Verde, and that of the easternmost islands of the same name.

It takes its name from the almost continual calms, constant rains, and thunder and lightning to a great degree, found there. The winds, when they do blow, are only small uncertain gusts, and shift about all round the compass; so that ships are sometimes here detained a long while, and can make but little way. See WIND, &c.

RAIN-BOW, IRIS, or simply the Bow, a meteor in form of a party-coloured arch or semicircle, exhibited in a rainy sky, opposite to the sun; by the refraction of his rays in the droops of falling rain. See METEOR, RAIN, and REFRACTION.

There is also a secondary or fainter bow, usually seen investing

VOL. II.

128.

the former, at some distance; and among naturalists we read of lunar rainbows, marine rainbows, &c.

The rainbow, Sir Isaac Newton observes, never appears but where it rains in the sun-shine; and may be represented artificially, by contriving water to fall in little drops like rain, through which the sun shining, exhibits a bow to a spectator placed between the sun and the drops; especially if a dark body, *e. gr.* a black cloth be disposed beyond the drops.

Anton. de Dominis first accounted for the rain-bow, in 1611: he explained at large how it was formed, by refraction and reflection of the sun beams in spherical drops of water; and confirmed his explications by experiments made with glass globes, &c. full of water. Wherein he was followed by Des Cartes, who mended and improved on his account: but as they were both in the dark as to the true origin of colours, their explications are defective, and in some things erroneous; which it is one of the glories of the Newtonian doctrine of colours, to supply and correct.

Theory of the RAIN-BOW—To conceive the origin of the rain-bow, let us consider what will befall rays of light coming from a very remote body, *e. gr.* the sun; and falling on a globe of water, such as we know a drop of rain to be.

Suppose then ADKN (*Tab. Optics, fig. 45.*) to be a drop of rain, and the lines EF, BA, ON, to be rays of light coming from the centre of the Sun, which, by reason of the immense distance of the Sun, we conceive to be parallel. See Parallel-RAY.

Now the ray B A being the only one that falls perpendicularly on the surface of the water; and all the rest obliquely; it is easily inferred that all the other rays will be refracted towards the perpendicular. See REFRACTION.

Thus the ray EF, and others accompanying it, will not go on straight to K; but as they arrive at HI, deflect from F to K, where some of them, probably, escaping into the air, the rest are reflected upon the line K N, so as to make the angles of incidence and reflection equal. See REFLECTION.

Farther, as the ray K N, and those accompanying it, fall obliquely upon the surface of the globe; they cannot pass out into the air, without being refracted, so as to recede from the perpendicular LM; and therefore will not proceed straight to Y, but deflect to P.

It may be here observed, that some of the rays arriving at N, do not pass out into the air, but are again reflected to Q; where being refracted like the rest, they do not proceed right to Z, but declining from the perpendicular T V, are carried to R: but since we here only regard the rays as they may affect the eye placed a little below the drop, *e. gr.* at P, those which deflect from N to Q, we set aside as useless, because they never come at the eye. On the contrary, it is to be observed, that there are other rays, as 2, 3, and the like; which being reflected from 3 to 4, thence to 5, and from 5 to 6 may at length arrive at the eye placed beneath the drop.

Thus much is obvious: but to determine precisely the quantities of refraction of each ray, there must be a calculation; by such calculation it appears that the rays which fall on the quadrant AD, are continued in lines, like those here drawn in the drop ADKN; wherein there are three things very considerable: First, that the two refractions of the rays in their ingress and egress are both the same way, so that the latter does not destroy the effect of the former. Secondly, That of all the rays passing out of AN; NP, and those adjoining to it, are the only ones capable of affecting the sense; as being sufficiently close or contiguous; and because coming out parallel: whereas the rest are divaricated, and dispersed too far to have any sensible effect, at least to produce any thing so vivid as the colours of the bow. Thirdly, That the ray NP has shade or darkness under it: for since there is no ray comes out of the surface N 4; it is the same thing as if the part were covered with an opaque body. We might add, that the same ray NP has darkness above it; since the rays that are above it are ineffectual; and signify no more than if there were none at all.

Add to these, that all the effectual rays have the same point of reflection, *i. e.* the parallel and contiguous rays, which alone are effectual after refraction, will all meet in the same point of the circumference; and be reflected thence to the eye.

Farther it appears by calculation, that the angle ONP, included between the ray NP, and the line ON drawn from the centre of the sun, which is the angle whereby the rainbow is distant from the opposite point of the sun, and which makes the semidiameter of the bow; contains 41°, 30'. The method of determining it see hereafter.

But since besides those rays coming from the centre of the sun to the drop of water, there are many more from the several points of its surface; there are a great many other effectual rays to be considered; especially that from the uppermost, and that from the lowest part of the sun's body.

Since then, the apparent diameter of the sun is about 16 seconds,

10 G

it

it follows that an effectual ray from the upper part of the sun will fall higher than the ray EF, by 15 seconds: this does the ray GH, (fig. 46.) which being refracted as much as EF, deflects to I, thence to L, and at length emerging equally refracted with the ray NP, proceeds to M; and makes an angle ONM, of  $41^{\circ} 14'$ , with the line ON.

In like manner the effectual ray QR, coming from the lowest part of the sun, falls on the point R, 16 minutes lower than the point F, on which the ray EF falls; and being refracted declines to S; whence it is reflected to T; where emerging into the air, it proceeds to V; so, as the line TV, and the ray OT contain an angle of  $41^{\circ}$  and  $46'$ .

Again, upon computing the deflections of the rays, which, like that 23 (Fig. 45.) coming from the centre of the sun, and being received into the lower part of the drop, we have supposed to be twice reflected, and twice refracted, and to enter the eye by lines like that 67 (Fig. 47.); we find that which may be accounted effectual, as 67, with the line 86 drawn from the centre of the sun, contains an angle 867, of about 52 degrees: whence it follows that the effectual ray from the highest part of the sun, with the same line 86 includes an angle less by 16 minutes; and that from the lowest part of the sun, an angle greater by 16 minutes.

Thus, since ABCDEF is the path of the efficacious ray from the highest part of the sun to the eye in F; the angle 86 F becomes of about fifty one degrees, and forty four minutes. In like manner, since GHIKLM is the way of an effectual ray from the lowest part of the sun to the eye, the angle 86 M becomes nearly of fifty two degrees, and sixteen minutes.

Since then we admit several rays to be effectual, beside those from the centre of the sun; what we have said of the *shade* will need some alteration: for of the three rays described (Fig. 45 and 46.) only the two extreme ones will have a shadow joined to them, and that only on the outer side. Hence it is evident that these rays are perfectly disposed to exhibit all the colours of the prism.

For the great quantity of dense or intense light, *i. e.* the bundle of rays collected together in a certain point, *v. gr.* in the point of reflection of the effectual rays, may be accounted as a lucid or radiant body, terminated all around by *shade*. But the several rays thus emitted to the eye are both of different colours, that is, fitted to excite in us the ideas of different colours, and are differently refracted out of the water into air, notwithstanding their falling alike upon the refracting surface. See COLOUR, &c.

Hence it follows that the different or heterogenous rays will be separated from one another, and will tend separate ways; and the homogenous rays will be collected, and tend the same way: And therefore this lucid point of the drop, wherein the refraction is effected, will appear fringed, or bordered with several colours; that is, red, green and blue colours will arise from the extremes of the red, green and blue rays of the sun transmitted to the eye from several drops one higher than another; after the same manner as is done in viewing lucid, or other bodies through a prism. See PRISM.

Thus, adds Sir Isaac Newton, the rays that differ in refrangibility will emerge at different angles; and consequently, according to their different degrees of refrangibility, emerging most copiously at different angles, will exhibit different colours in different places. See REFRACTIBILITY.

A great number then of these little globules, being diffused in the air, will fill the whole space with these different colours; provided they be so disposed as that effectual rays may come from them to the eye; and thus will the rainbow at length arise.

Now to determine what that disposition must be; suppose a right line drawn, from the centre of the sun through the eye of the spectator, as the line VX, (Fig. 46.) called the line of aspect: being drawn from so remote a point, it may be esteemed parallel to all other lines drawn from the same point: but a right line falling on two parallels makes the alternate angles. See ALTERNATE.

If, then, an indefinite number of lines be imagined drawn from the spectator's eye to a part opposite to the sun where it rains; which lines make different angles with the line of aspect, equal to the angles of refraction of the differently refrangible rays, *e. gr.* angles of  $41^{\circ}$ ,  $46'$ , and of  $41^{\circ} 30'$ , and of  $41^{\circ}$ , and  $40'$ . These lines falling on drops of rain illumined by the sun, will make angles of the same magnitude with rays drawn from the centre of the sun to the same drops. And therefore the lines thus drawn from the eye will represent the effectual rays that occasion the sensation of any colour.

That, *e. gr.* making an angle of  $41^{\circ} 46'$ , representing the least refrangible or red rays of the several drops, and of  $41^{\circ} 40'$ , the most refrangible or violet rays: the intermediate colours and refrangibilities will be found in the intermediate space. See RED, &c.

Now, it is known that the eye being placed in the vertex of a cone, sees objects upon its surface as if they were in a circle; and the eye of our spectator is here in the com-

mon vertex of several cones, formed by the several kinds of efficacious rays, with the line of aspect. And in the surface of that whose angle at the vertex or eye is the greatest, and wherein the others are included, are those drops or parts of drops which appear red; and in the surface of that cone whose angle is least, are the purple drops: and in the intermediate cones are the green, blue, &c. drops. Hence then several kinds of the drops must appear as if disposed into so many circular coloured fasciæ or arches, as we see in the rainbow.

This part of the solution Sir Isaac Newton expresses more artfully thus: suppose O (Fig. 48.) the eye, and OP a line parallel to the sun's rays, and let POE, POF be angles of  $40^{\circ}$ ,  $17'$ , and  $42^{\circ}$ ,  $2'$ . And suppose the angles to turn about their common side OP, with their other sides OE and OF, they will describe the bounds or verges of the rainbow.

For, if E, F be drops placed any where in the conical surface described by OE, OF; and be illumined by the sun's rays SE, SF; the angle SEO being equal to the angle POE or  $40^{\circ} 17'$ , shall be the greatest angle in which the most refrangible rays can, after reflection, be refracted to the eye; and therefore all the drops in the line OE shall send the most refrangible rays most copiously to the eye, and thereby strike the senses with the deepest violet colour in that region.

And in like manner the angle SFO being = to the angle POF =  $42^{\circ} 2'$ , shall be the greatest, in which the least refrangible rays after one reflection can emerge out of the drops; and these rays shall come most copiously to the eye, from the drops in the line OF, and strike the senses with the deepest red colour in that region.

And by the same argument the rays, which have intermediate degrees of refrangibility, shall come most copiously from drops between E and F, and so strike the senses with the intermediate colours, in the order which their degrees of refrangibility require; that is, in the progress from E to F, or from the inside of the bow to the outside, in this order, violet, indigo, blue, green, yellow, orange, red: though the violet, by the mixture of the white light of the clouds, will appear faint, and incline to a purple.

And since the lines OE, OF may be situated any where in the abovementioned conical surface; what is said of the drops and colours in these lines is to be understood of the drops and colours throughout the whole superficies. Thus is the primary or inner bow formed.

Secondary, or outer RAINBOW—As to the secondary or fainter bow usually surrounding the former; in assigning what drops would appear coloured, we excluded such lines as drawn from the eye, making angles a little greater than  $42^{\circ} 2'$ , should fall upon; but not such as should contain angles much greater.

For, if an indefinite number of such lines be drawn from the spectator's eye, some whereof make angles of  $50^{\circ}$ ,  $57'$ , with the line of aspect; *e. gr.* OG; other angles of  $54^{\circ}$ ,  $7'$ , *e. gr.* OH; those drops whereon these lines fall, must of necessity exhibit colours. Particularly those of  $50^{\circ}$ ,  $57'$ .

*E. gr.* the drop G will appear red; the line GO being the same with an effectual ray, which, after two reflections and two refractions, exhibits a red colour. Again, those drops which receive lines of  $54^{\circ} 7'$ , *e. gr.* the drop H will appear purple, the line OH being the same with an effectual ray which, after two reflections and two refractions, exhibits purple.

Now there being a sufficient number of these drops, it is evident there must be a second rainbow, formed after the like manner as the first.

Thus Sir Isaac Newton: in the least refrangible rays, the least angle at which a drop can send effectual rays after two reflections, is found by computation to be  $50^{\circ} 57'$ , and in the most refrangible the least angle is found  $54^{\circ} 7'$ .

Suppose, then, O the place of the eye, as before, and POG, POH to be angles of  $50^{\circ} 57'$ , and  $54^{\circ} 7'$ . And these angles to be turned about their common side OP; with their other sides OG, OH, they will describe the verges or borders of the rainbow, CHDG.

For if GH be drops placed any where in the conical superficies described by OG, OH, and being illumined by the sun's rays; the angle SGO being equal to the angle POG or  $50^{\circ} 57'$ , shall be the least angle, in which the then least refrangible rays, can, after two reflections, emerge out of the drops; and therefore the least refrangible rays shall come most copiously to the eye from the drops in the line OG, and strike the senses with the deepest red in that region.

And the angle SHO being equal to POH,  $54^{\circ} 7'$ , shall be the least angle in which the most refrangible rays, after two reflections, can emerge out of the drops; and therefore those rays shall come most copiously to the eye from the drops in the line OH, and so strike the senses with the deepest violet in that region.

And

And by the same argument, the drops in the region between G and H, shall strike the senses with the intermediate colours, in the order which their degrees of refrangibility require; that is, in the progress from G to H, or from the inside of the bow to the outer, in this order: *red, orange, yellow, green, blue, indigo, violet.*

And since the lines O G, O H, may be situated any where in the conical surface; what is said of the drops and colours in these lines, is to be understood of the drops and colours every where in these superficieses.

Thus are formed two bows, an *interior* and stronger, by one reflection; and an *exterior* and fainter by two; the light becoming weaker and weaker by every reflection.

Their colours will lie in a contrary order to one another; the first having the red without, and the purple within; and the second the purple without and red within; and so of the rest.

**Artificial RAINBOW**—This doctrine of the *rainbow* is confirmed by an easy experiment: for upon hanging up a glass globe full of water in the sun-shine, and viewing it in such a posture as that the rays which come from the globe to the eye, may, with the sun's rays, include an angle either of  $42^\circ$ , or  $50^\circ$ ; if *e. gr.* the angle be about  $42^\circ$ , the spectator, supposed at O, will see a full red colour in that side of the globe opposite to the sun, as at F. And if that angle be made a little less, suppose by depressing the globule to E, the other colours, yellow, blue and green, will appear successively, in the same side of the globe, also exceedingly bright.

But if the angle be made about  $50^\circ$ , suppose by raising the globule G, there will appear a red colour in that side of the globe towards the sun; though that somewhat faint; and if the angle be made greater, suppose by raising the globe to H; the red will change successively to the other colours, yellow, green, and blue.

The same thing is observed in letting the globe rest, and raising, or depressing the eye to make the angle of a just magnitude.

**Dimension of the RAINBOW**—Des Cartes first determined it's diameter by a tentative, and indirect method; laying it down that the magnitude of the bow depends on the degree of refraction of the fluid; and assuming the ratio of the sine of incidence to that of refraction, to be in water as 250 to 187. See REFRACTION.

But Dr. Halley has since, in the *Philosoph. Transf.* given us a simple, direct method of determining the diameter of the *rainbow* from the ratio of refraction of the fluid being given; or *vice versa*, the diameter of the *rainbow* being given, to determine the refractive power of the fluid. The praxis is as follows.

First, *The ratio of refraction being given; to find the angles of incidence, and refraction of a ray which becomes effectual after any given number of reflections*—Suppose any given line as A C (*Tab. Optics, Fig. 49.*) which divide in D; so, as that A C be to A D in the ratio of refraction; and again divide it in E, so as A C be to A E as the given number of reflections increased by unity, is to unity; with the diameter C E describe a semicircle C B E, and from the centre A with the radius A D describe an arch D B intersecting the semicircle in B. Then drawing A B, C B; A B C or it's complement to two right angles, will be the angle of incidence; and A C B the angle of refraction required.

Secondly, *The ratio of refraction, and any angle of incidence being given to find the angle which a ray of light emerging out of a refracting sphere, after a given number of reflections, makes with the line of aspect, or an incident ray; and consequently to find the diameter of the rainbow*—The angle of incidence, and the ratio of refraction being given, the angle of refraction is given; which angle being multiplied by double the number of reflections increased by 2, and double the angle of incidence subtracted from the product, the angle remaining is the angle sought.

Thus supposing, the ratio of refraction to be, as Sir Isaac Newton has determined it, *viz.* as 108 to 81, in the red rays, as 109 to 81 for the blue rays, &c. the preceding problem will give the distance of the colours in the

I. RAINBOW,	{ Red $42^\circ 11'$ Violet $40^\circ 16'$	} The spectator's back being turned to the sun.
II. RAINBOW,	{ Red $50^\circ 58'$ Violet $54^\circ 9'$	

If the angle made by a ray after three or four reflections, were required, and therefore the diameters of the third and fourth *rainbow*, (which are scarce ever seen, by reason of the great diminution of the rays, by so many repeated reflections) they will be found,

III. RAINBOW,	{ Red $41^\circ 37'$ Violet $37^\circ 9'$	} The spectator being turned towards the sun.
IV. RAINBOW,	{ Red $43^\circ 52'$ Violet $49^\circ 34'$	

Hence, the *breadth of the rainbows* is easily found: for the greatest semidiameter of the first bow, *i. e.* from red to red being  $42^\circ, 11'$ , and the least, *viz.* from violet to violet  $40^\circ, 16'$ ; the breadth of the *fascia* or *bow*, measured a-cross from

red to violet will be  $1^\circ, 45'$ , and the greatest diameter of the second bow being  $54^\circ, 9'$ , and the least  $50^\circ, 58'$  the breadth of the *fascia* will be  $3^\circ, 10'$ . And hence the distance between the two will be found  $8^\circ, 15'$ .

In these measures the sun is only esteemed a point; wherefore as his diameter is really about 30 so much must be added to the breadth of each *fascia* or *bow*, from red to violet, and so much be subtracted from the distance between them.

This will leave the breadth of the *primary bow*,  $2^\circ, 15'$ , that of the *secondary bow*  $3^\circ, 40'$ , and the interval between the bows  $8^\circ, 25'$ ; which dimensions deduced by calculation, Sir Isaac Newton assures us from his own observations, agree very exactly with those found by actual mensuration in the heavens.

**Particular phenomena of the RAINBOW**—from this theory of the *rainbow*, all the particular phenomena are easily deduced: hence we see why the Iris is always of the same breadth; by reason the intermediate degrees of refrangibility of the rays between red and violet, which are it's extreme colours, are always the same.

Secondly, Why it is more distinctly terminated on the side of the red, than on that of the violet; there being no efficacious rays in the space adjoining to the red drops, *i. e.* to the space between the bows; whence it terminates abruptly; whereas in the space on the side of the violet ones there are some rays emitted to the eye, which though too feeble to affect it strongly, yet have this effect, that they soften the violet edge insensibly, so that it is difficult to determine precisely where it terminates.

Thirdly, why the *bow* shifts it's situation as the eye does; and, as the popular phrase has it, *flies those who follow it, and follows those that fly it?* the coloured drops being disposed under a certain angle about the line of aspect, which is different in different places: whence, also, it follows that every different spectator sees a different bow.

Fourthly, Why the bow is sometimes a larger portion of a circle, sometimes a less? it's magnitude depending on the greater, or less part of the surface of the cone, above the surface of the earth at the time of it's appearance; and that part being greater or less as the line of aspect is more inclined or oblique to the surface of the earth; which inclination, or obliquity, is greater as the sun is higher: whence, also, the higher the sun, the less the *rainbow*.

Fifthly, Why the bow never appears when the sun is above a certain altitude? the surface of the cone wherein it should be seen, being lost in the ground, at a little distance from the eye, when the sun is above  $42^\circ$  high.

Sixthly, Why the bow never appears greater than a semicircle, on a plane? since be the sun never so low, and even in the horizon; the centre of the bow is still in the line of aspect; which, in this case, runs along the earth, and is not all raised above the surface.

Indeed, if the spectator be placed on a very considerable eminence, and the sun in the horizon; the line of aspect, wherein the centre of the bow is, will be notably raised above the horizon, (considering the magnitude of the circle whereof the bow uses to be a part.) Nay, if the eminence be very high, and the rain near, it is possible the bow may be an entire circle.

Seventhly, How the bow may chance to appear inverted, *i. e.* the concave side be turned upwards? to wit, a cloud happening to intercept the rays, and prevent their shining on the upper part of the arch: in which case only the lower part appearing, the bow will seem as if turned upside down: which probably has been the case in several prodigies of this kind, related by authors.

Indeed the bow may appear inverted from another cause: for, if, when the sun is  $41^\circ, 46'$  high, his rays fall upon the smooth surface of some spacious lake, in the middle whereof a spectator is placed; and if at the same time there be rain falling to which the rays may be reflected from the lake: it will be the same as if the sun should shine below the horizon, and the line of view be extended upwards: thus the surface of the cone wherein the coloured drops are to be placed, will be wholly above the surface of the earth. But since the upper part will fall among the unbroken clouds, and only the lower part be found among the drops of rain, the arch will be inverted.

Eighthly, why the bow sometimes appears inclined; the accurate roundness of the bow depending on it's great distance, which prevents us from judging of it exactly: if the rain which exhibits it, chance to be much nearer, we shall see it's irregularities; and if the wind in that case drive the rain so as the higher part be farther from the eye than the lower, the bow will appear inclined.

Ninthly, Why the legs of the *rainbow* sometimes appear unequally distant? If the rain terminate on the side of the spectator, in a plane so inclined to the line of aspect as to make an acute angle on the left hand, and an obtuse angle on the right; the surface of the cone which determines what drops will appear, will fall upon them in such manner as that those on the left hand will appear farther from the eye than those

on the right. For the line of aspect being perpendicular to the plane of the bow, if you suppose two rectangular triangles, a right and left, the cathetus of each to be the line of view, and the base of the semidiameter of the bow, inclined as above: it is evident, since those angles of the triangles, next the eye, must always be the same, (*viz.* 43° in the inner bow) the basis of the right-hand triangle will appear much longer than that of the left.

**Lunar RAIN-Bow** — The moon, sometimes, also exhibits the phenomenon of an Iris, or bow; by the refraction of her rays in the drops of rain in the night-time. See **MOON**.

Aristotle says, he was the first that ever observed it; and adds that it never happens, *i. e.* is never visible, but at the time of the full moon; her light at other times being too faint to affect the sight after two refractions, and one reflection.

The lunar Iris has all the colours of the solar, very distinct and pleasant; only faint, in comparison of the other; both from the different intensity of the rays, and the different disposition of the medium.

In that mentioned *Philos. Transact.* No. 331. Mr. Thoresby observes the largeness of the arch was not so much less than that of the sun, as the different dimensions of their bodies, and their distances from the earth should seem to require: but, as to its intireness and the beauty of its colour, it was admirable. It continued about 10 minutes before the interposition of a cloud hindered its observation.

**Marine RAIN-Bow** — The *marine* or *sea-bow*, is a phenomenon sometimes observed in a much agitated sea; when the wind sweeping part of the tops of the waves, carries them aloft; so that the sun's ray falling upon them, are refracted, &c. as in a common shower; and paint the colours of the bow.

M. Bourzes, in the *Philos. Transact.* observes, that the colours of the marine rainbow are less lively, distinct, and of less duration than those of the common bow; that there are scarce above two colours distinguishable, a dark yellow on the side next the sun, and a pale green on the opposite side.

But these bows exceed as to number, there being sometimes 20 or 30 seen together: they appear at noon-day, and in a position opposite to that of the common bow, *i. e.* the concave side is turned upwards, as, indeed, it is necessary it should be, from what we have shewn in accounting for the phenomena of the solar bow.

To this class of bows may be referred a kind of *white colourless rainbows*, which Mentzelius, and others, affirm to have seen at noon-day. M. Mariotte in his fourth *Essai de Physique*, says, these bows are formed in mists, as the others are in showers; and adds, that he has seen several, both after sun-rising and in the night.

The want of colours he attributes to the smallness of the vapours which compose the mist: we should rather account for it from the exceeding tenuity of the little *vesiculæ* of the vapour; which being in effect only little watery pellicles bloated with air, the rays of light undergo but little refraction in passing out of air into them; too little to separate the differently coloured rays, &c.

Hence the rays are reflected from them, compounded as they came, that is, white. See **REFRACTION**.

Rohault mentions coloured rainbows on the grass; formed by the refractions of the sun's rays in the morning dew. *Trait. de Phys.*

**RAIN-water.** See the article **WATER**.

**RAISED-airs.** } See the articles } **AIR.**

**RAISED-plan.** } } **PLAN.**

**RAISER**, in building, a board set on-edge under the fore side of a step, a stair, &c. See **STAIR**, &c.

**RAISING**, in the manage, one of the three actions of a horse's legs; the other two being the stay, and the tread. See **AIR**, &c.

The *raising* or lifting up of his leg in caprioles, curvets, &c. is esteemed good, if he perform it hardily and with ease; not crossing his legs, nor carrying his feet too much out or in; yet bending his knees as much as is needful.

**RAISING-pieces**, or **REASON-pieces**, in architecture, are pieces that lie under the beams, and over the posts or puncheons.

**RAISINS**, grapes prepared by drying them in the sun, or the air; to fit them for keeping, and for some medicinal purposes. See **CURRENTS**.

Of these there are various kinds: as, *raisins* of Damascus, thus called from the capital city of Syria, in the neighbourhood whereof they are cultivated. They are much used in the composition of ptisans, together with jujubes and dates; are broad, flat and seeded, of the size of the thumb; whence it is easy judging of the extraordinary bulk of the grape, when fresh. Travellers tell us of bunches weighing 25 pounds. Their taste is faintish and disagreeable.

*Raisins* of the sun, are a kind of *raisins* brought from Spain, of a reddish or blueish colour, seeded, very agreeable to eat. There are various other sorts, denominated from the place where they grow, or the kind of grape, &c. as *raisins* of Calabria, Muscadine *raisins*, &c.

**RAITING**, or **RATING**, the laying of hemp, flax, tim-

ber, &c. when green, in a pond or running water, to season and dispose it for future use.

**RAKE**, of a ship, is so much over her hull as over-hangs at both ends of her keel. See **OVER-RAKE**.

That part of it which is before, is called the *rake forward on*; and that part which is at the setting on of the stern post, is called her *rake-aft*, or *ast-ward on*.

When a ship hath but a small *rake* forward on, but is built with her stern too strait up, she is called *blouffe-headed*.

**RAKE** of the rudder, is the hindermost part of it. See **RUDDER**.

**RAKE**, among hunters. See the article **RAG**.

**RAKING**, of a horse, is the drawing his ordure with the hand out of the fundament, when he is coftive and cannot dung. In order to this the hand must be anointed with sallet-oil or butter.

A horse is also said to *rake*, when being shoulder-splaid, or having strained his fore-quarters, he goes so lame as to drag one of his fore-legs in a circle.

**RAKING-table**, or **RAKED table**, among architects, a member hollowed in the square of a pedestal, or elsewhere. See **CAVETTO**, **SCOTIA**, &c.

**RALLYING**, in war, the re-assembling, or calling together of troops broken, routed, and put to flight.

**RAM**, in astronomy. } See the article **ARIES**.

**Battering RAM.**

**RAMADAN**, a sort of lent observed by the Mahometans; during which they fast the whole day, with such extreme superstition, that they dare not wash their mouth, nor even swallow their spittle. See **LENT** and **FASTING**.

The men indeed are allowed to bathe themselves; but it is on condition they do not plunge the head under water, lest some drops enter by the mouth or ears, &c.—But for the women they are strictly forbid bathing, for fear of taking in water at the pudendum—To make amends, they feast all night; and usually spend more this month than in six others.

**RAMAGE**, a term used for the boughs or branches of trees. See **BRANCH**, &c. Hence,

**RAMAGE hawk**, or *falcon*, one that is wild and coy, as having been long among the boughs, preying for itself.

All falcons retain this name till they have left the aery; being so called in May, June, July, and August—These are very rarely reclaimed. See **HAWK**, and **FALCON**.

**RAMAGE-velvet.** See the article **VELVET**.

**RAMIFICATION**, the production of boughs or branches; or of figures resembling branches. See **BRANCH**.

**RAMIFICATIONS**, in anatomy, are the divisions of the arteries, veins, and nerves, arising from some common trunk—See *Tab. Anat. (Anatol.) fig. 1. n. 18. 18. fig. 4. fig. 5.* See also **ARTERY**, **VEIN**, and **NERVE**.

**RAMMER**, or **BETLE**, an instrument for driving down stones or piles into the ground; or for beating the earth, and making it more solid for a foundation. See **FOUNDATION**.

**RAMMER of a gun**, the *gun-stick*; a rod or staff used in charging a gun, to drive home the powder to the breech, as also the shot, and the wad, which keeps the shot from rolling out. See **CHARGE**.

The rammer of a great gun has a round piece of wood at one end; the other is usually rolled in a piece of sheep-skin, fitted to the bore of the piece, in order to clear her after she has been discharged: which they call *spunging the piece*. See **SPUNGE**, and **SPUNGING**.

**RAMPANT\***, in heraldry, is applied to a lion, bear, leopard, or other beast, in a posture of climbing, or standing upright on his hind-legs, and rearing up his fore-feet; shewing only half his face, as one eye and one ear.

\* The term is french, and signifies literally, *creeping*.

It is different from *saliant*, which denotes a posture less erect, or somewhat stooping forwards, as if making a fall.

This posture is to be specified in blazoning in all animals, except in the lion and griffon; it being their natural situation.

**RAMPART\***, or **RAMPIER**, in fortification, a massy bank, or elevation of earth raised about the body of a place, to cover it from the great shot; and formed into bastions, curtains, &c.—See *Tab. Fort. fig. 21. lit. rr.* See also **FORTREES**, **WALL**, **BASTION**, &c.

\* The word is formed from the Spanish *Ampara*, defence, covering.

Upon the *rampart* the soldiers continually keep guard, and pieces of artillery are planted for the defence of the place—

Hence, to shelter the guard from the enemies shot, the outside of the *rampart* is built higher than the inside, *i. e.* a parapet is raised upon it with a platform. See **PARAPET**, and **PLATFORM**—Hence, also, earth not being capable to be raised perpendicularly, like stone; the *rampart* is built with talus or slope, both on the inner and outer-side. See **TALUS**.

The *rampart* is sometimes lined, *i. e.* fortified with a stone wall within side, otherwise it has a berm. See **BERME**—It is incompassed with a moat or ditch, out of which the earth that forms the *rampart* is dug. See **DITCH**.

The

The height of the *rampart* should not exceed three fathom; this being sufficient to cover the houses from the battery of the cannon: neither ought it's thickness to be above 10 or 12, unless more earth be taken out of the ditch, than can be otherways bestowed.

The *ramparts* of half-moons are the better for being low; that the small fire of the defendants may the better reach the bottom of the ditch: but yet they must be so high, as not to be commanded by the covert-way.

**RAMPART** is also used in civil architecture, for the space left void between the wall of a city and the next houses.

This is what the Romans called *pomærium*, wherein it was forbid to build; and where they planted rows of trees, for the people to walk and amuse themselves under.

**RAMUS**, in anatomy, &c. a branch of a greater vessel. See **VESSEL**.

**RAMUS anterior** is particularly used for a branch of the subcutaneous vein, passing under the muscles of the ulna.

*Ramus posterior*, denotes a branch of the same vein running near the elbow.

**RANA**. See the article **RANULA**.

**RANCID\***, **RANCIDUS**, denotes a fatty substance that is become mouldy, or musty; or that has contracted an ill smell, by being kept close. See **MOULDINESS**.

\* The word is particularly understood of old rusty bacon. It comes from the Latin *rancidus*, of *ranceo*, to be rank.

**RANDOM-shot**, a shot made when the muzzle of a gun is raised above the horizontal line, and is not designed to shoot directly, or point-blank. See **GUNNERY**.

The utmost *random* of any piece is about ten times as far as the bullet will go point-blank; and the bullet will go farthest when the piece is mounted to about 45 degrees above the level-range. See **RANGE**.

The space or distance of the *random*, is reckoned from the platform to the place where the ball first grazes.

**RANFORCE ring**. See **RE-IN-FORCED ring**.

**RANGE**, in gunnery, the path of a bullet, or the line it describes, from the mouth of the piece, to the point where it lodges. See **GUN**, **BULLET**, **RANDOM**, &c.

If the piece be laid in a line parallel to the horizon, it is called the *right* or *level range*. See **HORIZONTAL**.

If it be mounted to 45 degrees, the ball is said to have the *utmost range*; and so proportionably; all others between 00 degrees and 45°, being called the *intermediate ranges*. See **GUNNERY**, **PROJECTILE**, **RANDOM**, &c.

*Amplitude of the RANGE of a projectile*. See **AMPLITUDE**.

**RANGER**, a sworn officer of a forest, whose business it is to walk daily through his charge, to drive back the deer out of the purlieus or disforested places, into the forest lands; and to prevent all trespasses done in his bailiwick, at the next court held for the forest. See **FOREST** and **PURLIEU**.

The *ranger* is made by the king's letters, and has a fee paid yearly out of the exchequer, and certain fee-deer.—In the charter de foresta, mention is made of twelve kind of *rangers*.

**RANGES**, in a ship, are two pieces of timber, going a-crofs from side to side; one aloft, on the fore-castle, a little abaft the fore-mast; and the other in the beak-head before the wouldings of the bow-sprit.

**RANGING**, in war, the disposing of troops in a condition proper for engagement, or for marching. See **ARMY**.

The army was *ranged* in form of battle to receive the enemy; *ranged* in three columns, for a march, &c. See **LINE**, **COLUMN**, &c.

In building, the side of a work that runs strait, without breaking into angles, is said to *range*, or *run range*.

**RANK**, a due order; or a place allotted a thing suitably to it's nature, quality, or merit. See **ORDER**.

Kings are persons of the first *rank* on earth: In cavalcades, processions, &c. every person is to observe his *rank*, See **PRECEDENCE**.

**RANK**, in military discipline, denotes a series or row of soldiers, placed side by side; a number of which *ranks* form the depth of the Squadron or battalion, as a number of files does the width. See **FILE**.

To *close the rank*, is to bring the men nearer: to *open*, to set them further a-part.—To *double the ranks*, is to throw two into the space of one, by which the files are thinned.

**Rear RANK**. See the article **REAR**.

**RANK**, in respect of ships. See **RATE**.

**RANSOM**, a sum of money, paid for the redemption of a person out of slavery; or for the liberty of a prisoner of war. See **REDEMPTION**.

In our law-books, *ransom* is also used for a sum paid for the pardoning of some notorious crime.

Horn makes this difference between *ransom* and *amercement*, that *ransom* is the redemption of a corporal punishment due to any crime. See **AMERCEMENT**.

When one is to make a fine and *ransom*, the *ransom* shall be treble the fine. *Crompt. Just.*

**RANT**, in the drama, an extravagant flight of passion; overshooting nature and probability. See **PROBABILITY**.

VOL. II.

Lee's tragedies abound with *rants*: yet the rankest, it is observed, frequently meet with applause on the stage.

We find instances of *rants*, even in our severest poets. Such, *e. gr.* is that in the beginning of Ben Johnson's *Catiline*, where the parricide speaking to Rome, says, *I'd plough up rocks, sleep as the Alps, in dust; and lave the Tyrrhene waters into clouds; but I would reach thy head!*

**RANULA**, or **RANA**, in medicine, a tumour under the tongue, which like a ligament hinders a child from speaking, or sucking.

The *Ranula sub lingua*, is sometimes the same with what we popularly call being *tongue-tied*: a defect which is usually caused by a short frænum not permitting the tongue to perform it's proper motions.—Though at other times, there is a strong concretion, or rather imoothume under the tongue, which is the proper *ranula*, by the Greeks called ΒΑΡΑΧΙΩΝ.

This imoothume contains in a bag a matter that is sometimes cedematous, at other times melicerous, scirrhus, black, or livid; in which cases the operation of cutting is dangerous; and grows to the magnitude of a bean or chestnut. *Snow.*

**RANULARES**, or **RANINÆ venæ**, in anatomy, two veins under the tongue, arising from the external jugular, and running on either side the linea mediana. See **TONGUE**.

These veins are opened with good success in quinzies.—They take their denomination from a resemblance of their state to that of little frogs, called in Latin, *ranulae*, because never out of water.

**RAPACIOUS animals**, in the general, are such as live upon prey. See **ANIMAL**.

Naturalists divide birds into *rapacious*, *carnivorous*, and *frugivorous*. See **BIRD**.

The characteristic notes of *rapacious* birds are, that they have a great head, and a short neck; hooked, strong, and sharp pointed beak and talons, fitted for tearing of flesh; strong and brawny thighs, for striking down their prey; a broad thick fleshy tongue like that of human creatures: 12 feathers in their train; and 24 flag feathers in each wing. The two appendices or blind guts, are always very short. See **EAGLE**, **FALCON**, **HAWK**, &c.

*Rapacious Birds* have a membranous stomach; and not a muscular one, or a gizzard, such as birds have that live on grain. See **STOMACH** and **DIGESTION**.

They are very sharp sighted; and gather not in flocks, but generally speaking, are solitary; though vultures will fly 50 or 60 in a company.

**RAPE**, **RAPTUS**, in law, a *ravishing*; or the having carnal knowledge of a woman by force, and against her will.

If the woman conceive, the law esteems it no *rape*; from an opinion that she cannot conceive unless she consent. *Coke on Litt. lib. 2. cap. 11.*

This offence is felony in the principal and his aiders, by several statutes; and the criminal is excluded from the benefit of his clergy. See **FELONY**.

By the civil law, *C. de raptu virginum*, ravishing is decreed capital, even though the woman, being a maid, or widow, consent to marry the ravisher. In France, the civil law constitution obtains, though it had been suspended some time by the ordinances which allowed the man to marry the woman with her consent. By an ordinance in 1639, the *rape* of a girl or a boy are put on the same footing. Fleta observes that by our laws the complaint must be made within forty days, else the woman may not be heard. *lib. 3. cap. 5.* All carnal knowledge of a maid before ten years of age, is deemed by the law a *rape*. *Stat. An. 8. Eliz. cap. 6.*

In Bracton's time, the *raptor*, or *ravisher*, was punished with the loss of his eyes and testicles, *quia colorem stupri induxerunt*. 3 Inst. fol. 60.

The civilians make another kind of *rape*, called *subornatio*, *rape of subornation*, or *seduction*; which is when a person seduces, or entices a maid to uncleanness, or even marriage, and that by gentle means; provided there be a considerable disparity in age or condition between the parties. In this case, the father and mother intent their action reciprocally for the *crimen raptus*, or *subornationis*.

The French laws make no difference between the *rape* of violence, and that of solicitation, or subornation; they make both capital.—This kind of *rape* our laws call *ravishment*. See **RAVISHMENT**.

**RAPE**, of the forest, is a trespass committed in the forest by violence. See **FOREST**.

This is mentioned in the laws of Henry. I. as one of the crimes cognizable alone by the King.

**RAPE**, is also a name given the wood or stalks of the clusters of grapes, when dried and freed from the fruit.

The *rape* is used in making vinegar; serving to heat, and four the wine: but it is first put into a place to sour itself before it be cast into the vinegar vessel; to which end, presently after the vintage, it is carefully put up in barrels, left it take air, otherwise it would heat itself, and be spoiled: There is no other way of keeping *rape*, hitherto discovered, but to fill the vessel, wherein it is contained, with wine or vinegar. See **VINEGAR**, and **WINE**.

10H

RAPE,

**RAPE, RAPA**, is also used for a part, or division of a county; signifying as much as a *hundred*. See **HUNDRED**.

Though, sometimes *rape* is taken for a division containing several hundreds—Thus Suffex is divided into six *rapes*, viz. those of Chichester, Arundel, Bramber, Lewes, Pevensey, and Hastings; every one of which, besides it's hundreds, has a castle, river, and forest belonging to it.

The like parts in other counties are called *tithings*, *lathe*s, or *wapentakes*. See **TITHING**, **LATHE**, **WAPENTAKE**.

**RAPIER\***, properly denotes a long, ordinary, old fashioned cutting sword, such as those wore by the common soldiers. See **SWORD**.

\* The word is formed from the French *rapier*, of the Greek *ῥαπίς*, *cedere*, to smite, strike.

In this sense do the French still use the term: so that among them to *take the rapier*, is to enter in the army.

**RAPIER**, in a modern sense among us, usually denotes a small sword—as contradistinguished from a back-sword, or sheering sword. See **SWORD**.

**RAPINE, RAPINA** in law—To take a thing in private against the owner's will, is properly *theft*; but to take it openly, or by violence, is *rapine* or *robbery*, See **ABACTOR**, **ROBBERY**, &c.

**RAPSODIST**, } See { **RHAPSODIST**.

**RAPSODY**, } { **RHAPSODY**.

**RAPTU** *hæredit*, an ancient writ which lies for the taking away an heir, holding in focage; of which there are two sorts; one when the heir is married, the other when not. See **RAVISHMENT**.

**RAPTURE, RAPTURA**, an extasy, or transport of mind. See **EXTASY**, **ENTHUSIASM**, **RHAPSODY**, &c.

**RARE**, in physics, denotes a body that is very porous, whose parts are at a great distance from one another, and which contains but little matter under a great deal of bulk. See **RAREFACTION**, **BODY**, **PORE**, &c.

In this sense *rare* stands opposed to *dense*. See **DENSITY**.

The corpuscular philosophers, viz. Epicureans, Gassendists, Newtonians, &c. assert that bodies are *rarer* some than others, in virtue of a greater quantity of vacuity included between their pores.—The Cartesians hold, that a greater *rarity* only consists in a greater quantity of *materia subtilis* included in the pores—Lastly, the Peripateticks contend, that *rarity* is a new quality superinduced upon a body, without any dependance, either on vacuity, or subtile matter. See **PLENUM**, **VACUUM**, **CARTESIAN**, &c.

**RAREFACTION, RAREFACTIO**, in physics, the act whereby a body is rendered *rare*; that is, is brought to possess more room, or appear under a larger bulk, without any accession of new matter. See **RARE**.

*Rarefaction* is opposed to *condensation*. See **CONDENSATION**.

Our more accurate writers restrain *rarefaction* to that expansion of a mass into a larger bulk, which is effected by means of heat—All expansion from other causes they call dilatation. See **HEAT** and **DILATATION**.

The Cartesians deny any such thing as absolute *rarefaction*: extension, with them, constituting the essence of matter, they are obliged to hold all extension equally full. See **EXTENSION** and **PLENUM**.

Hence, they make *rarefaction* to be no other than an accession of fresh, subtile, and insensible matter, which entering the parts of a body, sensibly distends them. See this disproved under **VACUUM**.

It is by *rarefaction* that gunpowder has it's effect: and to the same principle we owe our æolipiles, thermometers, &c. See **GUNPOWDER**, **THERMOMETER**, **ÆOLIPILE**, &c.

The degree to which the air is *rarefiable* exceeds all imagination: Merfennus, long ago, by means of an intense heat, found that air might be rarified, so as to possess more than 70 times it's former space. See **AIR**.

Mr. Boyle afterwards found, that air, by it's own elasticity, and without the help of any heat, would dilate itself so as to take up 9 times it's former space; then 31 times; then 60; then 150: at length, by many degrees he found it would reach to 8000 times, then 10000, then 13679. See **ELASTICITY**. Such is the rarefaction of common air, from it's own principle of elasticity, and without any previous condensation; but if it be compressed, the same author found it's greatest space when most rarified, is to its least when most condensed, as 55000 to 1. See **COMPRESSION**.

Such an immense *rarefaction*, Sir Isaac Newton shews, is inconceivable on any other principle than that of a repelling force inherent in the air, whereby its particles mutually fly from one another. See **ATTRACTION**, &c.

This repelling force, he observes, is much more considerable in air than in other bodies, as being generated from the most fixt bodies, and that with much difficulty, and scarce without fermentation; those particles being always found to fly each other with the most force, which when in contact, cohere the most firmly. See **REPELLING-power**.

The members of the French royal academy have bestowed a world of attention on the different *rarefactions*, or rather

the different *rarities* of the air at different heights. M. Mariotte established this as a principle, from experiments, that the different *rarefactions* or condensations of the air follow the proportion of the weights wherewith it is pressed.

Hence, supposing the mercury in the level of the sea suspended to 28 inches, which is the weight of the whole atmosphere; and that 60 foot height of air are equivalent to a Line, or 1½ of an inch of mercury; so that the barometer at the height of 60 foot from the sea, would fall a line; it is easy finding what height of air would be equal to a second, or any other line of mercury: for as 28 inches of mercury are to 28 inches, so is the height of 60 foot of air, to a fourth term; which is the height of air corresponding to a second line of mercury.

And after the same manner may the heights of air corresponding to each line be found; which will make a geometrical progression, the sum whereof will be the whole height of the atmosphere. Of consequence a certain part of that sum will be the height of a mountain at whose top the barometer shall have sunk a certain quantity. See **MOUNTAIN**. Mess. Cassini and Maraldi, upon measuring the heights of several mountains, found that this progression of M. Mariotte, was defective; that it always gave the height of the mountains, and consequently the *rarefactions*, less than they really were; and from some new experiments M. Amontons found that the principle will only hold in the mean *rarefactions*, not in the extremes. See **AIR**.

**RAREFACTIVES, RAREFACIENTIA**, in medicine, remedies which open and enlarge the pores of the skin, to give an easy vent to the matter of perspiration. See **ARÆOTIC**, **DIAPHORETIC**, **PERSPIRATION**, &c.

Such are anise, mallows, pellitory, camomile-flowers, linseed, &c.

**RASANT, or RAZANT**, in fortification—**RASANT flank, or line**, is that part of the curtain, or flank, whence the shot exploded raze or glance along the face of the opposite bastion. See **LINE** and **FLANK**.

The defence of the bastion is *rasant*. See **DEFENCE**.

**RASH** in clockwork. See the article **RATCH**.

**RASH**, in medicine, an eruption or efflorescence upon the skin, thrown out in fevers, or surfeits. See **ERUPTION**, **EXANTHEMA**, **SURFEIT**, &c.

**RASP**, a rank sort of file. See **FILE**.

**RASPIRATORY**, a surgeon's instruments wherewith they scrape foul, carious, or fractured bones.

**RASPHUYS, or RASP-houfe**, a celebrated work-houfe, or house of correction, at Amsterdam. See **WORK-houfe**.

**RATA pro RATA**. See the article **PRO rata**.

*Onerando pro RATA portionis*. See **ONERANDO**.

**RATAFIA**, a fine spirituous liquor, prepared from the kernels, &c. of several kinds of fruits, particularly cherries, and apricocks.

*Ratafia of cherries* is prepared by bruising the cherries, and putting them into a vessel wherein brandy has been kept; then adding to them the kernels of cherries, with strawberries, sugar, cinnamon, white pepper, nutmegs, cloves; and to 20 pound of cherries, 10 quarts of brandy.—The Vessel is left open 10 or 12 days, then stopped close, for two months before it be tapped.

*Ratafia of apricocks* is prepared two ways; viz. either by boiling the apricocks in white wine, adding to the liquor an equal quantity of brandy, with sugar, cinnamon, mace, and the kernels of apricocks; infusing the whole for 8 or 10 days; then straining the liquor, and putting it up for use: or by infusing the apricocks, cut in pieces, in brandy, for a day or two; passing it through a straining bag, and putting in the usual ingredients.

**RATCH, or RASH**, in clock-work, a sort of wheel having twelve fangs, which serve to lift up the detents every hour, and to make the clock strike. See **CLOCK**.

**RATCHETS**, in a watch, are the small teeth at the bottom of the fusee, or barrel; which stop it in winding up. See **WATCH**.

**RATE**, a standard or proportion by which either the quantity or value of a thing is adjusted. See **STANDARD**. The rates of bread, &c. in London, are fixed by authority See **ASSISE**.

The rate of interest, as now established by law in England, is 5 per cent. The rate of interest in Italy is 3 per cent. In Sweden 6. In France 5. In Spain 10. In Barbadoes 10. In Ireland 12. In Turkey 20.—Low rates of interest advance the prices of land. See **INTEREST**.

The rates or fares of hackney-coachmen, chairmen, and watermen, are fixed by act of parliament, 14 Car. II. See **Hackney-COACH**, &c.

The rates of exchange, factorship, &c. are different. See **EXCHANGE**, **FACTORAGE**, &c.

**RATE-tithe**. When sheep, or other cattle, are kept in a parish for less time than a year, the owner must pay tithe for them, *pro rata*, according to the custom of the place. See **TITHE**.

**RATE**, of a ship of war, is it's order, degree, or distinction, as to magnitude, burthen, &c. See **SHIP**, &c.

The

The *rate* is usually accounted by the length and breadth of the gun-deck, the number of tuns, and the number of men and guns the vessel carries—There are six *rates*:

*First RATE* man of war has its gun-deck from 159 to 174 feet in length, and from 44 to 50 foot broad; contains from 1313, to 1882 tuns; has from 706 to 800 men; and carries from 96 to 110 guns. See NAVY.

*Second RATE ships* have their gun-deck from 153 to 165 foot long; and from 41 to 46 broad; they contain from 1086 to 1482 tuns; and carry from 524 to 640 men; and from 84 to 90 guns.

*Third RATES* have their gun-decks from 142 to 158 foot in length; from 37 to 42 foot broad; they contain from 871 to 1262 tuns; carry from 389 to 476 men; and from 64 to 80 guns.

*Fourth RATES* are in length on the gun-deck, from 118 to 146 foot; and from 29 to 38 broad; they contain from 448 to 915 tuns, carry from 226 to 346 men; and from 48 to 60 guns.

*Fifth RATES* have their gun-decks from 100 to 120 foot long; and from 24 to 31 broad; they contain from 259 to 542 tuns; carry from 145 to 190 men; and from 26 to 44 guns.

*Sixth RATES* have their gun-decks from 87 to 95 foot long; and from 22 to 25 foot broad; they contain from 152 to 256 tuns; carry from 50 to 110 men; and from 16 to 24 guns.

*Note*, The new-built ships are much larger, as well as better than the old ones of the same *rate*; whence the double numbers all along; the larger of which express the proportions of the new-built ships, as the less those of the old ones.—For the number of each *rate* in the English fleet. See NAVY.

RATEEN, or RATTEN, in commerce, a thick woollen stuff, quilted, wove on a loom with four treddles, like serges and other stuffs that have the whale or quilting.

There are some *rateens* dressed and prepared like cloths; others left simply in the hair; and others where the hair or nap is frized.

*Rateens* are chiefly manufactured in France, Holland, and Italy; and are mostly used in linings.

The frize is a sort of coarse *rateen*; the drugget, a *rateen* half linen, half woollen.

RATIFICATION, RATIFICATIO, an act, approving of, and confirming something done by another, in our name.

A treaty of peace is never secure till the princes have *ratified* it. See TREATY.

All procurator imports a promise of *ratifying* and approving what is done by the proxy or procurator. After treating with a procurator, agent, factor, &c. A *ratification* is frequently necessary on the part of his principal.

RATIFICATION, is particularly used in our laws, for the confirmation of a clerk in a benefice, prebend, &c. formerly given him by the bishop, &c. where the right of patronage is doubted to be in the king.

RATIFICATION is also used for an act confirming something we ourselves have done in our own name.

An execution, by a major, of an act passed in his minority, is equivalent to a *ratification*.

RATING. See the article RATING.

RATIO, REASON, in arithmetic and geometry, that relation of homogeneous things which determines the quantity of one from the quantity of another, without the intervention of any third. See RELATION.

The homogeneous things thus compared, we call *the terms of the ratio*; particularly, that referred to the other, we call *the antecedent*; and that to which the other is referred, *the consequent*. See TERM, &c.

Thus, when we consider one quantity, by comparing it with another, to see what magnitude it has in comparison of that other; the magnitude this quantity is found to have in comparison thereof is called the *ratio*, *reason*, of this quantity to that: which some think would be better expressed by the word *comparison*. See COMPARISON.

Euclid defines *ratio* by the *habitude or relation of magnitudes of the same kind in respect of quantity*.—But this definition is found defective; there being other relations of magnitudes which are constant, yet are not included in the number of *ratios*: such as that of the right line, to the sine of the complement in trigonometry.

Hobbs endeavoured to mend Euclid's definition of *ratio*, but unhappily; for in defining it, as he does, by the *relation of magnitude to magnitude*; his definition has not only the same defect with Euclid's in not determining the particular kind of relation; but has this farther, that it does not express the kind of magnitudes, which may have a *ratio* to one another.

*Ratio* is frequently confounded with *proportion*; yet ought they by all means to be distinguished, as very different things. *Proportion*, in effect, is an identity, or similitude of two *ratios*. See PROPORTION.

Thus, if the quantity A be triple the quantity B; the relation of A to B, *i. e.* of 3 to 1, is called the *ratio* of A to

B. If two other quantities, C, D, have the same *ratio* to one another that A and B have, *i. e.* be triple one another; this sameness of *ratio* constitutes *proportion*: and the four quantities A : B :: C : D, are in proportion, or proportional to one another.

So that *ratio* exists between two terms, proportion requires more.

There is a twofold comparison of numbers: by the first, we find how much they differ, *i. e.* by how many units the antecedent exceeds, or comes short of, the consequent.

This difference is called, the *arithmetical ratio*, or exponent of the arithmetical relation or habitude of the two numbers.

Thus if 5 and 7 be compared, their arithmetical *ratio* is 2. By the second comparison, we find how oft the antecedent contains, or is contained in the consequent; *i. e.* as before, what part of the greater is equal to the less.

This *ratio*, being common to all quantity, may be called *ratio* in the general, or by way of eminence. But it is usually called *geometrical ratio*; because expressed, in geometry, by a line, though it cannot be expressed by any number.

Wolfius better distinguishes *ratio*, with regard to quantity in the general, into *rational* and *irrational*.

*Rational RATIO*, is that which is as one rational number to another, *e. gr.* as 3 to 4. See NUMBER.

*Irrational RATIO*, is that which cannot be expressed by rational numbers.

Suppose, for an illustration, two quantities A and B; and let A be less than B. If A be subtracted as often as it can be, from B, *e. gr.* five times, there will either be left nothing or something. In the former case A will be to B as 1 to 5; that is, A is contained in B five times; or  $A = \frac{1}{5}B$ . The *ratio*, here, therefore, is *rational*.

In the latter case, either there is some parts, which being subtracted certain times from A, *e. gr.* three times, and likewise from B, *e. gr.* 7 times leaves nothing; or there is no such part: if the former, A will be to B, as 3 to 7, or  $A = \frac{3}{7}B$ , and therefore the *ratio*, *rational*. If the latter, the *ratio* of A to B, *i. e.* what part A is of B, cannot be expressed by rational numbers; nor any other way than either by lines, or by infinite approaching series. See SERIES.

The exponent of a *geometrical ratio* is the quotient arising from the division of the antecedent by the consequent—Thus the exponent of the *ratio* of 3 to 2, is  $1\frac{1}{2}$ ; that of the *ratio* of 2 to 3, is  $\frac{2}{3}$ ; for when the less term is the antecedent, the *ratio*, or rather the exponent, is an improper fraction. Hence the fraction  $\frac{1}{2} = 3 : 4$ . If the consequent be unity, the antecedent itself is the exponent of the *ratio*: thus the exponent of 4 to 1 is 4. See EXPONENT.

If two quantities be compared without the invention of a third; either the one is equal to the other, or unequal: Hence, the *ratio* is either of *equality* or *inequality*.

If the terms of the *ratio* be unequal, either the less is referred to the greater, or the greater to the less: That is, either the less to the greater, as a part to the whole; or the greater to the less as the whole to a part: The *ratio* therefore determines how often the less is contained in the greater, or how often the greater contains the less, *i. e.* to what part of the greater the less is equal.

The *ratio* which the greater term has to the less, *e. gr.* 6 to 3, is called the *ratio of the greater inequality*. The *ratio* which the less term has to the greater, *e. gr.* 3 to 6, is called the *ratio of the less inequality*.

This *ratio* corresponds to quantity in the general, or is admitted of by all kinds of quantities, discrete or continued, commensurable, or incommensurable. But discrete quantity, or number does likewise admit of another *ratio*.

If the less term of a *ratio* be an aliquot part of the greater, the *ratio* of the greater inequality is said to be *multiplex*, multiple: and the *ratio* of the less inequality, *submultiple*. See MULTIPLE, and SUBMULTIPLE.

Particularly, in the first case, if the exponent be 2, the *ratio* is called *duplex*; if 3, *triplex*, &c. In the second case, if the exponent be  $\frac{1}{2}$ , the *ratio* is called *subduplex*; if  $\frac{1}{3}$ , *subtriplex*, &c. *E. gr.* 6 to 2 is in a triple *ratio*; because 6 contains two thrice. On the contrary, 2 to 6 is in a subtriple *ratio*, because 2 is the third part of 6. See DUPLEX, SUBDUPLEX, &c.

If the greater term contain the less once; and over and above, an aliquot part of the same; the *ratio* of the greater inequality is called *superparticularis*; and the *ratio* of the less *subsuperparticularis*.

Particularly, in the first case, if the exponent be  $1\frac{1}{2}$ , it is called *sesquialterate*; if  $1\frac{2}{3}$ , *sesquitercia*, &c. In the other, if the exponent be  $\frac{1}{2}$ , the *ratio* is called *subsesquialterate*; if  $\frac{1}{3}$ , *subsesquitercia*, &c.

*E. gr.* 3 to 2 is in a *sesquialterate ratio*; 2 to 3 in a *subsesquialterate*.

If the greater term contains the less once, and over and above several aliquot parts; the *ratio* of the greater inequality is called *superpartiens*, that of the less inequality is *subsuperpartiens*.

Particularly in the former case, if the exponent be  $1\frac{2}{3}$ , the *ratio* is called *superbipartiens tertias*; if the exponent be  $1\frac{3}{4}$ , *super-*

*supertripartiens quartas*; if  $1\frac{2}{3}$ , *superquadrupartiens septimas*, &c. in the latter case, if the exponent be  $\frac{2}{3}$ , the ratio is called *subsuperbipartiens tertias*; if  $\frac{3}{4}$ , *subsupertripartiens quartas*; if  $\frac{4}{5}$ , *subsuperquadrupartiens septimas*.

*E. gr.* the ratio of 5 to 3 is *superbipartiens tertias*; that of 3 to 5, *subsuperbipartiens tertias*.

If the greater term contain the less several times, and, besides, some quota part of the same; the ratio of the greater inequality is called *multiplex superparticularis*; and the ratio of the less inequality, *submultiplex subsuperparticularis*.

Particularly, in the former case, if the exponent be  $2\frac{1}{2}$ , the ratio is called, *dupla sesquialtera*; if  $3\frac{1}{2}$ , *tripla sesquiquarta*, &c. In the latter case, if the exponent be  $\frac{6}{5}$ , the ratio is called *subdupla subsesquialtera*; if  $1\frac{3}{5}$ , *subtripla subsesquiquarta*, &c.

*E. gr.* the ratio of 16 to 5 is *tripla sesquiquinta*; that of 4 to 9 *subdupla subsesquiquarta*.

*Lastly*, if the greater term contain the less several times, and several aliquot parts thereof besides; the ratio of the greater inequality is called *multiplex superpartiens*; that of the less inequality, *submultiplex subsuperpartiens*.

Particularly, in the former case, if the exponent be  $2\frac{2}{3}$ , the ratio is called *dupla superbipartiens tertias*; if  $3\frac{2}{3}$ , *tripla superbiquadrupartiens septimas*, &c. In the latter case, if the exponent be  $\frac{4}{3}$ , the ratio is called, *subdupla subsuperbipartiens tertias*; if  $\frac{5}{3}$ , *subtripla subsuperquadrupartiens septimas*, &c.

*E. gr.* the ratio of 25 to 7 is *tripla superquadrupartiens septimas*; that of 3 to 8, *subdupla subsuperbipartiens tertias*.

These are the various kinds of rational ratios; the names whereof, though they occur but rarely among the modern writers, (for in lieu thereof they use the smallest terms of the ratios, *e. gr.* for *dupla* 2 : 1, for *sesquialtera*, 3 : 2) yet are they absolutely necessary to such as converse with the ancient authors.

Clavius observes, that the exponents denominate the ratios of the greater inequality, both in deed and name; but the ratios of the less inequality, only in deed, not in name. But it is easy finding the name in these; if you divide the denominator of the exponent, by the numerator.

*E. gr.* if the exponent be  $\frac{1}{5}$ , then  $5 : 8 = 1\frac{1}{5}$ ; whence it appears the ratio is called *subsupertripartiens quintas*.

As to the names of irrational ratios, nobody ever attempted them.

*Same, or Identical ratios* are those whose antecedents have an equal respect to their consequents, *i. e.* whose antecedents divided by their consequents, give equal exponents. And hence may the identity of irrational ratios be conceived.

Hence, *first*, as oft as the antecedent of one ratio contains its consequent, or whatever part it contains of its consequent, so oft, or such part of the other consequent does the antecedent of the other ratio contain: or, as oft as the antecedent of the one is contained in its consequent, so oft is the antecedent of the other contained in its consequent.

*Secondly*, If A be to B as C to D, then will A : B :: C : D; or A : B = C : D. The former of which is the usual manner of representing the identity of ratios; the latter is that of the excellent Wolfius; which has the advantage of the former, in that the middle character =, which denotes the sameness, is scientific, *i. e.* expresses the relation of the thing represented, which the other :: does not. See CHARACTER.

Two equal ratios, *e. gr.* B : C = D : E, we have already observed, to constitute a proportion: of two unequal ratios, *e. gr.* A : B and C : D we call A : B the greater, if A : B > C : D; on the contrary we call C : D the lesser, if C : D < A : B.

Hence, we express a greater and less ratio thus. *E. gr.* 6 to 3 has a greater ratio, than 5 to 4; for,  $6 : 3 (=2) > 5 : 4 (=1\frac{1}{4})$ . But 3 to 6 has a less ratio than 4 to 5, for  $\frac{3}{6} = \frac{1}{2} < \frac{4}{5}$ . Compound ratio is that made up of two or more other ratios, which the factum of the antecedents of two or more ratios has to the factum of their consequents. Thus 6 to 72 is in a ratio compounded of 2 to 6, and 3 to 12.

Particularly, if it be compounded of two, it is called a duplicate ratio; if of three, a triplicate, if of four, quadruplicate; and in the general multiplicate, if it be composed of several similar ratios. Thus 48 : 3 is a duplicate ratio of 4 : 1 and 12 : 3. See DUPLICATE and TRIPPLICATE.

*Alternate RATIO*, is where the antecedent of one ratio is to its consequent, as the antecedent of another to its consequent; the very same ratio, in this case, holding alternately in respect of the antecedents to each other, and the consequents to each other.—Thus if A : B :: C : D; then, alternately, A : C :: B : D.

*Ordinate RATIO*, is that, wherein the antecedent of the first ratio is to its consequent, as the antecedent of the second is to its consequent.

*Denominator of a RATIO*. See DENOMINATOR.

*Properties of RATIOS*—*First*, ratios similar to the same third are also similar to one another; and those similar to similar, are also similar to one another.

*Secondly*, If A : B = C : D; then, inversely, B : A = D : C.

*Thirdly*, Similar parts P and p have the same ratio to wholes T and t; and if the wholes have the same ratio, the parts are similar.

*Fourthly*, If A : B = C : D; then alternately, A : C = B : D. And hence, if B = D : A = C; hence, also, if A : B = C : D; and A : F = C : G; we shall have B : F = D : G. Hence, again, if A : B = C : D; and F : A = G : C; we shall have F : B = G : D.

*Fifthly*, Those things which have the same ratio to the same, or equal things, are equal: and *vice versa*.

*Sixthly*, if you multiply any quantities, as A and B, by the same or equal quantities: their products D and E will be to each other as A and B.

*Seventhly*, if you divide any quantities as A and B, by the same or equal quantities, the quotients F and G will be to each other as A and B.

*Eighthly*, The exponent of a compound ratio is equal to the factum of the exponents of the simple ratios. See EXPONENT.

*Ninthly*, If you divide either the antecedents, or the consequents of similar ratios, A : B and C : D by the same E; in the former case, the quotients F and G will have the same ratio to the consequents B and D; in the latter, the antecedents A and B will have the same ratio to the quotients H and K.

*Tenthly*, If there be several quantities in the same continued ratio A, B, C, D, E, &c. the first, A, is to the third C, in a duplicate ratio, to the fourth, D, in a triplicate, to the fifth, E, in a quadruplicate, &c. ratio of the ratio of the first, A, to the second B.

*Eleventhly*, If there be any series of quantities in the same ratio, A, B, C, D, E, F, &c. the ratio of the first, A, to the last, F, is compounded of the intermediate ratios, A : B, B : C, C : D, D : E, E : F, &c.

*Twelfthly*, ratios compounded of ratios, whereof each is equal to each other, are equal among themselves. Thus the ratios 90 : 3 = 960 : 32 are compounded of 6 : 3 = 4 : 2, and 3 : 1 = 12 : 4; and 5 : 1 = 20 : 4.

For other properties of similar or equal ratios, see PROPORTION.

*RATIO*, in our law writers, is used for a judgment given in a cause. See JUDGMENT.

Hence, *ponere ad rationem*, is to cite one to appear in judgment. Wallingh. 88.

*RATIO-status*, *RAGIONE di stato*. See REASON of state.

*RATIO victus*. See the article VICTUS.

*RATIOCINATION*, the act of reasoning. See REASONING.

*RATION\**, or *RATIAN*, in the army, a pittance, or proportion of amunition, bread, drink, or forage, distributed to each soldier for his daily subsistence. See AMMUNITION, &c.

\* Some write the word *racion*, and borrow it from the Spanish *racion*. But they both come from the Latin, *ratio*: in some parts of the sea they call it *reason*.

The horse have *rations* of hay and oats, when they cannot go out to forage.

The *rations* of bread are regulated by weight—The ordinary ration of a foot soldier is a pound and half of bread per day.

The officers have several *rations* according to their quality, and the number of attendants they are obliged to keep. When the *ration* is augmented on occasions of rejoicing, it is called *double ration*.

The ship's crews have also their *rations* or allowances of biscuit, pulse, and water, proportioned according to their stock. The usual *ration* at sea, particularly among the Portuguese, &c. is a pound and half of biscuit, a pint of wine, and a quart of fresh water per day, and each month an arrobe or 31 pound of salt meat, with some dried fish and onions.

*RATIONABLES expensæ*, *reasonable expences*. The commons in parliament, as well as the proctors of the clergy in convocation, were anciently allowed *rationabiles expensas*; that is, such allowance as the king, considering the prices of all things, shall judge meet to impose on the people to pay for the subsistence of their representatives. See REPRESENTATIVE, DE EXPENSIS, &c.

This, in the 17th of Edward II, was settled at 10 groats per day for knights, and 5 for burgesses. Afterwards 4 shillings a day for knights, and 2 shillings for burgesses; which was then deemed an ample retribution both for expences, for labour, attendance, neglect of their own affairs, &c. See PARLIAMENT.

*RATIONABILI parte bonorum*, a writ which lies for the wife, against the executors of her husband denying her the third part of her husband's goods, after debts and funeral expences paid. See GOODS.

Fitzherbert quotes Magna Charta and Glanville, to prove that

that by the common law of England, the goods of the deceased, his debts first paid, should be divided into three parts; whereof his wife to have one, his children a second, and the executors a third. Adding, that this writ lies as well for the children, &c. as the wife. — But it seems only to obtain where the custom of the country makes for it.

*Recto de RATIONABILI parte.* See RECTO.

**RATIONABILIBUS** *divisis*, is a writ that lies where two lords have feigneries joining together, for him that finds his waste incroached upon, within the memory of man, against the encroacher; thereby to rectify the Bounds of the feigneries: in which respect Fitzherbert says it is of the nature of a writ of right.

**RATIONAL**, *reasonable*. See REASON.

**RATIONAL** *fable*. See the article FABLE.

**RATIONAL** *fraction*, or *broken number*, is that equal to some aliquot part or parts of unity. See FRACTION.

**RATIONAL**, or *true horizon*, is that whose plane is conceived to pass through the centre of the earth; and which therefore divides the globe into two equal portions, or hemispheres. See HORIZON.

It is called the *rational horizon*, because only conceived by the understanding; in opposition to the *sensible* or apparent horizon, which is visible to the eye. See SENSIBLE.

**RATIONAL** *integer*, or *whole number*, is that whereof unity is an aliquot part. See NUMBER and ALIQUOT part.

**RATIONAL** *mixt number*, is that consisting of an integer and a fraction; or of unity, and a broken number. See NUMBER and MIXT.

Commensurable quantities are defined by being to one another, as one *rational* number to another. See COMMENSURABLE.

For unity is an aliquot part of a rational number; and a fraction has some aliquot part common with unity: in things, therefore, that are as a *rational* to a *rational* number, either the one is an aliquot part of the other, or there is some common aliquot part of both: therefore they are commensurable.

Hence, if a *rational* number be divided by a *rational*, the quotient is a *rational*.

**RATIONAL** *physicians*. See PHYSICIAN.

**RATIONAL** *quantity* or *number*, a quantity or number commensurable to unity. See NUMBER and UNITY.

Supposing any quantity to be 1, there are infinite other quantities, some whereof are commensurable to it, either simply, or in power: these Euclid calls *rational quantities*. See QUANTITY.

The rest, that are incommensurable to 1, he calls *irrational quantities*, or *surds*. See SURD.

**RATIONAL** *ratio*, is a ratio whose terms are *rational* quantities; or a ratio which is as one *rational* number to another, *e. gr.* as 3 to 6. See RATIO.

The exponent of a *rational* ratio is a *rational* quantity. See EXPONENT.

**RATIONAL** *soul*. See the article SOUL.

**RATIONALE**, a solution, or account of the principles of some opinion, action, hypothesis, phenomenon, or the like. See PRINCIPLE, PHÆNOMENON, &c. — Hence,

**RATIONALE** is also the title of several books — The most considerable is the *Rationale of divine offices*, by Guil. Durandus, a celebrated school divine, bishop of Mende; finished in 1286, as he himself tells us.

**RATIONALE** also denotes an ancient sacerdotal vestment, wore by the high-priest under the old law; and called by the Hebrews *חֹשֶׁן* *hoshchen*; by the Greeks *κορυμβ*; by the Latins *rationale* and *pectorale*; and by the English translators, *breastplate*. See PECTORALE.

The *rationale* was a piece of embroidered stuff wore on the breast, about a span-square — Du Cange describes it as a double square, of four colours, interwove with gold, and set with twelve precious stones in four rows, whereon were engraven the names of the twelve tribes; and fastened to the shoulder by two chains and two hooks of gold — The form of the *rationale* was prescribed by God himself, Exod. 28.

A **RATIONALE** appears also to have been antiently wore by the bishops under the new law — But authors are in doubt about it's form; some will have it resemble that of the Jews; others take it to be only the pallium. See PALLIUM.

**RATIONALIS**, an officer mentioned in several antient inscriptions. See ACCOUNTANT.

Lampridius, in the life of Alex. Severus, uses *rationalis* as synonymous with *procurator*. See PROCURATOR.

The *rationales* were intendants, or surveyors under the emperors; and though Lampridius pretends they were first established by Severus, it is evident there were some under Augustus.

**ENS** **RATIONIS**. See the article ENS.

**DISTINCTIO** **RATIONIS**. See the article DISTINCTIO.

**RATIONIS** *os*, in anatomy, the bone of the forehead, otherwise called *os frontis*. See FRONTRIS.

**RATLINES**, or, as the seamen call them, **RATFLINGS**; VOL. II. N° CXXIX.

those lines which make the ladder steps, to get up the shrouds and putlocks: hence called the *ratlings of the shrouds*.

**RATTEN**. See the article RATEEN.

**RATTLE**, among the antients, a musical instrument, of the pulsatile kind: called by the Romans, *crepitaculum*. See MUSICK.

Mr. Malcolm takes the tintinnabulum, crotalum, and sistrum, to have been only so many different kinds of rattles. See BELL, CROTALUM, SISTRUM, &c.

The invention of the *rattle* is ascribed to the famous mathematician Archytas; whence Aristotle calls it, *Αρχυτας πλαταγα*, Archytas's *rattle* — Diogenianus adds the occasion of the invention; *viz.* that Archytas having children, he contrived this instrument to prevent their tumbling other things about the house. So that how much soever some instruments have changed their uses, the *rattle* we are sure has preserved it's.

**RAVELIN**, in fortification, was antiently a flat bastion, placed in the middle of a curtain. See BASTION and CURTIN.

**RAVELIN** is now a detached work, composed only of two faces, which make a salient angle, without any flanks; and raised before the curtain on the counterescarp of the place.

A *ravelin* is a triangular work resembling the point of a bastion, with the flanks cut off — See *Tab. Fortif. fig. 21. lit. iii.* It's use before a curtain, is to cover the opposite flanks of the two next bastions. It is used also to cover a bridge or a gate; and is always placed without the moat.

What the engineers call a *ravelin*, the soldiers generally call a *demilune*, or half-moon. See DEMI-LUNE, &c.

There are also *double ravelins*, which serve to defend each other — They are said to be *double* when they are joined by a curtain.

**RAVISHMENT**, in law, denotes an unlawful taking either a Woman, or an heir in ward.

Sometimes it is also used in the same sense as *rape*. See RAPE.

**RAVISHMENT** *de gard*, is a writ which antiently laid for the guardian against him who took from him the body of his ward. See GUARDIAN, WARD, &c.

**RAW** *hide*. See the article HIDE.

**RAW** *filk*. See the article SILK.

**RAY**, **RADIUS**, in optics, a beam or line of light, propagated from a radiant point, through an unrefracting medium. See LIGHT, RADIANT, &c.

Sir Isaac Newton defines *rays* to be the least parts of light, whether successive in the same line, or contemporary in several lines.

For, that light consists of parts of both kinds, appears hence, that one may stop what comes this moment in any point, and let pass that which comes the next; and again may stop what comes in this point, and let pass that in the next — Now, the least light, or part of light which may be thus stopped alone, he calls a *ray of light*.

If the parts of a *ray* of light do all lie straight between the radiant and the eye, the *ray* is said to be *direct*: the laws and properties whereof make the subject of optics. See OPTICS, and DIRECT.

If any of them be turned out of that direction, or bent in their passage, the *ray* is said to be *refracted*. See REFRACTION.

If it strike on the surface of any body, and be driven back, it is said to be *reflected*. See REFLECTION.

In each case, the *ray*, as it falls either directly on the eye, or on the point of reflection, or of refraction, is said to be *incident*. See INCIDENCE.

Again, if several *rays* be propagated from the radiant equidistantly from one another, they are called *parallel rays*. See PARALLEL.

If they come inclining towards each other, they are called *converging rays*. See CONVERGING.

And if they go continually receding from each other, they are called *diverging rays*. See DIVERGING.

It is from the circumstances of *rays*, that the several kinds of bodies are distinguished in optics. A body, *e. gr.* that diffuses it's own light, or emits *rays* of it's own, is called a *lucid*, or *luminous* body.

If it only reflect *rays* which it receives from another, it is called an *illuminated body*.

If it only transmit *rays*, it is called a *transparent body*. See TRANSPARENCY.

If it intercept the *rays*, or refuse them passage, it is called an *opaque body*. See OPACITY.

Hence no body radiates, *i. e.* emits *rays*, unless it be either luminous, or illumined. See RADIATION.

It is by means of *rays* reflected from the several points of illumined objects to the eye, that they become visible, and that vision is performed; whence such *rays* are called *visual rays*. See VISUAL.

In effect we find that any point of an object is seen in all places to which a right line may be drawn from that point: but it is allowed, nothing can be seen without light, therefore every point of an object diffuses innumerable *rays* every way. Again, from other experiments it appears that the images

of a  
are  
ve  
A  
i  
!

ll objects, whence right lines may be drawn to the eye, painted in the eye, behind the crystallin, very small, but very distinct.

And lastly, from other experiments, that each ray carries with it the species, or image of the radiating point: and that the several rays emitted from the same point are again united in one point, by the crystallin, and thus thrown on the retina. See VISION.

It is the spissitude, or closeness of the rays emitted from a luminous body, that constitutes the intenseness of the light. Yet the direction wherein the rays strike the eye, has a good sway. In effect, a perpendicular ray, striking with more force than an oblique one, in the ratio of the whole sine to the sine of the angle of obliquity (as follows from the laws of percussion) a perpendicular ray will affect the eye more vividly than an oblique one in that ratio.

If then the spissitude of the rays be equal, the intensity will be as the direction; if the direction be the same, the intenseness will be as the spissitude. If both differ, the intenseness will be in a ratio compounded of the direction and the spissitude.

Hence, first, If light be propagated in parallel rays through an unresisting medium, it's intensity will not be varied by distance.

Secondly, If light be propagated in diverging rays, through an unresisting medium, it's intensity will decrease in a duplicate ratio of the distances from the radiant point, reciprocally. See QUALITY.

Thirdly, If light be propagated in converging rays, through an unresisting medium, it's intensity will increase in a duplicate ratio of the distances from the point of concurrence, reciprocally.

Fourthly, If the breadth of an illuminated plane be to the distance of the radiant point, as 1 to 2000000, it is the same thing as if the rays struck upon it parallel: and hence, since the diameter of the pupil of the eye, when largest, scarce exceeds  $\frac{1}{4}$  of an inch; the rays will fall upon it parallel, as to sense, at the distance of 3860 English feet, which is nearly 6 furlongs. See LIGHT.

The effect of concave lenses, and convex mirrors, is to make parallel rays diverge; converging rays, become parallel; and diverging rays to become more divergent. See MIRROR.

The effect of convex lenses, and concave mirrors, is to make diverging rays become parallel; parallel rays become convergent, and converging rays to converge the more. See LENS.

The rays of light are not homogeneous, or similar, but differ in all the properties we know of, viz. refrangibility, reflexivity, and colour. See REFRACTIBILITY, &c.

It is probably from the different refrangibility, that the other differences have their rise; at least it appears, that those rays which agree or differ in this, do so in all the rest.

Thus from the different sensations the differently disposed rays excite in us, we call them, red rays, yellow rays, &c. See COLOUR.

The effect of the prism is to separate and sort the different kinds of rays, which come blended promiscuously from the sun; and to throw each kind by itself, according to it's degree of refrangibility and colour, red to red, blue to blue, &c. See PRISM.

Besides, refrangibility, and the other properties of the rays of light already ascertained by observation and experiment, Sir Isaac Newton suspects they may have many more; particularly, a power of being inflected, or bent, by the action of distant bodies; and those rays which differ in refrangibility, he conceives likewise to differ in this flexibility.

In passing by the edges and sides of bodies, he conceives that the rays may be bent several times backwards and forwards, with a motion like that of an eel; and that those rays which appear to fall on bodies, are reflected or refracted before they arrive at the bodies. And adds, that they may be refracted, reflected, and inflected, all by the same principle acting in different circumstances. See INFLECTION, &c.

Again, do not the rays falling on the bottom of the eye excite vibrations in the retina; which being propagated along the fibres of the optic nerve into the brain cause vision? and do not several sorts of rays make vibrations of several bignesses, which excite sensations of several colours, much after the manner as the vibrations of the air, according to their several bignesses, excite sensations of several sounds? See SOUND.

Particularly, do not the most refrangible rays excite the shortest vibrations, to make a sensation of a deep violet; and the least refrangible, the largest, to make a sensation of a deep red? and the several intermediate kinds of rays, vibrations of intermediate bignesses, to make sensations of the intermediate colours? See COLOUR.

And may not the harmony and discord of colours arise from the proportion of these vibrations; as those of sound depend on the vibrations of the air? for some colours, if viewed to-

gether, are agreeable, as gold and indico; others disagreeable. See CONCORD and HARMONY.

Again, have not the rays of light several sides endued with several original properties?—It is certain we find that every ray of light has two opposite sides, originally endued with a property whereon the unusual refraction of island crystal depends, and other two opposite sides not endued with that property. See CRYSTAL.

Lastly, Are not the rays of light very small bodies emitted from shining substances?

Such bodies may have all the conditions of light: and there is that action and re-action between transparent bodies and light, which very much resembles the attractive force between other bodies. Nothing more is required for the production of all the various colours, and all the degrees of refrangibility, but that the rays of light be bodies of different sizes; the least of which may make violet, the weakest and darkest of the colours, and be the most easily diverted by refracting surfaces from it's rectilinear course; and the rest as they are bigger and bigger, may make the stronger and more lucid colours, blue, green, yellow, and red. See RAINBOW, RED, &c.

Nor is any thing more requisite for the putting of the rays into fits of easy reflection, and easy transmission, than that they be small bodies, which by attraction, or some other force, excite vibrations in the bodies they act upon; which vibrations being swifter than the rays, overtake them successively, and agitate them so as by degrees to increase and diminish their velocity, and thereby put them into those fits. See TRANSMISSION.

Lastly, the unusual refraction of island crystal looks very much as if it were performed by some attractive virtue lodged in certain sides both of the rays and the crystal.

Common RAY, in optics, is sometimes used for a right line drawn from the point of concurrence of the two optical axes, through the middle of the right line which passes through the middle of the centres of the pupils of the two eyes. See AXIS.

Cone of RAYS.

Deflection of RAYS.

Inclination of incident RAYS.

Optic RAYS.

Reflexibility of the RAYS. See REFLEXIBILITY.

Principal RAY, in perspective, is the perpendicular distance between the eye, and the vertical plane or table, as some call it. See PERSPECTIVE.

Pyramid of RAYS. } See { PYRAMID of rays.

Pencil of RAYS. } See { PENCIL of rays.

RAZANT.

RAZANT flank.

Line of defence RAZANT.

RE, in grammar, &c. an inseparable particle, or preposition, added at the beginning of words, to vary, double, or otherwise modify their meaning.

The modificative *re* was first introduced by the Latins, from whom it is borrowed, into most of the modern tongues: Priscian derives it from *retro*, backwards; others rather derive *retro* from *re*; others derive *re* from the Greek *ῥεα*, easy, or from *ῥεω*, I flow.

The effect of the *re* is various: usually it signifies *again*, *re-sum*, *ava*; as in *re-joyn*, *re-sign*, *re-sume*, *re-course*, *re-bound*, *re-cite*, *re-hear*, *re-cognize*, *re-compare*, *re-double*, *re-linguish*, &c.

Sometimes it stands for *contra*, *avri*, *against*; as in *re-luctance*, *re-cumbent*, *re-cline*, &c.

Sometimes for *super*, *over*, as in *re-dundant*; sometimes for *longe*, *far*, as in *re-moving*, &c.

RE, in music. See the article NOTE.

RE, in matters of monies. See the article REE.

REACH, in the sea-language, the distance between any two points of land that lie in a right line from one another.

RE-ACTION, in physics, the action whereby a body acted upon, returns the action, by a reciprocal one, upon the agent. See ACTION.

The Peripatetics define *re-action* to be that which a passive body returns upon the agent, by means of some quality contrary to that received therefrom; in the same part where-with the agent acted; and at the same time—as if water, while it is heating by the fire, does, at the same time, cool the fire.

It was known even in the schools, that there is no action in nature, without *re-action*; and it was a maxim among them, *omne agens, agendo repatitur*.

But the equality of the actions was not known; Sir Isaac Newton established it as one of the laws of nature, that *action and re-action are equal and contrary*; or that the mutual actions of two bodies striking one against another, are exactly equal, but in contrary directions; or in other words, that by the action and *re-action* of bodies one on another, there are produced equal changes in each; and those changes are impressed towards directly contrary parts or ways. See Law of NATURE.

Thus,

Thus, whatever body presses or draws another, is equally pressed or drawn by it again: if any one press a stone with his finger, his finger is as much pressed by the stone.

If a horse by a rope, &c. draw a stone, the horse will be equally drawn by the stone; for the rope being stretched both ways alike, endeavours to relax itself again, and by that means draws the horse towards the stone, and hinders the progression of the horse, as much as it forwards that of the stone.

If any body striking against another, doth by it's force any way change it's motion, itself will undergo the same change in it's own proper motion, but towards a contrary part; from the *re-action* of that body, and the equality of it's mutual pressure.

By these actions are produced equal changes, not indeed of the velocities, but of the motions of bodies; (that is of such bodies as have no impediment any other way) for the changes of their velocities being made towards contrary parts, (because the motions are equally changed) are reciprocally proportional to the bodies themselves. See MOTION.

Some of the school philosophers deny any such thing as *re-action*, properly so called, at all; urging that action arises only from the ratio of the greater inequality; that is, we are only to account for action the excess of action, or what the agent does more than is returned by the patient. But the equality between action and *re-action*, sets aside the exception.

**READINGS**, in criticism—*Various READINGS*, *variae lectiones*, are the different manners of reading the text of authors in antient manuscripts; where a diversity has arisen from the corruption of time, or the ignorance of copists. See TEXT.

A great part of the business of the critics lies in settling the readings, by confronting the various readings of the several manuscripts, and considering the agreement of the words, and sense—The various readings in the bible and classic authors, are almost innumerable. See BIBLE.

**READINGS** are also used for a sort of commentary or gloss on a law, text, passage, or the like; to shew the sense an author takes it in, and the application he conceives to be made of it. See COMMENTARY, ANNOTATION, GLOSS, &c.

**RE-AFFORESTED**, is where a forest having been disafforested, is again made a forest—As the forest of Dean was, by an act of parliament in the 20th of King Charles II. See FOREST, AFFOREST, DISAFFOREST, &c.

**RE-AGGRAVATION**, in the romish ecclesiastical law, the last monitory, published after three admonitions, and before the last excommunication. See MONITORY.

Before they proceed to fulminate the last excommunication, they publish an aggravation, and a *re-aggravation*—Fevret observes, that in France the minister is not allowed to come to *re-aggravation*, without the permission of the bishop or official, as well as that of the lay judge. See EXCOMMUNICATION.

**REAL**, **REALE**, is applied to a being that actually exists; in which sense it coincides with *actual*. See ACTUAL. See also REALITY.

**REAL**, in law, is opposed to *personal*. See PERSONAL.

**REAL action**, that whereby the plaintiff lays title to land, &c. See ACTION.

Customs are said to be *real*; that is, they determine all inheritances within their extent; and none may dispose of them, but according to the conditions allowed by the customs where they are situate. See CUSTOM.

**REAL altitude**. See the article ALTITUDE.

**REAL character**. } CHARACTER.

**REAL chattels**. } CHATTELS.

**REAL covenant**. } COVENANT.

**REAL distinction**. } DISTINCTION.

**REAL distress**. } DISTRESS.

**REAL estate**, is that consisting in lands, tenements, &c. See ESTATE, GOODS, &c.

**REAL horizon**. See HORIZON.

**REAL optic place**. } PLACE.

**REAL patronage**. } PATRONAGE.

**REAL privilege**. } PRIVILEGE.

**REAL qualities**. } QUALITY.

**REAL root**. } ROOT.

**REAL services**. } SERVICE.

**REAL suit**. } SUIT.

**REAL writs**. } WRIT.

**REAL**, **RIAL**, or **RYAL** in commerce. See RIAL.

**REALGAR**, **RISIGALUM**, a red friable mineral substance, popularly called *red arsenic*. See ARSENIC.

*Realgar* is prepared from orpiment, by fusing it over the fire in a close vessel. See ORPIMENT.

It is of an acrimonious nature, and reputed poisonous, though not in any great degree. See POISON.

Boerhaave takes it for the same with the *sandaracha* of the antients. See SANDARACHA.

In the history of the French academy, we have an account of a cup brought to Paris by the ambassadors of Siam, and presented there, as a remedy used by that people against all diseases.

Upon an examination, which had like to have cost M. Homberg dear, he found it to be a kind of *realgar*, or red arsenic, more caustic than ours.

It's use among the Siamese, he takes to have been the same with that of *regulus* of antimony; viz. to give an emetic quality to the wine drank out of it.

As the dose of medicines is much stronger in the torrid zone than among us, (the quantity of ipecacuanha, *e. gr.* ordinarily taken by the Indians, being twenty times as great as that among us) it is very possible a cup of *realgar*, though enough to poison an European, may prove a gentle medicine to a Siamese.

**REALISE**, in commerce, a term little known in trade before the year 1710, when those immense fortunes began to be made in France and England, by the business of actions or stock. See ACTION, BUBBLE, COMPANY, &c.

By *realising* is meant the precaution many of those, who had gained most, took, to convert their paper into real effects; as lands, houses, rich moveables, jewels, plate; but above all into current species. A precaution, capable of ruining the state; but which the French regency had the wisdom to frustrate, by taking proper measures to have the money, thus ready to be hoarded up, returned to the public.

**REALISTS**, **REALISTÆ**, a sect of school philosophers, formed in opposition to the Nominalists. See NOMINALISTS.

Under the *Realists* are included the Scotists, Thomists, and all excepting the followers of Ocham. See SCOTIST, THOMIST, &c.

Their distinguishing tenet is, that universals are realities, and have an actual existence, out of an idea and imagination; or, as they express it in the school language, *a parte rei*: whereas the Nominalists contend that they exist only in the mind; and are only ideas, or manners of conceiving things. See UNIVERSAL.

Doctor Odo, or Oudart, a native of Orleans, afterwards abbot of St Martin de Tournay, was the chief of the sect of the *Realists*; he wrote three books of dialectics; where, on the principles of Boethius and the antients, he maintained that the object of that art is things, not words: whence the sect took it's rise, and name.

**REALITY**, **REALITAS**, in the schools, a diminutive of *res*, thing, first used by the Scotists to denote a thing which may exist of itself, or which has a full and absolute being of itself, and is not considered as a part of any other. See ESSE, EXISTENCE, &c.

Yet a *reality* is conceived as something less than *res*; and accordingly every *res* is supposed to contain a number of *realities*, which they otherwise call *formalities*.

Thus, *e. gr.* in a man, according to the doctrine of the Scotists, are a number of *realities*, viz. a substance, life, animal, and reason.

Some distinguish *reality* into subjective and objective. See SUBJECT, and OBJECT.

**REALM**\*, **REGNUM**, *kingdom*, a country which gives it's head or governour the denomination of king. See KING, MONARCHY, GOVERNMENT, &c.

\* The word is formed of the French, *Royaume*, which denotes the same.

**REAR**\*, a term frequently used in composition, to denote something behind or backwards in respect of another; in opposition to *van*, or *vaunt*, before. See VAN.

\* It is formed by corruption of the French, *Arriere*, signifying the same.

**REAR**, in a military sense, is used for the hind-part of an army, &c. in opposition to the *front*, or face thereof. See FRONT.

**REAR-GUARD**, is that part of an army which marches last; following the main body, to hinder or stop deserters. See GUARD.

**REAR-HALF-FILES**, are the three hindmost ranks of a battalion, when it is drawn up six deep. See FILE.

**REAR-LINE**, of an army encamped, is the second line; it lies about four or five hundred yards distant from the first line, or front. See LINE.

**REAR-RANK**, is the last rank of a battalion, or squadron, when drawn up. See RANK.

**REAR-ADMIRAL**, is the admiral of the third and last squadron of the royal fleet. See ADMIRAL, SQUADRON, and FLEET.

**REASON**, **RATIO**, a faculty, or power of the soul, whereby it distinguishes good from evil, truth from falsehood. See SOUL and FACULTY.

Or, *reason* is that principle, whereby, comparing several ideas together, we draw consequences from the relations they are found to have. See IDEA and RELATION.

Some of the later school philosophers define *reason* the comprehension of many principles which the mind successively can conceive, and from which conclusions may be drawn. See CONCLUSION.

Others conceive *reason* as no other than the understanding itself, considered as it discourses. See UNDERSTANDING and

and DISCOURSE—Chauvin thinks it better defined, an innate notion or idea, farther diffused, and arising from a continued attention.

*Reason*, Mr Lock observes, comprehends two distinct faculties of the mind, *viz.* *sagacity*, whereby it finds intermediate ideas; and *illation*, whereby it so orders and disposes of them as to discover what connection there is in each link of the chain, whereby the extremes are held together, and thereby, as it were, draws into view the truth sought for. Illation, or inference, consists in nothing but the perception of the connection there is between the ideas in each step of the deduction, whereby the mind comes to see either the certain agreement or disagreement of any two ideas; as in demonstration, in which it arrives at knowledge: or their probable connection, on which it gives or withholds its assent; as in opinion. See KNOWLEDGE and OPINION.

Sense and intuition reach but a little way: the greatest part of our knowledge depends upon deductions and intermediate ideas. In those cases, where we must take propositions for true, without being certain of their being so, we have need to find out, examine, and compare the grounds of their probability: In both cases, the faculty which finds out the means, and rightly applies them to discover certainty in the one, and probability in the other, is that which we call *reason*.

In *reason*, therefore, we may consider four degrees: *first*, the discovering and finding out of proofs. See INVENTION. *Secondly*, the regular and methodical disposition of them, and laying them in such order, as their connection may be plainly perceived. See METHOD.

*Thirdly*, The perceiving of their connection; and,

*Fourthly*, The making a right conclusion. See CONCLUSION.

*Reason* fails us in several instances: as, *first*, Where our ideas fail. See IDEA and IGNORANCE.

*Secondly*, It is often at a loss because of the obscurity, confusion, or imperfection of the ideas it is employed about—Thus, having no perfect idea of the least extension of matter, nor of infinity, we are at a loss about the divisibility of matter. See OBSCURITY.

*Thirdly*, Our *reason* is often at a stand because it perceives not those ideas which would serve to shew the certain or probable agreement or disagreement of any two other ideas.

*Fourthly*, Our *reason* is often engaged in absurdities and difficulties, by proceeding upon false principles, which being followed, lead men into contradictions to themselves, and inconsistency in their own thoughts. See AXIOM, MAXIM, PRINCIPLE, &c.

*Fifthly*, Dubious words, and uncertain signs, often puzzle men's *reason*, and bring them to a non-plus.

Though the deducing one proposition from another, be a great part of the office of *reason*, and that about which it is usually employed; yet the principal act of ratiocination is the finding the agreement or disagreement of two ideas one with another, by the intervention of a third. As a man, by a yard, finds two houses to be of the same length, which could not be brought together to measure their equality by juxtaposition. Words have their consequences as the signs of such ideas and things agree, or disagree, with what they really are; but we observe it only by our ideas. See REASONING.

Hence we may be able to form an idea of that ordinary distinction of things, into such as are *according to*, those that are *above*, and those *contrary to reason*.

*According to reason*, are such propositions, whose truth we can discover by examining and tracing those ideas we have from sensation and reflection, and by natural deduction find to be true or probable.

*Above reason* are such propositions, whose truth or probability we cannot by *reason* derive from those principles.

*Contrary to reason*, are such propositions as are inconsistent with, or irreconcilable to, our clear and distinct ideas.

Thus the existence of one God, is according to *reason*: the existence of more than one God, contrary to *reason*: the resurrection of the body after death, *above reason*.

*Above reason* may be also taken in a double sense; *viz.* above probability, or above certainty. See PROBABILITY and CERTITUDE.

They who dispute most against the power and privileges of human *reason*, do it because their own *reason* persuades them to that belief; and so, whether the victory be on their or our side, are equally defeated.

They seek to terrify us with the example of many great wits, who by following this *ignis fatuus* (so they call the only pole star God has given us to direct our course by) have fallen into wild and ridiculous opinions, and increased the catalogue of heresies to so great a number: but these men either followed not their *reason*, but made it follow their will; or first hoodwinked it by interest and prejudice, and then bad it shew them the way; or were wanting in those necessary diligences required for so doubtful a passage: or, if, without any of these, the weakness of their understanding had deceived them; the error is neither hurtful to themselves, nor would be to others, if this doctrine of governing ourselves by our own

*reason*, and not by authority and example, were established.

*Disc. concern. Hum. Reas.*

It is not the use of such liberty, but the appropriating it to ourselves, that is the cause of all the disorders charged thereon: for those who lay a restraint on other men's *reason*, have first made use of their own to settle them, and do make use of it in this very restraining of others. *Ibid.*

REASON, in matters of religion, is used in opposition to *faith*. See FAITH.

This use of the word, Mr Lock takes to be in itself very improper: for *faith* is nothing but a firm assent of the mind; which if it be regulated, as it is our duty, cannot be afforded to any thing but upon good *reason*, and so cannot be opposite to it.—See FAITH.

He that believes without having any *reason* for believing, may be in love with his own fancies, but neither seeks truth, as he ought, nor pays the obedience due to his maker, who would have him use those discerning faculties he has given him, to keep him out of mistake and error—But since *reason* and *faith* are by some men opposed, it may be necessary to consider them together.

*Reason*, as contradistinguished to *faith*, is the discovery of the certainty or probability of such propositions, or truths, which it has got by the use of its natural faculties, *viz.* by sensation or reflection.

*Faith*, on the other hand, is the assent to any proposition upon the credit of the proposer, as coming immediately from God; which we call revelation. See REVELATION, and ASSENT.

REASON, in logick and rhetoric, denotes a necessary or probable argument; or an answer to the question, *cur est?* Why is it? See ARGUMENT.

As if it be enquired, why do the subject and predicate agree? And it is answered, because they are spoke of the same thing: This last enunciation is a *reason*.

Hence, say the schoolmen, because, *quia*, is the sign or character of a reason, as *non*, no, of a negation, and *est*, is, of an affirmation.

They make three kinds of *reasons*, *rationes*; *viz.* *ratio ut*, that; *ne*, least; and *quia*, because. For, answering to a question, *cur*, why; we begin with because, *quia*; as, why do you study? that I may become learned; which is the *ratio ut*. Again, why do you study? least I should be ignorant; which is the *ratio ne*. Lastly, why is a body tangible? because matter is impenetrable; which is the *ratio quia*.

The *reason ut*, properly denotes the end, or final cause; and *reason ne*, the beginning: accordingly the one is called the beginning, the other the end; so that the *reason quia*, is left the only *reason*, properly so called.

Among metaphysicians, REASON is used in the same sense with essence; or that whereby any thing is what it is. See ESSENCE.

This is sometimes also called formal *reason*, as representing the thing under that form or nature under which it is conceived. See FORM and FORMAL.

REASON, in mathematicks. See the article RATIO.

REASON of state\*, *Ratio status*, in matters of policy, denotes a rule or maxim, whether it be good or evil, which may be of service to the state. See GOVERNMENT.

\* The phrase is borrowed from the Italians, who first used *ragione di stato* in this sense.

*Reason of state*, is properly understood of something that is necessary and expedient for the interest of the government, but contrary to moral honesty, or justice.

Politicians have a long time disputed about the *ratio status*: whether states and governments are tied down to the same laws of morality with individual persons; or whether things, otherwise immoral and unlawful, may not be practised on urgent occasions, by way of *reason of state*?

The question is, whether any thing be unlawful, or prohibited a state, that is necessary to the preservation of that state, or whether it be allowed to preserve itself on any terms?

Challenge upon REASON. See CHALLENGE.

REASONABLE *aid*, a duty which the lord of the fee antiently claimed of his tenants holding in knight's service, or on socage; towards the marrying his daughter, or the making his eldest son knight. See SERVICE, SOCAGE, &c.

This is taken away by Stat. 2. Car. II. See AID.

REASONING, RATIOCINATION, the exercise of that faculty of the mind called *reason*; or reason deduced into discourse. See REASON and DISCOURSE.

The agreement or disagreement of two ideas, does not appear from the bare consideration of the ideas themselves, unless some third be called in, and compared, either separately or conjointly therewith: the act, then, whereby from ideas thus disposed and compared, we judge this or that to be so or not so, is called *reasoning*.

Rohault defines *reasoning* to be a judgment depending on some antecedent judgment: thus; having judged that no even number can be composed of five uneven numbers; and that ten

ten is an even number ; to conclude that ten cannot be divided into five uneven parts, is a *ratiocination*, or *reasoning*. This agrees with father Malebranche's doctrine, one of the great points whereof is, that *reasoning*, on the part of the understanding, is only a meer *perceiving*. See PERCEPTION.

That ingenious author endeavours to shew, that as to the understanding, there is no difference between a simple *perception*, a *judgment*, and a *reasoning*, except in this, that the understanding perceives a simple thing without any relation to any thing else, by a simple *perception*—That it perceives the relations between two or more things in a *judgment*—And lastly, that it perceives the relations that are between the relations of things in a *reasoning*. So that all the operations of the understanding are no more than meer perceptions. See JUDGMENT.

Thus, *e. gr.* when we conclude, that 4 being less than 6 ; twice 2 being equal to 4, are of consequence less than 6 ; we do no more than perceive the relation of the inequality between the relation of twice two and four, and the relation of 4 and 6. See UNDERSTANDING.

The manner of proceeding justly in *reasoning*, so as to arrive with the greater safety at the knowledge of truth, makes what we call *method*. See METHOD.

For the real benefit of logic to *reasoning*. See LOGIC and SYLLOGISM.

RE-ATTACHMENT, in law, a second attachment of him who was formerly attached, and dismissed the court without day, by the not coming of the justices, or the like casualty. See ATTACHMENT.

Brook makes *re-attachment* either *general* or *special*—*General* is where a man is *re-attached* for his appearance on all writs of assize lying against him—*Special*, for one or more certain writs.

RE-BAPTISANTS, a religious sect who maintain that persons irregularly baptized, are to be baptized a-fresh. See BAPTISM.

The anabaptists are *re-baptists*, inasmuch as they baptize those at maturity who had been before baptized in childhood. See ANABAPTIST.

St Cyprian, and pope Stephen, had mighty differences about the rebaptization of converted heretics. See HERETIC.

Donatus was condemned at Rome in a council, for having re-baptized some persons who had fallen into idolatry after their first baptism. See DONATIST.

REBATE, REBATEMENT, in commerce, a term much used at Amsterdam, for a discount or abatement in the price of certain commodities, when the buyer advances the sum in hand for which he might have taken time. See DISCOUNT.

*Rebate* (among us is usually called *prompt payment*) is estimated by months ; and is only allowed for certain kinds of merchandizes, which, according to the custom of Amsterdam, are,

German wools,	} which are fold at	{ 15 18 33 18 21	} Months <i>rebate</i> .
Ashes, and-pot-ashes,			
Italian silks,			
Sugars of Brasil,			
Spanish wools,			

That is, these commodities are sold for ready money ; only deducting or *rebating* the interest of the money, which ought not to be paid till the end of 15, 18, &c. months.

This interest, called *rebate*, is usually regulated on the footing of 8 per cent. per annum.

The reason of this expedient is, that the merchants having not always wherewithal to pay for their goods in hand, by means of the *rebatement*, such as have, will find their account in it ; and such as have not, will be engaged to discharge themselves as soon as possible, in hopes of the discount.

REBATEMENT, in heraldry, a diminution or abatement of the dignity of the figures or bearings in a coat of arms. See ABATEMENT.

REBELLION, originally signified a second resistance, or rising of such as had been formerly overcome in battle by the Romans, and had yielded themselves to their subjection.

It is now generally used for a traitorous taking up of arms against the king, either by his own natural subjects, or by those formerly subdued.

*Rebel* is sometimes also used in our antient statutes, for a person who wilfully breaks a law ; and sometimes for a villain disobeying his lord.

Commission of REBELLION. See COMMISSION.

REBELLIOUS *assembly*, a gathering of twelve persons, or more, intending, going about, or practising, unlawfully, and of their own authority, to change any laws of the realm ; or to destroy the enclosure of any park, or ground enclosed, banks of fish-ponds, pools, conduits, &c. to the intent the same shall remain void, or that they shall have way in any of the said grounds ; or to destroy the deer in any park, fish in ponds, coney in any warren, dove-houses, &c. or to burn stacks of corn, or to abate rents, or prices of victuals. See RIOT, &c.

REBOUND. See the article RECOIL.

REBUS, a name-device, as Cambden Englishes it ; or an enigmatical representation of some name, &c. by using a figure, or picture, instead of a word, or part of a word. See NAME and DEVICE.

Such is that of the gallant, mentioned by Cambden, who expressed his love to Rose Hill, by painting in the border of his gown, a rose, a hill, an eye, a loaf, and a well ; which in the *rebus*-stile, reads, *rose hill I love well*.

The Picards have the honour of the invention of this notable kind of wit ; whence the French, to this day, call it, *rebus de Picardie*. Cambden adds, that the English first learned it of them in the reign of our Henry III. by means of the garrisons we then had in Calais, Guienne, and other places bordering on Picardy.

It's origin is by Menage, &c. ascribed to the priests of Picardy, who, it seems, antiently, in carnival-time, used every year to make certain libels entitled, *de rebus quæ geruntur*, being raileries on what intrigues and transactions had passed about the city ; wherein they made great use of such sort of equivoques and allusions, breaking and joining words, and supplying them with paintings.

Thus in the *rebus* of Picardy, says Marot, a curry-comb, *etrille* ; a scythe, *faux* ; and a calf, *veau*, make *etrille faux-veau*. But the practice has been since prohibited, by reason of the scandal.

Cambden tells us, the *rebus* was in wonderful esteem among our forefathers ; and that he was nobody who could not hammer out of his name an invention by this wit-craft, and picture it accordingly.

The sieur Des Accords, has made an ample collection of the most famous *rebus*'s de Picardy. And Mr Cambden has done something of the same kind in his Remains—The abbot of Ramsey, he tells us, engraved in his seal a ram in the sea, with this verse, to shew he was a right ram, *cujus signa gero, dux gregis est ut ego*—Sir Thomas Caval (Caval signifying a horse) engraved a galloping horse in his seal, with this limping verse, *Thomæ Creditis, cum cernitis ejus equum*—So John Eaglehead bore in his seal an eagle's head, with this motto around it, *Hoc aquilæ caput est, signumq; figura Johannis*.

Bolton, prior of St Bartholomew's, signified his name by a bolt thrust through a tun—Hilp, abbot of Westminster, a man highly in favour with Henry VII. had a quadruple *rebus* for his single name ; sometimes he set up in his windows the figure of an eye with a slip of a tree ; sometimes the letter I with the said slip ; in other places one slipping boughs in a tree ; and in others, one slipping from a tree ; with the word, *I-slip*.

Thomas, earl of Arundel, signified his name by a capital A in a rundle. Morton, the great archbishop of Canterbury, was contented to use mor upon a tun ; and sometimes a mulberry called *morus*, out of a tun. So Luton, Thornton, Ashton, &c. signified their names by a lute, a thorn, an ash, upon a tun. So a hare on a bottle was the device of Hare-bottle ; a mag-pye on a goat, of Pigot ; a hare by a sheaf of rye in the fun, of Harrison : Lionel Duckett used a lion with an L on it's head, whereas says Cambden, it should have been on it's tail : had the lion been eating a duck, adds the same author, it had been a rare device, worth a ducat or a duck-egg. Garret Dews signified his name on his sign by two men in a garret casting dews at dice.

Abel Drugger's device in Ben. Johnson's Alchymist, and Jack of Newberry in the spectator, are known to every body—But the *rebus* being once raised to sign posts, grew out of fashion at court, and has been left to hang there ever since ; indeed attempts have been lately made for it's rescue by a reverend divine, in his *Tunbridge-Love-Letters*, &c.

Yet has the *rebus* antiquity on it's side, as having been in use in the pure augustin age : Cicero, in a dedication to the Gods, inscribed Marcus Tullius, with a little pea, called by the Latins *cicer*, by us a *chick-pea*. And Julius Cæsar, in some of his coins, used an elephant, called *Cæsar* in the Mauritanian tongue. Add to these, that the two mint masters in that age, L. Aquilius Florus, and Voconius Vitulus, used, the first a flower, the second a calf, on the reverse of their coins.

REBUTTER \*, in law, the answer of the defendant in a cause to the plaintiff's surrejoinder. See SURREJOINDER.

\* This is called a *rebutter*, from *re*, and the French, *bouter*, to repel, or bar.

The plaintiff's answer to the defendant's *rebutter*, is called a *sur-rebutter*. See SURREBUTTER.

REBUTTER is also when a man warrants any land or hereditament to another ; and the person making the warranty or his heir, sues him to whom the warranty is made, or his heir or assignee, for the same thing : if he who is so sued, plead the deed or fine with warranty, and pray judgment if the plaintiff shall be received to demand the thing which he ought to warrant to the party, against the warranty in the deed, &c. this is called a *rebutter Term de Ley*, 511.

Again, If I grant to the tenant to hold *sine impetitione vasti*, and afterwards implead him for waste ; he may debar me of

the action, by shewing my grant: which is likewise a *rebutter*.

**RECANTATION.** See **PALINODY**, and **RETRACTATION**.

**RECAPITULATION**, in oratory, &c. a part of the peroration; called also, *anacephalæosis*. See **PERORATION**, &c.

*Recapitulation* is a summary of the preceding discourse; or a concise, transient enumeration of the principal things insisted on at large therein; whereby the force of the whole is collected into one view.

An instance of this may be given in the peroration of Cicero's *Manilian*: *Quare cum bellum ita necessarium sit ut negligi non possit: ita magnum ut accuratissime sit administrandum; Et cum ei imperatorem præficere possitis, in quo sit eximia belli scientia, singularis virtus, clarissima auctoritas, egregia fortuna: dubitabitis, quirites, quin, &c.*

**RECAPTION**, **RECAPTIO** in law, the taking a second distress of one formerly distrained for the same cause, and also during the plea grounded on the former distress. See **DISTRESS**.

*Recaption* is also the name of a writ lying for the party thus distrained, to recover damages.

**RECEIPT**, or **RECEIT**, in commerce, an acquittance or discharge; or an act whereby it appears a thing has been paid off, or acquitted. See **ACQUITTANCE**.

Where the receipt is on the back of a bill, &c. it is usually called an *indorsement*. See **ENDORSEMENT**.

Among tradesmen, **RECEIPT** usually makes the second of the three articles of an account: the receipt contains the moneys received; the two others the expence, and the return or balance. See **ACCOUNT**, and **BOOK-KEEPING**.

**RECEIPT**, or **RESCUIT**, in law, denotes also an admission, or receiving of any person to plead his right, in a cause formerly commenced between two other persons. See **RESCUIT**.

**RECEIPT of homage.** } See **RESCUIT**.  
**RECEIPT of the exchequer.** } See **EXCHEQUER**.  
**RECEIPT, in medicine.** } See **RECIPE**.

*Auditor of RECEIPTS.* See the article **AUDITOR**.

**RECEIVER**, a vessel used in chemistry, pneumatics, &c. See **RECIPIENT** and **EXHAUSTED**.

**RECEIVER**, **RECEPTOR**, or **RECEPTATOR**, in law; is used commonly in the evil part, for such as knowingly receive stolen goods from thieves, and conceal them—The crime is felony, and the punishment transportation.

**RECEIVER**, also denotes an officer; whereof there are various kinds, denominated from the particular matters they receive, the places where, or the persons for whom, &c.

As, *receiver of rents*: *receiver general of the customs*. See **CUSTOMS**—*Receiver of the fines*, upon original writs in chancery, &c.

**RECEIVER general** of the dutchy of Lancaster, is he who gathers all the revenues and fines of the lands of the said dutchy, all forfeitures, assessments, &c. See **DUTCHY**, &c.

**RECENT fruits.** See the article **FRUIT**.

**RECEPTACULUM chyli**, **RECEPTACULUM commune**, or *cisterna chyli*, in anatomy, a reservoir or cavity near the left kidney, into which the lacteal vessels do all discharge their contents. See **LACTEAL**.

This receiver, called also from it's inventor *dustus pecqueticus*, lies under the emulgent and great arteries, between the two origins of the diaphragma. Hither do the lacteal vessels of the second order bring the chyle after it's being diluted, and rendered thinner by the lymph in the glands of the mesentery. See **CHYLE** and **MESENTERY**.

In a preparation of this part, by filling it with mercury, Mr Cowper found it to consist of three several large trunks; two of them more than a quarter of an inch in diameter.

This division is only observed in human bodies, in whom Dr Drake thinks it's erect position makes it necessary, in order to take off the resistance which would arise from the pressure of the chyle and lymph, were it contained in a single receiver. In quadrupeds, it's horizontal position may make one trunk sufficient.

It's osculum, or exit, is upwards in the thorax, and thence called the *thoracic duct*. See **THORACIC DUCT**.

**RECEPTION**, **RECEPTIO**, in philosophy, denotes the same with *passion*, considered as opposed to *action*. See **PASSION** and **ACTION**.

The schoolmen, however, make some difference: The *receptive passion*, say they, does not tend to the destruction of the being, as passion does; but to the perfection thereof. It is conceived as the acquisition of some new reality or modification, by means of the action of another.

**RECEPTION** is also properly used for the manner of treating or entertaining a person; and the solemnities and ceremonies practised on that occasion. See **ENTRY**.

The queen of Sweden's *reception* into Paris was one of the most magnificent these ages have seen. The *reception* of embassadors is usually performed with a great deal of pomp.

**RECEPTION** is sometimes also used for the act of approving, accepting, and admitting a thing. See **ACCEPTANCE**.

The canon law only binds where it is *received*: The civil law is received in some countries, not in others. See **CIVIL LAW**. The French would never *receive* the council of Trent, the Spanish inquisition, nor the dogmata of the ultramontane canonists.

**RECEPTION**, in astrology, is a dignity befalling two planets when they exchange houses: *e. gr.* when the sun arrives in cancer, the house of the moon; and the moon, in her turn, arrives in the sun's house.

The same term is also used, when two planets exchange exaltation.

**RECEPTITIOUS goods.** See the article **GOODS**.

**RECESSION of the equinoxes.** See **PRECESSION**.

**RECESSUS imperii**, **RECESS of the empire**, a phrase used in speaking of the affairs of Germany; signifying a collection of the votes or determinations of a diet. See **DIET** and **IMPERIAL**.

At the end of each diet, before it breaks up, they gather together all their resolutions, and reduce them into writing; the act which contains them they call *recessus imperii*, because made when on the point of retiring. See **EMPIRE**.

There being, now, no articles of succours for the war against the Turks, which used to make the greatest part of the *recessus imperii*; they are at a loss for matter to fill them withall, as well as for the manner of drawing them up. *Mozambano*. The disorders in the imperial chamber of Spires were so great, that in 1654, they made several regulations therein; inserted in the *recessus imperii*. *Id.* See **CHAMBER**.

**RECHABITES**, a kind of religious order among the antient Jews, instituted by Jonadab the son of Rechab; comprehending his family and posterity.

Their founder prescribed him three things; *first*, not to drink any wine. *Secondly*, not to build any houses, but to dwell under tents. *Thirdly*, not to sow any corn, or plant any vines. The *Rechabites* observed these rules with a great deal of strictness, as appears from Jeremy xxxv. 6, &c.—Whence, St Jerom in his xiiiith epistle to Paulinus, calls them *Monachi*, *Monks*. Jonadab, their founder, lived under Jehoash, king of Judah, cotemporary with Jehu king of Israel; his father Rechab, from whom his posterity were denominated, descended from Raguel or Jethro, father-in-law to Moses, who was a Kenite, or of the race of Ken; whence *Kenite* and *Rechabite*, are used as synonymous in scripture.

**RECHACING**, in hunting, the driving back of the deer, or other beasts, into the forests, chaces, &c. which had stragled out into the copses, or thickets, &c. See **FOREST**, &c.

Antiently there were offices of *rechacers* of the deer, bestowed by the king on gentlemen, or old hunters, with salaries for the keeping of running dogs, to *rechace* the deer into the forests, and then to beat the dogs off, without pursuing any farther. See **PURLIEU**.

**RECHANGE in commerce.** See **RE-EXCHANGE**.

**RECHANGE** is also used at sea for such tackle as is kept in reserve aboard the ship, to serve in case of failure of that already in use. See **TACKLE**.

The Levantines use the word *respect* or *respit* in the same sense.

**RECHARGE**, of a fire-arm, is a second loading or charge. See **CHARGE**.

The *recharge* should never be so deep as the first charge, lest the piece being over-heated should burst. See **CANNON**, &c.

**RECHEAT**, in hunting, a lesson which the huntsman winds on the horn, when the hounds have lost their game; to call them back from pursuing a counter-scent. See **HORN**, **HUNTING**, &c.

**RECIPE**, in medicine, a prescription, or formula of a remedy, appointed to be administered to a patient. See **PRESCRIPTION**.

It is thus called, because always beginning with the word *recipe*, take; ordinarily expressed by the abbreviator *R*.

**RECIPIANGLE**, or **RECIPIENT-ANGLE**, a mathematical instrument, serving to take the quantity of angles; used especially in the drawing plans of fortifications.

The *recipiangle* is a popular instrument among the French, but little known among us: it is usually very simple, in form of a square, or rather a bevel; consisting of two arms or branches, riveted together, and yet moveable, like a sector on the centre or rivet. See **BEVEL**.

To take an angle with it, they lay the centre of a protractor to the joint, and the degrees cut by the edge shew the quantity of the angle: otherwise the angle made by the two rulers is drawn on paper, and then measured with a protractor. See **ANGLE**.

Sometimes there is a circle divided into degrees added over the centre or rivet, with an index to shew the degrees without a protractor—At other times the under branch is divided. To measure a salient angle with any of the *recipiangles*, apply the insides to the lines that form the angle; for a re-entrant angle, apply the outsides, &c.

**RECIPIENDO excommunicato.** See **EXCOMMUNICATO**.

**RECIPIENDO & faciendo attornato.** See **ATTORNATO**.

**RECIPIENT**, **RECEIVER**, in chemistry, an appendage of an alembic, retort, &c. being a vessel luted to the beak thereof,

thereof, to receive the liquor raised in distillation, &c. See ALEMBIC, RETORT, DISTILLATION, &c.

RECIPIENT is also part of the apparatus of an air-pump; being a glass vessel placed a-top of the plate, for the air to be exhausted from. See AIR-PUMP.

To an air-pump belong various *recipients*, of various forms and sizes, and serving for various purposes. See VACUUM.

RECIPROCAL, RECIPROCUS, something that is mutual, or which is returned equally on both sides, or affects both parties alike. See MUTUAL.

The end of human society is to afford each other *reciprocal* aid: there are *reciprocal* duties between the prince and his subjects, the husband and wife, &c. There is a *reciprocal* action between the agent and patient. See REACTION.

The *lex talionis* establishes a kind of *reciprocation* of justice. See TALIO.

If two similar triangles be cut by parallel lines, the sections of the sides will be proportional; and *reciprocally*, if the sides be cut proportionably, the triangles are similar. See TRIANGLE.

RECIPROCAL, in logic, is applied to terms which have the same signification, or are convertible—as, *reasonable*, *animal*, and *man*. See TERM, and SYNONYMOUS.

Schoolmen define *reciprocation*, a conversion of the several terms in an enunciation—And terms are said to be converted in an enunciation, when the predicate is put in the place of the subject, and *reciprocally*, the subject in that of the predicate. See CONVERSE and CONVERSION.

Thus rationality and risibility are said to *reciprocate*; for we say equally, *a rational is risible*; and *a risible is rational*.

RECIPROCAL, in grammar, is applied to certain verbs and pronouns in some of the modern languages; in regard of their turning or reflecting the noun, or person upon himself.

Thus the pronoun-relative *himself*, refers Cato to Cato's self. See PRONOUN.

The abbe de Dangeau defines *reciprocal verbs* to be those whose nominative is plural, and denotes persons acting mutually on one another: as, *Ces quatre hommes s'entrebattoient*; these four men fought together. *Pierre & toi vous vous louez*; Peter and you praise one another, &c.

*Reciprocal verbs* are a species of those which that author calls *pronominals*, and which he distinguishes into *reciprocal* and *identical*. See VERB.

RECIPROCAL, in poetry, is applied to verses which run the same both backwards and forwards; called also *recurrents*. See RECURRENT.

RECIPROCAL *figures*, in geometry, are such as have the antecedents and consequents of the same ratio in both figures. See *Tab. Geom. fig. 22. n<sup>o</sup>. 2.* Here,

$$A : B :: C : D, \text{ or,} \\ 12 : 4 :: 9 : 3$$

That is, as much longer as the side A, in the first rectangle, is than B; so much deeper is the side C in the second rectangle, than the side D in the first: and consequently, the length of one is compensated by the depth of the other.

Also, as the side A is  $\frac{1}{3}$  longer than the side C, so the side B is  $\frac{1}{3}$  longer than D: wherefore the rectangles must needs be equal. See RECTANGLE.

This is the foundation of that catholic theorem; that the rectangle of the extremes must always be equal to that of the means: and consequently, the reason of the rule of three, or golden rule. See RULE.

For, suppose there was given any three numbers, or quantities, geometrically proportional, as A, B, and C; and that it were required to find a fourth, D, proportional to them: since  $A : B :: C : D$ , therefore  $AB = BC$ , and consequent-

ly,  $D = \frac{BC}{A}$  that is, the fourth term is equal to the quo-

tient of the second, multiplied by the third term, divided by the first.

Or thus in numbers: suppose given 12, 4, and 9; required a fourth proportional. Now as  $12 : 4 :: 9 : Q$ .

But  $12 Q = 4 \times 9 = 36$ . Therefore  $Q = \frac{4 \times 9}{12} (= 3)$  by

dividing both sides by 12.

And hence it follows, that if any two triangles, parallelograms, prisms, parallelepipeds, pyramids, cones, or cylinders, have their bases and altitudes *reciprocally* proportional, those two figures or solids are equal to one another; and *vice versa*, if they are equal, their bases and altitudes are *reciprocally* proportionable. See TRIANGLE, PARALLELEPIPED, PRISM, CONE, CYLINDER, &c.

RECIPROCAL *proportion*, is when in four numbers, the fourth is lesser than the second, by so much as the third is greater than the first; and *vice versa*. See PROPORTION.

This is the foundation of the inverse, or indirect rule of three.

Thus;  $4 : 10 : 8 : 6$ . See RULE.

Great use is made of this *reciprocal proportion*, by Sir Isaac Newton, and others, in demonstrating the laws of motion. See MOTION.

RECIPROCAL *theorem*. See the article THEOREM.

RECITATION, the act of *reciting*, or delivering a discourse,

either in the way of narration, rehearse, declamation, or reading. See DECLAMATION, &c.

RECITATIVO, or RECITATIVE *musick*, a kind of singing, which differs but little from ordinary pronunciation: such as that wherein several parts of the liturgy are rehearsed in cathedrals, or that wherein the actors ordinarily deliver themselves on the theatre, at the opera, &c. See SINGING and OPERA. The Italians value themselves on their performance in the *recitative* way. The *recitative's*, or *recitativo's*, in our operas, usually tire the audience, by reason they do not understand the language; the songs make them amends. See SONG.

RECITATIVE *style*, is the way of writing accommodated to this sort of musick. See STYLE.

RECKONING, in navigation, the act of estimating the quantity of a ship's way; or of the distance run between one place and another. See SAILING and DISTANCE.

This is usually performed by means of the log-line; the manner of applying which see under its proper article, LOG-LINE.

Yet is this liable to great irregularities—Vitruvius advises an axis to be passed through the sides of the ship, with two large heads propending out of the ship, wherein are to be included wheels touching the water, by whose revolution the space passed over in any given time, may be measured. The same has been lately recommended by Snellius: but there are few who have wrote of navigation, but have shewn the insufficiency of this method.

Dead RECKONING. See DEAD *reckoning*.

RECLAIMING, or RECLAIMING, in our antient customs, the action of a lord pursuing, prosecuting, and recalling his vassal, who had gone to live in another place, without his permission. See LORD and VASSAL.

RECLAIMING is also used in a similar sense, for the demanding of a person or thing to be delivered up, or surrendered, to the prince or state it properly belongs to; when, by any irregular means it has come into the possession of another. See CLAIM.

An officer was sent to reclaim the vessel seized by the Algerines, contrary to the terms of the treaty of peace. The government *reclaimed* the late cashier of the South-sea company, who had refuged himself in Flanders, but in vain.

RECLAIMING, in falconry, is the calling of a hawk, or bird of prey, back to the fist. See HAWK, and FALCON.

The sparrow-hawk, gos-hawk, &c. are *reclaimed* with the voice: the falcon only by shaking the lure—So that luring with regard to the falcon, is more proper than *reclaiming*. See LURE.

The partridge is also said to reclaim her young ones, when she calls them together upon their scattering too much.

RECLINATION, of a plane, in dialling, the number of degrees which a dial-plane, leans backwards, from an exactly upright or vertical plane, *i. e.* from the zenith. See PLANE.

The *reclination* is easily found, by means of a ruler and a quadrant; for having drawn an horizontal line on the plane by a level or quadrant, and to it another line at right angles; apply a ruler, so that one end of it may hang over, or reach beyond the plane: then will a quadrant, applied to the under edge of the ruler, shew the degrees and minutes of the plane's *reclination*; accounting from that side of the quadrant that is contiguous to the edge of the ruler. See DIAL, QUADRANT, &c.

RECLINER, or RECLINING *dial*, is a dial whose plane *reclines* from the perpendicular; *i. e.* leans from you when you stand before it. See RECLINATION.

When this reclination is equal to the height of the pole, the dial is said to be equinoctial. See DIAL.

Declining RECLINER, or declining RECLINING *dial*, is a dial which neither stands perpendicularly, nor opposite to one of the cardinal points. See DECLINER.

RECLUSE, among religious, a person close shut up in a very narrow cell of a hermitage, or other religious house; and cut off, not only from all conversation with the world, but even with the house. See HERMIT, &c.

The word is chiefly used for such as thus imprison themselves out of devotion, to do penance—It is sometimes also applied to incontinent wives, whom their husbands procure to be thus kept in a perpetual prison in some convent. See ADULTERY, &c.

*Recluses* were antiently very numerous: they were then a kind of solitaries who shut themselves up in some little cell, with a vow never to stir out of it. See MONK, ANACHORET, &c. None were admitted to this oath until they had given sufficient proofs of their abstinence, and had leave from the bishop, or the abbot of the monastery where they were shut up: for the cells of the *recluses* were always to join to some monastery.

The prelate's permission being obtained, they were tried for a year in the monastery; out of which, during that time, they never stirred. See PROBATION.

They were then admitted to their vow of stability in the church before the bishop; which being done, and the *recluse* entered his little cell, the bishop set his seal on the door.

The

The cell was to be very small, and very exactly closed. See CELL.—The *recluse* was to have every thing within it necessary to life; and, even, if he were a priest, an oratory consecrated by the bishop, with a window which looked into the church, through which he might make his offerings at the mass, hear the singing, sing himself with the community, and answer those who talked to him. But this window was to have curtains before it, both within-side and without; so that the *recluse* might neither see nor be seen.

Indeed he was allowed a little garden in his *reclusion*, to plant a few herbs and take fresh air: adjoining to his cell was that of his disciples, which he was very rarely without; with a window, through which they served him with necessaries, and received his instructions.

When it was judged proper to have two or three *recluses* together, their cells were made contiguous to each other, with windows of communication: if any woman would consult them, or confess to them, it was to be in the church, and in the face of all the world.

Where there were two or three *recluses* together, they were never to hold any conference, but on spiritual matters; and to confess to each other: where there was but one, he was to confess and examine himself.

If the *recluse* fell sick, his door was opened for people to come in and assist him; but he was not allowed to stir out on any pretence whatever.

These articles are extracted from the rule, compiled for the *recluses*, by Grimalic, a priest in the IXth century.

There were also women *recluses*, who led the same life, in proportion. St Viborade lived a *recluse* at St Gall, and was there martyred by the Hungarians in 825. See RECLUSION.

RECLUSION, the state of a recluse; or the cell and other appurtenances thereof. See RECLUSE.

F. Helyot gives a particular account of the ceremonies practised in the *reclusion* of a woman, in that of mother de Cambray, institutrix of the order of the presentation of Notre Dame. A cell being built for her in 1625, adjoining to the church of St Andrew in Tournay: the bishop waited for her early in the morning at the church door. Upon her arrival, prostrating herself at the feet of that prelate, he gave her his benediction, conducted her to the grand altar; and there blessing a mantle, veil, and scapular, put them on her, and gave her a new name.

Having here made her vow, and the bishop having harangued the people in praise of the new *recluse*, he conducted her processionally to her *reclusion*; the clergy all the way singing *Veni sponsa Christi*, &c.

Here the bishop blessing her a-fresh, consecrated the *reclusion*, and shut her up in perpetual confinement.

RECOGNISANCE. See the article RECOGNIZANCE.

RECOGNITION, RECOGNITIO, denotes an acknowledgment.—The word is particularly used in our law-books, for the title of the first chapter of the Stat. 1 Jac. I, whereby the parliament acknowledged the crown of England, after the death of queen Elizabeth, to have rightfully descended to king James.

RECOGNITION, in the drama. See DISCOVERY.

RECOGNITIONE *adnullanda per vim et duritiam facta*, is a writ to the justices of the common-bench, for sending a record touching a recognizance, which the recognizer suggests to have been acknowledged by force and hard dealing: that if it so appear it may be disannulled. See RECOGNIZANCE.

*Transcriptio RECOGNITIONIS factæ coram iusticiariis itinerantibus.* See TRANSCRIPTIO.

RECOGNIZANCE, or RECOGNISANCE, in law, a bond, or obligation of record acknowledged to the king; testifying the recognizer to owe to the recognizee, a certain sum of money.

It is thus called, because *recognized*, or acknowledged in some court of record, or before some judge, master in chancery, or justice of the peace.

Meer *recognizances* are not sealed, but enrolled; and execution, by force thereof, is of all the recognizer's goods or chattels (except draught beasts, or implements of husbandry) and the moiety of his land.

There are also *recognizances* for bail, others for appearing at the sessions to prosecute a felon, others for good behaviour, &c.

RECOGNIZANCE is also used in our antient statutes, for the verdict of the twelve jurors impanelled upon an assize; hence called *recognitors*. See JURY and VERDICT.

RECOGNIZEE, is he to whom one is bound in a recognizance.—He that is so bound is called RECOGNIZOR.

RECOIL, or REBOUND, the resiliency of a body, chiefly a fire-arm; or the motion whereby, upon explosion, it starts or flies backwards. See GUN, MORTAR, &c.

The greater the charge, *ceteris paribus*, the greater the rebound.—By an experiment made before the royal society, and related in the *Philos. Transact.* it was found that cannons charged to a certain degree, throw the ball from right to left

of their own direction; but that the cannons themselves *recoil* from left to right.

Some of the gentlemen of the French academy, doubting the justness of the observation, Mr Cassini, the younger, undertook to repeat the experiment; which he did by means of a machine, as like that used in England as he could; and that tried over, and over again.

The result was, that the ball, when the gun had liberty to *recoil*, was always thrown to the right of the point to which it was thrown when the gun was fixed without a possibility of rebounding; but then the *recoil* was always made the same way, *viz.* to the right; and he never found that contrariety of directions between the ball and the rebound, observed in the English experiment. See *Hist. Acad. R. Scienc. A.* 1703. p. 120, &c.

The cause of the Phenomena seems very difficult to assign: for supposing the guns of a common make, with the touch-hole on the top, we cannot so much as guess what cause should constantly determine the ball from right to left.—Unless some very material circumstances be omitted in the recital they have given us of the experiment.

RECOLLECTION, a mode of thinking, whereby those ideas sought after by the mind, are with pain and endeavour found, and brought again to view. See MEMORY, REMINISCENCE, MODE, THINKING, &c.

RECOLLECTS, a congregation of reformed Franciscans, called also *Friars minor of St Francis, of the strict observance.* See FRANCISCAN.

They were established about the year 1530; when some religious of the order of St Francis, willing to keep his rule to the letter; Clement VII. gave them houses, particularly Tullies in the Limosin, and Murat in Auvergne, whither they might retire, and receive such as were disposed to follow them.—The same year he approved the reform; and in 1584 it was carried into Italy.

RECOMMENDATI. See AFFIDATUS.

RECONCILIARI, in our law-books, &c.—A church is said *reconciliari*, to be *reconciled*, when it is consecrated a-fresh, after having been polluted or profaned; as by the possession of pagans, heretics, &c. See CHURCH, CONSECRATION, PROFANATION.

RECONNOITRE\*, in war, to go view and examine the state of things, in order to make a report thereof.

\* The word is pure French, signifying literally, to know, collect.

We say, to *reconnoitre* the coasts, to *reconnoitre* a port, &c.—

A body of horse was sent to *reconnoitre* their camp, the ground, the condition of the roads, rivers, &c.

A general is to go *reconnoitre* in person, the place to be besieged, in order to learn it's situation, avenues, it's strengths and weaknesses.

RECONNOITRE is also used at sea—To *reconnoitre* a vessel, a fleet, &c. is to approach near enough to examine the rate and burthen of a vessel, &c. the force it may have a-board, what nation it is of, &c.

To *reconnoitre* a land, or shore, is to observe it's situation, in order to find what land it is.

RECORD, RECORDUM, in law, an authentic testimony of any thing in writing, contained in rolls of parchment, and preserved in a court of record. See COURT, ROLL, &c.

Records are said to be *vetustatis, et veritatis, vestigia*—An act committed to writing in any of the king's courts, during the term wherein it is written, is alterable; being no record: but that term once ended, and the act enrolled, it is a record, and of such credit, as admits no alteration, or proof to the contrary.

Lawyers reckon three sorts of records: *viz.* a judicial record, as attainder, &c.—a ministerial record upon oath, as an office of inquisition found—and a record made by conveyance and consent, as a fine, or deed enrolled, and the like.

Matter of RECORD.

Myster of RECORD.

Oyer de RECORD.

Prisoner upon matter of RECORD.

} See { MATTER.  
MUSTER.  
OYER.  
PRISONER.

RECORD, among fowlers: a bird is said to *record*, when it begins to tune, or sing within itself; to form it's notes, and dispose it's organs for singing.

The cock thrush is distinguished from the hen in *recording*; the first being more loud and frequent than the second.

RECORDARE *facias*, a writ directed to the sheriff to remove a cause depending in an inferior court, as hundred-court, county-court, court of antient demesne, &c. to the king's-bench, or common-pleas.

It is thus called, because it commands the sheriff to *make a record* of the proceedings either by himself, or others; and then to send up the cause.

RECORDER, RECORDATOR, a person whom the mayor, or other chief magistrate of any city or town corporate having jurisdiction and a court of record within their precincts, does associate with him, for his better direction in

in matters of justice, and proceedings according to law. See MAYOR, &c.

He is usually a man versed and experienced in the common law—In some towns which have their particular assizes within themselves, and no mayor, the recorder is the judge.

**RECORDO** & *processo mittendis*, is a writ to call a record, together with the whole proceedings in the cause, out of an inferior court, into the king's court.

**RECOVERY**, in a legal sense, an obtaining of any thing by judgment, or trial at law: answering to *evictio* among the civilians. See JUDGMENT and TRIAL.

There is a true and a feigned recovery.

**True RECOVERY** is an actual or real recovery of any thing, or the value thereof, by judgment—as if a Man sue for any land, or other thing, and have a verdict, and judgment for him.

**Feigned, or common RECOVERY**, is a sort of *fielto juris*; being a certain form or course prescribed by law to be observed for the better assuring of lands and tenements to us; the end and effect whereof is to discontinue and destroy estates tail, remainders, and reversions, and to bar the entails thereof. See TAIL, REMAINDER, REVERSION, &c.

This recovery is either with a single, or a double voucher.

**In RECOVERY with a single voucher**, there are three parties required, the demandant, the tenant, and the vouchee.

The demandant is he who brings the writ of entry, and may be termed the *recoverer*—The tenant is he against whom the writ is brought, and may be called the *recoveree*—The vouchee is he whom the tenant voucheth, or calls to warrant for the land in demand. See VOUCHER.

**RECOVERY with double voucher**, is where the tenant voucheth one, who voucheth another, or the common vouchee.

The point is a little quaint, and perplexed: to explain it, suppose a Man desirous to cut off an estate tail in lands or tenements, to the end that he may sell, give, or bequeath them; the first thing he does, is to cause a feigned writ of entry, *sur disseisin in le post*, to be brought, of the lands of which he intends to dock the entail; and in a feigned declaration thereupon made, pretends he was disseised by him, who by a feigned fine, or deed of bargain and sale, is named and supposed to be tenant of the lands.

This feigned tenant, if it be a single recovery, is made to appear, and vouch a poor fellow, the bag-bearer of writs of the custos brevium of the common-pleas; (where alone these common recoveries are allowed) who makes default: upon which a judgment is by this fiction entered, that the demandant shall recover, and have a writ of seisin for the possession of the lands in question; and that the tenant shall recover the value of the lands against the lands of the vouchee bag-bearer, (who has not a foot of land) which is an imaginary satisfaction for the heir in tail, though he is to be never the better for it. See ENTAIL.

By this means one Edward Howes, a bag-bearer, and common vouchee, in the space of 20 years, passed, or suffered to be recovered against him, a great part of the lands of England; obliging his own lands to answer the value of those recovered against the tenants or remainders in tail.

*Clerk of enrollments of RECOVERIES and fines.* See CLERK.

**RECOUPE\***, in law, to rebate or discount. See REBATE and DISCOUNT.

\* The word is pure French, formed of *re* and *couper*, to cut again.

Thus, if a man have ten pounds issuing out of certain lands, and he disseises the tenant of the land; in an assize brought by the disseisee the disseisor shall *recoupe* the rent in the damages.

**RECOUPE**, also denotes a quick sharp reply to a peremptory demand. See REPARTEE.

**RECREANT**, in our old law-books, implies cowardly, faint-hearted. See CHAMPION, COMBAT and DUEL.

Hence, *recreantise*. See the article CRAVEN.

*Recreant* was so reproachful a word, that Glanville would not describe it—*Recreantes equi* is used by Fleta, lib. 2. cap. 2. for dull, jaded horses.

**RECREMENT**, **RECREMENTUM**, in medicine, some superfluous matter mixed with other that is useful. See FÆCES.

In which sense it amounts to much the same with *feces*, or excrement. See FÆCES and EXCREMENT.

**RECREMENT** is sometimes also used to denote such secreted juices in the body, as are afterwards of use to the œconomy: as the lymphæ, gall, &c. — which are thus called in contradistinction to *excrements*, which are expelled out of the body, as of no farther use. See EXCREMENT.

**RECRIMINATION**, a posterior accusation brought by the accused against his accuser, upon the same fact. See ACCUSATION.

When two parties have made their mutual complaint at the same time; the business is first, to determine who shall be the accuser, and who the accused; i. e. on whom shall fall the *recrimination*.

VOL. II. N° 129.

By the French laws, *recrimination* is of no force till the criminal have been purged legally.

**RECRUDESCENCE**, **RECRUDESCENTIA**, in medicine, is, when a disease that was gone off returns again. See RELAPSE.

**RECTANGLE**, in geometry, called also *oblong*, and *long square*, a quadrilateral rectangular figure, (M L I K, Tab. Geometry, fig. 60) whose opposite sides (O P and N Q, as also O N and P Q) are equal. See QUADRILATERAL.

Or, a *rectangle* is a parallelogram, whose sides are unequal, but angles right. See PARALLELOGRAM.

To find the area of a *rectangle*; measure the length of the sides M L and M I; and multiply them by one another: the product is the area of the *rectangle*.

Thus M L being = 345 foot, and M I = 123 foot; the area will be found 42435 square feet.

Hence, 1<sup>o</sup>, *rectangles* are in a ratio compounded of that of their sides M L and I K; and therefore *rectangles* which have the same height, are to each other as their bases; and those which have the same base are to each other as their heights.

2<sup>o</sup>, If therefore there be three lines in continual proportion; the square of the middle one is equal to the *rectangle* of the two extremes. See PROPORTION.

3<sup>o</sup>, If there be four right lines in continual proportion; the *rectangle* under the extremes is equal to the *rectangle* under the middle terms.

4<sup>o</sup>, If from the same point A fig. 61. be drawn two lines; one whereof, A D, is a tangent to a circle, the other a secant A B: the square of the tangent A D, will be equal to the *rectangle* under the secant A B; and that part of it without the circle, A C.

5<sup>o</sup>, If two or more secants A a, A B; &c. be drawn from the same point A; the *rectangles* under their wholes and their parts without the circle, will be equal. See SECANT.

6<sup>o</sup>, If two chords intersect each other, the *rectangles* under their segments will be equal. See CHORD.

*Similar RECTANGLES.* See the article SIMILAR.

**RECTANGLE**, in arithmetic, is the same with *product* or *factum*. See PRODUCT and MULTIPLICATION.

**RECTANGLED, RIGHT-ANGLED, triangle**, is a triangle, one of whose angles is right, or equal to 90<sup>o</sup>.

There can be but one right angle in a plain triangle; therefore a *rectangled triangle*, cannot be equilateral. See TRIANGLE.

**RECTANGULAR**, in geometry, is applied to figures, and solids which have one or more angles right. See ANGLE, &c.

Such are squares, *rectangles*, and *rectangled triangles* among plain figures; cubes, parallelepipeds, &c. among solids. See FIGURES, SOLID, &c.

Solids are also said to be *rectangular* with respect to their situation: thus, if a cone, cylinder, &c. be perpendicular to the plane of the horizon, it is called a *rectangular* or *right cone*, cylinder, &c. See CONE and CYLINDER.

The antients used the phrase *rectangular section of a cone*, to denote a parabola; that conic section, before Apollonius, being only considered in a cone whose section by the axis would be a triangle, right-angled at the vertex.

Hence it was that Archimedes entitled his book of the quadrature of the parabola, by the name of *rectanguli conis sectio*.

**RECTANGULAR barometer.** } See { BAROMETER.

**RECTANGULAR windmills.** } See { WINDMILLS.

**RECTIFICATION\***, the act of *rectifying*, i. e. of correcting, remedying, or redressing some defect or error, in respect either of nature, art, or morality. See RIGHT, RECTITUDE, &c.

\* The word is compounded of *rectus*, right, direct, and *facio*, I become.

**RECTIFICATION**, in chemistry, is the repeating of a distillation or sublimation several times; in order to render the substance purer, finer, and free from aqueous, or earthy parts. See DISTILLATION.

*Rectification* is a reiterated depuration of a distilled matter, e. gr. brandy, spirits, or oils; by passing them again over their faces, or marc, to render them more subtle, and exalt their virtues. See SPIRIT, &c.

Fixed salts are *rectified* by calcination, dissolution, or filtration. See SALT, DISSOLUTION, &c.

Metals are *rectified*, i. e. *refined*, by the *coppel*; regulus's, by repeated fusions, &c. See METAL, REFINING, &c.

**RECTIFICATION**, in geometry, is the finding of a right line equal to a curve. See CURVE.

All we need to find the quadrature of the circle, is the *rectification* of it's circumference; it being demonstrated, that the area of a circle is equal to a *rectangled triangle*, whose two sides comprehending the right angle, are the radius, and a right line equal to the circumference. See CIRCLE and CIRCUMFERENCE.

To *rectify* the circle, therefore, is to *square* it: or rather both the one and the other are impossible—For the various attempts

tempts to rectify the circle in order to the quadrature, &c. See *QUADRATURE of the circle*.

The *rectification of curves* is a branch of the higher geometry; wherein the use of the new-invented integral calculus, or inverse method of fluxions, is very conspicuous—For, since a curve line may be conceived to consist of innumerable right lines, infinitely small; if the quantity of one of them be found, by the differential calculus; their sum, found by the integral calculus, gives the length of the curve.

Thus, if  $MR$  (*Tab. Analysis. fig. 18.*)  $= dx$ , and  $mR = dy$ ;  $Mm$ , or the element of the curve will be  $\sqrt{dx^2 + dy^2}$ . See *ELEMENT*.

If then, from the differential equation, to the particular curve, we substitute the value either of  $dx^2$ , or of  $dy^2$ , we shall have the particular element, which being integrated, gives the length of the curve. See *CALCULUS Integrabilis* and *FLUXIONS*.

Indeed the element of the curve is sometimes more commodiously determined from some particular circumstances; instances whereof we shall give in the *rectification of the parabola and cycloid*.

To RECTIFY the parabola—For this we have

$$\begin{aligned} adx &= 2ydy \\ a^2 dx^2 &= 4y^2 dy^2 \\ dx^2 &= 4y^2 dy^2 : a^2 \\ \sqrt{(dx^2 + dy^2)} &= \sqrt{(dy^2 + 4y^2 dy^2 : a^2)} = dy \sqrt{(aa + 4yy : a)} \end{aligned}$$

To render this element of the curve integrable; let it be resolved into an infinite series; (see *SERIES*.) Then in the general theorem.

$$n = 2 \quad m = 1 \quad P = a^2 \quad Q = 4y^2 : a^2 \quad P^n : n = a = A$$

$$\frac{m}{n} A Q = \frac{1}{2} a \cdot 4y^2 : a^2 = -2y^2 : a = B$$

$$\frac{m-n}{2n} B Q = -\frac{1}{4} \cdot \frac{2y^2 \cdot 4y^2}{a^2} = -\frac{2y^4}{a^3} = C$$

$$\frac{m-2n}{3n} C Q = -\frac{1}{3} \cdot \frac{2y^4 \cdot 4y^2}{a^3} = -\frac{4y^6}{a^5} = D$$

$$\frac{m-3n}{4n} D Q = -\frac{1}{4} \cdot \frac{4y^6 \cdot 4y^2}{a^5} = -\frac{10y^8}{a^7}, \text{ \&c. in infinitum.}$$

$$\text{Wherefore, } dy \sqrt{(aa + 4yy)} : a = dy + \frac{2y^2 dy}{a^2} - \frac{2y^4 dy}{a^4} +$$

$$\frac{4y^6 dy}{a^6} - \frac{10y^8 dy}{a^8}, \text{ \&c. Whose integral } y + \frac{2y^3}{3a^2} - \frac{2y^5}{5a^4} +$$

$$\frac{4y^7}{7a^6} - \frac{10y^9}{9a^8}, \text{ \&c. In infinitum expresses the parabolic arch } AM.$$

Hence, first, let  $AC$ , and  $DC$  (*Tab. Analysis, fig. 19.*) be the conjugate semi-axes of an equilateral hyperbola; then will  $AC = DC = a$ . Suppose  $MP = 2y$ ,  $QM = x$ ; then will  $AP = x - a$ ; consequently, by reason of  $PB$ .  $AP = PM^2 : xx - aa = 4yy$ , and hence  $xx = 4yy + aa$ ; consequently,  $x = \sqrt{(4yy + aa)}$ . If then  $qm$  be supposed infinitely near  $QM$ , we shall have  $Qq = dy$ ; and therefore the element of the area  $CQMA = dy \sqrt{(aa + 4yy)}$ . The *rectification* of the parabola therefore depends on the quadrature of the hyperbolic space  $CQMA$ .

It is to be here noted that all integrations or summations are reduced to the quadratures of curves; in what cases soever they be used: so that to have them perfect, the rule laid down under *quadrature of the logistic curve*, must be observed throughout.

To RECTIFY the cycloid—Let  $AQ = x$ ,  $AB = 1$ , (*fig. 27.*) then will  $Qq = MS = dx$ ,  $PQ = \sqrt{(x - xx)}$ . And hence  $AP = \sqrt{x - x^{1:2}}$ ; consequently by reason of the similitude of the triangles  $APQ$  and  $MmS$ ,

$$AQ : AP :: MS : Mm$$

$$x : x^{1:2} :: dx : x^{-1:2} \cdot 2dx$$

Therefore  $Mm$  is the differential of the cycloidal arch  $AM = x^{-1:2} \cdot 2dx$ . Wherefore  $\int x^{-1:2} \cdot 2dx = 2x^{1:2} = 2 \sqrt{x}$   $AP$  is the arch  $AM$ .

The *rectification* of curves Mr de Moivre shews may be obtained by considering the fluxion of the curve as an hypotenuse of a rectangular triangle, whose sides are the fluxions of the ordinate and abscissa: care being taken in the expression of this hypotenuse, that only one of the fluxions be remaining, as also only one of the intermediate quantities, viz. that whose fluxion is retained: an example will render this clear.

The right sine  $CB$  (*fig. 20.*) being given, to find the arch  $AC$ .—Let  $AB = x$ ,  $CB = y$ ,  $OA = r$ . CE the fluxion of the abscissa, ED the fluxion of the ordinate, CD the fluxion of the arch  $CA$ . From the property of the circle  $2rx - xx = yy$ , whence  $2rx - 2xx = 2yy$ , and therefore  $\dot{x} = \dot{y}$ . But

$$CD q = \ddot{y} + \ddot{x} = \ddot{y} + r - x \frac{y^2 \ddot{y}}{rr - 2rx + xx} = \frac{\ddot{y}}{rr - yy} + \frac{y^2 \ddot{y}}{rr - yy}$$

$$= \frac{rr \ddot{y}}{rr - yy}; \text{ therefore } CD = \frac{\ddot{y}}{\sqrt{rr - yy}} = \frac{1}{\sqrt{rr - yy}} + \frac{y^2 \ddot{y}}{\sqrt{rr - yy}}$$

$$+ rr - yy$$

And consequently, if  $rr - yy$  be thrown into an infinite series, and the several members of it be multiplied into  $\ddot{y}$ , and then the flowing quantity of each be taken, we shall have the length of the arch  $AC$ .

RECTIFIED *spirits*, &c. are such as have undergone the operation of *rectification*, or have been distilled over and over, to separate from them any heterogeneous matter, which might have arisen with them in the former distillations. See *RECTIFICATION*.

Hence we say, spirit of wine twice *rectified*, thrice *rectified*, &c. See *SPIRIT*.

It is the *rectification* that makes the difference between brandy and *rectified* spirits of wine. See *BRANDY*.

RECTIFIER, in navigation, is an instrument used for determining the variation of the compass, in order to *rectify* the ship's course, &c. See *VARIATION* and *COURSE*.

It consists of two circles, either laid upon, or let into one another, and so fastened together in their centres that they represent two compasses, the one fixed, the other moveable; each divided into 32 points of the compass, and 360 degrees, and numbered both ways, from the north and the south, ending at the east and west in 90 degrees.

The fixed compass represents the horizon, in which the north, and all the other points are liable to variation.

In the centre of the moveable compass is fastened a silk thread, long enough to reach the outside of the fixed compass. But if the instrument be made of wood, an index is used instead of the thread. See *COMPASS*.

RECTIFYING of curves. See *RECTIFICATION*.

RECTIFYING of the globe, or sphere, is a previous adjusting of the globe or sphere, to prepare it for the solution of problems. See *GLOBE* and *SPHERE*.

It is done by bringing the sun's place in the ecliptic on the globe, to the graduated side of the brass meridian; elevating the pole above the horizon, as much as is the latitude of the place: fitting the hour index exactly to twelve at noon; and screwing the quadrant of altitude (if there be occasion) to the zenith.

All this is comprehended under the term, *rectifying the globe*. When this is done, the celestial globe represents the true posture of the heavens, for the noon of that day it is rectified for.

RECTILINEAR, RIGHT-LINED, in geometry, is applied to figures whose perimeter consists of right lines. See *FIGURE*, *PERIMETER*, *LINE*, &c.

RECTILINEAR angle.

RECTILINEAR maps.

RECTILINEAR superficies.

ANGLE.

MAPS.

SUPERFICIES.

RECTITUDE, RECTITUDO, RECTUM, in matters of philosophy, refers either to the act of judging, or of willing; and therefore whatever comes under the denomination of *rectitude*, is either what is true, or what is good: these being the only objects about which the mind exercises it's two faculties of judging and willing. See *TRUTH* and *GOOD*.

*Rectitude of the mind*, considered as it judges, i. e. of the faculty of judgment, consists in it's agreement and conformity to the nature and reason of things; in it's determining and deciding about them according to what their constitutions, properties, uses, &c. really are. See *JUDGMENT*. See also *LOGIC*, &c.

*Rectitude of the mind*, considered as it wills, called also *moral rectitude*, or *uprightness*, consists in the choosing and pursuing of those things which the mind, upon due inquiry and attention, clearly perceives to be good; and avoiding those that are evil. See *WILL*.

RECTITUDINES, in law, rights, or legal dues, belonging either to God or Man. See *RIGHT*.

RECTO, in law, a writ usually called a *writ of right*; of so high a nature, that whereas other writs in real action are only to recover the possession of the lands, &c. in question, lost by the plaintiff or his ancestor; this aims to recover both the seisin thus lost, and the property of the thing: so that both rights are here pleaded together; that of *property*, and that of *possession*. See *PROPERTY* and *POSSESSION*.

If a man lose his cause upon this writ, he is without all remedy. See *RIGHT*.

There are two kinds of this writ: *breve magnum de recto*, or *breve de recto patens*, a writ of right patent; and *recto clausum*, a writ of right close.

The first is so called, because sent open—It lies only for him that hath fee-simple in the lands sued for, against the tenant of the freehold at least.

Indeed, the writ of right patent is extended in practice beyond it's original intention: for a writ of right of dower, which lies for the tenant indower, is patent; and so in several other cases. *Fitzherb.*

The writ of right close, called also *breve parvum de recto*, is directed to the lord of ancient demesne, or the bailiff of the king's manors, and lies for those who hold lands and tenements by charter, in fee-simple, or in fee-tail, or for term of life, or in dower, if they be ejected out of such lands or disseised.

In

In such a case a man or his heirs may sue out the writ of right close, directed to the lord of antient demesne, commanding him to do him right in his court.

**RECTO de advocacione ecclesiæ**, a writ of right, lying where a man has right of advowson in fee to him and his heirs, and the incumbent dying, a stranger presents his clerk to the church: and he not having brought his action of *quare impedit* nor *darrien presentment* within six months, has suffered the stranger to usurp upon him.

**RECTO de custodia terræ & hæredis**, a writ which lies for him whose tenant dying in his nonage, a stranger enters and takes the body of the heir.

This writ as to lands holden in *capite*, or by knight's service, is become useless by the Stat. 12. Car. II. But not where there is a guardian in socage, or appointed by the last will of the ancestor.

**RECTO de dote**, a writ of right of dower, which lies for a woman that has received part of her dower, and proceeds to demand the remnant in the same town against the heir or his guardian. See **DOWER**.

**RECTO de dote unde nihil habet**, is a writ of right which lies in case where the husband having divers lands and tenements, has assured no dower to his wife; and she is thereby driven to sue for her thirds against the heir, or his guardian.

**RECTO de rationabili parte**, a writ that lies between privies of blood, as brothers in gavel-kind, or sisters, or other copartners, as nephews and neices; and for land in fee-simple.

If a man leave his land for life, and afterwards die, leaving issue two daughters, and after, the tenant for life likewise dies; the one sister entering on all the land, and so deforming the other, the sister so deformed shall have this writ to recover her part.

**RECTO quando dominus remisit**, a writ of right, which lies in case where lands or tenements in the seignior of any lord, are in demand by a writ of right.

If the lord hold no court; or at the prayer of the demandant or tenant, send his writ to the king's court, to put the cause thither for that time; this writ issues for the other party, and has its name from the words comprised, which is the true occasion thereof.

**RECTO sur disclaimer**, a writ which lies where the lord, in the court of common pleas does avow upon his tenant, and the tenant disclaims to hold of him; upon which disclaimer the lord shall have this writ.

**RECTO folio**. See the article **FOLIO**.

**RECTOR**, of a parish, the *parson*; or he who has the charge or cure of a parish church. See **PARSON**.

If the predial tithes of the parish be impropriated, or appropriated, *i. e.* either in lay hands, or in those of some ecclesiastical community, instead of *rector*, the parson is called *vicar*. See **VICAR** and **IMPROPRIATION**—In England are reckoned 3845 rectories. See **PARISH**.

The name *rector* denotes him governor, or ruler, *quia tantum jus in ecclesia parochiali habet, quantum prælatus in ecclesia collegiata*. See **PARSONAGE**.

**RECTOR**, also denotes the chief elective officer in several foreign universities; particularly that of Paris. See **UNIVERSITY**.

The *rector* is chosen afresh every three months: antiently he was chosen every six weeks. The alteration was made by the legate of pope Nicholas III. in 1278.

The *rector* is chosen out of the faculty of arts—While that faculty, and the faculty of theology were united, one officer had the inspection of both, under the title of *chancellor*: upon their division, a *rector* was created.

The *rector* makes a solemn procession four times a year, attended by the doctors, bachelors, &c. in their formalities.

**RECTOR** is also used in several convents for the superior, or officer who governs the house. See **SUPERIOR**.

The Jesuits use it for the superiors in such of their houses, as are either seminaries or colleges. See **JESUIT**, **COLLEGE**, **SEMINARY**, &c.

**RECTORY**, or **RECTORATE**, **RECTORIA**, a parish-church, parsonage, or spiritual living, with all its rights, glebes, and tithes. See **CHURCH**, **PARISH**, **PARSON**, **RECTOR**, &c.

**RECTUM**, in law. See **RECTO**, **RIGHT** and **RECTITUDE**.

**RECTUM**, in our old law-writers, is also used for a trial or accusation. See **TRIAL**, &c.

**Commune RECTUM**, denotes a trial at law, or in the common course of law—*Stare ad rectum*, denotes to stand a trial—*Rectum rogare*, to petition the judge to do right.

**RECTUM**, in anatomy, denotes the third and last of the large intestines—See *Tab. Anat. (Splanchn)* fig. 9. lit. f. See also **INTESTINE**.

It is thus called, because it passes straight from the os sacrum to the anus; without making any turns or circumvolutions, as all the other guts do.

Its length is usually about a hands-breath; and its capacity, the thickness of three fingers—Its upper part is tied fast to

the ossa sacrum and coccygis, by means of the peritonæum; and in men to the neck of the bladder, in women to the vagina uteri: its lower end, the anus, is furnished with three muscles. See **ANUS**.

The first, is the sphincter and serving to shut it, and prevent the excrements from passing out involuntarily. See **SPHINCTER**, &c.

The other two, are the levatores ani, which serve to raise or pull back the *rectum* after the expulsion of the excrements; which, especially after hard stools, is apt to be too far protruded. See **LEVATOR ANI**.

**RECTUS**, in anatomy, a name common to several muscles; on account of the straightness of the course of their fibres, from their origin to their insertion; having particular denominations from the parts to which they minister, as the *Rectus abdominis*, *rectus femoris*, *rectus capitis lateralis*, *major externus*, *minor externus*, *major internus*, *minor internus*, and *rectus palpebræ*.

**RECTUS abdominis**, is a muscle of the lower belly, which arises from the sternum, and the extremity of the last two ribs; and goes straight down to the fore-part of the abdomen, to be inserted in the os pubis.—See *Tab. Anat. (Mysl.)* fig. 1. n. 47. fig. 2. n. 28. See also **ABDOMEN**.

It hath three or four innervations, or rather tendinous contractions of its fleshy fibres, which divide the belly of it, as it were, into so many distinct muscles.

It has veins and arteries, which creep on its inside from the mammillary and epigastric vessels, which communicate together, that the blood may return by the mammillary veins, when the passage is stopped by the epigastric which are compressed in women with child.

**RECTUS femoris**, is a muscle of the leg, which arising from the lower part of the spine of the ilium, and descending between the two vasti, is inserted into the patella.—See *Tab. Anat. (Mysl.)* fig. 1. n. 53. See also **FEMUR**.

**RECTUS palpebræ**, is a muscle which lifts up the eyelid. It arises from the bottom of the orbit of the eye, where the optic nerves pierce the cranium, and passing above the superbus, is inserted by a large tendon into the border of the eyelid. See **PALPEBRÆ**.

**RECTUS capitis lateralis**, a pair of short thick fleshy muscles, rising from the superior part of the transverse processes of the first vertebra of the neck, whence it ascends, and is inserted into the os occipitis. See **HEAD**.

Its use is to move the head laterally towards either shoulder: when they act together, being antagonists, they keep it steady.

**RECTUS externus capitis major**, the third pair of muscles of the head, arising fleshy and tendinous from the upper part of the double spine of the second vertebra of the neck, and spreading in its ascent, is inserted into the posterior part of the os occipitis.—It serves to draw the head directly back upon the first vertebra.

**RECTUS externus minor**, a pair of muscles arising from the hind-part of the first vertebra of the neck; and inserted into the middle of the os occipitis.

It serves likewise to draw the head directly backwards.

These two muscles are otherwise called *renuents*.

**RECTUS internus capitis major**, a pair of muscles arising from the fore-part of the five interior transverse processes of the first vertebra in the back, near its great hole.

**RECTUS internus minor**, arises from the fore-part of the first vertebra of the neck; and is inserted into the anterior appendix of the os occipitis, immediately under the former.

These serve to nod the head forwards, being antagonists to the *rectus externus*, or *renuens*, on the back of the head; and are hence also called *annuents*.

**RECTUS in curia**, in law, one who stands at the bar, and no man objects any thing against him.

When a man hath reversed the outlawry, and can participate of the benefit of the law, he is said to be *rectus in curia*. See **OUTLAWRY**.

**RECURRENT**, **RECURRENTS** in anatomy, a nerve arising from the par vagum, and distributing several branches to the larynx, to assist in the formation and modulation of the voice; whence it is also called the *vocal nerve*. See **NERVE**, **VOICE**, &c.

It has its name *recurrent*, from its reascending or running back again from the thorax to the larynx.

There are really two *recurrents*, right and left: the left arises from the trunk of the vagum; the right from a plexus thereof, immediately under the clavicle—They both run up along the trachea, to which they impart some twigs, and end at last in the muscles of the larynx.

Their office appears partly hence, that a dog is not able to bark after they are cut. See **LARYNX**.

**RECUSANTS**, persons who refuse to acknowledge the king's supremacy. See **SUPREMACY**, and **CONVICT**.

Such are the Roman catholics, who hold the pope to be over him; hence called popish *recusants*. See **POPE** and **KING**.

The

The Romanists are not charged with double taxes, &c. merely as romanists, but as *recusants*.

**RECUSATION, RECUSATO**, an act whereby a judge is desired to refrain from judging some certain cause, on account of his relation to one of the parties; or some capital enmity, or the like.

By the French laws kinship within the fourth degree, is deemed a legal cause of *recusation*; as also the judge's being god-father, &c. of one of the parties.

**RED**, in physics, one of the simple or primary colours of natural bodies, or rather of the rays of light. See **BODY, RAY** and **COLOUR**.

The *red* rays are those of all others the least refrangible: hence, as Sir Isaac Newton supposes the different degrees of refrangibility to arise from the different magnitudes of the luminous particles whereof the rays consist; the *red* rays, or *red* light, is concluded to be that which consists of the largest particles. See **REFRANGIBILITY**.

Authors distinguish three general kinds of *red*; one bordering on the blue, as colombine, or dove colour, purple, and crimson. See **PURPLE, &c.** Another bordering on yellow, as flame-colour and orange. See **ORANGE, &c.** Between these extremes is a medium partaking neither of the one nor the other; which is what we properly call *red*.

Acids turn black, blue, and violet into *red*; and *red* into yellow; and yellow into a very pale yellow—Alkali's change *red* into violet, or purple, and yellow into feuilletmort, or dead leaf colour. See **ACID** and **ALCALI**.

Terrestrial and sulphurous matters become *red* by extreme heat; and some, at length, black; as we see in brick, red bole, red chalk, slate, punice, &c. which when vitrified by a burning glass, become black.

Lobsters become *red* by a moderate fire; and by a violent one black. Mercury and sulphur mixed and heated over a moderate fire, make a beautiful *red*, called *artificial cinnabar*. See **CINNABAR**.

An acid spirit, as lemon juice, being poured on a blue solution of turnsole, turns it into a beautiful *red*—Alkali restores it to its original blue. Filtrating of the reddish wine takes from it all its *red* colour.

M. de la Hire observes, that a very luminous body viewed through a black one, always appears *red*: as when the sun is seen shining through a black cloud. He adds, that many people who see all the other colours perfectly well, yet have no idea of *red*, and only see it as black. See **BLUE**.

**RED**, in dying, is one of the five simple, or mother colours of the dyers. See **COLOUR** and **DYING**.

Some reckon seven kinds, or casts of *red*: viz. scarlet *red*, crimson *red*, madder *red*, half-grain *red*, lively orange *red*, and scarlet of cochineel. But they may be all reduced to three; according to the three principal drugs which give the colours; which are vermillion, cochineel and madder.

The fine scarlet, called *scarlet of the gobelins*, is given with agaric, bran-water, woad and scarlet grain, or kermes. Some dyers add cochineel, and others fennigreek; brightening it with bran-water, agaric, tartar, and turmeric. See **SCARLET**.

*Crimson red* is dyed with bran-water, tartar, and cochineel melleque. See **CRIMSON**.

*Madder red* is dyed with madder; to which some add realgal, or arsenic; others common salt, or other salts, with wheat flower; or agaric with spirit of wine, with galls or turmeric. See **MADDER**.

The *half-grain* is made with agaric and bran-water, half scarlet-grain, half madder, and sometimes turmeric.

The *half crimson* is made of half madder, half cochineel.

As to the *lively orange red*, the stuff must be first put in yellow, then in a liquor made of goat's hair (which has been boiled several times with madder, and now) dissolved over the fire with certain acids, as urine, tartar, &c.

The *scarlet of cochineel*, or dutch *scarlet*, as the French call it, is made with starch, tartar and cochineel; after first boiling it with alum, tartar, sal-gemma and aqua-fortis, wherein pewter has been dissolved. See **COCHINEEL**.

Besides these seven *reds*, which are good and allowed colours, there is also a Brasil *red*; which is discouraged, as fading easily. See **BRAZIL**.

Of the seven good *reds*, only four have particular casts or shades: the madder *red*, crimson *red*, lively orange *red*, and *scarlet* of cochineel.

The casts or shades of crimson, are flesh-colour, peach-colour, carnation-rose-colour, and apple-tree-flower-colour—Those of madder, are flesh-colour, onion-peel-colour, and flame-colour—Those of orange are the same with those of crimson. Scarlet, besides the shades of all the rest, has some peculiar to itself, as cherry-colour, fire-colour, &c.

**RED**, in painting—For painting in oil colours they use a *red* called *cinnabar* or vermillion; and another called *lacca*. See each in its place, **CINNABAR**, **VERMILLION** and **LACCA**.

In limning, and fresco, for a violet *red*, instead of lacca they

use a natural earth found in England; for a brown *red* they use *oker*. See **REDDLE, OKER, &c.**

**RED**, in heraldry. See the article **GULES**.

**RED**, in cosmetics, a fucus or paint wherewith the ladies enliven their cheeks and lips.

There are two kinds of *reds*; the one in leaves, called Spanish *red*; the other a liquor, which is an extract of scarlet dye.

**RED arsenic**. See the article **ARSENIC**.

**RED chalk**

**RED deer**

**RED fish**

**RED lead**

**RED star**

**RED storax**

**RED tartar**

**REDENS or REDANT**. See **REDENS**.

**REDDAT**—*Precipe quod REDDAT*. See **PRECIPE**.

**REDDANDIS chartis**. See the article **CHARTIS**.

**REDDENDUM**, in law, a clause in a lease, &c. whereby a rent is reserved to the lessor. See **RENT** and **LEASE**.

**REDDITARIUM**, an ancient law term, for a terrier, roll or rental, in which the rents and services of a manor are set down. See **ROLL, RENT, TERRIER, &c.**

**REDDITION, REDDITIO**, a surrendering or restoring. In law it denotes a judicial acknowledgment that a thing in question belongs to the demandant.

**REDDLE, RUDDLE, or Red chalk**, a red fossil stone, which has its particular mine or quarry; and is used by painters, &c. to make red pencils, or crayons for designing.

The best is the produce of England, is moderately hard, easy to cut or saw into long slips. The goldsmiths and gilders also use it to burn the gold leaf they use—Some call *reddle*, *lapis hæmatites*, supposing it to have a particular faculty of stopping blood: but others will have the real hæmatites to be another stone. See **HÆMATITES**.

**REDEEMABLES**, are lands, funds, &c. sold with a reservation of the equity of redemption. See **REDEMPTION**.

Crown lands are *redeemable* for ever; others only for a certain time.

**REDEMPTION, REDEMPTIO** in law, a faculty or right of re-entering upon lands, &c. that have been sold, and assigned; upon re-imbursing the purchase-money, with legal costs.

Bargains wherein the *faculty*, or, as some call it, the *equity of redemption* is reserved; are only a kind of pignorative contracts.

A certain time is limited, within which the faculty of *redemption*, shall be exercised; and beyond which it shall not extend.

**REDEMPTIONS, REDEMPTIONES**, in our old law-writers, denote grievous mulcts imposed by way of commutation for the head or life of the delinquent. See **RANSOM** and **MISERICORDIA**.

**REDENS, REDANS or REDANT**, in fortification, a kind of work indented in form of the teeth of a saw, with salient and re-entering angles; to the end that one part may flank or defend another. See **WORK, DEFENCE, &c.**

It is also called *saw work*, and *indented work*. The faces flank one another.

*Redens* are frequently used in the fortifying of walls, where it is not necessary to be at the expence of building bastions; as when they stand on the side of a river, a marsh, the sea, &c. The parapet of the corridor is frequently *redented*, or carried on in the way of *redans*. See **PARAPET** and **COUNTER-SCARP**.

**REDHIBITION, REDHIBITIO**, in the civil law, an action allowed a buyer, whereby to annul the sale of some moveable, and oblige the seller to take it back again, upon the buyer's finding it damaged, or that there was some personal cheat, &c.

The *redhibition*, or *redhibitory action*, has place in several cases, in the body of the civil law—If a horse was sold that had the glanders, were broken-winded, or foundered, it was a *redhibitory case*; and the seller might be obliged to take him again within nine days.

**REDINTEGRATED medals**. See the article **MEDAL**.

**REDINTEGRATION, REDINTEGRATIO**, in the civil law, the act of restoring a person to the enjoyment of a thing whereof he had been illegally dispossessed.

In France, where a person is dispossessed of his property, he claims it again by a *redintegrand*, or action of restitution—The *redintegrand* must be demanded within a year and a day, otherwise it is precluded.

**REDINTEGRATION**, in chemistry, the restoring of any mixed body, or matter, whose form has been destroyed by calcination, corrosion, sublimation, or the like; to its former nature and constitution.

The *redintegration* of mercury is properly called *revivification*. See **REVIVIFICATION**—Mr Boyle has an express treatise on the *redintegration* of salt-petre; where he shews that after reducing it by fluxion into fixed nitre, which is next of kin to salt of tartar in all its properties; he could presently

*redintegrate*

*redintegrate* it by pouring a sufficient quantity of spirit of nitre to it; *i. e.* he could re-produce true chrystals of the usual form and virtue of salt-petre. See SALT-PETRE.

It is a strong objection against the chemical principles, that we cannot *redintegrate* the body they were procured from, by re-mixing them. See PRINCIPLE and ELEMENT.

This seems to argue that the body did not properly consist of such elements; or that they were not originally contained in it, but were rather produced by the Fire. See FIRE, &c.

REDIRE *ad pacem*. See the article AD *pacem*.

REDISSEISIN, in law, a disseisin made by him who once before was found and adjudged to have disseised the same man of his lands or tenements; for which there lies a special writ, called a *writ of redisseisin*.

RED-MANS, or RADMANS, in domesday and other ancient books, are probably the same rod, or rad-nights, *viz.* men who by the tenure or custom of their lands were to ride with or for the lord of the manor about his business.

REDOUBT\*, or REDOUTE, REDUCTUS, in fortification, a small square fort, without any defence but in front; used in trenches, lines of circumvallation, contravallation, and approach; as also for the lodging of corps de garde, and to defend passages. See FORT.

\* The word is French, formed from the Latin, *reductus*.

In marshy grounds, *redoubts* are often made of stone work, for the security of the neighbourhood: their face consists of from ten to fifteen fathom; the ditch round them from eight to nine foot broad and deep; and their parapets have the same thickness. See SCENCE.

REDRESSING, the rectifying, or setting, any thing straight again. See RECTIFICATION.

Trees and other plants have a natural faculty of *redressing* themselves, when by any external cause they are forced out of the perpendicular. See PERPENDICULARITY.

In the moral sense, to *redress* grievances, is to reform or remove them.

To *redress* a stag, among hunters, is to put him off his changes.

REDSEAR. See the article IRON.

REDUBBORS, those who buy stolen cloaths, &c. and to the end they may not be known, turn them into some other colour, or fashion, &c. See FRIPPERY, and REGRATOR.

REDUCE in chemistry. See the article REDUCT.

REDUCTED *chart*. See the article CHART.

REDUCING *scale*, is a thin broad piece of box, with several lines and scales of equal parts, thereon; for turning chains and links into acres and rods, by inspection. See REDUCTION, &c.

It is used by surveyors to reduce maps or draughts from one dimension into another: it is sometimes also called the *surveying scale*. See SCALE.

REDUCT, or REDUIT, a military term, signifying an advantageous piece of ground, entrenched and separated from the rest of the place, camp, &c. for an army, garrison, &c. to retire to in case of surprize. See CASTLE, and DONJON.

REDUCT, in building, a quirk, or little place, taken out of a larger, to make it more uniform and regular; or for some other convenience, as for a little cabinet aside of a chimney, alcoves, &c. See QUIRK.

REDUCT, or REDUX, among chemists, is a powder by which calcined metals and minerals are reduced again to their regulus, or pure substance. See REGULUS, CALX, &c.

REDUCTION, REDUCTIO, in the schools, a manner of bringing a term or proposition, which before was opposite to some other, to be equivalent to it. See PROPOSITION, &c.

*Reduction* is effected by the addition or retrenchment of a negative particle—Thus, to reduce this proposition: *no man is an animal*, to be equivalent to it's opposite, *every man is an animal*; I drop the negative, and say, *man is an animal*—After the like manner might the term, *every man*, be reduced, by adding the negative, and saying *there is no man*.

REDUCTION of *propositions*, is used in a more general sense, for any expression of one proposition, by another proposition equivalent thereto. See PROPOSITION.

To a *reduction*, therefore, there are two propositions required; the *reduced* and *reducing*; which are considered as the extremes thereof; and to be connected in the *reduction*, by means of the particle *that is*, which here has the effect of a copula.

As here, *only animals think*; *that is*, *animals think*, and *nothing beside animals think*—Where the proposition preceeding the particle, is *reduced*, and the subject of the *reduction*; that following the particle *reduces*, and has the effect of the predicate of the *reduction*: and the particle *that is*, acts as a copula, importing, not barely that the proposition is expressed by another, but by another equivalent one, or as it were the same.

REDUCTION of *sylogisms*, is a regular changing or transforming of an imperfect sylogism into a perfect one—Or, it is a change of a sylogism in respect of form, whereby the necessity of the illation or inference is made more evident. See SYLLOGISM.

VOL. II. N° CXXX.

*Reduction* obtains in sylogisms of the second and third figure; as also in the indirect mode of the first—By it, these are all brought to the first. See MOOD and FIGURE.

There are two kinds of this *reduction*, the one *direct* or *affirmative*, performed merely by a conversion of one or both the premises, or by a transposition thereof; as when CAMESTRES is reduced to CELARENT.

The other *indirect*, called *per impossibile*, or *ad absurdum*, whereby the person who denies the goodness and legitimacy of an imperfect sylogism, is reduced to assert or grant something absurd and impossible; or contradictory to some other thing maintained by him.

Suppose *e. gr.* a person granting the premises of the following sylogism denies the conclusion—*All fraud is prohibited, but some trading is not prohibited, therefore some trading is not fraud*—We thus proceed against him: if the sylogism be not good, the antecedent is just, but the consequent false; and therefore the contrary of the conclusion must be true: now, I take the contrary of the conclusion which you thus give, *viz.* all trading is fraud; and of that with the other premise of the former sylogism, *viz.* the major, which you likewise grant, make a new sylogism; thus, *all fraud is prohibited; all trading is fraud; therefore all trading is prohibited*. But this proposition, *all trading is prohibited*, and the other, *some trading is prohibited*, which you granted me in the first sylogism, are contradictory.

REDUCTION, in arithmetick, is the converting of monies, weights, or measures, into the same value in other denominations; *e. gr.* pounds into shillings and pence; or shillings and pence into pounds.

The *reductions* of the principal monies, coins, weights, and measures, antient and modern, foreign and domestic, are found under the respective articles, MONEY, COIN, WEIGHT, MEASURE, POUND, FOOT, &c.

*Reduction* is of two kinds: 1<sup>o</sup>. *descending*: when a quantity is to be brought from a higher denomination to a lower.

This is done by considering how many of the next less denomination are contained in the next greater before, and by that number multiplying the greater. See MULTIPLICATION.

Thus pounds are reduced into shillings by multiplying by 20; shillings into pence by multiplying by 12; and pence into farthings, by multiplying by 4. See POUND, &c.

Troy pounds are reduced into grains, by multiplying by 12, 20, and 24. And *averdupois* hundreds into ounces, by 4, 28, and 16. See OUNCE, &c.

The 2<sup>o</sup>. *ascending*; when a lower denomination is to be reduced to an higher.

In order to this, divide the least by so many of it's denomination as are contained in the next greater: thus 24720 pence, divided by 12, and the quotient by 20, give 103 pounds. See DIVISION.

If there remain any thing in each division, it is respectively either odd pence or shillings: thus 6713 pence reduced, give 27*l.* 19*s.* 5*d.* cut off the last, the rest is the pounds required.

To expedite the practice, several compendious ways of *reduction* have been invented. See PRACTICE.

Thus yards are turned into ells, by subtracting a fifth; and into ells Flemish by adding a fifth—Ells Flemish are reduced into yards, by subtracting a quarter—Ells Flemish reduced to ells English by multiplying by 6, and cutting off the right hand figure. See ELL, &c.

Great pounds of silk of 24 ounces, are reduced to pounds of 16 ounces, by adding one half. Pounds of 16 ounces into pounds of 24, by subtracting one third.

REDUCTION of *fractions*. See the article FRACTION.

REDUCTION of *equations*, in algebra, is the clearing them from all superfluous quantities, bringing down the quantities to their lowest terms, and separating the known quantities from the unknown; 'till, at length, only the unknown quantity is found on one side, and known ones on the other. See EQUATION.

The *reduction* of an equation is the last part of the resolution of the problem. See RESOLUTION, and PROBLEM.

The end of all algebraical operations, is to have the unknown letter alone in one member of the equation; and in the other, all the known letters, without any mixture of unknown; for, in this case, it is evident that the value of the unknown quantity is found.

This *reduction* is effected by adding the quantities subtracted, subtracting those added; multiplying those divided, and dividing those multiplied; extracting the roots out of powers, and raising roots to powers; so as still to preserve an equality. See EQUALITY—This suffices for the *reduction* of simple equations; but for higher equations, the process is less obvious.

From the manner wherein powers are formed, it is evident, that as the unknown letter is raised to a higher power, it will be found in it's lower powers, mixed and combined so many more times with known quantities, and of consequence will be so much the more difficult to be disengaged there-

from. And the difficulty is the same, where there are several unknown letters multiplied singly one into another, and again multiplied by known letters. See PROBLEM.  
The *reduction* of the equation being made; from the last quantity thus gained, the geometrical construction is to be deduced. See CONSTRUCTION.

REDUCTION of curves. See the article CURVE.

REDUCTION of a figure, design, or draught, is the making a copy thereof either larger or smaller than the original; still preserving the form and proportion. See FIGURE.

The great use of the proportional compasses is in the *reduction* of figures, &c. whence they are also called *compasses of reduction*. See COMPASS.

There are various methods of reducing figures, &c. the most easy is by means of the pentagraph or parallelogram; but this has it's defects. See PENTAGRAPH.—The best and most usual methods of *reduction*, are as follow:

To REDUCE a figure: As ABCDE (Tab. Geometry, fig. 64.) into a less compass: about the middle of the figure, as z, pitch on a point: and from this point draw lines to it's several angles, A, B, C, &c. then drawing the line *ab*, parallel to AB, *bc* parallel to BC, &c. you will have the figure *abcde* similar to ABCDE.

If the figure *abcde* had been required to be enlarged, there needed nothing but to produce the lines from the point beyond the angles, as z D, z C, &c. and to draw lines, viz. DC, DB, &c. parallel to the sides *dc*, *db*, &c.

To REDUCE a figure by the angle of proportion—Suppose the figure ABCDE (Fig. 65.) required to be diminished in the proportion of the line AB, to *ab*. (Fig. 66.) Draw the indefinite line GH (Fig. 67.) and from G to H set off the Line AB: on G describe the arch HI. Set off the Line *ab* as a chord on HI, and draw GI. Then with the angle IGH you have all the measures of the figure to be drawn. Thus to lay down the point *c*, take the interval BC, and upon the point G describe the arch KL; also, on the point G describe MN; and upon A with the distance MN describe an arch cutting the preceding one in *c*, which will determine the side *bc*. And after the same manner are all the other sides and angles to be described.—The same process will also serve to enlarge the figure.

To REDUCE a figure by a scale—Measure all the sides of the figure, *e. gr.* ABCDE, by a scale, and lay down the same measures, respectively, from a smaller scale in the proportion required. See SCALE.

To REDUCE a map, design, or figure, by squares—Divide the original into little squares, and divide a fresh paper of the dimensions required, into the same number of squares; which will be larger or less than the former, as the map is to be enlarged or diminished.

This done, in every square of the second figure, draw what you find in it's correspondent one in the first. See MAP, &c.

REDUCTION to the ecliptic, in astronomy, is the difference between the argument of latitude, as NP (Tab. Astron. fig. 26.) and an arch of the ecliptic NR, intercepted between the plane of a planet, and the node N. See ECLIPTIC.

To find the reduction: the angle of inclination PNR, and the argument of latitude NP being given; find, by the doctrine of spherics, the arch NR: subtract NR and NP from each other, the remainder is the *reduction*.

REDUCTION into first matter, is a term which alchymists use when they find their substances putrify, and grow black.

REDUCTION is more particularly used for the converting of a dry matter into a liquid, particularly water; which by the alchymists is held the principal of all things. See WATER, PRINCIPLE, &c.

The *reduction* of metals into their first matter or principles, according to these philosophers, can only be effected by mercury; nothing else being able to loosen the fixt sulphur of metallic bodies, which binds them together. See METAL and MERCURY.

REDUCTION, in chirurgery, denotes an operation whereby a dislocated, luxated, or fractured bone, is restored to it's former place. See BONE, LUXATION, DISLOCATION, FRACTURE.—*Reduction* or *reposition*, is always performed before any remedy be applied.

REDUIT, in military affairs. See the article REDUCT.

REDUNDANCE, or REDUNDANCY, a fault in discourse, consisting in the use of a superfluity of words. See PLEONASM.

Words perfectly synonymous, are *redundant*, and ought to be retrenched—*Redundancy* makes the style weak and languid.

REDUNDANT hyperbola, is a curve of the higher kind, thus called, because it exceeds the conic section of that name in the number of it's hyperbolical legs; being a triple hyperbola, with six hyperbolical legs. See CURVE and HYPERBOLA.

REDUPLICATION, in rhetoric, a figure whereby a verse begins with the same word as the preceeding one ends. See ANADIPLOSIS.

REDUPLICATION, in logic, is a kind of condition expressed in a proposition, indicating or assigning the manner wherein

the predicate is attributed to the subject. See REPLICATION.

The usual *reduplicating* words are *quatenus*, *as*, *so far as*, *considered as*, *inasmuch as*, &c. Hence,

REDUPLICATIVE proportions, are such wherein the subject is repeated; with some circumstance or condition—Thus, *men, as men, are rational: kings, as kings, are subject to none but God.*

REDUX, in chemistry. See the article REDUCT.

REE, RE, REIS, or RES, a little Portuguese copper coin, nearly equal to the late French denier tournois, or to a third part of the English farthing. See COIN.

The *ree* is both a current and imaginary money; the Portuguese usually reckoning by *rees*, as the Spaniards by *maravedis*. See MARAVEDIS.

Strangers in treating with them, are frequently surprized with demands of several thousand *rees*, when the matter betwixt them is only of a few pieces of eight; the *millree* or thousand *rees*, only making 6s. 3d. *sterl.*—750 of them are equal to the piece of eight. See MILLREE.

REED, an antient Jewish measure. See MEASURE.

Answerable to this is the *canna* or *cane* of some modern nations. See CANE.

Ezechiel's REED. See EZECHIEL'S REED.

REEF, a term in navigation—When there is a great gale of wind, they commonly roll up part of the sail below, that by this means it may become the narrower, and not draw so much wind; which contracting or taking up of the sail, they call a *reef*, or *reefing the sail*.

So also when a top-mast is sprung, as they call it, that is, cracked, or almost broken in the cap; they cut off the lower piece that was near broken off, and setting the other part, now much shorter, in the step again, call it a *reefed top-mast*.

REEL, in the manufactures, a machine serving for the office of *reeling*. See REELING.

There are various kinds of *reels*; some very simple, others very complex; of the former kind, those most in use are, 1<sup>o</sup>. A little *reel*, held in the hand, consisting of three pieces of wood; the biggest and longest whereof (which does not exceed a foot and a half in length, and  $\frac{1}{2}$  of an inch in diameter) is traversed by two other pieces disposed different ways.

2<sup>o</sup>. The common *reel*, or *windlass*, which turns upon a pivot and has four flights, traversed by long pins or sticks whereon the skain to be *reeled* is put, and which are drawn closer, or opened wider, according to the skain.

Other *reels* used in particular arts, are explained under their particular articles; as the *reel* used in the milling of silk, under the article MILLING: and that in the *reeling* or winding of silks, under the article of SILK, &c.

REELING, in the manufactures, the winding of thread, silk, cotton, or the like, into a skain, or upon a bottom; to prevent it's intangling. See SILK, &c.

It is also used for the charging or discharging of bobins or quills, to use them in the manufacture of different stuffs, as thread, silk, cotton, &c.—*Reeling* is performed different ways, and by different engines. See REEL.

RE-ENTRING angle, in fortification. See ANGLE.

RE-ENTRY, in law, the resuming or retaking that possession which we had lately fore-gone. See ENTRY.

As, if I make a lease of land, or tenement, I do thereby fore-go the possession: and if I condition with the lessee, That for non-payment of the rent at the day, it shall be lawful for me to *re-enter*; this is as much as if I conditioned to take again the lands, &c. into my own hands, and to recover the possession by my own act, without the assistance of judge, or other process.

REER county. See the article RIER.

REEVE of a church, is the guardian of it; or the church-warden. See CHURCH-WARDEN.

So, *shire-reeve* is the sheriff, or guardian of a county. See SHERIFF—And *port-reeve*, the warden of a port or haven. See PORTGREVE.

REEVING, in the sea language, is the putting a rope thro' a block—Hence to pull a rope out of a block, is called *un-reeving*.

RE-EXCHANGE, in commerce, a second payment of the price of exchange; or rather the price of a new exchange, due upon a bill of exchange that comes to be protested; and to be refunded the bearer, by the drawer or endorser. See EXCHANGE.

The occasion of *re-exchange* is, when the bearer of a bill of exchange, after protesting it for want either of acceptance, or of payment, borrows money on his own promise, bond, or the like; or draws a bill of exchange in the place where the payment was to be made, on the person who furnished the first; for which he pays a second exchange, which being added to the first already paid, the drawer of the first bill is answerable for two exchanges, properly called *exchange* and *re-exchange*. See BILL and PROTEST.

The bearer of a protested bill has a right to recover both the one and the other on the drawer. Yet the simple protestation which the bearer makes in the act of protest, that he will take

take up a like sum at *re-exchange*, for want of his bill being accepted or paid, is not sufficient to entitle him to demand the re-imbursment of his *re-exchange*; unless he make it appear he has actually taken up money in the place whereon the bill was drawn.

Otherwise the *re-exchange* will only amount to the restitution of the first exchange, with interest, the expences of protesting, and of the journey, if there have been any.

If a bill of exchange, payable to the bearer or order, come to be protested, the *re-exchange* is only due upon the drawer for the place where the remittance was made; not for those places where it may have been negotiated: at least, the drawer has a right to be refunded his *re-exchange* for those places, by the endorser.

Indeed the *re-exchange* is due from the drawer upon all places where a power of negotiation is given by the bill, and upon all others, if the power of negotiating be indefinite.

Lastly, the interest of the *re-exchange*, of the expences of the protest, and the journey, are only due from the day of the demand.

It is supposed to be the Gibelins driven out of Italy by the faction of the Guelphs, and sheltered at Amsterdam, who first established the custom of *re-exchange*; on pretence of the interests, damages, and expences they underwent, when the bills given them for the effects they had been obliged to abandon, were not accepted, but came to be protested. See *BILL of exchange*.

**RE-EXTENT**, in law, a second extent made upon lands or tenements, on complaint, that the former extent was partially made. See *EXTENT*.

**REFECTION**, *REFECTIO*, among monks and ecclesiastics, a spare meal or repast, just sufficing for the support of life. See *REPAST*, *PITTANCE*, &c.

**REFECTION** is also used in antient authors for a duty, or service incumbent on any person to provide meals, for ecclesiastics or even princes. See *PROCURATION*.

**REFECTORY**, or *REFECTUARY*, *REFECTORIUM*, a spacious hall in convents, and other communities, where the monks, nuns, &c. take their refectiions or meals in common.

The *refectory* of the Benedictines of St. George at Venice, designed by Palladio, is one of the finest in the world. *Daviler*.

**REFERENCE**, in writing, &c. a mark relative to another similar one in the margin, or at the bottom of the page; where something omitted in the text, is added; and which is to be inserted either in reading or copying. See *CHARACTER*.

A copist must be very expert at taking *references*.

*References* are also used in books, where things being but imperfectly handled, the reader is directed to some other part or place where they are more amply explained.

Dictionaries are full of *references* denoted by *see*, or *vide*—By means of these *references*, the Dictionary writer settles a correspondence between the several parts of his work; and may give his dictionary most of the advantages of a continued treatise. See *DICTIONARY*.

Indices or tables are only *references* to the several parts of the work where the several matters are handled.

**REFERENDARY**, *REFERENDARIUS*, in antient customs, an officer who exhibited the petitions of the people to the king; and acquainted the judges with his commands.

An officer of this kind, Spelman observes, we had in England, in the time of the Saxons—The like office was afterwards discharged by others called masters of requests. See *REQUEST*.

**REFINING**, the art or act of purifying a thing; or of rendering it finer, cleaner, and purer. See *PURIFICATION*, and *CLARIFYING*.

*Refining* is chiefly used in speaking of metals; sugar and salt. See *METAL*, &c.

The **REFINING** of gold is performed three ways: either with antimony, with sublimate, or with aqua-fortis; which last method, much the most usual, and least dangerous of the three, is called *departing* or *parting*; the process whereof see under the articles *GOLD* and *DEPARTING*.

**REFINING of gold with antimony**—They here use a wind-furnace; (a description whereof may be seen under the article *FURNACE*) with an ordinary crucible, of a size answerable to the quantity of gold to be refined; observing that the gold and antimony together do not above half fill it.

The gold being melted in the crucible, the antimony is thrown in, in powder—The proportion of the mineral to the metals, is about a pound to eight ounces, if the gold be between 22 and 16 carats fine: if it be beneath 16 carats, they use about five quarters of a pound to eight ounces: the coarser the gold, still the more antimony is required.

As soon as the antimony is in the crucible, it is covered up; and after charging the furnace with charcoal, they put on it's head or cover; which stands till such time as the crucible be left quite bare; then the head being taken off, and the crucible left to cool in the furnace itself, till such time as it may be taken out by the hand, they break it, to get out the bottom

or culot, which is a mass of fine gold remaining at the bottom, with the fæces of the antimony, the silver and copper alloy, and sometimes little particles of gold itself, over it.

Though the gold thus prepared be very pure, yet the antimony gives it such a harsh brittle quality, that it ceases to be ductile; and must be softened by fusion with salt-petre and borax, to bring it to itself.

For this operation they prepare what they call a *dry coppel*; that is, a coppel made of crucible earth, which does not imbibe like the coppels made of ashes. See *COPPEL*.

The coppel being sufficiently heated in the *refining* furnace, they put the gold in it, and cover it up with charcoal.

As soon as the gold is dissolved, which is very soon, by reason of the remains of the antimony, they blow it with the bellows to drive the mineral entirely away, which now goes off in smoak; adding to it, as soon as the fumes cease, a little salt-petre and borax, in powder; which collect the impurities remaining upon the dissolution, and fix the gold in the coppel, in form of a plate.

The gold being taken out of the coppel, and melted a-fresh in a crucible, with an addition of two ounces of salt-petre and as much borax in powder, to each eight ounces of gold, as soon as it ceases to fume, they cast it into an ingot; which upon trial is found 23 carats, 26 thirty-seconds fine.

As to the particles of gold which may have been left behind with the alloy in the fæces of the antimony, they get them out by a dry coppel, with the same meltings and ingredients as are used in softening the former—And when they are assured, by the essay, of the share of gold that matter contains, they refine it, to separate the copper; and afterwards make the depart.

As to the gold which may be left sticking to the dry coppels, they get it out by breaking, and pulverizing the crucibles, and by repeated lotions of the powder thereof in several waters; after the manner described under the article *washing*. See *WASHING*.

**REFINING of gold by means of sublimate**—The process is begun like that with antimony; *i. e.* in the same furnace, with the same coal, the same fire, and the same crucibles.

The gold being melted in the crucible, they cast in the sublimate, not pulverized, but only broke in pieces—As to the proportion; to 8 ounces of gold to be refined, they put an ounce, or ounce and a half, or even two ounces, if the gold be of 22 carats; three ounces, if 20 carats; and 4 or 6 ounces, if it only be from 18 to 20 carats. In which last case they part the sublimate into two; putting half at a time, with the gold, into a new crucible; which when the operation is over, leaves the gold from 18 to 23 carats, according to it's fineness before—After this, they raise it farther by the fire, as follows:

The broken sublimate being put into the crucible with the melted gold, the crucible is immediately covered up, to smother the mineral: which done, the furnace is filled with charcoal, and the head put on—A quarter of an hour afterwards they take off the head, lay the crucible bare, and give the gold air, *i. e.* blow off all the ashes, and other impurities that may be floating on the liquid gold, with a pair of bellows, the nozzle whereof is crooked.

This they repeat again and again, till all the impurities of the gold being carried off, by virtue of the sublimate, it be found of a bright glittering colour: after which it is taken out of the crucible, and the gold cast into an ingot.

The method of *refining* by sublimate is both more complete and cheaper than that by antimony; but they are both exceedingly dangerous, by reason of their sulphurous and arsenical exhalations: the only difference in their malignity consisting in this, that the poison of the antimony is slower than that of the sublimate. See *SUBLIMATE*, &c.

Gold may also be *refined* with lead and ashes; but this is a method seldom used, excepting in essays. See *ESSAY*.

**REFINING of silver**—There are two ways of *refining* silver: the one with lead; the other with salt-petre. The best and cheapest is that with lead; though that with salt-petre still obtains in many places, for want of workmen who understand the process of the latter.

We shall here only give that with salt-petre; referring for the other to the article *SILVER*.

**REFINING with salt-petre** is performed in a wind furnace—The silver to be *refined* having been reduced into grains, of the size of little peas, by pouring it, when melted, into a tub of common water; it is heated over again in a boiler.

After this they put it in a crucible, and along with it, to every eight ounces of metal, two of salt-petre.

The crucible is now covered up with an earthen lid, in form of a dome, exactly luted; which lid, however, is to have a little aperture in the middle.

The crucible being put in the furnace, and covered with charcoal, which is only to be lighted by degrees, at length they give it the full force of the fire to put the metal into a perfect fusion. This they repeat three times successively, at an interval of a quarter of an hour.

After the third fire they uncover the furnace, and let the crucible

ble cool; and at length break it, to get out the silver, which is found in a button or culot; the bottom whereof is very fine silver; and the top mixed with the faeces of the salt-petre, and the alloy of the silver, and even some particles of the fine silver.

The culot being separated from the impurities, is melted in a new crucible, and into the dissolution is thrown charcoal dust, and the whole briskly worked together. Then the crucible being covered up again, and the furnace charged with coal, a second fire is given it.

This done, the ashes and other impurities are blown from the top of the metal, till it appear as clear as a looking-glass; and then an ounce of borax broke in pieces is thrown in.

Lastly, the crucible being cover'd up again, they give it the last fire; after which it is cast into ingots; which are found eleven penny-weights, and sixteen grains fine.

To recover the silver that may be left in the faeces, or scoria, they pound them, and give them repeated lotions in fresh waters. See WASHING.

**REFINING of copper**, is only performed by giving the mineral matter several lotions before the melting it; and then giving it several repeated fusions. See COPPER.

**REFINING of tin** is performed much after the same manner as that of copper. See TIN.

Though we may distinguish two kinds of fineness of this metal: the one arising from it's fusion; that tin taken first out of the furnace wherein it is melted, being always purer than that towards the bottom.

The other kind of fineness is that given the tin by adding some other metal or mineral to it, to render it more sonorous, as well as brighter: such is tin of antimony, pewter, &c. See PEWTER, &c.

**REFINING of iron**, begins likewise by the melting it. See IRON.

The greater degree of fusion the mineral has, the more the metal is purified: but this first fusion is not sufficient—To render the iron malleable, and fit it to endure the file, it must be melted a second time; then forged or beaten a long time with huge heavy hammers, wrought by water; then heated in the fire, and at last reduced on the anvil, into bars of several thicknesses. See FORGING.

The more the iron is heated in the fire; and the more it is beaten, whether hot or cold, the finer it becomes. See IRON.

**Steel** is only iron refined to a great degree by heating it, with some other ingredients which close up the pores, and soften the grain thereof. See STEEL.

**REFINING of lead**, is performed like that of most other imperfect metals, by frequent meltings, still scumming it before it be cold, and casting in tallow, and other kinds of fat.

They also make essays of lead; not to refine it, but to see if it be pure, and without mixture of any other metal. See LEAD.

**REFINING of sugar**—The operation is begun by several strong lixiviums or lyes of lime-water, and eggs, shells and all, mixed and beaten together.

This first refining is performed in the Caribees and other places where the sugar-canes are cultivated; and only serves for the brown or coarse sugar.

When these are imported into Europe, the sugar-bakers take them up, and refine them farther, by a second operation, or rather a repetition of the first.

To render the sugar very fine, fit for confections, they usually give it a third refining; wherein they only use the whites of eggs, and their shells beaten together, and thrown into the melted sugar; which is called *clarifying the sugar*. See SUGAR.

**REFINING of salt-petre**—The salt being put in an earthen or iron vessel, as much spring-water is poured on it as suffices to dissolve it. The vessel is then put over a gentle fire; and as soon as the water begins to boil, alum-powder is thrown into it: the proportion is, one pound of alum to 128 pound of salt-petre; and a little vinegar is added. As it boils, the scum is to be taken off; and thus is it refined. See SALT-PETRE.

For the **REFINING of other matters**, as camphor, cinnabar, sulphur, lapis, salt, borax, &c. See CAMPHOR, CINNABAR, SULPHUR, SALT, &c.

**REFLECTED vision**. See the article VISION.

**REFLECTING**, or **REFLEXIVE dial**, is a sort of dial, which shews the hour by means of a thin piece of looking-glass plate, duly placed to cast the sun-rays to the top of a cieling, on which the hour-lines are drawn. See DIAL.

**REFLECTING microscope**. } See { MICROSCOPE.

**REFLECTING level**. } See { LEVEL.

**REFLECTING telescope**. } See { TELESCOPE.

**REFLECTION**, or **REFLEXION**, in mechanics, the return, or regressive motion of a moveable, occasioned by the resistance of a body, which hindered it's pursuing it's former direction. See MOTION, RESISTANCE, &c.

It is controverted, whether there be any moment's rest or in-

terval between the incidence and the reflection? for the affirmative, stand the Peripatetics, and all who conceive the reflected motion to be different from the incident one of the same body—The motion of incidence, according to these authors, is wholly lost, and destroyed by the resistance of the obstacle struck against; and the moveable is thus rendered absolutely quiescent in the point of contact; till a new motion of reflection is produced therein, from a contrary cause.

The Cartesians assert the negative; absolutely denying any rest at all between the incidence and reflection: urging that if the motion were once destroyed, though but for a moment, there would be nothing to excite it again; but the body would persevere in that new state, as much as if it had been at rest a thousand years. See REST and law of NATURE.

Accordingly Rohault, and others, define reflection to be no other than a change of determination; or a continuation of the former motion in a new direction. See DETERMINATION, &c.

As, say they, a pendulum, when arrived at it's greatest sweep, does not stop; so a hard body, striking on another hard one, does not rest, but pursues it's motion the contrary way, according to the established law of nature; and this from the immediate influence or impulse of the cause that first moved it—But this doctrine is now generally set aside.

Reflection is conceived by the latest and best authors, as a motion peculiar to elastic bodies, whereby after striking, on others which they cannot remove, they recede, or turn back, by their elastic power. See ELASTIC body.

On this principle it is asserted, that there may be, and is a period of rest between the incidence and reflection; since the reflected motion is not a continuation of the other, but a new motion, arising from a new cause or principle, viz. the power of elasticity. See ELASTICITY.

It is one of the great laws of reflection, that the angle a reflected body makes with the plain of a reflecting obstacle, is equal to that wherein it struck on that obstacle. See ANGLE and INCIDENCE — For the several laws of motion observed in the REFLECTIONS of bodies, see the article PERCUSSION.

**REFLECTION of the rays of light**, in optics, is a motion of the rays, whereby, after impinging on the solid parts of bodies, or rather, after a very near approach thereto, they recede or are driven therefrom. See REFLEXIBILITY.

The reflection of the rays of light from the surfaces of bodies, is the means whereby bodies become visible. See VISION. And the disposition of bodies to reflect this or that kind of rays most copiously is the cause of their being of this or that colour. See COLOUR.

The reflection of light from the surfaces of mirrors, makes the subject of catoptrics. See CATOPTICS.

The reflection of light, Sir Isaac Newton has shewn, is not effected by the rays striking on the very parts of the bodies; but by some power of the body equally diffused throughout it's whole surface, whereby it acts upon the ray, attracting or repelling it without any immediate contact. See RAY.

This power he shews to be the same whereby, in other circumstances, the rays are refracted; and whereby they are at first emitted from the lucid body. See LIGHT.

The arguments he produces to prove this are as follow — 1<sup>o</sup>. Because the surfaces of polished glasses, which to the eye appear smooth, are yet in reality very rugged and uneven; (polishing being nothing but the grating, scratching and breaking off the coarser protuberances, by means of sand, glass putty or tripoly.) If the rays of light, therefore, were reflected by striking on the solid parts of the glass, the reflections would never be so accurate as we find they are; but the rays would even be as much scattered by the most polished glass, as by the roughest — It remains, therefore, a problem how glass polished by fretting substances can reflect light so regularly as it does, which problem is scarce otherways to be solved than by saying, that the reflection of a ray is effected, not by a single point of the reflecting body, but by some power of the whole body, evenly diffused all over it's surface, and by which it acts on a ray without immediate contact: for that the parts of bodies do act upon light at a distance, is already shewn under the article INFLECTION.

2<sup>o</sup>. If the colours separated by a prism placed at the entrance of a beam of light into a darkened room, be successively cast on a second prism placed at a greater distance from the former, in such manner as that they all fall alike, or with an equal obliquity upon it; the second prism may be so inclined to the incident rays, that those which are of a blue colour shall be all reflected by it; and yet those of a red colour pretty copiously transmitted—Now, if the reflection were caused by the parts of the air or glass, we would ask, why, at the same obliquity of incidence, the blue should wholly impinge on those parts so as to be all reflected, and yet the red find pores enough to be in a great measure transmitted?

3<sup>o</sup>. Where two glasses touch one another, there is no sensible reflection, and yet we see no reason why the rays should not impinge on the parts of the glass, as much when contiguous to other glass, as when contiguous to air.

4<sup>o</sup>. When the top of a water-bubble, by the continual subsiding

siding and exhaling of the water, grows very thin, there is such a little, and almost insensible quantity of light *reflected* from it, that it appears intensely black; whereas round about that black spot, where the water is thicker, the *reflection* is so strong as to make the water seem very white — Nor is it only at the least thickness of thin plates or bubbles, that there is no manifest *reflection*, but at many other thicknesses, gradually greater and greater. For in one of our author's observations the rays of the same colour were by turns transmitted at one thickness, and *reflected* at another thickness for an indeterminate number of successions: and yet in the superficies of the thinned body, where it is of one thickness, there are as many other parts for rays to impinge on, as where it is of any other thickness.

5°. If red and blue rays, separated by a prism, fall successively on a thin plate of any pellucid matter, whose thickness increases in continual proportion (such as a plate of air between two glasses, the one plane and the other a little convex) the same plate will, in the same part *reflect* all the rays of one colour, and transmit all those of the other; but in different parts, will *reflect* the rays of one and the same colour, at one thickness, and transmit them at another; and thus alternately, and *in infinitum* — Now it can never be imagined that at one place the rays which for instance, exhibit a blue colour, should have the fortune to strike on the solid parts, and those which exhibit a red to hit on the void parts of the body; and at another place, where the body is either a little thicker, or a little thinner, that on the contrary the blue should hit on the pores, and the red upon the solid parts.

6°. In the passage of light out of glass into air, there is a *reflection* as strong as in its passage out of air into glass, or rather a little stronger, and by many degrees stronger than in its passage out of glass into water.

Now it seems improbable that air should have more *reflecting* parts than water or glass: but if that should be supposed, yet it will avail nothing; for the *reflection* is as strong or stronger when the air is drawn from the glass by the air-pump, as when it is adjacent to it — If any should here object, on Des Cartes's hypothesis, that though the air be drawn, there is a subtle matter remaining to supply its place, which being of a denser kind, is better fitted for the *reflection* of light than any other body: beside that we have elsewhere shewn such subtle matter to be fictitious; and that supposing its existence, and its *reflecting* power, no light could ever have been propagated, but must have been all *reflected* back to the lucid body, immediately after it was first emitted; the following experiment does evidently convict it of falsity.

7°. If light in its passage out of glass into air strike more obliquely than at an angle of 40 or 41 degrees, it is wholly *reflected*, if less obliquely it is in great measure transmitted — Now it is not to be imagined, that light at one degree of obliquity should meet with pores enough in the air to transmit the greater part of it, and at another degree should meet with nothing but parts to *reflect* it wholly; especially considering that in its passage out of air into glass, how oblique soever be its incidence, it finds pores enough in the glass to transmit a great part of it — If any suppose that it is not *reflected* by the air, but by the outmost superficial parts of the glass, there is still the same difficulty: besides, that such a supposition is unintelligible, and will also appear to be false by applying water behind some part of the glass instead of air: for so, in a convenient obliquity of the rays, suppose of 45 or 46 degrees, at which they are all *reflected* where the air is adjacent to the glass, they shall be in great measure transmitted where the water is adjacent to it: which argues, that their *reflection* or transmission depends on the constitution of the air and water behind the glass, and not on the striking of the rays upon the parts of the glass; the rays not being *reflected* until they have reached the last part of the surface, and are begun to go out. For if in going out they fall upon a surface of oil and water, they proceed; the attraction of the glass being ballanced by an equal force the contrary way, and prevented from having its effect by the attraction of the liquor adhering to it: but if the rays in passing out of this last surface fall into a vacuum which has no attraction, or into air which has but little, not enough to counter-balance the effect of the glass; in this case the attraction of the glass draws them back, and *reflects* them.

This will appear still more evident, by laying two glass prisms, or the object glasses of two telescopes, the one plane and the other a little convex, upon each other, so as they may neither touch nor yet be too far a-part. For that light which falls on the hind surface of the first glass, where the glasses are not above  $\frac{1}{100000}$  part of an inch a-part, will be transmitted through the surface, and through the air or vacuum between the glasses, and pass into the second glass: but if the second glass be taken away, then the light passing out of the second surface of the first glass into the air or vacuum, will not proceed but return into the first glass, and be *reflected*.

Whence it follows, that the rays are drawn back again by some force in the first glass; there being nothing else to occasion their return — And hence too, it follows, that the *re-*

*fection* is not effected by means of any subtle matter, contiguous to the hind surface, according to the principles of Des Cartes; since that matter ought to *reflect* them when the glasses were nearly contiguous, as well as when the second glass is quite removed.

Lastly, If it be asked how some of the rays come to be *reflected*, and others transmitted: and why they are not all alike *reflected*, supposing the *reflection* owing to the action of the whole surface? the same great author shews, that there are both in the rays of light, and in the bodies themselves, certain vibrations (or some such property) impressed on the rays, by the action either of the luminary that emits them, or of the bodies that *reflect* them; by means whereof it happens, that those rays in that part of their vibration which conspires with the motion of the parts of the body, enter the body, are refracted and transmitted; but those in a contrary part of their vibration *reflected*. See VIBRATION and MEDIUM. See also REFRACTION and TRANSMISSION.

Add, that every ray of light, in its passage through any refracting surface, is put into a certain transient constitution or state, which in the progress of the ray returns at equal intervals, and disposes the ray at each return to be easily transmitted through the next *refracting* surface; and between each return to be easily *reflected* by it.

These alternate dispositions, which Sir Isaac Newton calls *fits of easy reflection*, and of *easy transmission*, he accounts for by supposing that the rays of light, in impinging on bodies, excite vibrations therein, which happening to move faster than the rays, when a ray is in that part of the vibration which conspires with its motion, it passes through; but when in the contrary part of the vibration, is beat back again: whence every ray is successively disposed to be easily *reflected*, or easily transmitted, by every vibration which overtakes it. See TRANSMISSION.

REFLECTION, in catoptrics, is the return of a ray of light from the polished surface of a speculum or mirror, driven thence by some power residing therein. See MIRROR and CATOPTRICS.

The ray thus returned is called a *reflex*, or *reflected ray*, or *ray of reflection*; and the point of the speculum whence the return commences, the *point of reflection*.

Thus the ray AB (*Tab. Optics, fig. 26.*) proceeding from the radiant A, and striking on the point of the speculum B; being returned thence to C; BC represents the *reflected ray*, and B the *point of reflection*: in respect whereof AB represents the *incident ray*, or *ray of incidence*, and B the *point of incidence*. See POINT and RAY.

Again, a line CG drawn from any point as C of the *reflected ray* BC, perpendicular to the speculum, is called the *cathetus of reflection*, or *cathetus of the eye*: as a line AF, drawn from the radiant perpendicular to the speculum, is called the *cathetus of incidence*. See CATHETUS.

Of the two angles which the *reflected ray* BC makes with the mirror, the smallest, CBE, is called the *angle of reflection*: as, of the two angles the incident ray makes with the speculum, the smallest ABD is called the *angle of incidence*. See ANGLE.

If the mirror be either concave, or convex, the smallest angles the ray makes with a tangent to the point of *reflection* and incidence, are the *angles of reflection* and incidence.

The angle CBH which the *reflected ray* makes with a perpendicular to the point of *reflection*, is called the *inclination of the reflected rays*; as the angle ABH is called the *inclination of the incident ray*. See INCLINATION.

General laws of REFLECTION — I. If a ray of light be *reflected* from a speculum of any form; the angle of incidence is ever equal to the angle of reflection — This law obtains in percussions of all kinds of bodies, and consequently must do so in those of light. See laws of PERCUSSION, see also ANGLE. It might therefore be here assumed as an axiom: but it is of that importance, and its demonstration so beautiful, that we cannot omit it — Suppose, then, DC (*fig. 54.*) an incident ray, propagated from the radiant D: here, though the motion of the ray be simple, yet its determination in the line DC being oblique with respect to the obstacle, is really compounded of two determinations; the one along DE, the other along DG. See COMPOUND motion.

The force along DC, therefore is equal to the two forces along DG and DH. But the obstacle GF only opposes one of the determinations, viz. that along DG (for it cannot oppose a determination parallel to itself, as DE;) therefore only the force along DG will be lost by the stroke; that along DH or GC remaining entire — But a body perfectly elastic (such as we suppose the ray of light) will recover by its elasticity, the force it lost by the shock. See ELASTICITY.

The ray, therefore, will recover the force DG or CH. Thus, retaining both its forces, and both its former determination HC and CF, after percussing, it will be impelled along CF and CH, by the same forces as before along DH and DG. By its compound motion, therefore, it will describe the right line CE, and that in the same time as

DC; and HE and DH will be equal, as being described by the same force. Now, the two triangles DCH and CHE are equal, and consequently their similar angles equal. Since then,  $HCA = HCF$ ;  $DCA$  the angle of incidence, is equal to  $ECF$  the angle of reflection. *Q. E. D.*

This law is confirmed in light by an easy experiment. For a ray of the sun falling on a mirror, in a dark room, through a little hole; you will have the pleasure to see it rebound, so as to make the angle of reflection equal to that of incidence. See *CAMERA obscura*.

The same may be shewn various other ways: thus, *e. gr.* placing a semicircle  $F i G$  (*Tab. Optics, fig. 26.*) on a mirror DE, its centre on B, and its limb perpendicular to the speculum; and assuming equal arches,  $F a$  and  $G e$ ; place an object in A, and the eye in C: then will the object be seen by a ray reflected from the point B, and if B be covered, the object will cease to be seen.

Hence, 1<sup>o</sup>. If a ray of light, as HB, fall perpendicularly on the surface of a speculum DE, it will be reflected back upon itself.

2<sup>o</sup>. From the same point of a speculum, several rays cannot be reflected to the same point; for in that case all the several angles of reflection would be equal to the same angle of incidence; which is absurd.

3<sup>o</sup>. One ray as AB cannot be reflected to two or more points; for in that case all its angles of reflection would be equal to the same angle of incidence; which is as absurd as before. See *RADIANT*.

II. *Each point of a speculum reflects rays falling on it, from each part of an object.*—Hence, since several rays coming from several parts of a radiant object, cannot be reflected from the same point of a speculum to the same point; the rays that flow from different points of the object, are separated after reflection: and hence each ray shews the point whence it proceeded. See *VISION*.

On this principle it is that the rays reflected from mirrors or looking-glasses, exhibit the appearances of objects placed before them. See *LOOKING-GLASS*.

And hence we easily conceive why rough bodies exhibit no images; in regard they reflect the light in such manner as to confound rays which proceed from different points, by means of their eminences and cavities, their alternate risings and fallings—But for this, all hard bodies would be mirrors.

III. *If the eye C, and the radiant point A change places; the point will continue to radiate upon the eye, in the same course or path as before.*

For if the object be removed from A to C, it will still radiate on its former point of reflection B; but there can be but one right line drawn between the two points G and D; and the rays are right lines. Therefore that which was before the ray of reflection, will now be the ray of incidence; and since it will be reflected under the same angle as that under which it fell, that which was before the ray of incidence, will now be the ray of reflection. So that the object removed to C, will radiate on the eye placed in A, by the right lines CB and BA. *Q. E. D.*

Hence, an object is seen by the reflected ray AB, with the eye placed in A, the same, as if the eye were in AC, and the object in A.

The truth of this theorem is so easily confirmed by experiment, that some, with Euclid, assume it as a principle; and demonstrate the great law of reflection therefrom—Thus; suppose the angle of incidence a little greater than the angle of reflection; then will the angle ABF be greater than that CBE. Wherefore, changing the places of the eye and the object, the angle CBE will become the angle of incidence; and therefore CBE greater than ABF, by the supposition. So that the same angle ABF will be both greater and smaller than the other CBE; which being absurd, ABE cannot be greater than CBE—The same absurdity will follow, if you suppose the angle of incidence less than the angle of reflection—Since then the angle of incidence can neither be greater nor less than that of reflection, it must be equal to it.

IV. *The plane of reflection, that is, the plane wherein the incident and reflected rays are found, is perpendicular to the surface of the speculum; and in spherical specula passes through the centre.* See *PLANE*.

Hence the cathetus both of incidence and reflection is in the plane of reflection. See *CATHETUS*.

That the plane of reflection is perpendicular to the speculum, is assumed by Euclid, Alhazen, and others, as a principle, without any demonstration; as being evident from all observation and experiment.

V. *The image of an object seen in a mirror, is in the cathetus of incidence.*—This the ancients assumed as a principle: and, hence, since the image is certainly in the reflected ray, they inferred it must appear in the point of concurrence of the reflected ray with the cathetus of incidence; which indeed holds universally in plane and spherical mirrors, and usually in concave ones; a few cases only excepted, as is shewn by Kepler.

For the particular laws of REFLECTION, arising from the circumstances of the several kinds of specula, or mirrors, plane,

concave, convex, &c. see them laid down under the article *MIRROR*.

*Point of REFLECTION.* See the article *POINT*.

*REFLECTION of the moon*, is a term used by some authors, for what we otherwise call her variation; being the third inequality in her motion, whereby her true place out of the quadratures, differs from her place twice equated. See *MOON*.

*REFLECTION* is also used in the Copernican system, for the distance of the pole from the horizon of the disk; which is the same thing as the sun's declination in the Ptolemaic system. See *DECLINATION*.

*REFLECTION* is also used figuratively for an operation of the mind, whereby, turning as it were back upon itself, it makes itself and its own operation its object; and considers or contemplates the manner, order, and laws which it observes in perceiving, reasoning, willing, judging, doubting, believing, &c. and frames itself new ideas of the relations discovered therein. See *SOUL*, *FACULTY*, *PERCEPTION*, *IDEA*, &c.

*REFLEX, REFLECT*, in painting, is understood of those places in a picture which are supposed to be illuminated by a light reflected from some other body represented in the same piece. See *LIGHT*.

Or, *reflexes* may be defined those places which beside the general light that illumines the whole piece, receive some particular light, from their situation with respect to some more illumined polished body that reflects part of the rays it receives upon them. See *COLOUR*.

*Reflexes* are scarce sensible except in the shadowed parts—The management of the *reflexes* requires a world of accuracy and skill—All reflected light is supposed to carry with it part of the colour of the body which reflects it; so that those places which receive this light, must have their colour mixed or tinged with that colour, but the same place may receive *reflexes* from different objects, differently coloured, and those again receive *reflexes*, from others—The painter therefore must have a view to every circumstance of the colour, light and position of each figure; must consider what effect each has on others, and pursue nature through all the variety of mixtures. See *CLAIR-obscur*.

*REFLEX vision*, or *REFLECTED vision*, is that performed by means of rays reflected from the polished surfaces of objects to the eye. See *VISION* and *REFLECTION*.

*Reflex vision* is the subject of catoptrics. See *CATOPTRICS*.—Under *reflex vision* come all the phenomena of specula or mirrors of all kinds. See *MIRROR*.

*REFLEXIBILITY of the rays of light*, is that property whereby they are disposed to be reflected. See *REFLECTION*.

Or, it is their disposition to be turned back into the same medium, from any other medium on whose surface they fall—Hence those rays are said to be *more or less reflexible*, which are returned back more or less easily under the same incidence. See *RAY*.

Thus if light pass out of glass into air, and by being inclined more and more to the common surface of the glass and air, begins at length to be totally reflected by that surface; those sorts of rays which at like incidences are reflected most copiously; or the rays which by being inclined begin soonest to be totally reflected, are most *reflexible*.

That rays of light are of different colours endued with different degrees of *reflexibility*, was first discovered by Sir Isaac Newton; and is shewn by the following experiment—Applying a prism DFE (*Tab. Optics, fig. 55.*) whose angles are each 45°, to the aperture C of a darkened room, in such manner as that the light is reflected from the base in G: the violet rays are seen first reflected in HG; the other rays continuing still refracted in IK—After the violet, the blue are all refracted, then the green, &c. See *PRISM*.

Hence it appears, that the differently coloured rays, differ in degree of *reflexibility*. See *COLOUR*.

From other experiments it appears, that those rays which are more *reflexible*, are also most *refrangible*. See *REFRANGIBILITY*.

*REFLEXION.* See the article *REFLECTION*.

*REFLUX of the sea*, the ebbing of the water; or its return from the shore. It is thus called, as being the opposite motion to the flood, or flux. See *FLUX* and *TIDE*.

*REFORM*, a re-establishment, or revival of former neglected discipline; or a correction of the reigning abuses therein. See *REFORMATION*.

The term is much used in a monastic sense, for the reducing an order or congregation of religious to the antient severity of the rule, from which it had gradually swerved; or even for the improving on the antient rule and institution itself, and voluntarily making it more severe. See *ORDER* and *RELIGIOUS*.

In this sense the order of St Barnard is said to be only a *reform* of that of St Benedict. See *BERNARDIN* and *BERNEDICTIN*.

To *REFORM* in a military sense, is to reduce a company, regiment,

regiment, or other body of men, either by disbanding the whole, or only breaking a part, and retaining the rest; or sometimes by incorporating them in other regiments—Hence, **REFORMADO**, or **REFORMED officer**, one whose troop, or company is suppressed in a *reform*, and he continued either in whole or half pay, doing duty in the regiment.

A *reformed* captain on foot follows the company, and assists the standing officer as a second; but still maintains his degree and precedence. See **CAPTAIN**.

**REFORMATION**, **REFORMATIO**, the act of *reforming*, or correcting an error, or abuse in religion, discipline, or the like. See **REFORM**.

The *reformation* of the Roman calendar by Pope Gregory, was effected in the year 1582, chiefly by the advice of Aloysius Lilius, and Clavius. See **CALENDAR**.

The *reformation of religion*, called by way of eminence, *the reformation*, was begun by the elector of Saxony, at the solicitation of Luther, about the middle of the sixteenth century. See **LUTHERANISM**.

King Henry VIII. of England, happening to have then a pique against pope Clement VII. by reason of his persisting in not allowing of his divorce from queen Catherine of Austria, fell in with the torrent, abolished the pope's supremacy, seized the monasteries, and other religious houses, and divided their lands among the nobility and gentry.

In every thing else he persevered a papist—So that the *Reformation* went on but lamely in his time—Under his son Edward VI. it went much farther; but was all undone again by his successor queen Mary, who re-established the antient superstitions.

But the executions of above 500 people, who were burnt for the protestant faith in the five years of her reign, so alienated the people from popery, that queen Elizabeth, her sister, found it no hard matter to carry the *reformation* to its full length, and to settle it on the foot whereon it now stands among us.

*Right of REFORMATION*, *ius REFORMATIONIS*, is a right which the princes of Germany claim to *reform* the church in their respective territories; as being invested with the spiritual as well as the temporal power.

The *ius reformationis* is annexed to the sovereignty; by this they have the power of conscience, the disposition of ecclesiastical revenues, &c. as they enjoyed the same at the treaty of Munster in 1624.

**REFORMED calendar** } See the articles { **CALENDAR**.  
**REFORMED church** } **CHURCH**.  
**REFORMED officer** } **REFORMADO**.

**REFRACTED dials**, are such as shew the hour by means of some *refracting* transparent fluid. See **DIAL**.

If a pin or stick be set up, or any point be assigned in a concave bowl or dish, for the centre of the dial; and a horizontal dial be applied over the same; assigning the meridian line on the edges of the bowl; and marking out the rest of the hour lines also on the edges of the bowl: then taking away the horizontal dial, and elevating a string or thread from the end of the said pin over the meridian line, as much as is the latitude or elevation of the pole of the place.—Then, by bringing the thread to cast a shadow or any hour-point formerly marked out on the edges of the bowl, by a candle or the like; that shade in the bowl is the true hour-line: and if the bowl be full of water, &c. when this is done; it will never shew the true hour by the shadow of the top of the pin, but when filled again with the same liquor.

**REFRACTED ray**, or *ray of REFRACTION*. See **RAY** and **REFRACTION**.

**REFRACTED vision**. See the article **VISION**.

**REFRACTION**, **REFRACTIO**, in mechanics, the deviation of a moving body from its direct course, by reason of the different density of the medium it moves in; or a flexion and change of determination, occasioned by a body's falling obliquely out of one medium into another of a different density. See **MEDIUM**.

Thus a ball A, (*Tab. Mechanics, fig. 52.*) moving in the air in the line A B, and falling obliquely on the surface of the water C D, does not proceed straight to E, but deviates or is inflected to F—Again, if the ball moving in water in the same line A B should fall obliquely on a surface of air C D; it will not proceed straight to E, nor yet deflect to F, but to G. Now the deflection in each case is called the *refraction*; and the two cases are distinguished by means of the perpendicular M I; that B G being called *refraction towards the perpendicular*, or to the *axis of refraction*; and the other B F, *refraction from the perpendicular*, or from the *axis of refraction*.

These *refractions* are supposed to arise hence, that the ball arriving at B, in the first case, finds more resistance or opposition on the side O, *i. e.* from the side of the water, than from the side P, or that of the air; and in the latter more resistance from the side P, which is now the side of the water, than the side O, which is that of the air.

The *great law of refraction*, then, which holds in all bodies, and all mediums, is, that a body passing obliquely out of a medium which resists it more into another, which resists it

less, is refracted towards the perpendicular; and in passing out of a medium which opposes it less into another which opposes it more, is refracted from the perpendicular.

Hence the rays of light falling out of air into water are refracted towards the perpendicular; whereas a ball thrown into the water is refracted from it; by reason water, which resists the motion of light less than air, resists that of the ball more: or, to speak more justly, by reason water, by its greater attraction, accelerates the motion of the rays of light more than air does; for that this is the true cause of *refraction*, at least in light, shall be shewn under **REFRACTION** of light.

To have a body *refracted*, it is necessary it fall obliquely on the second medium—In perpendicular incidences there is no *refraction*.

Vossius, indeed, and Snellius imagined they had observed a perpendicular ray of light undergo a *refraction*; a perpendicular object appearing in the water nearer than in reality it was: but this was to attribute that to a *refraction* of the perpendicular rays, which was owing to the divergency of the oblique rays after *refraction*, from a nearer point.

Yet is there a manifest *refraction* even of perpendicular rays found in *island crystal*. See **ISLAND CRYSTAL**.

Rohault adds, that though an oblique incidence be necessary in all other mediums we know of; yet the obliquity must not exceed a certain degree—If it do, the body will not penetrate the medium, but be *reflected* instead of *refracted*—Thus cannon balls in sea engagements, falling very obliquely on the surface of the water, are observed to mount a-loft again, and frequently to sweep the men from off the opposite decks: and the like happens to the little stones wherewith children make their ducks and drakes.

The antients confounded *refraction* with *reflection*; and it was Sir Isaac Newton, who first taught us the just difference between them—He shews withall, that there is a good deal of analogy between them; and particularly in the case of light. See **REFLECTION** and **REFRACTION** of light.

The laws of *refraction* of the rays of light in mediums differently terminated, *i. e.* whose surfaces are plain, concave, convex, &c. make the subject of dioptrics. See **DIOPTRICS**.

By *refraction* it is, that convex glasses, or lenses collect the rays, magnify objects, burn, &c. See **LENS**, **CONVEX**, and **CONCAVE**.

Hence the foundation of microscopes, telescopes, &c. See **MICROSCOPE** and **TELESCOPE**, &c.

By *refraction* it is, that all remote objects are seen out of their their real places; particularly, that the heavenly bodies are apparently higher than they are in reality, &c. See **APPARENT** and **PLACE**. See also **REFRACTION astronomical**.

**REFRACTION of light**, in optics, is an inflexion or deviation of the rays from their rectilinear course upon falling obliquely out of one medium into another, of a different density. See **RAY**.

The *refraction* of light Sir Isaac Newton shews is not performed by the rays falling on the very surface of bodies; but without any contact, by the action of some power in bodies equally diffused throughout their surfaces; by which same power acting in other circumstances, they are also emitted and reflected. See **LIGHT**.

The same arguments whereby we have proved that *reflection* is performed without immediate contact, go a great way towards demonstrating the same of *refraction*: to which may be added the following ones.

1°. Because if when light falls out of glass into air, with the utmost obliquity it will be transmitted at, it be then made to fall a little more obliquely, it becomes wholly reflected—For, the power of the glass after it has refracted light emerging as obliquely as possible, supposing the rays to fall still more obliquely, will be too strong to let any of the rays pass; consequently, instead of being *refracted* they will be all reflected.

2°. Because in thin lamellæ, or plates of glass, light is reflected and *refracted* several times alternately, as the thickness of the lamellæ increases in arithmetical progression—For here it depends on the thickness of the lamina which of the two it shall do; whether reflect it, or let it be transmitted.

3°. Because whereas the power of other bodies both to reflect and refract light are very nearly proportional to their densities; yet unctuous and sulphurous bodies are found to reflect more strongly than according to their densities—For as the rays act more strongly on those bodies to kindle them, than on others; so do they, again, by their mutual attraction, act more strongly on the rays to *refract* them.

*Lastly*, Because not only those rays transmitted through glass are found to be *refracted*, but also those passing in the air, or in a vacuum near its extremities, or even near the extremes of many opaque bodies, *e. gr.* the edge of a knife, undergo a similar inflection, from the attraction of the body. See **INFLECTION**.

The manner wherein *refraction* is performed by meer attraction,

traction, without contact, may be thus accounted for—Suppose *HI* (*Tab. Optics*, fig. 56.) the boundary of two mediums, *N* and *O*; the first the rarer, *e. gr.* air; the second the denser, *e. gr.* glass; the attraction of the medium here will be as their densities—Suppose *PS* to be the distance to which the attracting force of the denser medium exerts itself within the rarer.

Let now a ray of light *Aa* fall obliquely on the surface which separates the mediums; or rather, on the surface *PS*, where the action of the second and more resisting medium commences. All attraction being performed in lines perpendicular to the attractive body, as the ray arrives at *a*, it will begin to be turned out of its rectilinear course, by a superior force wherewith it is attracted by the medium *O*, more than by the medium *N*, *i. e.* by a force wherewith it is driven towards it in a direction perpendicular to its surface—Hence the ray is bent out of its right line, in every point of its passage between *PS* and *RT*, within which the attraction acts. Between those lines, therefore it describes a curve *aBb*. But beyond *RT*, being out of the sphere of attraction of the medium *N*, it will proceed uniformly in a right line, according to the direction of the curve in the point *b*.

Again, suppose *N* the denser and more resisting medium, *O* the rarer; and *HI* the boundary, as before; and let *RT* be the distance to which the denser medium exerts its attractive force within the rarer: even when the ray has passed the point *B*, it will be within the sphere of superior attraction of the denser medium; but that attraction acting in lines perpendicular to its surface, the ray will be continually drawn from its straight course *BM* perpendicularly towards *HI*; thus having two forces or directions, it will have a compound motion, whereby instead of *BM* it will describe *Bm*; which *Bm*, will in strictness be a curve.

Lastly, After it has arrived in *m*, being out of the influence of the medium *N*, it will persist uniformly in a right line, in the direction wherein the extreme of the curve leaves it.

Thus we see how *refraction* is performed, both towards the perpendicular, and from it.

But note, the attraction of the denser medium, *e. gr.* *N*. is continually diminishing as the ray proceeds from *B*, towards the limit of attraction *RT*; in regard fewer and fewer parts still come to act: at *IH*, *e. gr.* all the parts between that and *PS* attract, but at *RT*, none but those in the line *HI*—Note also, that the distance between *PS* and *RT* being small, when we consider *refractions*, no notice is taken of the curve part of the ray; but we consider it as consisting of two straight lines, *CB*, *AB*, or *mB*, *AB*.

**REFRACTION**, in dioptrics, is the inflection or bending of the rays of light, in passing the surfaces of glasses, lenses, and other transparent bodies of different densities.

Thus a ray, as *AB*, (*Tab. Optics*, fig. 56.) falling obliquely from the radiant *A*, upon a point *B*, in a diaphanous surface, *HI* rarer or denser than the medium along which it was propagated from the radiant; it has its direction there altered by the action of the new medium, and instead of proceeding to *M* deviates, *e. gr.* to *C*.

This deviation is called the *refraction of the ray*: *BC* the *refracted ray*, or *line of refraction*; and *B* the *point of refraction*. See **RAY**, **LINE**, and **POINT**.

The line *AB* is called the *line of incidence*, or *ray of incidence*; and in respect hereof *B* is also called the *point of incidence*. See **INCIDENCE**.

The plane wherein both the incident and *refracted* rays are found, is called the *plane of refraction*; a right line *BE* drawn in the *refracting* medium perpendicular to the *refracting* surface in the point of *refraction* *B*, is called the *axis of refraction*—And a right line *DB* drawn perpendicular to the *refracting* surface, in the point of incidence *B*, along the medium through which the ray fell, is called the *axis of incidence*. See **PLANE**, **AXIS**, &c.

The Angle *ABI* included between the incident ray, and the *refracting* surface, is called the *angle of incidence*; and the angle *ABD* included between the incident ray, and the axis of incidence, is called the *angle of inclination*—The angle *MBC* which the *refracted* ray makes with the incident, is called the *angle of refraction*; and the angle *CBE* which the *refracted* ray makes with the axis of *refraction*, is called the *refracted angle*. See **ANGLE**.

**General laws of REFRACTION**—1°. *A ray of light in its passage out of a rarer, into a denser medium, e. gr. out of air into glass, is refracted towards the perpendicular, i. e. towards the axis of refraction.*

Hence, the *refracted angle* is less than the *angle of inclination*: and the *angle of refraction* less than that of incidence; as they would be equal, were the ray to proceed straight from *A* to *M*. Hence, also a ray perpendicular to the *refracting* surface, will pass through without being *refracted*; as it cannot be *refracted* to the perpendicular. The physical cause thereof is, that the attraction of the denser medium, which in incidences oblique to its surface acting perpendicular to that surface, draws the ray out of its course: this attraction, we say, in a perpendicular incidence, acts in the direction of the ray.

2°. *The ratio of the sine of the angle of inclination, to the sine of the refracted angle, is fixed and constant; viz. if the refraction be out of air into glass, it is found greater than as 114 to 76; but less than 115 to 76; that is, nearly as 3 to 2.*

This ratio, assigned by Huygens, agrees with another of Sir Isaac Newton, who makes the sine of the angle of inclination to the sine of the *refracted* angle, as 31 to 20; which is, likewise, nearly as 3 to 2—Indeed there is some difference in the quantity of *refraction*, in different kinds of glass; but in physical matters preciseness is not necessary—In rain water, Des Cartes found, the ratio of the sine of the angle of inclination, to the sine of the *refracted* angle, as 250 to 187, that is, nearly as 4 to 3; which agrees with Sir Isaac Newton's observation, who makes it as 529 to 396—In spirit of wine the same great author makes the ratio as 100 to 73; which is not far from the sesquitercian ratio—In air he makes it as 3851 to 3850.

Whence the different *refractive* power in different fluids arises, is not determined—Clear water, of all others, *refracts* the least; and if impregnated with salts, its *refraction* is increased in proportion to the quantity of salt. Sir Isaac Newton shews, that in many bodies, *e. gr.* glass, crystal, a selenites, pseudo-topaz, &c. the *refractive* power is proportionable to their densities; only in sulphurous bodies, as camphire, oil, olive, amber, spirit of turpentine, &c. the power is two or three times greater than in other bodies of equal density; yet they have the *refractive* power with respect to each other, nearly as their densities—As to air, he shews that a ray of light in traversing quite through the atmosphere, is *refracted* the same it would be were it to pass with the same obliquity out of a vacuum into air of equal density with that in the lowest part of the atmosphere. See **AIR**.

From the law just laid down, it follows that one angle of inclination, and its corresponding *refracted* angle being found by observation; the *refracted* angles corresponding to the several other angles of inclination, are easily computed—Now, Zahnus and Kircher have found, that if the angle of inclination be 70°, the *refracted* angle will be 38°, 50'; on which principle Zahnus has constructed a table of *refractions* out of air into glass, for the several degrees of the angle of inclination; a specimen whereof follows:

Ang. of Incl.	Refracted Angle.	Angle of Refraction.	Ang. of Incl.	Refracted Angle.	Angle of Refraction.
1°	0° 40' 5"	0° 19' 55"	10°	6° 39' 16"	3° 20' 44"
2	1 20 6	0 39 54	20	13 11 35	6 48 25
3	2 0 3	0 59 56	30	19 29 29	10 30 31
4	2 40 5	1 19 55	45	28 9 19	16 50 41
5	3 20 3	1 39 57	90	41 51 40	48 8 20

Hence it appears that if the angle of inclination be less than 20°, the angle of *refraction* out of air into glass, is almost  $\frac{1}{3}$  of the angle of inclination; and therefore a ray is *refracted* to the axis of *refraction*, by almost a third part of the quantity of its angle of inclination—And on this principle it is that Kepler and most other dioptrical writers, demonstrate the *refractions* in glasses.

The constant ratio of the sines of the angles of inclination, and the *refracted* angles was first discovered by Willeb. Snellius—It is vulgarly attributed to Des Cartes; who having seen it in Snellius's MS, first published it in his dioptrics, without naming Snellius; as we are informed by Huygens.

Indeed, as the rays of light are not all of the same degree of *refrangibility*; this constant ratio must be different in different kinds—The ratio therefore observed by authors is to be understood of rays of the mean *refrangibility*, *i. e.* of green rays. The difference of *refraction* between the least and most *refrangible* rays, that is between violet and red rays, Sir Isaac Newton shews is about  $\frac{1}{3}$  part of the whole *refraction* of the mean *refrangible*; which difference he owns is so small that there seldom needs to be any regard had to it. See **REFRACTION**.

3°. *When a ray passes out of a denser into a rarer medium, e. gr. out of glass into air, it is refracted from the perpendicular, or from the axis of refraction.*—And hence the angle of *refraction* is greater than the angle of inclination.

Hence, also, if the angle of inclination be less than 30°; *MBC* is nearly equal to  $\frac{1}{3}$  of *MBE*—Therefore *MBC* is one half of *CBE*: consequently if the *refraction* be out of glass into air; and the angle of inclination less than 30°; the ray is *refracted* from the axis of *refraction* by almost one half part of the angle of inclination—And this is the other dioptrical principle used by most authors after Kepler, to demonstrate the *refractions* of glasses.

If the *refraction* be out of air into glass, the ratio of the sine of inclination to the sine of the *refracted* angle is as 2 to 3; if out of air into water, as 4 to 3: therefore, if the *refraction* be the contrary way, *viz.* out of glass or water into air; the ratio of the sines in the former case, will be as 2 to 3, in the latter as 4 to 3.

4°. *A ray falling on a curve surface, whether concave or convex, is refracted after the same manner as if it fell on a plane which is a tangent to the curve in the point of incidence.*

For

For the curve and plane surface touching it, have an infinitely small part common to them both (each being originally generated by the flux of a point.) But a ray is *refracted* in such a little part; therefore it is the same as if it were *refracted* in such a plane.

5°. If a right line  $EF$  (fig. 57.) cut a refracting surface  $GH$  at right angles; and if from any point in the denser medium as  $D$  be drawn  $DC$  parallel to the incident ray  $AB$ : this will meet the refracted ray in  $C$ ; and will be to it as the sine of the refracted angle to the sine of the angle of inclination.

Hence, if  $BC$  pass out of glass into air, it is in a sublesquialterate ratio to  $CD$ ; if out of air into glass, in a sesquialterate ratio to  $CD$ .

Hence, also, if light pass out of water into air;  $CB$  is in a sublesquitercian ratio to  $CD$ ; if out of air into water in a lesquitercian. See fig. 57. and 58.

**Laws of REFRACTION in plane surfaces** — 1°. If parallel rays be *refracted* out of one transparent medium into another of different density, they will continue parallel after *refraction*. The physical reason is, that being parallel, their obliquity, or angle of incidence is the same: but at equal obliquities we have shewn the *refraction* is equal; consequently the parallelism which they had before the *refraction*, will be retained after it.

But this may be also demonstrated geometrically, thus: if the rays be perpendicular to the *refracting* surface, they will pass without any *refraction*; consequently being parallel before their passage, they will be so after it. If they fall obliquely, as  $AB$  and  $DC$ , the angles of incidence  $\theta$  and  $u$ , and consequently also the angles of inclination  $x$  and  $y$ , will be equal. But the sines of the angles of inclination  $x$  and  $y$ , have the same ratio to the sines of the *refracted* angles  $m$  and  $n$ ; therefore the *refracted* angles  $m$  and  $n$  are also equal; consequently the *refracted* rays are parallel.

Hence a glass, plain on both sides, being turned directly to the sun; the light passing through it will be propagated after the same manner as if the glass were away: for the rays being perpendicular will pass without *refraction* — If the glass be turned obliquely to the sun, the light after *refraction* will be of the same intensity as before; the intensity depending on the spissitude or closeness of the rays, and on the angle wherein they strike the object, or the eye, both which are here unvaried. See **RAY**.

2. If two rays  $CD$  and  $CP$  (fig. 59.) proceeding from the same radiant  $C$ , and falling on a plane surface of a different density, so as the points of *refraction*  $D$  and  $P$  are equally distant from the cathetus of incidence  $GK$ ; the *refracted* rays  $DF$  and  $PQ$  have the same virtual focus, or point of dispersion  $G$ . See **VIRTUAL**.

Hence, 1°. Since in rays very near each other, the distance from the cathetus is the same as to sense; very near rays will diverge from the same point  $G$ , *i. e.* have the same virtual focus  $G$  — And hence, 2°. When *refracted* rays falling on the eye placed out of the cathetus of incidence, are either equally distant from the cathetus, or very near each other; they will flow upon the eye, as if they came to it from the point  $G$ ; consequently the point  $C$  will be seen by the *refracted* rays as in  $G$ .

3. If a ray  $CD$  fall obliquely out of a thinner into a denser medium, having a plane surface; the distance of the radiant point  $CK$  will have a less ratio to the point of dispersion, or virtual focus  $KG$ , than the sine of the *refracted* angle to the sine of the angle of inclination — But if the distance of the point of *refraction* from the cathetus of incidence  $KD$  be less than the eleventh or nineteenth part of the distance of the radiant point  $CK$ ; and if in the former case the tenth, in the latter the hundredth part thereof be so small that it cannot be assigned or need not be minded then will  $CK$  be to  $KG$ , as to sense, in the ratio of the sine of the *refracted* angle, to the sine of the angle of inclination.

Hence, 1°. If the *refraction* be out of air into glass, the distance of the point of dispersion of rays near the cathetus, is sesquialterate, of the radiant point; of more remote rays, greater than sesquialterate.

Hence, 2°. If the eye be placed in a denser medium, objects in a rarer will appear more remote than they are; and the place of the image in any given case, may be determined from the ratio of the *refraction* — Thus to fishes swimming under water, objects out of the water must appear farther distant than in reality they are.

4. If a ray  $DG$  fall obliquely out of a denser, into a rarer medium  $AB$ , the distance of a radiant point  $GK$ , has a greater ratio to the distance of the point of dispersion  $KC$ , than the sine of the *refracted* angle has to the sine of the angle of inclination — In the other case of the preceding theorem,  $KG$  will be to  $KC$ , as to sense, in the ratio of the sine of *refracted* angle, to the sine of the angle of inclination.

Hence, 1°. If the *refraction* be out glass into air, the distance of the point of dispersion of rays near the cathetus of incidence, is sublesquialterate of the distance of the radiant

point. That of the more remote rays is less than sublesquialterate.

But, 2°. If the *refraction* be out of water into air, the distance of the point of dispersion of rays near the cathetus, is sublesquitercian; of those more remote, less than sublesquitercian.

And, 3°. The eye therefore being in a rarer medium, objects placed in a denser appear nearer than they are; and the place of the image may be determined in any given case by the ratio of *refraction* — Hence the bottom of a vessel full of water; is raised by *refraction*, to a third part of its height, with respect to an eye perpendicularly over the *refracting* surface; and hence fishes and other bodies under water, appear nearer than they really are.

5. If the eye be placed in a rarer medium, an object seen in a denser medium, by a ray *refracted* in a plain surface, will appear larger than it really is — If the object be in a rarer, and the eye in a denser medium, the object will appear less than it is — And in each case the apparent magnitude is to the real one in a ratio compounded of the distance of the point to which the rays tend before *refraction*, from the *refracting* surface  $FL$  (fig. 60.) to the distance of the eye  $GL$ , from the same, and of the distance of the object from the eye  $GM$ , to its distance from a point to which the rays  $FM$  tend before *refraction*.

Hence, 1°. If the object  $AB$  be very remote;  $FM$  will be physically equal to  $GM$ ; and therefore the real magnitude  $MB$  to its apparent one  $MH$ , as  $GL$  to  $FL$ , or the distance of the eye  $G$  from the *refracting* plane to the distance of the point of convergence  $F$  from the same plane.

Hence, 2°. Objects under water, to an eye in the air, appear larger than they are; and to fishes under water, objects in the air appear less than they are.

**Laws of REFRACTION in spherical surfaces, both concave and convex** — 1. A ray of light  $DE$  (fig. 61.) parallel to the axis of a denser sphere, after a single *refraction* in  $E$ , falls in with the axis in the point  $F$ , beyond the centre  $C$ .

For the semidiameter  $CE$  drawn to the point of *refraction*  $E$ , is perpendicular to the surface  $KL$ , and is therefore the axis of *refraction*; but a ray out of a rarer into a denser medium, we have shewn, is *refracted* towards the perpendicular, or the axis of *refraction*; therefore the ray  $DE$  will converge to the axis of the sphere  $AF$ ; and will, therefore at length concur with it; and that beyond the centre  $C$ , in  $F$ , because the angle of *refraction*  $FEH$  is less than the angle of inclination  $CEH$ .

2. If a ray  $DE$  fall on a spherically convex surface of a denser medium, parallel to its axis  $AF$ ; the semidiameter  $CE$  will be to the *refracted* ray  $EF$  in the ratio of the sine of the *refracted* angle, to the sine of the angle of inclination: but the distance of the focus or point of concurrence from the centre  $CF$ , is to the *refracted* ray  $FE$  in the ratio of the sine of the *refracted* angle to the sine of the angle of inclination.

3. If a ray  $DE$  fall on a denser spherical convex surface  $KL$ , parallel to the axis  $AF$ ; the distance of the focus from the *refracting* surface  $FB$ , is to its distance from the centre  $FC$ ; in a ratio greater than that of the sine of the angle of inclination to the sine of the *refracted* angle — But if the rays be very near the axis, and the angle of inclination  $BCE$  only of a few degrees; the distances of the focus from the surface, and the centre  $FB$  and  $FC$ , will be, nearly, in the ratio of the sine of the angle of inclination, to the sine of the *refracted* angle.

Hence, 1°. If the *refraction* be out of air into glass; in the case of rays near the axis,  $BF : FC :: 3 : 2$ . And in the case of the rays remote from the axis,  $BF : FC :: 7 : 3 : 2$ . Consequently in the former case,  $BC : BF :: 1 : 3$ ; and in the latter  $BC : CF :: 1 : 3$ .

And 2°. If the *refraction* be out of air into water; in the former case,  $BF : FC :: 4 : 3$ ; and in the latter,  $BF : FC :: 7 : 4 : 3$ . Consequently in the former  $BC : BF :: 1 : 4$ , and in the latter  $BC : BF :: 1 : 4$ .

Hence, 3°. Since the sun's rays are parallel as to sense; if they fall on the surface of a solid glass sphere, or of a sphere full of water, they will not concur with the axis within the sphere. So that Vitellio was mistaken when he imagined that the sun's rays falling on the surface of a chrystallin sphere, *refracted* to the centre. See **Focus**.

4. If a ray  $DE$  (fig. 62.) parallel to the axis  $FA$ , fall out of a denser into a rarer spherical medium; after *refraction* it will diverge from the axis; and the distance of the point of dispersion, or the virtual focus from the centre of the sphere,  $FC$ , will be to its semidiameter  $CE$  in the ratio of the sine of the *refracted* angle to the angle of *refraction*; but to the portion of the *refracted* ray drawn back,  $FE$ , in the ratio of the sine of the *refracted* angle to the sine of the angle of inclination.

5. If a ray  $ED$  fall parallel to the axis  $AF$  on the spherically convex surface  $KL$ , of a rarer medium, out of a denser; the distance of the point of dispersion from the centre,  $FC$ , is to its distance from the surface  $FB$ , in a ratio greater than that of the sine of the *refracted* angle to the sine of the

angle of inclination — But if the rays  $DE$  be very near the axis  $FA$ , the ratio will be very nearly the same with that of the *refracted* angle to the sine of the angle of inclination.

Hence, 1<sup>o</sup>. If the *refraction* be out of glass into air; in the case of rays near the axis,  $FC : FB :: 3 : 2$ . Consequently  $BC : FB :: 1 : 2$ . Therefore in the case of rays more remote from the axis,  $BC : FB \angle 1 : 2$ .

2<sup>o</sup>. If the *refraction* be out of water into air; in the former case  $FC : FB :: 4 : 3$ . Consequently  $BC : FB :: 1 : 3$ ; in the latter case, therefore,  $BC : FB \angle 1 : 1$ .

3<sup>o</sup>. Since then the point of dispersion  $F$  is more remote from the *refracting* surface  $KL$ , if the rays proceed out of water, than out of glass into air; parallel rays are less dispersed in the former case than in the latter.

6. If a ray  $HE$  (fig. 61.) fall parallel to the axis  $FA$ , out of a rarer, on the surface of a spherically concave denser medium; the *refracted* ray  $EN$  will be driven from the point of the axis  $F$ ; so as  $FE$  will be to  $FC$ , in the ratio of the sine of the angle of inclination, to the sine of the *refracted* angle.

7. If a ray  $EH$  fall parallel to the axis  $FB$  on the concave surface  $KL$  of a spherical denser medium, from a rarer; the distance of the point of dispersion from the *refracting* surface  $FB$ ; is to it's distance from the centre,  $FC$ , in a ratio greater than that of the sine of the angle of inclination, to the sine of the *refracted* angle. But if the rays be very near the axis, and the angle  $BCE$  very small;  $BF$  will be to  $C$   $F$  very nearly in the ratio of the sine of the angle of inclination, to the sine of the *refracted* angle.

Hence, 1<sup>o</sup>. If the *refraction* be out of air into glass; in the case of rays near the axis,  $FB : FC :: 3 : 2$ ; in the case of rays more remote from the axis  $FB : FC \angle 3 : 2$  consequently in the former,  $BC : FC :: 1 : 2$ . And hence, in the latter,  $BC : FC \angle 1 : 2$ .

Hence also 2<sup>o</sup>. If the *refraction* be out of air into water; in case of the rays near the axis;  $FB : FC :: 4 : 3$ . In the case of rays more remote from the axis  $FB : FC \angle 4 : 3$ . Consequently in the first case,  $BC : FC :: 1 : 3$ . And hence, in the latter,  $BC : FC \angle 1 : 3$ .

And hence, 3<sup>o</sup>. Since the point of dispersion  $F$ , is farther from the centre  $C$ , if the *refraction* be in water than in air; the rays will be less dispersed in the latter case than in the former.

8. If the ray  $HE$  (fig. 62.) fall parallel to the axis  $AF$ , from a denser, upon the surface of a spherically concave rarer medium; the *refracted* ray will concur with the axis  $AF$ , in the point  $F$ ; so as the distance of the point of concurrence from the centre  $CF$ , may be to the *refracted* ray  $FE$  in the ratio of the sine of the *refracted* angle, to the sine of the angle of inclination.

**REFRACTION in a glass prism** — If a ray of light  $DE$  (fig. 62. n<sup>o</sup>. 2.) fall obliquely out of air on a prism  $ABC$ ; being *refracted* towards the perpendicular, instead of proceeding to  $F$  it will decline to  $G$ , i. e. towards a line  $HI$ , drawn perpendicular to the surface  $AB$  in the point of *refraction*  $E$  — Again, since the ray  $EG$  passing out of the glass into air falls obliquely on  $CB$ ; it will be *refracted* to  $M$ : so as to recede from the perpendicular  $NGO$ . And hence the various phenomena of the prism. See PRISM.

**REFRACTION in a convex lens** — If parallel rays  $AB$ ,  $CD$ , and  $EF$  (fig. 63.) fall on the surface of a lens  $2B3K$ ; the perpendicular ray  $AB$  will pass unrefracted to  $K$ , where emerging into air perpendicular, as before, it will proceed straight to  $G$ . But the rays  $CD$  and  $EF$  falling obliquely out of air into glass, in  $D$  and  $F$ , will be *refracted* towards the axis of *refraction* (i. e. towards lines  $HI$  and  $LM$  drawn perpendicular to the *refracting* surface in the points of *refraction*  $F$  and  $D$ ) and decline to  $P$  and  $Q$  — Again, emerging obliquely out of the glass into the surface of the air, they will be *refracted* from the perpendicular; and therefore  $DQ$  will not proceed to  $X$  but to  $G$ ; and  $FP$ , not to  $V$  but to  $G$ : thus likewise might all the other rays falling on the surface of the glass, be shewn to be *refracted* so as to meet the rest about the point  $G$ . See FOCUS.

Hence the great property of convex glasses; viz. that they collect parallel rays, or make them converge into a point. See CONVEXITY.

**REFRACTION in a concave lens** — Parallel rays  $AB$ ,  $CD$ , and  $EF$  (fig. 64.) falling on a concave lens  $GBHMK$ ; the ray  $AB$  falling perpendicular on the glass at  $B$ , will pass unrefracted to  $M$ ; where being still perpendicular, it will pass into the air, without *refraction*, to  $L$ . But the ray  $CD$  falling obliquely on the surface of the glass, will be *refracted* towards the perpendicular  $NDO$ , and proceed to  $Q$ ; and the ray  $DQ$ , again, falling obliquely out of the glass upon the surface of air, will be *refracted* from the perpendicular  $RQS$ , and proceed to  $V$ . After the same manner might the ray  $EF$  be shewn to be *refracted* to  $Y$ , and thence to  $Z$ .

Hence the great property of concave glasses, viz. That they

disperse parallel rays, or make them diverge. See CONCAVITY.

**REFRACTION in a plane glass** — If parallel rays  $EF$ ,  $GH$ ,  $IL$  (fig. 65.) fall obliquely on a plain glass  $ABCD$ ; the obliquity being the same in all, by reason of their parallelism, they will be all equally *refracted* towards the perpendicular; and accordingly being still parallel at  $M$ ,  $O$ , and  $Q$ , will pass out into the air equally *refracted*, again, from the perpendicular, and still parallel. See PARALLEL; and LOOKING-glass.

Thus will the rays  $EF$ ,  $GH$ , and  $IL$ , at their entering the glass, be inflected towards the right; and in their going out as much inflected to the left; so that the first *refraction* is here undone by the second; though not so as that the object is seen in it's true place — For the ray  $BQ$  being produced back again, will not coincide with the ray  $LI$ ; but will fall to the right thereof; and this the more as the glass is thicker: however as to matter of colour, the second *refraction* does really undo the first. See COLOUR.

**REFRACTION in island crystal** — The laws of *refraction* in island crystal differ very much from those laid down in other substances; for here is a double *refraction*, contrary ways, whereby not only oblique rays are split or divided into two, and *refracted* to opposite parts, but even perpendicular rays are also split, and one half of them *refracted* — For the theory hereof. See island CRYSTAL.

The particular laws of **REFRACTION in the several kinds of lenses**, see under LENS.

**REFRACTION in astronomy, or REFRACTION of the stars**, is an inflection of the rays of those luminaries, in passing through our atmosphere; whereby the apparent altitudes of the heavenly bodies are increased. See STAR and ALTITUDE, &c.

This *refraction* arises hence, that the atmosphere is unequally dense in different stages or regions; rarest of all a-top, and densest at bottom; which inequality in the same medium, makes it equivalent to several unequal mediums. See AIR and ATMOSPHERE.

Sir Isaac Newton has shewn that a ray of light in passing from the highest and rarest part of the atmosphere, down to the lowest and densest, undergoes the same *refraction* it would do in passing immediately, at the same obliquity, out of a vacuum into air of equal density with that in the lowest part of the atmosphere.

The effect of this *refraction* may be thus conceived. Suppose  $ZV$  (Tab. Astronomy, fig. 57. n<sup>o</sup>. 2.) a quadrant of a vertical circle, described from the centre of the earth  $T$ , under which is  $AB$  a quadrant of a circle on the surface of the earth, and  $GH$  a quadrant of the surface of the atmosphere: and suppose  $SE$  a ray of light emitted by a star at  $S$ , and falling on the atmosphere at  $E$  — This ray coming out of the ætherial medium, which is much rarer than our air, or perhaps out of a perfect vacuum, and falling on the surface of the atmosphere, will be *refracted* towards the perpendicular: and since the upper air, again, is rarer than that near the earth, and grows still denser as it approaches us: the ray, in it's progress will be continually *refracted*, so as to arrive at the eye in the curve line  $EA$ .

Supposing, then the right line  $AF$  to be a tangent to the arch in  $A$ , the ray will enter the eye  $A$ , according to the direction of  $AF$  — and since objects are always seen in that line, according to the direction whereof the rays enter the eye, the star will appear in  $AF$ ; that is, in the heavens at  $Q$ , which is nearer the zenith than the star really is.

Hence arise the phenomena of the crepusculum, or twilight, See CREPUSCULUM.

And hence also it is that the moon is sometimes seen eclipsed, when she is below the horizon, and the sun above it. See ECLIPSE.

That there is a real *refraction* of the stars, &c. is deduced not only from physical considerations, and from arguments a priori, and a similitudine; but also from precise astronomical observations; thus,

The distance of the two stars, Spica Virginis, and the Lion's Tail, when near the meridian, or even near the west, is constantly found  $35^{\circ} 2'$ . But when the Lion's Tail is risen in the east  $34^{\circ} 0'$ , high, Spica Virginis is observed to be in almost the same vertical circle — Add to this, an observation of the Dutch, who wintered at Nova Zembla in 1597, from whom the sun totally disappeared on the 14th of November; and again began to appear on the 24th of January, which was six days sooner than he should have returned, according to astronomical calculations; as is observed in the Acta Eruditorum, A. 1697 — Nor must it be omitted that Charles XI, king of Sweden, being in 1694, at Tornou, in West-Bothnia, in the latitude of  $65^{\circ} 33'$ , observed, that the sun never set between the 14th and 15th day of June, but was visible in the middle of the night: the following year he appointed two mathematicians, Bilembergius, and Spolius, to observe the same more accurately; who accordingly found that at Tornou in the middle of the night, between the 10th and 11th of June the sun was  $\frac{1}{2}$  of his diameter above the horizon: and

on

on the 14th of June at Kangis, in the latitude of  $66^{\circ}$ ,  $15'$ , they found the sun at midnight, two diameters above the horizon.

Hence it is argued, that as light is propagated in right lines, no rays could reach the eye from a luminary below the horizon, unless they were deflected out of their course at their entrance into the atmosphere; it is evident, therefore, the rays are *refracted* in passing through the atmosphere. Hence the stars appear higher by *refraction* than they really are; so that to bring the observed or apparent altitudes to the true ones, the quantity of *refraction* must be subtracted. See ALTITUDE.

And hence, as the antients were unacquainted with the *refraction*; reckoning upon too great altitudes, it is no wonder they sometimes committed considerable errors.

From the doctrine of *refractions* it appears that we never see the real sun rising or setting, but only a phantom, or image thereof; the sun himself being at that time hid below the horizon.

And from the observations just mentioned, it follows, that the *refractions* are greater near the pole, than at lesser latitudes; doubtless from the greater density of the atmosphere, and the greater obliquity of the incidence.

M. de la Hire assures us, he could never find any difference in the meridian altitudes of the stars; so that the *refractions* re-

main always the same—Though he owns near the horizon the different constitution of the air, &c. may occasion some variations in the *refractions*.

Stars in the zenith are not subject to any *refraction* — Those in the horizon have the greatest — From the horizon the *refraction* continually decreases to the zenith: all which follows hence, that in the first case the rays are perpendicular; in the second their obliquity is the greatest; in the third, it is continually increasing.

At the same altitudes, the sun and stars all undergo the same *refraction*; for at equal altitudes, the incident rays have the same inclinations: but the sines of the *refracted* angles as are the sines of the angles of inclination, &c.

Indeed Tycho Brahe, who first deduced the *refractions* of the sun, moon, and fixt stars from observation; makes the solar *refractions* greater than those of the fixt stars; and the lunar *refractions* sometimes greater than those of the stars, sometimes less — But the theory of *refractions* (which we have observed is owing to Snellius) was not fully understood in his age—De la Hire and Cassini, find the *refraction* the same in all.

M. de la Hire gives us a table of the *refractions* of the stars, in their several degrees of altitude; deduced from the surest and most accurate observations; as follows:

Table of the REFRACTIONS of the heavenly bodies, at the several degrees of altitude.

Alt.	Refract.	Alt.	Refract.	Alt.	Refract.	Alt.	Refract.	Alt.	Refract.	Alt.	Refract.
0	32' 0"	16	3' 26"	30	1' 51"	46	1' 9"	61	0' 40"	77	0' 17"
1	26 35	17	3 23	31	1 47	47	1 7	62	0 39	78	0 15
2	20 43	18	3 12	32	1 43	48	1 6	63	0 37	79	0 14
3	15 44	19	3 1	33	1 40	49	1 4	64	0 35	80	0 12
4	12 26	20	2 51	34	1 36	50	1 2	65	0 33	81	0 11
5	10 26	21	2 44	35	1 33	51	1 0	66	0 32	82	0 10
6	9 8	22	2 38	36	1 30	52	0 58	67	0 31	83	0 8
7	8 2	23	2 31	37	1 27	53	0 56	68	0 30	84	0 7
8	7 1	24	2 24	38	1 24	54	0 54	69	0 28	85	0 6
9	6 17	25	2 18	39	1 22	55	0 52	70	0 26	86	0 4
10	5 41	26	2 12	40	1 19	56	0 50	71	0 25	87	0 3
11	5 11	27	2 7	41	1 17	57	0 48	72	0 24	88	0 2
12	4 46	28	2 3	42	1 15	58	0 46	73	0 23	89	0 1
13	4 25	29	1 59	43	1 13	59	0 44	74	0 21	90	0 0
14	4 7	30	1 55	44	1 11	60	0 42	75	0 20		
15	3 51			45				76	0 18		

Tycho Brahe will have the *refractions* of the sun to vanish at the altitude of  $46^{\circ}$ ; those of the moon at  $45^{\circ}$ , and those of the fixt stars at  $20^{\circ}$ : but Cassini has found that they reach even to the zenith — Indeed Tycho represented all the *refractions* less than they are; except the horizontal one, which he made too big: for he makes the horizontal *refraction* in the sun  $34'$ ; in the moon  $33'$ ; in the fixt stars  $30'$ . De la Hire and Cassini make it  $32'$  in all the heavenly bodies. Tycho, again makes the *refraction* of the sun at  $33^{\circ}$  altitude, to be  $55''$ ; but Cassini  $1'$ ,  $43''$ .

Fa. Laval in 1710, 22<sup>d</sup> Jan. observed the meridian altitude of the sun to be  $70^{\circ}$ ,  $25'$ ,  $50''$ ; and on the 23<sup>d</sup> of June, observed the same to be  $70^{\circ}$ ,  $26'$ ,  $0''$ , which is  $10''$  more, that should be less—Having met with some like observations before, he takes occasion to suspect the *refraction* to be varied according to the different winds which blow from the different quarters — When the north-west wind blows, he thinks the *refraction* is the greatest; and adds, from observations made at St Baume, and St Pilon, that the *refraction* at 24 fathoms above the surface of the sea, is double that at 600 fathoms. See HORIZON — Huygens long ago observed the *refraction* to be changed every hour; though his experiments were made at very little altitudes, and in terrestrial objects.

The *refraction* diminishes the right and oblique ascensions of a star, and increases the descensions: it increases the northern declination, diminishes the southern. See ASCENSION, DESCENSION, &c.

*Refraction*, in the eastern part of the heavens, diminishes the longitude of a star, but increases the same in the western part of the heavens: it diminishes the southern latitude, and increases the northern. See LONGITUDE and LATITUDE.

The *refraction* therefore, is by no means to be overlooked in astronomy — It is absolutely necessary to the determining of the phenomena of the heavenly motions, to a degree of accuracy; so that the antient astronomy, where no regard was had to it, must of necessity have been exceedingly defective on this very account. See ASTRONOMY.

To observe the REFRACTION of a star, &c.—1<sup>o</sup>. Observe the meridian altitude of a star near the zenith; whence the latitude of the place being known, the true declination of the star is easily had, the star being now void of any sensible *refraction*. See DECLINATION.

2<sup>o</sup>. Observe the altitude of the same star in any other degree, and note the time by a pendulum. 3<sup>o</sup>. For the given time

of observation, from the declination of the star compute it's true altitude. See ALTITUDE.

This being thus found less than the altitude observed; subtract the one from the other; the remainder is the *refraction* for that moment, in that degree.

REFRACTION of altitude, is an arch of a vertical circle, as S s' (Tab. Astronomy, Fig. 28.) whereby the altitude of a star S'E, is increased by the *refraction*. See ALTITUDE.

REFRACTION of declination, is an arch of a circle of declination, as s'I, whereby the declination of a star D'S is increased or diminished by the *refraction*. See DECLINATION.

REFRACTION of ascension and descension, is an arch of the equator, D d, whereby the ascension and descension of a star, whether right or oblique, is increased or diminished, by means of the *refraction*. See ASCENSION, &c.

REFRACTION of longitude, is an arch of the ecliptic, T t, fig. 29. whereby the longitude of a star is increased or diminished by means of the *refraction*. See LONGITUDE, &c.

REFRACTION of latitude, is an arch of a circle of latitude s'I, whereby the latitude of a star, T'S, is increased or diminished by means of *refraction*. See LATITUDE.

REFRACTION, in commerce, is a term sometimes used by merchants, where there has been an oversight in an account, to the prejudice of a person, who thereupon demands restitution of so much, added or omitted by mistake.

You must make me a *refraction* of five pound forgot in your account — I will deduct or make you a *refraction* of 30 s. charged inadvertently in my bill.

REFRANGIBILITY of light, the disposition of the rays to be refracted. See REFRACTION.

A greater or less *refrangibility* is a disposition to be more or less refracted, in passing at equal angles of incidence, into the same medium. See LIGHT, MEDIUM, &c.

That the rays of light are differently *refrangible*, is the foundation of Sir Isaac Newton's whole theory of light and colours—The truth of the principle will appear from the following experiments.

1<sup>o</sup>. A ray of light being received through a little round hole into a dark room, upon a glass prism, A B C (Tab. Optics. fig. 65. n<sup>o</sup>. 2.) in such manner as to pass through it near the angle C; the various colours of the rainbow will be seen painted in all their splendor on a white paper, E F; viz. the red in E, then the yellow, then green, blue, and at last purple, or violet; and on whatever body you receive the light, still the colours will be the same.

Yet,

Yet this coloured light is still propagated, like other light, in right lines; it is reflected, too, like other light, from a mirror, and refracted through a lens; yet retains its colours both after refraction and reflection — When collected into a focus, the rays degenerate into a very bright white; but upon diverging again from the focus, resume their former colours.

Hence, 1<sup>o</sup>. Since nothing here happens to the rays in passing the prism, but that they are refracted, both in entering, and in quitting it: (See PRISM.) Light is converted into those colours by meer refraction.

2<sup>o</sup>. Since the coloured rays are still propagated in right lines, both when reflected from mirrors, and refracted in lenses; they still retain all the properties of light, and therefore are still light.

3<sup>o</sup>. Since the several coloured rays decussated and mixed together in the focus, appear white; but after separation, beyond the focus, recover their former colours; therefore red, yellow, green, blue, and purple rays mixed together in a convenient proportion, constitute a resplendent white. See WHITE.

Note, The experiment will succeed if the room be not dark, only the colours will be less vivid.

2. A prism DEF (fig. 66.) being so disposed as that the refractions of the rays both at their entrance and exit, are equal (which is obtained, by turning it slowly round its axis till the coloured light, which now rises, and now falls, appear stationary between the two.) In the middle space between the prism and the coloured light, painted on the wall, place another prism GH to receive the coloured light LM. After a second refraction in this second prism the coloured light painted on the wall, IK, will be inclined to a like light NO, seen there, even when the prism GH is removed; so as the blue extremities N and I will be further a-part than the red ones K and O.

Hence, 1<sup>o</sup>. The blue rays must of necessity be more refracted than the red ones; and there is, likewise, an unequal refraction in the intermediate rays.

Hence, therefore, the sun's rays are not all of the same refrangibility; consequently, not of the same nature. See RAY.

3. Those rays are most refrangible, which are most reflexible. See this proved under REFLEXIBILITY.

The difference between refrangibility and reflexivity was first discovered and published by Sir Isaac Newton in 1675, in the *Phil. Transact.* and from that time vindicated by him, from the objections of several authors; particularly F. Pardies, M. Mariotte, Fr. Linus, or Lin, and other gentlemen of the English college at Liege: at length it was more fully laid down, illustrated, and confirmed by great variety of experiments in his immortal optics.

But, further, as not only those colours of light produced by refraction in a prism, but also those reflected from opaque bodies, have their different degrees of refrangibility and reflexivity; and as a white light arises from a mixture of the several coloured rays; the same great author concluded all homogenous light to have its proper colour, corresponding to its degree of refrangibility, and not capable of being changed by any reflexions, or any refractions; that the sun's light is composed of all the primary colours; that all compound colours arise from a mixture of the primary ones, &c. See COLOUR.

The different degrees of refrangibility, he conjectures to arise from the different magnitude of the particles whereof the different rays consist — Thus the most refrangible rays, *i. e.* the red ones, he supposes to consist of the largest particles; the least refrangible, *i. e.* the violet rays, of the smallest particles; and the intermediate rays, yellow, green, and blue, of particles, of intermediate sizes. See RED, GREEN, RAY, &c.

REFRESHMENT, quarters of. See QUARTERS.

REFRET, in music. See the article RITORNELLO.

REFRIGERATIVE, in medicine, a remedy, or diet which refreshes the inner parts by cooling them — Such, usually, are pitifans, clysters, potions, &c. See PTISAN, &c.

REFRIGERATORY, REFRIGERATORIUM, in chymistry, a vessel, filled with cold water, placed about the head of an alembic, to cool and condense the vapours raised thither by the fire, and to convert them into a liquor, to be discharged thence through the beak. See DISTILLATION, ALEMBIC, SPIRIT, WATER, &c.

The water in the refrigeratory is to be changed from time to time, as it begins to grow warm.

Sometimes they content themselves with wrapping a wet cloth about the head of the alembic, instead of a refrigeratory: but the more usual method now used to supply the place of the refrigeratory, is by a worm or spiral pipe running through a tub of cold water. See SERPENTINE.

Distillation chiefly consists in evaporation and refrigeration. See EVAPORATION, &c.

REFUGE, REFUGIUM, in our old customs, a sanctuary or asylum. See SANCTUARY and ASYLUM.

At Paris is an hospital called the *refuge*, wherein dissolute women are shut up. See PENITENT and MAGDALEN.

REFUGEES, French-protestants, who by the revocation of the edict of Nants, in 1685, have been constrained to quit their country, and retire for *refuge* into Holland, Germany, England, &c. to save themselves from the necessity of abandoning their religion. See EDICT, HUGUENOT, &c.

REGAL, REGIUS or REGALIS, something belonging to a king. See KING.

*Regal* is of the same import with *royal*; the former being formed of the Latin *rex*; the other of the French, *roy*, king. See ROYAL.

REGAL fishes. See the article ROYAL fishes.

REGAL suit. See the article SUIT.

REGALE, in the French jurisprudence, is a right belonging to the king over all benefices in that kingdom. See BENEFICE.

The *regale* consists in enjoying the revenues of bishoprics during the vacancy of their sees, and of presenting to the benefices dependent thereon, which become vacant during that time, and till a successor have taken the oath of fidelity, and have procured letters patents, to secure him from the *regale*.

The enjoyment of the fruits of the see is called the *temporal regale*; that of presenting the benefices, the *spiritual regale*. Some refer the origin of the *regale* to the time of Clovis, and say the clergy granted this privilege to the king, upon his defeating the Visigoths; others alledge, that pope Adrian I. gratified Charlemagne with it, in a council held at Rome — It is observed by others, that the *regale* was originally no more than a ward, or administration; and that the kings were only depositaries of the fruits of the vacant bishoprics, and appointed oeconomus to look to them during the vacancy. See OECONOMUS.

It is added, that the kings of the first and second race never enjoyed any such privilege, and that it was only introduced in the twelfth century, in favour of investitures. See INVESTITURE.

REGALE, REGALIO, a magnificent treat or entertainment, given ambassadors, or other persons of distinction, to divert or do them honour.

In Italy, it is usual at the arrival of any traveller of eminence, to send him a *regale*; that is, a present of fruits, sweet-meats, &c. by way of refreshment.

REGALIA, in law, the royal rights, or prerogatives of a king. See KING, PREROGATIVE, &c.

These are reckoned by civilians to be six; 1<sup>o</sup>. power of jurisdiction. 2<sup>o</sup>. power of life and death. 3<sup>o</sup>. power of war and peace. 4<sup>o</sup>. masterless goods. 5<sup>o</sup>. assellments. 6<sup>o</sup>. minting of money. See ROYALTIES.

REGALIA is also used for the several parts of the apparatus of a coronation; as the sceptre with the cross; sceptre with the dove; St Edward's staff; four several swords; the globe; the orb with the cross, &c. used at the coronation of our kings.

REGALIA, of the church, are those rights and privileges which cathedrals, &c. enjoy by grants, and other concessions of kings. See CHURCH, CATHEDRAL, &c.

*Regalia* is sometimes also used, for the patrimony of a church: as, *regalia sancti petri* — And more particularly, for such lands and hereditaments as have been given by kings to the church. *Cepimus in manum nostram baroniam & regalia quae archiepiscopus Eborum de nobis tenet.* Pryn. lib. Ang.

These *regalia*, while in possession of the church, were subject to the same services as all other temporal inheritances; and after the death of the bishop reverted to the king, till he invested another with them; which in the reigns of William the conqueror, and some of his immediate successors, was frequently delayed, and as oft did the bishops make complaint thereof as appears from Malmesbury, Neubrigenfis, &c. See BISHOP.

This last author says, that great complaint was made against Henry II. *Quod episcopatus vacantes, & provenientia perciperet commoda, diu vacare voluit, & ecclesiasticis potius usibus applicanda in fiscum redegit.* See TEMPORALITY, BENEFICE, &c.

REGALIA facere, is used for a bishop's doing homage or fealty to the king, when he is invested with the *regalia*. See HOMAGE and BISHOP.

Thus Malmesbury, in Anselm. *Regalia pro more istius temporis faciens principi 7 kalend. octobris, Cantuariæ affedit.*

REGALITIES. See the article ROYALTIES.

REGARD, of the forest, the over-sight, or inspection thereof; or the office, and province of the *regarder*; which is to go through the whole forest, and every bailiwick thereof, before the holding of the sessions of the forest, or justice seat; to see and enquire of the trespasses therein. \* See FOREST.

\* *Ad videndum, ad inquirendum, ad certificandum, &c.* See REGARDER.

REGARD is also used for the extent of the *regarder's* charge, *i. e.* for the whole forest, or all the ground that is parcel thereof. See PURLIEU.

REGAR-

**REGARDANT**, in heraldry, is understood of a lion, or other beast of prey, borne in a posture of looking behind him, with his face towards his tail.

Others apply it to a beast which only shews the head, and some part of the neck, as moving from out of some division of the coat into another—He bears azure, three bends or, in a chief argent, charged with a lion *regardant* gules.

**Villain REGARDANT**, or **REGARDANT to the manour**, denotes an ancient servant, or retainer to the lord; thus called, because charged to do base services within the manour, to see the same freed of all filthy and loathsome things that might annoy it. *Coke on Littleton, fol. 120.*

**REGARDER of a forest**, **REGARDATOR forestæ**, an ancient officer of the king's forest, whose business was every year upon oath, to make a *regard*, i. e. take a view of the forest limits; also to enquire of all offences and defaults committed by the forresters within the forest, and of all the concealments of them, and whether all the other officers did execute their respective duties or not. See **FOREST**.

Manwood refers this institution to king Henry II. but Spelman thinks the name, at least, was given since; and that they were the same with those officers called *custodes venationis*. See **REGARD**.

**REG E**, *querela coram*. See **QUERELA**.

**REGEL**, or **RIGEL**, a fixed star of the first magnitude, in Orion's left foot—It's longitude, latitude, &c. see among the rest of the constellation **ORION**.

**REGENERATION**, in theology, the act of being born again by a spiritual birth, or becoming a child of God. See **CONVERSION**.

*Regeneration* is performed by the washing of the Holy Spirit, whereof baptism is the sign. When an infidel is converted, baptism is administered as a sign of *regeneration*. See **BAPTISM**.

**REGENT**, **REGENS**, a person who governs a kingdom during the minority, or the absence of a king. See **VICE-ROY**.

In France, the queen mother has the regency of the kingdom, under the title of *queen regent*, while the king is a minor—Some have urged that women being incapable of succeeding to that crown, were incapable of the *regency*; but custom has declared in their favour. See **SALIC**.

**REGENT** is also used for a professor of arts or sciences, who holds a class, or set of pupils, in a college. See **UNIVERSITY**, **COLLEGE**, &c.

The foreign universities are generally composed of doctors, professors and *regents*.—*Regent* and scholar are relative terms. See **TUTOR**.

*Regent* is generally restrained to the lower classes, as *regent* of rhetoric, *regent* of logic, &c. those of philosophy are rather called *professors*. See **PROFESSOR**.

**REGIA aqua**. }  
**Via REGIA**. } See the articles { **AQUA**.  
**Villa REGIA**. } { **VIA**.  
 { **VILLA**.

**REGICIDE**, **REGICIDA**, a king-killer—The term is also used for the act itself of murdering a king; of *rex*, king, and *cædo*, I slay.

*Regicide* is chiefly used in speaking of the persons concerned in the trial, condemnation, and execution of king Charles the first.

**REGIFUGE**, **REGIFUGIUM**, a feast held in ancient Rome on the sixth of the calends of March, i. e. on our 24th of February, in memory of the expulsion of their kings, particularly of Tarquin's flying out of Rome on that day. See **FEAST**.

Some will have the feast to bear this name from the *rex sacrorum*, king of the sacrifices, flying out of the comitia, or place of assembly, as soon as the sacrifice was over, in imitation of the flight of Tarquin the proud.

Some critics and antiquaries will have *regifugium*, the same with *fugalia*; others hold them to be different. See **FUGALIA**.

**REGIMEN\***, in medicine, a rule or course of living, with regard to eating, drinking, cloathing, and the like; accommodated to some disease, and to the particular course of medicine the patient is under. See **DIET**.

\* The word is pure latin, and signifies government or rule.

It is doubted whether the hot or cold *regimen* be most convenient in fevers?—The hot *regimen*; which antiently obtained in the small-pox, begins to be disused—The *regimen* is very different in different countries: Bartholin says, a slice of bacon in Denmark, is an usual dish for a person in a high fever.

**REGIMEN**, in chymistry and alchymy, is the method of ordering and conducting any thing, that it may answer it's intention.

Thus, *regimen of fire*, is the manner of making and ordering fire, and the degrees thereof. See **FIRE** and **DEGREE**.

**REGIMEN of the work**, that is, of the philosopher's stone, called *the work of patience*, is the rule and conduct to be observed to attain projection. See **PHILOSOPHERS Stone**, and **PROJECTION**.

VOL. II. N° CXXXI.

There are three things to be chiefly regarded in the *regimen of the work*—The first to administer a gentle, easy heat, at the beginning of the coction.

The second to continue this external heat according to the season of the work; always observing four seasons, as in the common and astronomical year: the beginning being the winter, the progress the spring, then summer, and lastly autumn, which is the time of maturity and perfection of the stone: in all which the heat is to be augmented in proportion to the augmentation observed in nature.

It is to be added, that the work may not be begun in any season, but regard is to be had to the seasons of nature; lest the winter of the work be found in the summer of the year, &c. Which, however, is to be understood of the day wherein the mercury is put in the ovum philosophicum; not of that when it is begun to be set at liberty from the prisons nature had inclosed it in.

The third is that in augmenting the fire, the augmentation be not of a whole degree at once; the spirits being unable to bear such violence; but a degree is to be divided into four parts, and one part to be taken at a time. See **DEGREE**.

All the operations of the first *regimen*, are occult and invisible: in the second *regimen* comes putrefaction, which is the first sensible change; shewing itself by it's black colour. See **PUTREFACTION**, &c.

**REGIMEN**, or *government*, in grammar, is that part of syntax or construction which regulates the dependency of words; and the alterations which one occasions in another. See **SYNTAX** and **CONSTRUCTION**.

Thus we say, the *regimen* of a verb active, is an accusative, i. e. a verb active governs an accusative; or requires that the noun which receives it's action be in the accusative case. See **VERB**, **ACCUSATIVE**, &c.

Prepositions have a *regimen*, i. e. they require certain cases in the nouns they are prefixed to; by which they are distinguished from *adverbs* which have none. See **PREPOSITION** and **ADVERB**.

The *regimen*, or construction of government, is entirely arbitrary; and differs in all languages; one language forming it's *regimen* by cases, as the Latins and Greeks; others by particles in lieu thereof; as the English, by *of*, *to*, &c. the French, Spaniards, and Italians, by *de*, *a*, *da*, &c. See **CASE**.

There are, however, some general maxims which hold in all languages as 1°. That there is no nominative case in any sentence but has a reference to some verb either expressed or understood. See **NOMINATIVE**.

2°. That there is no verb but has it's nominative case, either expressed or understood—Indeed in languages which have proper accusatives, as the Latin, before infinitives there is an accusative, not a nominative case: as *scio Petrum esse doctum*.

3°. There is no adjective but has a relation to some substantive. See **ADJECTIVE**, &c.

4°. That there is no genitive case but is governed by some other noun; inasmuch as that case always expresses the possessor, which must be governed by the possessed—This rule does not hold so apparently in the modern as the antient languages; in regard the particles *of*, *de*, &c. which are the proper signs of the genitive case, are frequently used as prepositions. See **GENITIVE**.

5°. That the *regimen* of verbs is frequently laid on different kinds of relations according to custom or usage; which yet does not change the specific relation of each case, but only shews that custom has made choice of this or that, according to fancy—Thus the Latins say, *juvare aliquem*, & *opitulari alicui*, to help one—So the French say, *servir quelqu'un* & *servir a quelqu'un*, to serve one—Thus the English say, *fight one*, or *fight with one*—And thus in Spanish most of the verbs active govern indifferently either a dative or an accusative. Sometimes, also, the verb admits of several *regimens*; as *præstare aliquem*, or *alicui*, *eripere morti aliquem*, or *alicui a morte*.

Indeed the different *regimen* sometimes makes an alteration in the sense; in which, particular regard is to be had to the usage of the language—Thus the Latin *cavere alicui*, signifies to watch, or to be careful of the preservation of any one: *cavere aliquem*, to beware of him.

There is one very common fault in *regimen*, which our accurate writers should be careful to avoid; viz. the using of two verbs that require different cases, together, as only governing one case: as in this example; after *embracing and giving his blessing to his son*; where *embracing* requiring an accusative, and *giving* a dative case, the *regimen*, or construction of the first verb with the noun is irregular: *embrace to a son*.

The same may be observed in nouns; as *I conjured him by the memory and the friendship he bore my father*; where *memory* does not agree with the verb *he bore*.

**REGIMENT**, in war, a body consisting of several troops of horse, or companies of foot, commanded by a colonel. See **COLONEL** and **MAJOR**.

The number of men in a *regiment*, is as undetermined as that of the men in a troop, or company. See TROOP and COMPANY.

There are *regiments* of horse, that are not above 300 men; and there are some in Germany of 2000; and the *regiment* of Picardy in France consists of 120 companies, or 6000 men. The French *regiments* of horse are not commanded by a colonel, as the foot are, but by a *mestre de camp*. See COLONEL.

Some observe, that there were no *regiments* of horse before the year 1637. Till then the troops were loose, and independent of each other, not incorporated into a body or *regiment*. See GUARD.

REGIO *assensu*, is a writ whereby the king gives his royal assent to the election of a bishop. See BISHOP.

REGION, REGIO, in geography, a *country*, or particular division of the earth; or a tract of land inhabited by people of the same nation. See EARTH, NATION, &c.

The modern astronomers divide the moon into several *regions* or provinces, to each whereof they give it's proper name. See MOON.

REGION in physiology—Authors divide the atmosphere into three stages, called the *upper*, *middle*, and *lower regions*. See ATMOSPHERE.

The *lowest* REGION is that wherein we breathe; and is bounded by the reflection of the sun's rays; that is, by the height to which they rebound from the earth. See RAY.

The *middle* REGION, is that wherein the clouds reside, meteors are formed, &c. extending from the extremity of the *lowest*, to the tops of the highest mountains. See METEOR, CLOUD, MOUNTAIN, &c.

The *upper* REGION, commences from the tops of the mountains, and reaches to the utmost limits of the atmosphere—In this reigns a perpetual, equable calmness, clearness, and serenity. See AIR.

Some authors use the term *elementary* REGIONS for the space of the whole atmosphere, from the earth to the sphere or heaven of the moon; because within this are contained the four elements, and all elementary bodies. See ELEMENT and ELEMENTARY.

*Ætherial* REGION is used for the whole extent of the universe, including the orb of the fixed stars, &c. See UNIVERSE.

REGION, in anatomy, denotes also a division of the human body. See BODY—Anatomists divide the body into three *regions*, or *venters*. See VENTER.

The *upper region* is that of the head; reaching as low as the first vertebra; and comprehending the animal organs, the brain, &c. See HEAD, &c.

The *middle region* is that of the thorax or breast, which Hippocrates calls the upper venter, and which reaches from the clavicles to the diaphragm; wherein are contained the vital parts, as the heart, lungs, &c. See HEART, LUNGS, &c.

The third or *lower region* is the abdomen or belly, &c. containing the natural parts, destined for digestion, purgation, and generation. See ABDOMEN.

Epilcolic REGION. } See the articles { EPICOLIC.  
Epigastric REGION. } EPIGASTRIC.  
Umbilical REGION. } UMBILICAL.

REGIONARY, REGIONARIUS, in ecclesiastical history, a title given from the fifth century, to persons who had the charge and administration of the church affairs within a certain district or *region*.

At Rome there were antiently seven *regionary deacons*, who presided over a kind of hospitals, and looked to the distribution of alms. See DEACON.

There were also *regionary subdeacons*, and *regionary notaries*, *regionary bishops*, &c. See NOTARY.

A *regionary* BISHOP was properly a missionary invested with an episcopal character, but without being attached to any particular see; that he might be at liberty to go preach, and perform other functions of his ministry, whithersoever the Spirit of God, and the wants of the people should call him. See BISHOP, MISSIONARY.

REGIS *pondus*. } See { PONDUS.  
REGIS *villa*. } VILLA.

REGISTER\*, REGISTRUM, a public book serving to enter and record memoirs, acts, and minutes, to be had recourse to, occasionally, for the justifying of matters of fact, &c. See RECORD, ARCHIVES, &c.

\* Menage derives the word by corruption, from *regesum*, a book containing extracts of several books, &c. collected together: *Dicitur regesum quasi iterum gesum*—Others derive it from the old French, *gisler*, to lie down in a bed, &c.

The law of Scotland is rendered very easy and regular, by means of the great number of *registers*, for recording the conveyances of lands, &c. of private persons—Of these there are two kinds: the one general, fixed at Edinburgh, under the direction of the *lord register*, who before the union was the fifth officer of state, and besides the *registry*, was clerk of the parliament, treasury, exchequer, and session.

The other is particularly kept in the several shires, stewarts, and regalities—The clerks hereof are obliged to transmit the *registers* of their respective courts to the general *register*; and the notaries their protocols: and here they are to disposed, that on demand the lieges can have a view of any writs which the law requires to be *registered*, or which parties for their security have thought fit to record.

The *registers* were first set on foot by act of parliament under king James VI. to the unspeakable advantage of the subject. No man can have a right to any estate, but it must be *registered* within forty days of his becoming seized of it, otherwise it is null: by this means all secret conveyances are cut off.

REGISTER, REGISTRARIUS, is also used for the clerk or keeper of a *register*, or *registry*. See CLERK.

Of these we have several, denominated from the *registers* they keep—as *register of the high court of delegates*; *register of the arches court of Canterbury*; *register of the court of admiralty*; *register of the prerogative court*; *register of the garter*, who is always dean of Windsor. See DELEGATE, ARCHES, ADMIRALTY, PREROGATIVE, GARTER, &c.

REGISTER of a *parish church*, is a book wherein the yearly baptisms, marriages, and burials of each parish, are orderly registered. See PARISH, &c.

This practice was laudably instituted by that great but unfortunate person, Thomas Cromwell, earl of Essex, anno 1538. while he was vicar-general to king Henry VIII. See BILL of mortality.

REGISTER is also the title of a book, containing the forms of most of the writs used in the common law; called the *register of writs*. See WRIT.

This *register*, Coke on Littleton observes, is one of the most antient books of the common law.

REGISTER *ships*, or *ships of REGISTER*, in commerce, are vessels to which the king of Spain, or the council of the Indies, grant permissions to go and traffic in the ports of the Spanish West-Indies. See COMMERCE.

They are thus called because the ships are to be *registered* before they set sail from Cadiz, which is the place where they usually load for Buenos Ayres.

These vessels, by the tenor of the cedula or permit, are not to exceed three hundred tons: but there is that good understanding between the merchants and the council of the Indies, that ships of five or six hundred tun frequently pass un-noted. The permissions cost thirty thousand pieces of eight each: but were they to cost an hundred thousand the merchants would be gainers, and the king of Spain a loser—For though the quantity and quality of the merchandizes on board be always expressed; yet, by force of presents, the officers here and in the Indies, allow them to load and unload vastly more than the permission expresses—Vessels whose certificate only mentions twelve thousand skins, and an hundred thousand pieces of eight, have been known to have on board above four millions in gold and silver; twenty six thousand skins, &c. So that the king of Spain's fifth, and his other dues, were almost nothing to what they should be.

Add to this, that in years 1702, 1703, &c. these *register* vessels, countenancing and backing each other, sold their commodities for above three hundred per cent. profit—A hat was sold for 18 pieces of eight; an ell of ordinary cloth for 12 pieces of eight, &c.

Among the *register* vessels may be reckoned a ship of five hundred tons, which the king of Spain allows the English South Sea Company to send each year to the fairs held at Porto Bello, Carthagena, and Vera Cruz, &c. See ASSIENTO.

REGISTER, among letter-founders, is one of the inner parts of the mould wherein the printing-types are cast. See LETTER.

It's use is to direct the joining them justly together again, after opening them to take out the new-cast letter. See LETTER-FOUNDRY.

REGISTERS, in chymistry, are holes, or chinks, with stopples to them, contrived in the sides of furnaces, to regulate the fire, *i. e.* to make the heat immediately more intense, or remiss, by opening them to let in the air, or keeping them close, to exclude it. See FURNACE, FIRE, HEAT, DEGREE, &c.

REGISTER, in printing, the disposing the forms of the press so as that the lines and pages printed on one side of the sheet, meet exactly against those on the other; which is done by means of two points in the greater or outward tympan. See PRINTING.

REGISTRY, REGISTRUM, comprehends the office, books, and rolls, wherein the proceedings of chancery, or any spiritual court, are *registered*, or recorded. See REGISTER, RECORD, ROLL, &c.

REGIUS-professors—King Henry VIII. founded five lectures in each of our universities, *viz.* of Divinity, Hebrew, Greek, Law, and Physic; the readers of which lectures are in the university statutes, called *regii professores*. See PROFESSOR.

REGIUS *morbus*. See the article JAUNDICE.

REGLET\*,

REGLET\*, or RIGLET, in architecture, a little flat narrow moulding, used chiefly in compartments, and pannels, to separate the parts or members from one another, and to form knots, frets, and other ornaments — See *Tab. Archit. fig. 1. fig. 26. lit. y. fig. 28. lit. l. m. fig. 32. lit. m. fig. 24. lit. N. z.* See also MOULDING, FRET, &c.

\* The word is a diminutive of the French, *regle*, rule.

The *reglet* according to Daviler, differs from the *fillet* and *listel*, in that it projects equally, like a ruler. See FILLET and LIST.

REGLETS, or RIGLETS, in printing, are thin rulers, or slips of wood of different dimensions, placed in the chase, between the pages, and at the extremes thereof, to keep them asunder and hold them tight. See PRINTING.

The *reglets* make the chief part of what they call the *furniture of the chase*. See CHASE.

They are particularly denominated from the place they hold in respect of the pages, *head-sticks, foot-sticks, gutter-sticks, &c.* The term REGLET is also used abroad for a ruler of metal,  $\frac{1}{4}$  of an inch long, but which may be lengthened out by joining several together; used to separate the columns, in books that have several in the same page; as also for lines to place the notes on it printing of music.

REGLET, is also used for a little thin slip of wood used by some compositors to take off the lines from the composing-stick, and place them on the galley, as fast as composed. See COMPOSITOR, GALLEY, &c.

REGNANT queen. See the article QUEEN.

REGRATER, REGRATARIUS, a law word, formerly used for one that bought wholesale, or by the great, and sold again by retail. See ENGROSSER, &c.

The term is now chiefly used to denote one that buys any wares or victuals, and sells them again in the same market or fair, or within five miles of it. See FORESTALLING.

REGRATER is also used for a person who refurbishes up old moveables, to make them pass for new. See FRIPPERY, and REDUBBOR.

Among masons, &c. to REGRATE, is to take off the outer surface of an old hewn stone, with the hammer and ripe, in order to whiten, and make it look fresh again. See STONE and MASONRY.

REGRESSION, or *retrogradation* of curves, &c. See RETROGRADATION, &c.

REGULA. See the article RULE.

REGULA, in architecture. See the articles REGLET, LIST, ORLE, &c.

REGULAR, REGULARIS, denotes the relation of any thing that is agreeable or conformable to the rules of art. See RULE and IRREGULAR.

In which sense the word stands opposed to *irregular*, or anomalous. See IRREGULAR, ANOMALOUS, &c.

Thus we say, a *regular* proceeding, *regular* building, *regular* poem, *regular* verb, &c. See VERB, POEM, &c.

REGULAR figure, in geometry, is a figure which is both equilateral, and equiangular; i. e. whose sides, and consequently angles, are all equal. See FIGURE.

The equilateral triangle and square are *regular figures*. See SQUARE and TRIANGLE — All other *regular* figures consisting of more than four sides, are called *regular polygons*. See POLYGON.

Every *regular* figure may be inscribed in a circle. See CIRCLE — For the dimensions, properties, &c. of REGULAR figures, see POLYGON.

REGULAR body, called also *platonian body*, is a solid terminated on all sides by regular and equal planes, and whose solid angles are all equal. See BODY, PLANE and SOLID.

The *regular* bodies are five in number; viz. — The *cube*, which consists of six equal squares; the *tetrahedron* of four equal triangles; the *octahedron* of eight; the *dodecahedron* of twelve; and the *icosahedron* of twenty; see each under its proper article. CUBE, TETRAEDRON, OCTAEDRON, &c. — Beside these five there can be no other *regular* bodies in nature.

To measure the surface and solidity of the five REGULAR bodies — The solidity, &c. of the cube is shewn under the article CUBE — The tetrahedron being a pyramid, and the octahedron a double pyramid; and the icosahedron consisting of twenty triangular pyramids; and the dodecahedron of twelve quinquangular ones, whose bases are in the surface of the icosahedron and dodecahedron, and their vertices meeting in a centre: the solidities of these bodies are all found from what we have shewn under the article PYRAMID.

Their surface is had by finding the area of one of the planes, from the lines that bound it (see TRIANGLE) and multiplying the area thus found by the number from which the body is denominated; e. gr. for the tetrahedron, by 4; for the hexahedron or cube, by 6; for the octahedron, by 8; for the dodecahedron, by 12; and for the icosahedron, by 20 — The product is the superficial area. See AREA and SUPERFICIES.

Proportions of the sphere, and of the five REGULAR bodies inscribed therein: the diameter of the sphere being 2.

The circumference of a great circle is	6.	28318
Surface of a great circle,	3.	14159
Surface of the sphere,	12.	56637
Solidity of the sphere,	4.	18859
Side of the tetrahedron,	1.	62299
Surface of a tetrahedron,	4.	6188
Solidity of a tetrahedron,	0.	15132
Side of a cube or hexahedron,	1.	1547
Surface of the hexahedron,	8.	
Solidity of the hexahedron,	1.	5396
Side of an octahedron,	1.	41421
Surface of the octahedron,	6.	9282
Solidity of the octahedron,	1.	33333
Side of the dodecahedron,	0.	71364
Surface of the dodecahedron,	10.	51462
Solidity of the dodecahedron,	2.	78516
Side of the icosahedron,	1.	95146
Surface of the icosahedron,	9.	57454
Solidity of the icosahedron,	2.	53615

If one of these bodies be required to be cut out of the sphere of any other diameter; say, as the diameter of the sphere 2, is to the side of any one solid inscribed in the same (suppose the cube 1. 1547.) so is the diameter of any other sphere (suppose 8.) to 9. 2376, the side of the cube inscribed in this latter sphere.

Let *dr*, then (*Tab. Geometry, fig. 81.*) by the diameter of any sphere, and *da  $\frac{1}{2}$  of it, = *ab* = *br*. Erect the perpendiculars *ae*, *cf*, and *bg*; and draw *de*, *df*, *er*, *fr*, and *gr*; then will (1) *re* be the side of the tetrahedron: (2) *df*, the side of the hexahedron: (3) *de* the side of the octahedron. (4) And cutting *de* in extreme and mean proportion in *b*, *db* will be the side of the dodecahedron. (5) Setting the diameter *dr* up perpendicularly at *r*; from the centre *c*, to it's top, draw the line *cg*, cutting the circle in *g* — Let fall the perpendicular *gb*; so is *br* the side of the icosahedron.*

REGULAR curves, are such whose curvity proceeds continually in the same uniform geometrical manner — Such are the perimeters of the conic sections. See CURVE, CONIC section, &c.

Such as have a point of inflection, or regression, and which being continued to a certain point, turn themselves a contrary way are called *irregular curves* — Such are the conchoid, and the solid parabola, which has a square for it's parameter. See FLEXION and RETROGRESSION.

REGULAR architecture, fortification, &c. See ARCHITECTURE and FORTIFICATION.

REGULAR Bastion. See the article BASTION.

REGULAR Place. See the article PLACE.

REGULAR, in the monastic sense, denotes a person who has made the vows in some religious house. See RELIGIOUS and VOW.

Under *regulars* are comprehended the whole body of monks, friars, and mendicants, &c. See MONK, MENDICANT, &c.

The denomination of *regulars*, in this case arises hence, that they are bound to observe the rule of the order they are entered into. See RULE and ORDER — Hence,

REGULAR priest is used for a priest who is in some religious order; in opposition to a *secular* priest, who lives in the world, or at large. See SECULAR.

A cardinal is reputed both *regular* and *secular* and is entitled to the privileges of both states. See CARDINAL.

*Regulars* may be promoted to bishoprics and archbishoprics, as well as *seculars*; but their promotion secularizes them; the episcopal dignity dispensing them from the observation of the rule whereof they have made profession. See SECULARISATION.

REGULAR abbots. See the article ABBOT.

REGULAR benefices, are such as can only be held by monks or religious; or at least, *per cupientem profiteri*, by a person desirous to embrace the monastic life. See BENEFICE.

It is a maxim in the Romish canon law — *Regularia regularibus*, i. e. *regular* benefices are to be conferred on *regular* priests — The abbies that are chiefs of their respective orders are all *regular*, and can only be served by monks and cardinals. See ABBY — All benefices are presumed *secular*, unless they be proved *regular*.

Antiently, the *regular* benefices were almost all conferred by way of administration or curacy; the religious incumbents being always *ad manum* of their superiors, who displaced them at pleasure — Hence the common maxim among the canonists, *omne beneficium regulare manuale*.

The benefices appropriated to *regulars* are abbies, conventual priories, simple priories, and claustral offices — They may be conferred on *seculars* in commendam. See COMMENDAM.

REGULAR canons. See the article CANON.

REGULAR places, are those within the boundary or inclosure of the convent; as the cloister, dormitory, chapter, and refectory

**factory**—In opposition to those destined for guests, and for the necessities of the house, which are reputed without the inclosure. See **ABBY**, **MONASTERY**, **CLOISTER**, &c.

**REGULAR corporation**. See the article **CORPORATION**.

**REGULAR small pox**. See the article **POX**.

**REGULATION**, a rule or order prescribed by a superior, for the uniform and orderly management of some branch of policy, justice, or the like. See **LAW**, **STATUTE**, **ORDINANCE**, &c.

**REGULATOR of a watch**, is a small spring belonging to the balance; serving to adjust the going, and make it either proceed faster or slower. See **WATCH**, &c.

**REGULO**, a title given to the sons of the emperors of China—The emperor's eldest son, whom we call the *first regulo*, was the only one of all his children in favour; till, of a sudden, matters took a new face. From some new intelligences, the emperor learnt the innocence of the hereditary prince whom he had deposed, and the artifices that had been used to ruin him: particularly, that the *regulo*, to succeed therein, had had recourse to magic, and at the instigation of certain lamæ, or Tartar priests had procured a statue to be buried in Tartary; accompanying the ceremony with several magical operations. Upon this, orders were instantly sent to seize the lamæ, and to dig up the statue: the *regulo* had his palace assigned him for a prison. *Let. Edif. & Cur.*

**REGULUS**, *petty king*, in our antient customs, is a term frequently used in the Saxon councils, for *comes* or count. See **COUNT** and **EARL**.

Hence *sub-regulus*, was also used for a vice-comes or vicount—Though in many places the two seem used indifferently for the same dignity—Thus in the archives of the cathedral of Worcester, Uthredus sometimes styles himself *regulus*, and sometimes *sub-regulus* of the city of Worcester.

But in other places we find a distinction—*Offa rex merciorum*; Uthredus, *regulus*; Aldredus, *sub-regulus*, &c.

**REGULUS**, in chymistry, denotes the finest and purest part of a metal or mineral, which sinks or precipitates to the bottom of the crucible or furnace, in melting the mineral or ore. See **METAL**, **MINERAL**, **FUSION**, &c.

To procure the *regulus*, that is, the mercurial parts of metals, &c. flux powders are commonly used; as nitre, tartar, &c. which purge the sulphurous part adhering to the metal, by attracting and absorbing it to themselves. See **FLUX powder**.

*Regulus* is principally used for that of antimony, which is a ponderous metallic powder, that upon fusing some of the mineral in it's crude state, sinks to the bottom, leaving the scoria or impurities a-top. See **ANTIMONY**.

The alchymists will have this matter called *regulus*, *i. e.* little king, as being the first born of the royal metallic blood; which is really a son, but not a perfect man, *i. e.* not yet a perfect metal for want of time and proper nourishment.

Antimony purify'd by simple fusion, is called *regulus of antimony*; or *regulus antimonii philosophorum*—But the more common way of reducing it into a *regulus*, is with the addition of flux powders, as tartar and nitre. See **FLUX powder**.

The scoria found at the top of this *regulus* is violently emetic, as well as the *regulus* itself, whereof if cups or drinking vessels be cast, the wine put into them will become vomitive.

Of this *regulus* cast in moulds are made those commonly called the *antimonial pills*, weighing about eight or ten grains each, one of which being swallowed, will operate considerably both by vomit and stool.

These pills having thus performed their office, and been discharged the body, will serve the same purpose again and again; whence they have obtained the name of perpetual pills—The virtue of this *regulus* is not however inexhaustible, as has been imagined; for by repeated infusions in wine, though the liquor be made violently emetic at first, yet by degrees it loses it's force, and at length ceases to be vomitive.

**Martial REGULUS of antimony**, is a mixture of little bits of iron, as the nails of horse's shoes, melted with the *regulus*.

In this operation the iron dissolving and absorbing the sulphurous parts of the antimony, more strongly than the fluxes in the former case; and turning it into a crocus; the antimony is hereby brought to a greater degree of purity, and rendered more efficacious than in the common *regulus*. See **IRON**, **SULPHUR**, &c.

This *regulus* is sometimes farther purify'd by repeated fusions and detonations, with the addition of fresh antimony, and more nitre, alternately: in which case it becomes *regulus antimonii stellatus* or *starry regulus of antimony*.

**REGULUS of arsenic**. See the article **ARSENIC**.

**REGULUS**, in astronomy, is a star of the first magnitude, in the constellation *leo*; called also from it's situation, *cor leonis*; or the lion's heart; by the Arabs, *alhabor*: and by the Chaldeans, *kalbeled* or *kalbeledid*, from an opinion of

it's influencing the affairs of the heavens; as is observed by Theon. See **STAR**.

The longitude of *regulus*, as fixed by Mr Flamsteed, is 25°, 31', 20"; and it's latitude 0°, 26', 38", North. See **LEO**.

**REHABILITATION**, **REHABILITATIO**, in the civil and canon law, an action whereby a prince or pope, by dispensations or letters patents, restores a delinquent to the condition he was in before his delinquency. See **DEGRADATION**, &c.

The king alone can *rehabilitate* an officer noted, condemned and degraded; or a gentleman who has derogated from his rank. See **NOBILITY**.

The pope alone pretends to *rehabilitate*, *i. e.* to render capable of benefices and orders, such as had fallen into heresy, or other irregularities.

In Romish countries, an ecclesiastic who assists at the execution of a sentence of death, is to be *rehabilitated*, by an absolution, called a *sevis*. See **ABSOLUTION**.

**REHEARSAL**, in music and the drama, an essay or experiment of some composition, made in private, previous to the representation or performance thereof in public; to habituate the actors or performers, and make them more ready and perfect in their parts—There is a new tragedy in *rehearsal*—the *rehearsal* of the anthem, &c.

**REI domesticæ domesticus**. See **DOMESTICUS**.

**REIMBURSEMENT**, in commerce, the act of repaying, or returning what monies a person had received, by way of advance, &c. or what another has disbursed or paid for us.

A person who gives a bill of exchange in payment, is to *reimburse* it, if it come to be protested, for want of being accepted or paid. See **BILL**, **PROTEST**, &c.

**REIMBURSING** is also used for paying the price a commodity costs it's owner—Thus, he has surrendered to me the lot of merchandize adjudged to him at the sale at London, by the directors of the East-India company on condition of *reimbursing* the price of the purchase, with the expences of carriage, and a profit of 5 per cent.

**REINFORCED**, or **RENFORCED**, *ring*, of a canon, is that next after the trunnions, betwixt them and the touch-hole. See **ORDNANCE**, **CANNON**, &c.

**REINFORCEMENT**, in war, a supply, or new provision of men, arms, ammunition, &c.

**REINTEGRATION**. See the article **REDINTEGRATION**.

**REINS\***, in anatomy, the kidneys; or that part of an animal whereby the urine is separated from the blood. See **KIDNEYS**. See also **URINE**.

\* The word according to Varro, is formed from the Greek, *γεν, quasi rivi obsecni humoris ab iis oriantur*—The Greeks call the *rein*, νεφρος, from the verb, νεφω, to rain, snow, &c. See **NEPHRITIC**.

In the manage they say, a horse should have *double reins*; which is when he has them a little more elevated on each side of the back-bone, than upon it; so that passing your hand along it, you find it large, well furnished and double, by the hollow that goes all along the back-bone—The back should be firm, and not hollow, or bending from the withers to the croup, but straight. See **HORSE**.

**REINS**, of a bridle, also denote two straps of leather meeting in the bridle-hand of the horseman, in order to make the bit bear, and keep the horse under subjection. See **BRIDLE**.

**False REINS** is a lath of leather, passed sometimes through the arch of the banquet, to bend the horse's neck.

**REINS of a vault**. See the article **VAULT**.

**REINSTATING**, the restoring of a person or thing to it's former state or condition, from whence it had been disturbed or displaced. See **REHABILITATION**, &c.

**REJOINTING**, or **REJOYNTING**, in architecture, the filling up the joints of the stones in old buildings, &c. when worn hollow by course of time, or weather.

*Rejointing* is performed by the best mortar; as that of lime, and cement; sometimes, also with plaister, as in the joints of vaults, &c. See **MORTAR**, &c.

**REJOYNDER**, in law, the defendant's answer to the plaintiff's replication. See **REPLICATION**, and **SURREJOYNDER**.

The order in the court of chancery is thus—First the defendant puts in an answer to the plaintiff's bill, which is sometimes also called an *exception*: the plaintiff's answer to this is called a *replication*; and the defendant's answer to that, a *rejoynder*; answering to what the civilians call *duplicatio*. See **CHANCERY**, &c.

**REIS**, **RE**, or **RES**. See the article **REE**.

**REITERATED grafting**. See **ENGRAFTING**.

**REITERATING**, in printing. See **PRINTING**.

**REITERATION**, the act of repeating a thing, or doing it a second time. See **REPETITION**.

The church does not allow of the *reiteration* of baptism. See **BAPTISM**—St Gregory observes, that it is no *reiteration* when there are wanting proofs of the thing's being regularly done before. See **REBAPTISANTS**.

In pleurifies, the physicians order the bleeding to be *reiterated* six or seven times. See PLEURISY.

REITTERS, an antient title given the German cavalry—The word is originally high Dutch, and signifies a horseman, cavalier, or even knight.

RELAPSE, a return or back-sliding into a danger, or evil; out of which a person had escaped.

Fevers, dropfies, &c. are diseases into which *relapses* are very frequent and dangerous—Such a person is relapsed into a heresy he had abjured.

RELATION\*, RELATIO, in philosophy, the mutual respect of two things; or what each is, with regard to the other.

\* The word is formed a *referendo*; *relation* consisting in this, that one thing is referred to another: whence it is also called *respect*, *habitude*, *comparison*, &c. See COMPARISON and HABITUDE.

The idea of *relation* we acquire, when the mind so considers any thing, that it doth, as it were, bring it to, and set it by, another; and carry it's view from the one to the other—Hence the denominations given to things intimating this respect are called *relatives*; and the things so brought together, are said to be *related*. See IDEA.

Thus when I call Caius, *husband*; or this wall *whiter*; I intimate some other person or thing in both cases, with which I compare *him* or *it*—Hence the wall is called by the schoolmen, the *subject*; the thing it exceeds in whiteness the *term*; and the whiteness the *foundation* of the *relation*.

*Relation* may be considered two ways; either on the part of the mind referring one thing to another; in which sense *relation* is only a mode or affection of the mind, whereby we make such comparison: or on the part of the things referred, which being no other than ideas, *relation*, in this sense, is only a new idea resulting or arising in the mind, upon considering of two other ideas—So that *relation*, take it as you will, is only the mind; and has nothing to do with the things themselves.

Any of our ideas, Mr Lock observes, may be the foundation of *relation*—Though where languages have failed to give correlative names, the *relation* is not easily taken notice of: as in concubine, which is a *relative* name, as well as wife.

There is, in effect, no idea but is capable of an infinite number of *relations*: thus one single man may at once sustain the *relations* of father, brother, son, husband, friend, subject, general, European, Englishman, islander, master, servant, bigger, less, &c. to an almost infinite number; he being capable of as many *relations*, as there can be occasions of comparing him to other things, in any manner of agreement or disagreement, or any respect whatsoever.

The ideas of *relations* are much clearer and more distinct, than of the things *related*: because the knowledge of one simple idea is oftentimes sufficient to give the notion of a *relation*: but to the knowing of any substantial being, an accurate collection of sundry ideas is necessary. See SUBSTANCE.

The perception we have of the *relations* between various ideas wherein the mind acquiesces, makes what we call *judgment*—Thus when I judge 2 times 2 make 4, or does not make 5; I only perceive the equality between 2 times 2 and 4; and the inequality between 2 times 2 and 5. See JUDGMENT.

The perception we have of the *relations* between the *relations* of various things, constitutes what we call *reasoning*—Thus when from this, that 4 is a smaller number than 6; and that twice 2 is equal to 4; I gather that twice 2 is a less number than 6; I only perceive the *relation* of the numbers twice 2 and 4, and the *relation* of 4 and 6. See REASONING.

The ideas of cause and effect we get from our observation of the vicissitude of things, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other beings—That which produceth, is the cause; that which is produced, the effect. See CAUSE and EFFECT.

Thus fluidity in wax is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat.

The denominations of things taken from time, are for the most part only *relations*—Thus when it is said, that queen Elizabeth lived sixty-nine, and reigned forty-five years, no more is meant, than that the duration of her existence was equal to sixty-nine, and of her government to forty-five annual revolutions of the sun: and so are all words answering to how long.

Young and old, and other words of time, that are thought to stand for positive ideas, are indeed *relative*; and intimate a *relation* to a certain length of duration, whereof we have the idea in our minds—Thus we call a man young or old, that hath lived little or much of that time, which men usually attain to: and thus a man is called young at twenty, but an herse old, &c.

There are other ideas, that are truly *relative*, which we

signify by names that are thought positive and absolute; such as great and little, strong and weak—The things thus denominated, are referred to some standards with which we compare them: thus we call an apple *great*, which is bigger than the ordinary sort of those we have been used to; and a man *weak*, that has not so much strength or power to move, as men usually have, or those of his own size.

Authors give various divisions of *relations*—The school philosophers commonly divide them into those of *origination*, under which are comprehended the *relations* of cause and effect: those of *negation*, which are between opposite things: and those of *affirmation*, which are *relations* of agreement between whole and part, the sign and thing signified, the adjunct and subject—This division is founded upon this, that the mind can only compare things three ways, viz. by inferring, denying, and affirming.

Others divide *relations* into those of *origination*; those of *agreement*, e. gr. similitude, parity, &c. those of *diversity*; and those of *order*, as priority, posteriority, &c.

Others divide them into *predicamental*, and *transcendental*.—Under the first come those *relations* between things that belong to the same predicament; e. gr. between father and son. To the latter belong those which are more general than the predicaments, or are of different predicaments; as the *relations* of substance and accident; of cause and effect; of creator, and creature. See TRANSCENDENTAL, &c.

Mr Lock gives us a distribution of *relations* on a different bottom—All simple ideas, he observes, wherein are parts or degrees, afford an occasion of comparing the subjects wherein they are, to one another, in respect of those simple ideas: as, whiter, sweeter, more, less, &c.—These, depending on the equality and excess of the same simple idea, in several subjects, may be called *proportional relations*.

Another occasion of comparing things being taken from the circumstances of their origin, as father, son, brother, &c. These may be called *natural relations*.

Sometimes the foundation of considering things, is some act whereby any one comes by a moral right, power, or obligation to do something: such are general, captain, burgher; these are *instituted* and *voluntary relations*, and may be distinguished from the natural, in that they are alterable and separable from the persons to whom they sometimes belonged, though neither of the substances so related be destroyed. But *natural relations* are not alterable, but are as lasting as their subjects.

Another *relation* is the conformity or disagreement of men's voluntary actions to a rule, to which they are referred, and by which they are judged of: these may be called *moral relations*.

It is this conformity or disagreement of our actions to some law (whereby good or evil is drawn on us from the will and power of the law-maker, and is what we call *reward* or *punishment*) that renders our actions morally good or evil. See GOOD and EVIL.

Of these moral rules or laws, there seem to be three sorts, with their different enforcements. First, the divine law: secondly, civil law: thirdly, the law of opinion or reputation. By their *relation* to the first, our actions are either sins or duties. To the second, criminal or innocent; to the third, virtues or vices. See SIN, VIRTUE, VICE, &c.

RELATION, in logic, is an accident of substance; accounted one of the ten categories or predicaments. See PREDICAMENT and CATEGORY.

Each substance admits of an infinity of *relations*—Thus the same Peter, consider'd with regard to Henry, is in the *relation* of a master; with regard to John, in that of a tenant; with regard to Mary, in that of a husband, &c. Again, with regard to one person, he is rich, with regard to another poor; with regard to another, he is far, near, tall, short, a neighbour, stranger, learned, unlearned, good, bad, equal, &c. It is disputed among the school philosophers, whether or no the *relation* be a thing formally and really distinct from the foundation of the substance? See SUBSTANCE.

RELATION, is also used in the school theology, to denote certain of the divine perfections, called *personal* ones; in regard by these one divine person is referred to another, and distinguished from it. See PERSON.

Hence they teach, that in God there is one nature, two processions, three persons, and four *relations*. See TRINITY. These *relations* are paternity, filiation, active spiration, and passive spiration. See PATERNITY, &c. See also FATHER, SON, SPIRIT, &c.

RELATION, in geometry, arithmetic, &c. is the habitude, or respect of two quantities to one another, with regard to their magnitude—This we more usually call *ratio*, *reason*. See RATIO.

The equality or sameness of two such *relations*, we call *proportion*. See PROPORTION.

RELATION, in grammar, is the correspondence which words have to one another in construction. See CONSTRUCTION.

Faulty and irregular *relations* are the things chiefly to be guarded against, in writing correctly; they make the sense obscure, frequently equivocal—Thus: the orator was attended to with a coldness, which was the more remarkable, as the audience were under some emotion before he began.—Here coldness being put indeterminately, the relative *which* can have no just and regular *relation* thereto. See RELATIVE.

RELATION is also frequently used for analogy, or what several things have in common. See ANALOGY.

In painting, architecture, &c. a certain *relation* of the several parts and members of the building or picture, constitutes what we call *symmetry*. See SYMMETRY.

RELATION *inharmonical*, in musical composition, is that whose extremes form a false, or unnatural interval, incapable of being sung.

This is otherwise called a *false relation*, and stands opposed to a *just* or *true relation*.

RELATION, in law, is where two things, as times, &c. are considered, as if they were one; the thing subsequent being considered as taking effect, by *relation*, at the time preceding.

As if *A* deliver a writing to *B*, to be delivered to *C*, as the deed of *A*; the writing shall be deemed to be delivered to *C*, at the time when it was given to *B*, by *relation*.

So bills in parliament to which the king assents on the last day of parliament, shall *relate*, and be of force from the first day thereof. Coke calls it *factio juris*. See DAY, TIME, &c.

RELATIVE *propositions*, are such as include some relation and comparison. See PROPOSITION.

Thus, where the treasure is, there will the heart be—As much as thou hast, so much thou art worth, &c. are *relative propositions*.

RELATIVE *gravity*. See GRAVITY.

RELATIVE *levity*. See LEVITY.

RELATIVE *motion*. See MOTION.

RELATIVE *necessity*. See NECESSITY.

RELATIVE *place*. See PLACE.

RELATIVE *space*. See SPACE.

RELATIVE *time*. See TIME.

RELATIVE *velocity*. See VELOCITY.

RELATIVE *terms*, in logic, are words which imply a relation, or a thing considered as compared to another. See RELATION and CORRELATIVE.

*Relative terms* include a kind of opposition between them; yet so, as that the one cannot be without the other.

Such are *father* and *son*, *husband* and *wife*, *king* and *subjects*, &c.

RELATIVE in grammar, is a word or term which in the construction answers to some word foregoing, called the *antecedent*. See ANTECEDENT.

Pronoun RELATIVE, which Buffier chuses rather to call *modificative* or *determinative*, is a particle added after a noun, or personal pronoun, with which it has an affinity, so that without them it signifies nothing; it's only use being to express in what view they are considered. See PRONOUN.

Of this kind, in the Latin, are *qui*, *quæ*, *quod*, &c. in the English, *who*, *which*, *whom*, &c. As in the book *which* you are reading; the man *whom* you seek; he *who* told it, &c.

—Where *which*, *whom* and *who* only follow the noun, or pronoun, to refer or determine them to some particular thing; as to seeking, reading, &c.

Frequently, the noun or pronoun, wherewith the *relative* is joined, is understood: as *I know who* did that.

Where it is evident I mean, I know the person who did, &c.

RELAXATION, RELAXATIO, in medicine, &c. the act of loosening or slackening the tone or tension of the fibres, nerves, muscles, &c. See TENSION, TONE, &c. See also FIBRE.

The *relaxation* of a muscle is supposed to be effected, either by the perspiration of the nervous spirits, or the regrefs of the spirits, blood, &c. which inflated it's fibres; or by the contraction of the air, in the globules of blood before expanded by the sudden influx and admixture of the spirits, &c. See MUSCLE and MUSCULAR motion.

RELAXATION, in chirurgery, is a preternatural extension, or straining of a nerve, tendon, muscle, or the like; either through violence or weakness.

*Hernias* are descents or *relaxations* of the intestines, &c. See HERNIA—From the same cause arise descents or prolapsions of the anus, &c. See PROCIDENTIA.

RELAXATION, in law, is used for a *releasing*. See RELEASE.

In this sense we say the *relaxation* of an attachment in the court of admiralty.

The tenor of indulgences is a *relaxation*, or diminution of the pains of purgatory. See INDULGENCE.

RELAY, a fresh equipage, horse, &c. sent before, or appointed to be ready, for a traveller to change; to make the greater expedition: as in riding post.

The term is borrowed from the French, *relais*, which signifies the same thing—In France, the general of the posts, entitles himself *superintendent* of the *relays*.

RELAYS, in hunting, are fresh sets of dogs, or horses, or both, disposed here and there, for readiness, in case the game come that way; to be cast off, or to mount the hunters; in lieu of the former, which are supposed to want respite. See HUNTING.

RELAY, in tapistry, is an opening left in a piece of tapistry, where the colours or figures are to be changed; because on those occasions the workmen are changed; or else, the places are left to be filled up till the rest of the work is done. See TAPITRY.

RELEASE, RELAXATIO, in law, denotes an instrument, whereby estates, rights, titles, entries, actions, and other things are sometimes extinguished and annulled, sometimes transferred, sometimes abridged, and even sometimes enlarged. A *Release* is either in fact or in law—A *release in fact* is that which the very words do expressly declare.

A *release in law*, is that which acquits by way of consequence, or intendment of law. See INTENDMENT.

RELEGATION, RELEGATIO, a kind of exile or banishment, wherein the obnoxious person is commanded to retire to a certain place prescribed, and to continue there till he be recalled. See EXILE.

Lord Coke calls *relegation* a banishment for a time only: Courtin more adequately defines *relegation* a banishment to a certain place for a certain term.

In Rome, *relegation* was a less severe punishment than deportation, in that the *relegated* person did not thereby lose the rights of a Roman citizen, nor those of his family, as the authority of a father over his children, &c. See BANISHMENT.

RELICS, RELIQUIÆ, in the Romish church, certain remains of the bodies or clothes of some saint or martyr, devoutly preserved in honour to his memory, carried at processions, kissed, revered, &c. See SAINT, MARTYR, PROCESSION, &c.

The abuses in point of *relics* are most flagrant: F. Mabillon, a Benedictin, complains of the great number of suspected *relics* exposed on altars: he owns that were there to be a strict inquisition into the *relics*, vast numbers of spurious ones would be found offered every where to the piety and devotion of the faithful; and adds, that bones are frequently consecrated, so far from belonging to saints, that in all probability they do not belong to christians.

The catacombs are an inexhaustible fund of *relics*; yet it is still disputed who were the persons interred therein? See CATACOMB.

In the eleventh century, a method was introduced of trying supposed *relics* by fire—Those which did not consume in the fire were reputed genuine; the rest not. See PURGATION, ORDEAL, JUDICIUM Dei.

It is an antient custom, which still obtains, to preserve the *relics* in the altars whereon mass is celebrated—To this purpose, a square hole is made in the middle of the altar, big enough to receive the hand; and herein is the *relic* deposited, wrapped in red silk, and inclosed in a leaden box. See ALTAR.

The Romanists alledge a good deal of antiquity in behalf of their *relics*.—The Manichees, it seems, out of hatred to the flesh, which they held an evil principle, are recorded as refusing to honour the *relics* of saints; which is esteemed a kind of proof that the Catholics did it in the first ages. See MANICHEE.

Indeed folly and superstition got into religion but too early.—Even the touching of linen cloaths on *relics*, from an opinion of some extraordinary virtue derived therefrom, appears to be as antient as the first ages; there being a hole made in the coffins of the forty martyrs at Constantinople, expressly for this purpose.

RELICT, RELICTA, in law. See the article WIDOW.

RELICTA *verificatio*, in law, is when a defendant relinquishes his proof or plea; and thereupon judgment is entered for the plaintiff.

RELIEF, RELEVUM, *levamen*, in law, a fine paid to the chief lord, by a person at his coming to the inheritance of land held in capite, or by military service. See FINE, LORD, TENURE, &c.

This was said *relevare hæreditatem caducam*, and the money thus paid was called *relevamen*, *relevum*, or *relief*—*Relief* is usually to the value of a year's rent or revenue.

The origin of the custom is thus—A feudatory or beneficiary estate in lands, being at first only granted for life; after the death of the vassal it returned to the chief lord, and was hence called *feudum caducum*, q. d. fallen to the lord by the death of the tenant. See FEE.

In course of time these feudatory estates being converted into inheritances by the connivance and consent of the lord; when the possessor of such estate died it was called *hæreditas caduca*, q. d. an inheritance fallen to the lord; from whom it was to be recovered, by the heirs paying a certain sum of money.

This

This *relief* was established after the conquest — For till that time *bariots* were paid the lord, at the death of his tenant; consisting of horses, arms, &c. See *HARIOT*.

But upon the conquest, the poor people being deprived of all such things by the Normans, a sum of money was substituted in lieu thereof, which was called a *relief*; and continues in some places to this day—However, it is true, *relief* and *bariot* are frequently confounded in ancient writers.

**RELIEF** *reasonable*, called also *lawful*, and *antient relief*, is that enjoined by some law, or fixed by ancient custom; and which does not depend on the will of the lord.

Thus in a charter of king John, mentioned by Matt. Paris—*Si quis comitum vel baronum nostrorum sive aliorum tenentium de nobis in capite per servitium militare, mortuus fuerit & cum decesserit, hæres suus plenæ ætatis fuerit & relevium debeat, habeat hæreditatem suam per antiquum relevium.*

What this was may be seen in the laws of William the Conqueror &c. — Bracton says, this fine was called a *relief quia hæreditas quæ jacens fuit per antecessoris decessum relevatur in manus hæredum*, &c.

A *relief* is also paid in socage tenure, or petit serjeanty; where a rent or other thing is paid by rendering as much as the rent or payment reserved.

By the custom of Normandy, *relief* is due for lands held in villenage, as well as in fee—By the custom of Paris, *relief* is not due upon inheritances in the direct line.

The quantity of the *relief* is very different: there are *single reliefs*, *double reliefs*, &c. The quality, too, is diverse: there are *reliefs of property*, paid by the heir: *reliefs of bail*, or *tutorage*, paid by a guardian for his minor, or by the husband for the fiefs of his wife, &c. *Relief of horse and arms*, &c.

By the laws of king Canutus, the *relief* of an earl, paid to the king, was eight war-horses with their bridles and saddles, four cuirasses, four helmets, four swords, four hunting-horses and a palfrey — The *relief* of a baron or thane was four horses, &c.

**RELIEF**, in chancery, denotes an order sued out for the dissolving of contracts and other acts, on account of their being unreasonable, prejudicial, grievous, or from some other nullity either *de jure*, or *de facto*. See *CHANCERY* and *EQUITY*.

Minors obtained *relief* against acts passed in their minority — Majors have *relief* in cases of enormous damage, deceit, violence, over-reaching, extravagant bargains, &c.

Among the Romanists, it is a rule, that the church obtains *relief* any time, and against all acts passed in its prejudice; no prescription prevailing against it. See *PRESCRIPTION*.

*Aid de RELIEF*. See the article *AID*.

**RELIEF** of a hare, among hunters, is the place where she goes to feed in the evening. See *HUNTING*.

**RELIEF**, in sculpture. See the article *RELIEVO*.

**RELIEVE**, in the military sense — To *relieve* is to take the post of another body—Hence, to *relieve* the guard, to *relieve* the trenches, &c. is to bring fresh men upon the guard, or the trenches, and to send those to rest who have been upon duty before. See *GUARD*, *TRENCH*, &c.—They also say, *relieve* a sentinel, *relieve* the steers-man, &c.

**RELIEVO**, or **RELIEF** *imboffment*, is applied to a figure which projects, or stands out, prominent, from the ground, or plain whereon it is formed; whether that figure be cut with the chissel, moulded, or cast. See *SCULPTURE*, &c. There are three kinds of *relievo*; viz. *alto*, *basso*, and *demi-relievo*.

*Alto-RELIEVO*, *haut relief*, or *high relievo*, is when the figure is formed after nature, and projects as much as the life.

*Basso RELIEVO*, *bas-relief*, or *low relievo*, is when the work is but raised a little from its ground; as we see in medals, and in the frontispieces of buildings, particularly the histories, festoons, foliages, and other ornaments in friezes.

*Demy-RELIEVO*, is when one half of the figure rises from plane, i. e. when the body of a figure seems cut in two, and one half is clapped on a ground — When in a *basso relievo* there are some parts that stand clear out, detached from the rest, the work is called a *demi-bosse*.

**RELIEVO**, in architecture, denotes the sally or projecture of any ornament. See *PROJECTURE*.

This, Daviler observes, is always to be proportioned to the magnitude of the building it adorns; and the distance at which it is to be viewed.

If the work be insulate and terminated on all sides, it is call'd a *figure in relievo*, or a *round imboffment*. Such are statues, acroters, &c.

**RELIEVO**, in painting, denotes the degree of force or boldness whereby a figure seems, at a due distance, to stand out from the ground of the painting, as if really imbossed.

The *relievo* depends much on the depth of the shadow and the strength of the light; or on the height of the different colours bordering on one another; particularly on the difference of the colour of the figure from that of the ground. See *SHADOW*, *COLOURING*, &c.

When the light is well chosen, to make the nearest parts or figures advance; and well diffused on the masses, still diminishing insensibly, and terminating in a large specious shadow, brought off insensibly; the *relievo* is said to be *bold*, and the *clair-obscur*, well understood. See *CLAIR-OBSCURE*.

**RELIGION**, **RELIGIO**, that worship or homage due to God, considered as creator, preserver, and redeemer of the world. See *GOD*, *THEOLOGY*, &c.

The foundation of all *religion* is, that there is a God, and that he requires some service at the hands of his creatures — From the different manners wherein we arrive at the knowledge of this service; *religion* is divided into *natural* and *revealed*.

*Natural RELIGION*, is whatever we descry to be due and meet by the meer dictates of natural reason; as, to love, and honour God, not to abuse his creatures, &c. See *NATURAL*, *REASON*, *DEIST*, &c.

*Revealed RELIGION* is what we learn to be due by some supernatural means; as by an express declaration of God himself, by the mouths of prophets, &c. See *REVELATION*, *PROPHECY*.

The first flows immediately from the relation between the creature and the creator: the latter does not follow from such a relation, but is super-added from the meer will and pleasure of the creator.

The first we ordinarily call *morality*, or *ethics*; because immediately conversant about the manners and duties of men towards one another; and towards themselves, considered as creatures of that being. See *MORALITY*, *ETHICS*, &c.

The latter we call by way of eminence *religion*, as being the rule of our duty immediately to God himself. See *REVELATION*.

The first supposes a God, a providence, a future state, rewards and punishments: the latter likewise supposes an immediate mission from God himself, attested by miracles, &c. See *MIRACLE*.

**RELIGION** is more particularly used for that special system of faith, and worship, which obtains in this, or that country; in this, or that sect; this, or that age, &c.

In this sense we say the *Romish religion*, the *Reformed religion*, the *religion of the Greeks*, the *Mahometan religion*, *Jewish religion*, &c. See *JUDAISM*, *MAHOMETANISM*, &c. under their proper heads.

The Siamese hold the diversity of *religions*, i. e. the different manners of honouring God, to be pleasing to him; inasmuch as they have all the same object, all tend to the same end, though by different means. *Claude*.

The sentiment of these idolaters is doubtless more just than that of our zealots, who hold all but those of their own religion odious to God—These several sects in *religion* see under their proper articles: see also *SECT*.

The *religion* of the ruling part of the world — You may find a lively description of it in a chorus in Seneca's *Troas*, at the end of the 2d act; beginning thus: *Verum est, an timidos fabula decipit? Umbras corporibus vivere conditis*, &c. This according to Patin is the religion of princes, and great men, of magistrates, monastic superiors, and even some physicians and philosophers. M. du Maine, head of the leaguers in France used to say that princes have no religion till after they are turned of 40 — *Cum numine nobis mors instans majore facit*. Patin. Lett. Chois. 106.

**RELIGION**, again, is applied to a military order, consisting of knights who live under some certain rule, &c. See *KNIGHT*, *MILITARY*, *ORDER*, &c.

In this sense we say the *religion of Malta*, &c. See *MALTA*.

**RELIGION**, is sometimes also used for a convent — Thus we say, there are *religions* of men, i. e. monks; *religions* of women, i. e. nuns—There are new *religions* established every day, i. e. new monasteries built. See *MONK*, *MONASTERY*, &c.

The **RELIGION** used absolutely denotes the reformed in France. — Thus they say, d'Ablancourt and Dacier, were of the *religion*. See *HUGUENOT*.

**RELIGIOUS**, in a general sense, something that relates to *religion*. See *RELIGION*.

We say, a *religious* life, *religious* society, &c. See *SOCIETY* — Churches, and church-yards are *religious* places—A *religious* war is also called a *croisade*. See *WAR* and *CROISADE*.

**RELIGIOUS**, is more particularly used for a person engaged by solemn vows to the monastic life; or a person shut up in a monastery to lead a life of devotion and austerity, under some rule or institution. See *VOW* and *ORDER*.

The male *religious* we popularly call *monks* and *friars*; the females, *nuns* and *canonesses*. See *NUN*, *MONK*, *CANON*, &c. M. Nicole observes, that some domestic chagrins, and a certain pride, which leads people to abscond when they cannot make a figure to their mind, makes as many *religious* as real piety—He adds, that a girl must be made a *religious* for no other reason, but because she cannot be married answerable to her condition.

A reli-

# R E M

A *religious* cannot make any will—By the council of Trent, a *religious* may reclaim his vows within five years. See RECLAIM.

Antiently the *religious* were all laymen, and it was even prohibited them to take up orders—In 1557 the parliament of Paris made a difficulty of receiving a bishop of Laon to the oath of a duke and peer, by reason of his being a *religious*: yet a *religious* being promoted to a bishopric, is thenceforth secularized or dispensed from the observation of his rule. See REGULAR.

In antient deeds and conveyances of lands, we often find the seller refrained from giving or alienating it, *viris religiosis vel Judæis*, to *religious* or to Jews; to the end the land might not fall into mortmain. See JUDAISM and MORTMAIN.

In a memorial directed by king John to his viscounts, they are ordered to proclaim through their respective counties, that no body as they love their bodies and cattle, injure the *religious* or clerks, either in word or deed; on penalty of being hanged up on the next oak—*Nulli sicut diligunt corpora & catalla sua malum faciant vel dicant viris religiosis vel clericis—Si quem inde attingere possimus ad proximam quercum eum suspendi faciemus.*

RELIGIOUS order. See the article ORDER.

Most military orders pretend, likewise to be *religious*; as those of Malta, who make vows, &c. See MALTA.

RELIQUA, the remainder or debet, which a person finds himself debtor in, upon the balancing and liquidating an account.

Hence, *reliquitary*, the debtor of a *reliqua*; as also a person who only pays piece-meal—The term *reliqua* is pure Latin.

RELIQUARY, a shrine or casket, in which the relics of a dead saint are kept. See SHRINE, RELICS, &c.

RELIQUIÆ, RELICS, in antiquity, the ashes and bones of the dead, which remained after burning their bodies; and which they very religiously gathered and put in urns, and afterwards deposited in tombs. See ASHES, FUNERAL, &c.

REMAINDER, REMANENTIA, in law, an estate limited in lands, tenements, or rents, given to a person at second hand, to be enjoyed after the decease of another, to whom the same is given immediately, or at first hand.

A man grants lands to one for term of life, the *remainder* to another for the term of his life; which *remainder* may be either for a certain time, or in fee simple, or fee tail.

Spelman makes the difference between a *remainder* and *reversion* to consist in this; that by a *reversion*, after the appointed term, the estate returns to the donor, or his heirs, as the proper fountain; whereas by *remainder* it goes to some third person, or stranger. See REVERSION.

Glanville observes, that bishops and abbots, in regard their baronies are the king's alms, cannot give any part thereof by way of *remainder*. See BISHOP.

REMAINDER, in mathematics, is the difference; or that which is left after the taking a lesser number, or quantity, from a greater. See SUBTRACTION.

RE-MARRYING, the repeating of a marriage; or the going through the solemnities of a second marriage. See MARRIAGE.

Clandestine and uncanonical marriages are deemed null; and the parties are to be *re-married* in form; at least to avoid disputes.

It was antiently expressly forbid to *re-marry* in the first year of viduity—M. Bayle observes, that a person who does not *re-marry*, is answerable to the public for all the time lost in his viduity, or widowerhood. See WIDOW.

REMEDY, REMEDIUM, in physic, a medicine, or preparation applied either internally or externally, for the cure of a disease. See MEDICINE.

Emplasters, unguents, cataplasms, &c. are *topical remedies*. See TOPICAL—Mercury and the bark are *specific remedies*. See SPECIFIC—Mineral waters, and ass's milk, and country-air, are usually the *last remedies*—Salivation is sometimes called by way of eminence, the *remedy*. See SALIVATION.

When *remedies* are stuffed with too many ingredients, they load the stomach with a slimy mucilage, which swells, obstructs, and does more hurt than good. See PHARMACY.

REMEDIES appended. See the article APPENDED.

REMEMBRANCE, is when the idea of something formerly known, recurs again to the mind, without the operation of a like object, on the external sensory. See MEMORY and REMINISCENCE, RECOLLECTION, &c.

REMEMBRANCERS, of the exchequer, are three officers, or clerks therein, formerly called *clerks of the remembrance*. See EXCHEQUER.

They are now distinguished by the appellations of the *king's remembrancer*; the *lord treasurer's remembrancer*; and the *remembrancer of the first fruits*—Their business is to put the lord treasurer and justices of the court in *remembrance* of such things as are to be called upon, and dealt in for the king's benefit.

The *king's* REMEMBRANCER enters into his office all recognizances taken before the barons, for any of the king's debts, for appearance, or for observing orders; and makes

# R E M

out process against the collectors of customs, subsidies, and fifteenths, for their accounts—All informations upon penal statutes are entered in this office, and there all matters upon English bills in the exchequer-chamber remain—He makes the bills of composition upon penal laws, takes the statement of debts; has delivered into his office all manner of indentures, fines, and other evidences whatsoever that concern the assuring of any lands to the crown: he every year in *crastino animarum*, reads, in open court, the statute for election of sheriffs, and gives them their oath, and reads the oath of all the officers of the exchequer, when they are admitted.

The *lord treasurer's* REMEMBRANCER, is charged to make process against all sheriffs, escheators, receivers, and bailiffs, for their account: process of fieri facias, &c. extent for any debts due to the king, either in the pipe, or with the auditors, and process for all such revenues as are due to the king, by reason of his tenures—He also makes record, whereby it appears whether sheriffs, or other accountants, pay their proffers due at Easter and Michaelmas—He makes another record, whether sheriffs or other accountants keep their days of prefixion: all estreats or fines, issues, and amerciaments, set in any of the courts of Westminster, or at the assizes or sessions, are certified into his office, and are by him delivered to the clerk of the estreats to write process upon them, &c.

The REMEMBRANCER of the *first fruits*, takes all compositions and bonds for first-fruits and tenths; and makes process against such as do not pay the same. See FIRST-FRUIT.

REMINISCENCE, REMINISCENTIA, is that power of the human mind, whereby it recollects itself, or calls again to it's remembrance such ideas or notions as it had really forgot: in which it differs from *memory*, which is a treasuring up of things in the mind, and keeping them there, without forgetting them. See REMEMBRANCE.

Hence memory may be considered as a continual *remembrance*; and *remembrance*, as an interrupted memory. See MEMORY.

How near a-kin soever the two faculties may seem, yet they are generally found separated; so that they who excell in the one, are defective in the other. See RECOLLECTION, RETENTION, &c.

The antient Platonists were of opinion, that all learning and knowledge consisted in the *reminiscence* or recollection of notions which had been in the soul, before it's union with the body. See PLATONISM.

REMINISCERE, the second Sunday in Lent; antiently thus called from the first word of the introit of the mass said for that day, *reminiscere miserationum tuarum*.

REMISIT—*Recto quando dominus* REMISIT. See RECTO.

REMISSION, REMISSIO, in physics, the abatement of the power or efficacy of any quality—In opposition to the increase of the same, which is called it's *intension*.

In all qualities capable of intension and *remission*, the intension decreases reciprocally as the squares of the distance from the centre of the radiating quality increase. See QUALITY.

REMISSION, in medicine, is when a distemper abates, but does not go quite off, before it returns again; as is common in fevers which do not quite intermit. See FEVER.

REMISSION, in law, &c. denotes the pardon of a crime, or the giving up the punishment due thereto. See PARDON.

REMIT, in commerce—To *remit* a sum of money, bill, or the like, is to send a sum of money, &c. See REMITTANCE.

To *remit* is also used among bankers for what is accustomed to be given a banker, or as it were, discounted with him, for his giving a bill of exchange. See EXCHANGE.

To *remit* is also to give up part of one's due to a debtor; as, I would *remit* you a fourth of what you owe on condition of paying me the rest in hand.

REMITTANCE, in commerce, the traffic or return of money from one place to another, by bills of exchange, orders, or the like. See COMMERCE, EXCHANGE, &c.

A *remittance* is properly a bill of exchange, or the like, sent to a correspondent, and the contents thereof to be received by him of some other person on whom it is drawn.

Such a merchant has *remitted*, or made a *remittance* of five thousand pounds in bank notes, to his correspondent at London—I will *remit* you, or make you a *remittance* of five hundred crowns in three bills of exchange, drawn on N. banker in your city, and payable at sight.

By means of these *remittances*, large sums of money are returned from one city to another, without danger, without carriage, &c.

In London it is easy getting *remittances* upon any city in the world: in the country it is more difficult. *Remittances* are not easily had upon Copenhagen. See BILL of exchange.

Book of REMITTANCES. See the article BOOK.

REMITTANCE is also used in speaking of the payment of a bill of exchange—Thus, I have received an hundred pistoles on your *remittance*—Mr N. banker in your city, should have paid you two hundred crowns on my *remittance*.

REMIT-

**REMITTANCE**, also denotes the due or fee allowed the banker, both of his wages, and the different value of the species, in the place where you pay the money, and where he *re-mits* it.

The *remittance* at London is very high—This *remittance* is more usually called *change* and *rechange*. See **RECHANGE**.

**REMITTER**, in law—Where a man has two titles to land, and is seized by the latter; and that proving defective, he is *remitted* or restored to the former more ancient title: this is called a *remitter*, from the Latin, *remittere*, to send back.

If land descend to him that had right to it before, he shall be *remitted* to his better title if he please. *Doctor* and *student*.

**REMITTING** *fever*. See the article **FEVER**.

**REMONSTRANCE**, an expostulation or humble supplication addressed to king, or other superior; to beseech him to reflect on the inconveniences, or ill consequences of some order, edict, or the like.

The parliament of Paris went in a body to make humble *remonstrances* to the king, on the subject of such a declaration.

**REMONSTRANCE**, is also used for an expostulatory council or advice; or a gentle, handsome reproof, made either in general or particular, to apprise or to correct some fault—A mother makes *remonstrances* to her daughter, &c.

**REMONSTRANTS**, **REMONSTRANTES**, a title given to the Arminians, by reason of the *remonstrance* they made in 1610, against the synod of Dort, wherein they were condemned. See **ARMINIAN**.

Episcopus and Grotius were at the head of the *remonstrants*. See **CONTRA-REMONSTRANTS**.

**REMORA**, in natural history, the *sucking fish*; a little fish, resembling a herring, with crest and fins; called by the Greeks, *echeneis*: famous for sticking to the sides of ships. It is much talked of by the ancients; who, as we find from *Pliny*, lib. 32. c. 1. unanimously believed it had the force to stop a vessel in full sail, or a whale in swimming: and hence called *remora*, a *remorando*—But Mr Catesby observes that even several of those fishes together can do no more than shells or corals and other foulnesses of the same bulk, which make a ship somewhat the slower—And in the same manner they may be some small hindrance to a whale. The author last mentioned assures us he has taken five of them off the body of a shark. Vid. *Phil. Transf.* No 438. p. 113.

**REMORA**, among surgeons, is also an instrument to set broken bones withal. See **FRACTURE**.

**REMOUNT**, in war—To **REMOUNT** the cavalry, is to furnish troopers, or dragoons with fresh horses, in lieu of such as have been killed or disabled in the service.

**REMPLY**, in heraldry, something *filled up*—The term is chiefly used to denote that the chief is quite filled up with a square piece of another colour, leaving only a bordure of the proper colour of the chief about the said piece.

**RENAL**, **RENALIS**, something belonging to the reins, or kidneys. See **KIDNEY**.

**RENAL glands**, *glandulæ RENALES*, in anatomy, are glands thus called, because situate near the reins or kidneys; first discovered by Bar. Eustachio, native of San Severino in Italy. See **GLAND**.

They are also called *capsulæ atrabiles*, in regard their cavity is always found full of a blackish liquor; and by others *renes succenturiati*, because resembling kidneys in form. See **RENES succenturiati**.

**RENCOUNTER\***, in the military art, the encounter of two little bodies or parties of forces.

\* The word is formed from the French, *rencountre*, meeting.

In which sense *rencounter* is used in opposition to a pitched battle—It was no battle; it was only a *rencounter*.

**RENCOUNTER**, in single combats, is used by way of contradiction to duel.

When two persons fall out, and fight on the spot, without having premeditated the combat, it is called a *recounter*—It is no duel, it is a *rencounter*. See **DUEL**.

**RENCOUNTRE**, or **RENCONTRE**, in heraldry, is applied to animals when they shew the head in front, with both eyes, &c. or when the face stands right forward, as if they came to meet the person before them.

Indeed in deer, this is called *maffacré*, and in the leopard it is the natural situation—He bears fable, in *rencounter*, a golden fleece.

**RENDER**, in law, a term used in levying a fine—A fine with *render*, is that whereby something is *rendered back* again, by the cognisee to the cognisor. See **FINE**.

The lawyers also say, there are certain things in a manour which lie in *prender*, i. e. may be taken by the lord or his officers when they please, without the tenant's leave: and others which lie in *render*, that is, must be *rendered* or answered by the tenant, as rents, reliefs, heriots, and other services. See **PRENDER**—Some service consists in seizure; some in *render*. *Perkins*.

**RENDERING**, in building. See **PARGETTING**.

VOL. II. No 131.

**RENDEZ-VOUS**, or **RENDEVOUS**, a place appointed to meet in at a certain day and hour.

The word is French; and is found so commodious, that most nations use it in its purity, for want of a word of equal import in their respective languages—The virtue of a woman is already shaken when she grants a *rendezvous*. St. Evre-mont.

A general *rendezvous* of the army—The regiments have their particular *rendezvous*, called *quarters of assembly*. See **QUARTER**.

**RENEGATE**, **RENEGADO**, a person who has apostatized or renounced the christian faith, to embrace some other religion; particularly Mahometanism. See **APOSTATE**.

It is the *renegado's* who prove the most barbarous to the christians when they fall into their hands—The *renegate* is thus called, *quasi re-negat-Christum*—Hoveden mentions it in the year 1192, under the name of *reneer*, from the French, *renier*, to deny again.

**RENES succenturiati**, in anatomy, are glands thus called as resembling the figure of the kidneys; and hence accounted a kind of *secondary reins*; *succenturiatus* signifying something in the place of another.

They are also called *capsulæ renales*, and *glandulæ renales*. See **RENAL glands**.

**RENEWING** of leaves and lives. See **REVERSION**, **ANNUITY**, **POLITICAL arithmetic**, &c.

**RENITENCY**, **RENITENTIA**, or **RENISUS**, among philosophers, that force in solid bodies, whereby they resist the impulse of other bodies; or react as much as they are acted on. See **REACTION**. See also **RESISTANCE**.

**RENNET**. See the article **RUNNET**.

**RENT\***, **REDDITIUS**, in law, a sum of money, or other consideration issuing yearly out of lands or tenements, alienated on that condition. See **REVENUE**.

\* It is thus called from the corrupt Latin, *rendita*, for *reddita* of *redditus*; because, as Fleta tells us, *retrofit & quotannis redit*.

The *rents*, of all the lands of England and Wales appear by the computations of Dr Davenant and Mr King, from the late land-tax, to be nearly ten millions per annum; those of the houses not let with the lands, two millions more; and those of all other hereditaments, two millions more: in all fourteen millions.

The lawyers ordinarily reckon three sorts of *rent*; viz. *rent-service*, *rent-charge*, and *rent-seck*.

**RENT-service**, is where a man holds lands of his lord by fealty, and certain rent; or by fealty-service, and certain rent; or that which a man making a lease of lands to another for term of years, reserveth to be yearly paid for them. See **SERVICE**, **FEALTY**, **RESERVE**, &c.

**RENT-charge**, is where a man makes over his estate to another by deed indented, either in fee, or fee-tail, or for term of life; yet reserves to himself, by the same indenture, a sum of money yearly to be paid to him, with a cause of distress for non-payment.

**RENT-seck**, or **Dry-RENT**, is that which a man making over his estate by a deed indented, reserveth yearly to be paid to him, without any cause of distress mentioned in the indenture.

**RENTS of assize**, are the certain rents of freeholders, and ancient copyholders: thus called because assized and certain: in opposition to *redditus mobiles*.

**RENTS resolute**, are reckoned among the fee-farm *rents* to be sold by the Stat. 22. Car. II. being such *rents* or tenths as were antiently payable to the crown from the lands of abbies and other religious houses: which lands, upon the dissolution of abbies, being demised to others, the said *rents* were still reserved and made payable to the crown.

*Assart RENTS.*

*Chantry RENTS.*

*Gild RENTS.*

*Paschal RENTS.*

*Quit RENTS.*

*White RENTS.*

**RENT-warden**, an officer in most of the companies of London; whose business is to receive the rents or profits belonging to the company. See **TREASURER**, **RECEIVER**, **CASHIER**, &c.

**RENTING\***, and **FINE-DRAWING**, in the manufactories, the sewing of two pieces of cloth, edge to edge, without doubling them; so as that the seam scarce appears at all: hence also called *fine-drawing*. See **FINE-DRAWING**.

\* The word is formed from the French, *rentraire*, which signifies the same thing; and which Menage after Salmasius derives from the Latin *retrahere* of *re*, in, and *trahere*, by reason the seam is drawn out of sight and covered.

Serges, &c. are to be sewed; cloths *fine-drawn*.—The author of one of the *Lett. Edif. & Cur.* speaking of the great dexterity of the *fine-drawers* in the East-Indies, assures us, that if you tear a piece of fine mullin, and give it one of them to mend, it shall be impossible for you to discover the place

place where it is rejoined, even though you had made a mark to know it by.

The dexterity of our own *fine-drawers* though inferior to that above mentioned is nevertheless such, as puts them in a condition to defraud the king, by sowing a head or slip of English cloth on a piece of Dutch, Spanish, or other foreign cloth; or a slip of foreign cloth on a piece of English, so as to pass the whole as of a piece; and by that means avoid the duties, penalties, &c.—The trick was first discovered in France, by M. Savary, author of the *Diction. de Commerce*.

To *renter* in tapistry, is to work new warp into a piece of tapistry damaged, eaten by the rats, &c. and on this warp to restore the ancient pattern or design—The warp is to be of woollen, not linnen—Among the titles of the French tapistry-makers, is included that of *renters*.

**FINE-DRAWING** is particularly used for a rent, or hole happening in the dressing or preparing of a piece of cloth, artfully sewed up or mended with silk.

All *fine-drawings* are reputed defects or blemishes; and ought to be allowed for in the price of the piece—Hence, M. Savary establishes it as a rule, which is certainly founded on natural equity, that every manufacturer mark the *fine-drawings* of his cloths with a piece of packthread tied to the list; to direct the draper to the spot: and that the draper apprise the taylor or other person, to whom he sells it, of the same; that he may not come to damage in the cutting; there being instances of drapers condemned to take back their cloth, when cut to pieces, for omitting to mention the *fine-drawings*, and other flaws.

On this occasion M. Savary extolls the procedure of an English merchant, who sending a piece of cloth damaged in one spot, to his correspondent at Paris, put a piece of gold in the damaged place, to make up the damage—But as this example is perhaps the only one of it's kind, that author recommends it to the merchant or draper to unfold all the pieces entirely, as they come to him; to discover the *fine-drawings* and other flaws, in order to make the clothier accountable for them.

**RENVERSE**, *inverted*, in heraldry, is when any thing is set with the head downwards, or contrary to its natural way of being.—Thus a chevron *renversé* is a chevron with the point downwards.

The same term they also use when a beast is laid on it's back.

**RENVERSED** *volt* } See the articles { **VOLT.**  
**RENVERSING** } **REVERSING.**

**RENUENTES**, in anatomy, a pair of muscles of the head, thus called as being antagonists to the annuantes; and serving to throw the head backward, with an air of refusal. See **HEAD**.

From their situation they are also called *rectus capitis, major & minor*. See **RECTUS capitis**.

**RENUNCIATION**, **RENUNCIATIO**, the act of renouncing, abdicating, or relinquishing any right, real or pretended. See **ABDICATION**, &c.

*Renunciations* are sometimes *express*; as by contracts, &c. sometimes *tacit*, as by contrary acts.

Dioclesian *renounced* the empire, to live as a philosopher—The present king Philip of Spain, by the treaty of Utrecht, was obliged to *renounce* the succession of the crown of France, to which he was heir presumptive: and has since by a voluntary act *renounced* his own crown, in favour of his son—*Renunciations* of kings are always suspected of some view or motive not to be avowed.

To *renounce* an inheritance, a community, &c. is to pass a solemn act before a notary, or public officer, whereby a person declares he will not intermeddle in an inheritance, or profit in a company; but surrenders his part, and quits all pretensions.

**REORDINATION**, **REORDINATIO**, the act of conferring orders on one already ordained. See **ORDINATION**.

The ceremony of ordination impresses what the divines call an indelible character; and cannot, therefore be repeated: yet is *reordination* practised in England, with regard to the dissenting ministers, who conform to the church; the bishops pretending that they alone have right to confer holy orders, and that every priest or minister who does not receive them at their hands, has no lawful, regular vocation.

This proves a great obstacle to the re-union of those ministers to the church of England; many of whom, otherwise disposed to conform, have scrupled to be *reordained*; inasmuch as *reordination* implies their former vocation to be null; that they had administered the sacraments without any right thereto; and that all their ministerial acts were invalid. See **PREBYTERIAN**.

In the eleventh century, the crime of simony having been very flagrant; many people fell into the error to believe that the simoniacal bishops could not ordain validly; and that those who had received orders at their hands should be *reordained*—The people of this sentiment made a party of

themselves; and were distinguished by the title of *rescindantes*.

**REPAIRING**, in building, &c. See **REPARATION** and **RESTAURATION**.

The *repairing* of large walls, doors, ciplings, coverings, &c. belongs to the proprietor or landlord—The tenant is only charged with *small repairs*, as glass windows, locks, &c. by the French called *locative repairs*.

To **REPAIR** a *statue*, or other piece of sculpture, is to touch up a statue, &c. (cast in a mould) with a chisel, graver, or other instrument; to finish the places which have not come well off.

To **REPAIR** a *cast*, figure or the like, they clear off the barb, and what is redundant in the joints and projectures. See **STATUE**. See also **FOUNDRY**.

To **REPAIR** a *medal*, is to retouch it; so as rusty, and defaced as it was, to render it clean, neat and perfect—In order to this, they take off the rust with a graver, touch up the letters, polish the ground, and raise and restore the figures which before were scarce seen.

When the figures are gnawed or broke, they fit a piece of cement on the spot; and on this cut with a graver so dexterously that the figures appear entire and well kept—Yet nothing spoils medals so much as *repairing* them. See **MEDAL**.

**REPAIRERS**, artificers who chase figures, and beautify sword-hilts, &c. See **ENCHASING**.

**REPAIRS**, in hunting, are the haunts and places which the hare runs to. See **HUNTING**.

**REPARANDIS** *pontibus*. See the article **PONTIBUS**.

**REPARATION**, **REPARATIO**, the act of repairing, re-establishing, retrieving, or mending a building, or other work. damaged or gone to decay. See **REPAIRING**.

The Enemy *repaired* the breach as soon as it was made.—The establishment of turn-pikes is for *repairing* of the roads.—An ecclesiastical patron is by ancient custom obliged to repair the choir or chancel of a church, and the parishioners the nave. See **RESTAURATION**.

**REPARATIONE facienda**, is a writ which lies in divers cases; *e. gr.* where there are tenants in common, or joint tenants of an house, &c. which is fallen to decay, and the one being willing to *repair* it, the other two will not: in this case the party willing shall have this writ against the other two.

**REPARTEE**. See the article **REPARTY**.

**REPARTITION**, **REPARTITIO**, a dividing or sharing a thing a second time. See **PARTITION**.

There are so many deficiencies found this year in the taxes of this parish, that there must be a *repartition* on the inhabitants; or a new imposition.

**REPARTY\***, or **REPARTEE**, a ready, smart reply; especially in matters of wit, humour, or raillery—It is dangerous attacking this lady, her *repartees* are so keen.

\* The word, in the original French, *repartie*, has the same signification.

Wicquefort observes a world of difference between a free, sprightly *reparty*, and an offensive farcasm. See **SARCASM**.

**REPAST**, **REPASTUM**, a meal, or refectory, taken at a stated hour. See **REFECTION**.

In old law-books **REPAST** is particularly used for a meal's meat given to servile tenants, while at work for their lord. The French call their meal, *repast*; the Latins, *passus*; the Italians and Spaniards, *pasto*—The *repasts* whereof the scripture has preserved the memory, shew that the ancient Hebrews were not very delicate in their eating—Abraham, a man of wealth and eminence, entertaining the angels, serves them with cakes baked under the ashes, a fatted calf hastily dressed, and milk and butter—But the quantity makes amends for the quality: three measures of flower, and a whole calf, for three persons!

Joseph to shew his respect to his brother Benjamin, ordered him a portion of meat five times as big as that of his other brothers.

In antiquity the *repasts* were frequently sacrifices; for which reason we find them often prepared by kings themselves. See **SACRIFICE** and **FEAST**.

**REPEALING**, in law, the revoking or annulling of a statute, deed or the like. See **ABROGATION**, **REVOCATION**, &c.

No act of parliament shall be *repealed* in the same session it was made in. See **PARLIAMENT**—A deed or will may not be *repealed* for a part and stand good for the rest.

Brook uses the word *repellance* in the same sense.

**REPEAT**, in music, a character shewing that what was last played or sung, must be *repeated*, or gone over again. See **REPETITION**.

The *repeat* serves instead of writing the same thing twice over—There are two kinds of *repeats*; the *great* and the *small*.

The *great REPEAT*, is only a double bar, dotted on each side; or two parallel lines drawn perpendicular across the staff; with dots

dotts on either hand. See its form under CHARACTERS of music.

This mark shews that the preceding strain is to be repeated; that is, if it be near the beginning of the piece, all hitherto sung or played is to be repeated; or if towards the end of a piece all from such another mark.

In gavots, we usually find the *repeat*, at about the third part of a piece—In minuets, borees, courants, &c. towards the end.

Some make this a rule, that if there be dotts on each side the bar, they direct to a repetition both of the preceding and the following strain; if there be only dotts on one side, then only the strain on that side to be repeated.

The small REPEAT is where only some of the last measures of a strain are to be repeated—This is denoted by a character set over the place where the repetition begins (see CHARACTERS in music) and continues to the end of the strain.

When the song ends with a repetition of the first strain, or part of it, instead of a *repeat*, they use the word *da capo*, i. e. from the beginning.

REPEATING watches. See the article WATCH.

REPELLENT, REPELLENS, in medicine, a remedy which repels or drives back a morbid humour into the mass of blood, from which it was unduly secreted. See HUMOUR and MEDICINE.

Repellents are medicines which prevent such an afflux of the fluids to any particular part, as might raise it into a tumour; or drive them back when they are collected. See TUMOUR.

\* The greek name, given by some writers, to what (from the latin) are called repellents; is *apocrusitics*, *αποκρουστικα*, compounded of *απο*, from; and *κρουω*, to beat.

To form an idea of the manner of their operation, it may be observed, that all tumours arise either from an increase in the velocity or quantity of the fluids, or a weakness in some particular part: though sometimes both concur—Now an increase in the velocity of the fluids makes them more forcibly push against, and distend all the parts in their circuit; if therefore any part be unequally pressed or relaxed by external injuries, that will be more elevated than any other; and for want of equal resistance with the rest of the body, will at length receive such a quantity of fluid, as will raise it into a tumour, especially if any of its vessels be obstructed: because the protrusion of fresh matter, à tergo, will continue to add thereunto, till the part is on the utmost stretch, and can hold no more. See BLOOD.

In this case all those means are said to be repellent, which check the growth of the tumour, and assist the reflux blood in taking up the obstructed matter, and washing it again into the common stream.

This intention is chiefly favoured by evacuation and revulsion; for whatsoever lessens the quantity of the fluid, will diminish the force upon the tumefied part—But it concerns us most to know how external application to the part itself, helps this affair.

Herein a medicine comes to be repellent, by consisting of such subtle parts, as may transmit some of them through the pores, and help to render the obstructed matter more fluid, so that it comes the more easy to be loosened, and fall again into the circulating current—But in this case there is a hazard of such things likewise putting the obstructed humour into a ferment, whereby it turns sooner into pus, and then they come under the denomination of *suppuratives* or *ripeners*. See SUPPURATIVE.

What, therefore, in the most strict sense, is to be reputed a repeller, is that which astringes and strengthens the part, so as to make it resist any such lodgment. See ASTRINGENT and STRENGTHENER.

These are such whose qualities are most manifest in their coldness, and drying properties: but there are so few instances wherein bandage is not better than such application, that very little comes to be used for that purpose. In hæmorrhages, and oozings out of serum, so as to deform the skin; simples of this nature mostly take place; which answer their ends in astringing the fibres, whereby their apertures are so closed, as not to admit through them afterwards any such fluid.

Some things also answer this end only by stimulating the fibres of the tumefied part, so as to give them sudden and forcible twitches, whereby the obstruction is sometimes loosened and shook away, as it were, into the reflux current—Such a sort of motion will be occasioned by the sudden application of any thing extremely cold as common water; but the practice is seldom safe, because if the first efforts which the fibres are put upon by those means, do not succeed in breaking away the inclosed matter, they will be strained, and not able afterwards to repeat their natural vibrations: the consequence of which is weakening the part, which will render the tumour more obstinate.

REPELLING power, *Vis REPELLENS*, in physics, is a certain power or faculty residing in the minute particles of na-

tural bodies, whereby under certain circumstances they mutually fly from each other. See POWER and PARTICLE.

This power is the reverse of the attractive power. See ATTRACTIVE.

Sir Isaac Newton having established the attractive power of matter from observation and experiment, argues, that as in algebra, where positive quantities cease, there negative ones commence; so in physics, where the attractive force ceases, there a repelling force must begin—But that there is such a force does likewise appear from observation. See REPULSION.

As the repelling power seems to arise from the same principle as the attractive, only exercised in different circumstances; it is governed by the same laws: now the attractive we find is stronger in small bodies than in great ones, in proportion to the masses—Therefore the repelling is so too. But the rays of light are of all others the most minute bodies we know of; therefore of all others their repelling force must be the greatest. See RAY.

Sir Isaac Newton computes that the attractive force of the rays of light is above 1000000000000000 times as strong as the force of gravity on the surface of the earth: hence arises that inconceivable velocity wherewith the light must move, to reach from the sun to our earth in seven minutes. For the rays emitted from the body of the sun by the vibrating motion of its parts, are no sooner got without the sphere of attraction of the sun, than they come within the action of the repelling power. See LIGHT.

The elasticity, or springiness of bodies, or that property whereby, after having their figure altered by any external force, they return to their former figure, follows from the repelling power. See ELASTICITY, AIR, &c.

REPERCUSSION, in mechanics. See REFLECTION.

REPERCUSSION, in music, a frequent repetition of the same sounds. See REPETITION.

This often happens in the modulation; where the essential chords of each mode, or of the harmonical triad, are to be struck oftener than the rest; and of these three chords the two extremes, i. e. the final and the predominant one (which are properly the *repercussions* of each mode) oftener than the middle one.

REPERTORY, REPERTORIUM, a place wherein things are orderly disposed, so as to be easily found when wanted.

The indices of books are *repertories*, shewing where the matters sought for are handled—Common places are a kind of *repertories*, very useful to the learned. See COMMON place.

REPERTORIUM *anatomicum*, denotes a large hall near an amphitheatre of dissections, where skeletons both human and brutal, are orderly preserved—Such is the *repertory* in the French king's garden at Paris.

REPETITION, REPETITIO, the reiterating of an action. See REITERATION.

Habits are acquired by the frequent repetition of actions. See HABIT—Musicians and comedians make several repetitions of their concerts and comedies, before they perform for good. See REHEARSAL.

School philosophers call the repetition of the same numerical effect in another place, the replication of that effect. See REPLICATION.

REPETITION, in music, denotes a reiterating or playing over again of the same part of a composition; whether it be a whole strain, a part of a strain, or a double strain.

The repetition is denoted by a character, called a *repeat*, which is varied so as to express the various circumstances of the repetition. See REPEAT.

When the song ends with a repetition of the last strain, or a part of it; the repetition is denoted by *da capo*; that is, from the beginning.

REPETITION, REPLY, is also used in music, when after a little silence, one part repeats or runs over the same notes, the same intervals, the same motions, in a word, the same song, which a first part had already gone over during the silence of this.

REPETITION, REPLY, is also a doubling, or trebling, &c. of an interval; or a reiteration of some concord or discord.

Thus a fifteenth is a repetition of the octave, i. e. a double octave or second octave. See OCTAVE.

REPETITION, in rhetoric, is a figure whereby the orator rehearces the same word, or phrase over again.

Of this there are two kinds—In the first, the word is repeated precisely in the same sense: As, *Oh, Jerusalem, Jerusalem, who killest the prophets, &c. my God, my God, why hast thou forsaken me.*

Such repetitions have the same effect in discourse, with second strokes of the pencil in painting; they render the colours more strong and lively.

Sometimes the orator begins again and again with the same word; of which we have an instance in the beginning of Cicero's

Cicero's first oration against Cataline: *nihilne te nocturnum præsidium palatii, nihil urbis vigiliæ, nihil timor populi, nihil consensus bonorum omnium, nihil hic munitissimus habendi senatus locus, nihil horum ora vultusque moverunt!* Where the word *nihil* so often reiterated gives an admirable force and vehemence to the discourse—Again, the same author: *quem senatus damnarit, quem populus R. damnarit, quem omnium existimatio damnarit, cum vos sententiis vestris absolvetis?* again, *non feram, non patiar, non sinam.*

The second kind of *repetition*, called *πλῶν*, *place*, is a *repetition* of the same word, in the same phrase; but in such a manner as that some new idea or character is added to the word, in the second, which it had not in the first.

As Corydon is always Corydon: *ex illo Corydon, Corydon est tempore nobis*; by which we signify that Corydon is no ordinary person; and that nothing can distinguish him but the *repetition* of his own name: as if we should say, *he is Corydon, that is enough*—By the same figure our Saviour speaks, when he says: *let your language be yea, yea, and nay, nay.*

**REPLANTING**, in gardening, the act of planting a second time. See **PLANTING**.

The gardeners use to displant their tulips every year, and *replant* them—Lettices must be displanted and *replanted* yearly, to make them head and knit—If strawberries, &c. be not displanted and *replanted* once in a few years, they degenerate. It is a proverb among gardeners, that if the devil were to *replant* his wife, he would cut off her head.

**REPLEADER**, **REPLACITARE**, in law, is to plead over again what was once pleaded before. See **PLEA** and **PLEADING**.

**REPLEGIARE** *de averiis*, a writ brought by one whose cattle are distrained, and put in a pound by another; upon security given the sheriff to pursue, or answer the action at law against the distrainer. See **REPLEVY**.

**REPLETION**, in medicine, a plenitude, or plethora. See **PLENITUDE** and **PLETHORA**.

*Repletion* is more dangerous than inanition—Bleeding and diet are the great resources when a person is incommoded with a *repletion*. See **DIET**, &c.

**REPLETION** is sometimes also used where the stomach is overladen, with too much eating or drinking—The physicians hold all *repletion* prejudicial; but that of bread the worst. See **SURFEIT**.

**REPLETION**, in the canon law, is where the revenue of a benefice or benefices is sufficient to fill or occupy the whole right or title of the graduate who holds them. See **BENEFICE**, **GRADUATE**, &c.

When there is a *repletion*, the party can demand no more by virtue of his degrees—In England, where benefices are not appropriated to degrees, *repletion*, strictly speaking, has no place. See **PLURALITY**.

In France, 600 livres, or 45 l. sterling per annum, make a *repletion*, when the benefice is obtained otherwise than by a degree; and 30 l. per annum, when it is obtained by virtue of a degree.

**REPLEVIN**, **PLEVINA**, a remedy granted on a distress; being a re-deliverance of the goods distrained to the first possessor, on security or pledges given by him to try the right with the distrainer, and answer him in the course of law. See **REPLEVY**.

If a person distrain another's goods or cattle for rent, or damage sefant, &c. the owner, upon giving security to the sheriff that he will prosecute his action against the party distraining, and return the goods or cattle again, if the seizure shall be adjudged good; may have a writ of *replevin* or *replegiari facias*. See **DISTRESS**.

**REPLEVISH**, in law, is to let one to mainprise, upon surety. See **MAINPRISE**.

**REPLEVY**, **REPLEVIE**, in law (from the Latin *replegiare*, to re-deliver to the owner upon pledges of surety) is the bringing of a writ of *replevin*, or *replegiari facias*, by him whose cattle or goods are distrained by another upon any cause; having first given security to the sheriff, that on the delivery of the thing distrained, he will prosecute the action against the person who made the distress. See **REPLEVIN** and **DISTRESS**.

In the Stat. 24 of Henry VIII. we read of *canes replegiari*, hounds *replevied*, in a case between the abbot of St Albans, and Geoffrey Childwic.

Goods may be *replevied* two ways; viz. by writ, which is that used by the common law—And by *plaint*; which is that by statute law, for the more speedy having again the cattle and goods, and is brought in the sheriff's court.

**REPLICATION**, **REPLICATIO**, in logic, the assuming or using the same term twice in the same proposition: otherwise called *reduplication*. See **REDUPLICATION**.

Some philosophers use the phrase *replicatio mundi*, *replication* of the world, for its conversion, or turning round—The human soul is said to be in a place *replicatively*, *replicativè*, when conceived to be all in the whole, and all in every part thereof. See **SOUL**.

**REPLICATION**, in law, is an exception of the second degree, made by the plaintiff to the plea or first answer of the defendant. See **REJOINDER**.

The *replication* is particularly that which the plaintiff replies to the defendants answer in chancery; and which is either *general* or *special*—The *special* is grounded upon matter arising out of the defendant's answer, &c. The *general* is so called from the general words therein used.

**REPORT**, the relation made upon oath, by officers or persons appointed to visit, examine, state or estimate any thing.

Damages, repairs, &c. are judged from the *reports* of experienced persons—Provisions for persons wounded are only granted on the *reports* of surgeons, &c.—In cases of rapes a *report* of matrons is to be had.

**REPORT** in law, is a public relation, or bringing to memory of cases judicially argued, debated, resolved, or adjudged in any of the king's courts of justice, with the cause and reason of the same delivered by the judges.

When the chancery, or any other court, refers the stating of some case, or comparing an account, &c. to a master in chancery, or other referee, his certificate therein is also called a *report*.

*Pinion of REPORT*. See the article **PINION**.

**REPOSE**, in poetry, &c. See the articles **REST**, **PAUSE**, &c.

**REPOSE** in painting, is applied to certain masses, or large systems or assemblages of light and shade: which being well conducted, prevent the confusion of objects and figures; by engaging and taking up the eye so as it cannot attend to the other parts of the painting, for some time: and thus leading it to consider the several groups gradually, and as it were to proceed from stage to stage—See **LIGHT**, **SHADOW**, **CLAIR-obscur**, &c.

**REPOSITION** \* *of the forest*, an act whereby certain grounds before made purlieu, are upon a second view laid to the forest again. See **REAFFORESTING**, **FOREST**, and **PURLIEU**.

\* The word is formed from the Latin *re* and *ponere*, to lay again. **REPOSITION** in surgery, the reduction of a bone. See **REDUCTION**.

**REPOSITORY**, **REPOSITORIUM**, a store-house or place where things are laid up, and kept—In which sense we say the *repository* of the royal society, &c. See **MUSEUM**.

**REPRESENTATION**, **REPRESENTATIO**, in the drama, the exhibition of a theatrical piece; including the scenes, machines, recitation, &c. See **SCENE**, **MACHINE**, **RECITATION**, &c.

Sir Richard Steel's principle is, that the design of a play is not to be read but *represented*; so that it is on the stage, not in the press it is to be judged of: and the pit not the public, are the judges. See **THEATRE**, **TRAGEDY**, **COMEDY**, &c.

**REPRESENTATIVE**, one that personates, or supplies the place of another; and is invested with his right, and authority. See **DEPUTY**, **LIEUTENANT**, &c.

The word *representative* is equivalent to procurator or proxy. See **PROCURATOR** and **PROXY**.

Thus we say the king is the *representative* of God on earth; magistrates are *representatives* of the king. See **KING**, &c.—The commons are the people's *representatives* in parliament. See **COMMONS**, **PARLIAMENT**, &c.

There is this defect in the constitution of our parliament; that whereas all Englishmen who have considerable estates, ought not to be taxed without their own consent in parliament, by themselves or their *representatives*; copy-holders, whereof some have a thousand pounds a year, have no voice in the election of knights of the shire. *Chamberl.*

**REPRIEVE**, or **REPRIVE**, in law a suspending or deferring the execution of the law upon a prisoner, for the present time.

A *reprieve* is properly a warrant from the king, for suspending the execution of a person condemned—The king cannot pardon a condemned person without the concurrence of parliament, but he frequently *reprieves* him for 99 years.

**REPRIMAND**, a sharp authoritative reproof—Such a person was *reprimanded* in court by the bench, &c.

**REPRISALS** \*, or **REPRIZALS**, **REPRESALIA**, in the civil law, a right which princes have to retake from their enemies, such things as they unjustly detain from them; or other things equivalent thereto.

\* The word is formed from the Italian, *represaglia*, which signifies the same thing.

When a place is taken or held from a prince, he seizes another by way of *reprisal*—Sometimes he takes men of the opposite party, by right of *reprisals*.

The Romans called this *clarigatio*: and the Greeks had something like it under the name of *androlepsia*. See **CLARIGATIO** and **ANDROLEPSIA**.

**REPRISALS** is also used for a letter or permission which a prince sometimes gives a subject, upon a full cognizance of the cause; authorizing him to retake from the first persons he meets

meets withal of the opposite party, as many effects as make an equivalent to what have been violently forced from him; and for which the opposite prince has refused to do him justice.

These permissions are also called *letters of mark*, or *mart*, and in the Stat. 27 Edw. III. *law of marque*; in regard, a person denied justice in another man's territory, redresses himself by goods belonging to men in that territory. See MARK.

This merchant has seized the effects of the Spaniard don——by way of *reprisal*, because the Spaniards had seized his; and no redress could be had at the court of Madrid.

REPRISE \*, or REPRIZE, in the commerce by sea, a merchant ship which having been taken by a corsair, privateer, or other enemy; is retaken or recovered by a vessel of the contrary party. See PRIZE.

\* The word is French, and signifies a *re-sumption* or *re-taking*. When a vessel thus retaken has been 24 hours in the hands of the enemy, it is deemed a lawful prize—If the *reprise* have been made within 24 hours; the vessel is to be restored to the proprietor, with every thing therein upon his allowing one third to the vessel who made the *reprize*.

If the *reprise* have been abandoned by the enemy, either in a tempest, or from any other cause, before it have been led into any port, it is to be restored to the proprietor.

REPRIZES, in law, are deductions, draws-backs, or duties paid yearly out of a manor, or lands—Such are rent-charges, pensions, fees of stewards or bailiffs, &c.—The manor of Doll yields 40*l.* per annum, *ultra reprizas*, besides all *reprisals*.

REPRIVE. See the article REPRIEVE.

REPROBATION, REPROBATIO, in theology, a decree or resolve which God has taken from all eternity, to punish sinners who shall die in impenitence. See IMPENITENCE, &c.

*Reprobation* stands in direct opposition to *predestination*. See PREDESTINATION.

Divines hold it a symptom of *reprobation*, when a sinner is hardened so as not to feel any farther remorse or misgivings of conscience. See CONSCIENCE, &c.

The casuists distinguish two kinds of *reprobation*, *positive* and *negative*.

*Positive* REPROBATION is that whereby God is supposed to create men with a positive and absolute resolution to damn them eternally.

This opinion of *reprobation*, is countenanced by St Augustine, and others of the fathers, and strongly maintained by Calvin, and most of his followers—Something like it is also found in the XXXIX articles of the church of England, but it is now generally exploded as injurious to God. See CALVINIST, &c.

*Negative* or *conditional* REPROBATION, is that whereby God, though he create all men with a sincere desire to save them, and furnishes them with the necessary means thereto, so as all may be saved if they will; yet, sees there are several who will not do it, with the aids he shall afford them, how powerful soever: and sees at the same time, they would do it with certain other aids, which he sees, but will not give them—*O altitudo!* &c. See GRACE.

REPRODUCTION, REPRODUCTIO, the act whereby a thing is produced a-new, or grows a second time. See REGENERATION.

When the stock of an oak, a fruit-tree, or the like, is cut off short, it *reproduces* an infinity of young shoots. See STOCK.

By *reproduction* is usually understood the restoration of a thing before existing, and since destroyed. See RESTAURATION.

The *reproduction* of several parts of lobsters, crabs, &c. makes one of the greatest curiosities of natural history—That in lieu of an organical part of an animal cut off, another shall arise perfectly like it, may seem inconsistent with the modern system of generation; where the animal is supposed to be wholly formed in the egg. See GENERATION and EGG.

Yet has the matter of fact been well attested by the fishermen, and even by several virtuoso's who have taken the point into examination, particularly M. de Reaumur, and M. Perrault, whose skill and exactness in things of this nature will hardly be questioned—The legs of lobsters, &c. consist each of five articulations; now when any of the legs happen to break by any accident, as in walking, &c. which frequently happens, the fracture is always found to be at a future near the fourth articulation; and what they thus lose is precisely *reproduced* in some time afterwards: that is, a part of a leg shoots out, consisting of four articulations; the first whereof has two claws as before: so that the loss is entirely repaired.

If a lobster's leg be broke off by design at the fourth or fifth articulation, what is thus broke off always comes again—But it is not so if the fracture be made in the first, se-

cond, or third articulation. In those cases the *reproduction* is very rare, if things continue as they are—But what is exceedingly surprizing, is, that they do not: for upon visiting the lobster maimed in these barren and unhappy articulations, at the end of two or three days, all the other articulations are found broke off, to the fourth; and it is suspected they have performed the operation on themselves, to make the *reproduction* of a leg certain.

The part *reproduced* is not only perfectly like that retrenched, but also in a certain space of time grows equal to it—Hence it is, that we frequently see lobsters, which have their two big legs unequal; and that in all proportions—This shews the youth of the legs.

A part thus *reproduced* being broke, there is a second *reproduction*—The summer, which is the only season of the year when the lobsters eat, is the most favourable time for the *reproduction*. It is then performed in four or five weeks: whereas it takes up eight or nine months in any other season.

The small legs are *reproduced*, but more rarely, as well as more slowly than the great ones: the horns do the same. Vid. Mem. Acad. R. Scienc. an. 1712. p. 295. Hist. p. 45. seq. item an. 1718. p. 31. See also CRAB'S-EYES.

REP-SILVER, money antiently paid by servile tenants to their lord, to be quitted of the duty of reaping his corn. See SILVER.

REPTILES \*, in natural history, a kind of animals denominated from their creeping or advancing on the belly—Or, *reptiles* are a genus of animals and insects which instead of feet, rest on one part of the body, while they advance forward with the rest. See ANIMAL, INSECT, &c.

\* The word is formed from the Latin, *repto*, I creep.

Such are earth-worms, snakes, caterpillars, &c.—Indeed, most of the class of *reptiles* have feet; only those very small, and the legs short in proportion to the bulk of the body. See FOOT and LEGS.

Naturalists observe a world of artful contrivance for the motion of *reptiles*—Thus, particularly, in the earth-worm. Dr. Willis tells us, the whole body is only a chain of annular muscles; or, as Mr Derham says, it is only one continued spiral muscle, the orbicular fibres whereof by being contracted, render each ring narrower and longer than before: by which means it is enabled, like the worm of an augre, to bore it's passage into the earth—It's *reptile* motion may also be explained by a wire wound on a cylinder, which when slipped off, and one end extended and held fast, will bring the other nearer it. So the earth-worm having shot out or extended his body (which is with a wreathing) it takes hold by those small feet it hath, and so contracts the hinder part of it's body—Dr Tyson adds, that when the forepart of the body is stretched out, and applied to a plane at a distance, the hind part relaxing and shortning, is easily drawn towards it as a centre.

It's feet are disposed in a quadruple row, the whole length of the worm; with which, as with so many hooks, it fastens down sometimes this, and sometimes that part of the body to the plane, and at the same time stretches out, or drags after it another.

The creeping of serpents is effected after a somewhat different manner; there being a difference in their structure; in that these last have a compages of bones articulated together.

The body here is not drawn together, but as it were complicated; part of it being applied on the rough ground, and the rest ejaculated and shot from it; which being set on the ground in it's turn, brings the other after it—The spine of the back, variously wreathed, has the same effect in leaping, as the joints of the feet in other animals; they making their leaps by means of muscles that extend the plicæ or folds.

REPTILE is likewise used, abusively, for plants and fruits which creep on the earth, or on other plants, as wanting strength of stalk to sustain themselves. See CLASPER, &c.

Such are cucumbers, melons &c. such also are ivy, the vine, &c. See CAPREOLATÆ.

REPUBLIC, RESPUBLICA, *commonwealth*, a popular state, or government; or a nation where the people have the government in their own hands. See STATE GOVERNMENT, &c.

This amounts to the same with what we otherways call a *democracy*. See DEMOCRACY.

The celebrated *republics* of antiquity, are those of Athens, Sparta, Rome, and Carthage—At present there is scarce any such thing as a real *republic*. *i. e.* a strictly popular state—Indeed the Venetians and Genoeese call their states *republics*, but their government is apparently *oligarchic*. See OLIGARCHY, and ARISTOCRACY.

The Dutch come the nearest to the character of a *republic*; yet they are very defective, at least in the sense and severity wherewith Rome, Carthage, &c. were *republics*. See STATES-general, PENSIONARY, STATHOLDER, &c.

It is a remark of M. St Evremont, that if the Dutch love the *republican* form, it is more for the sake of their trade, than of their liberty.

**REPUBLIC** of letters, is a phrase used in speaking collectively of the whole body of the people of study and learning.

There is a journal begun in Holland by M. Bayle, and continued by M. Bernard, consisting of extracts of books printed in the course of the year; called, *nouvelles de la republique des lettres*, news from the *republic* of letters. See **JOURNAL**.

**REPUDIATION**, **REPUDIUM**, in the civil law, the act of divorcing. See **DIVORCE**.

**REPULSION**, **REPULSIO**, in physics, the act of a repelling power, whereby natural bodies, under certain circumstances, mutually fly each other. See **REPELLING power**. *Repulsion* is the counter-part to *attraction* — Attraction only reaches to a little distance; where that terminates there *repulsion* commences. See **ATTRACTION**.

Indeed we meet with many obvious instances of *repulsion* among bodies; as, between water and oil; and in general, between water and all unctuous bodies; between mercury and iron; as also between the particles of dust, &c.

Thus, if a fat body lighter than water, be laid on the surface thereof, or if a piece of iron be laid on mercury, the surface of the fluid will be depressed about the bodies laid on it: a plain indication of *repulsion*; as the rising up of the fluid about the surfaces of other incumbent bodies is of attraction.

In the latter case the fluid is suspended by an attractive power, above the level, and kept from falling by its gravity: in the former a depression is made by the repelling power, which the liquor, notwithstanding its gravity, cannot run down into and fill up.

Upon this depend all the phenomena of very light glass bubbles floating on water; about which, when clean, the water rises: but when greased, the water sinks into a channel all around them—Hence also it is that in a glass vessel of water the fluid stands higher all about the edges near the glass, than towards the middle: but when the glass is filled till the water run down on all sides, then, it stands higher at the middle than at the sides — Hence, also, in a glass not full of water, a clean glass bubble always runs to the side, by reason the pressure which is upon it towards the middle, is partly taken off by the attractive force wherewith the water is raised near the edge. If the glass be so full as to be ready to run over, the bubble returns from the side towards the middle; the force wherewith the water is raised in the middle, taking off part of the pressure.

Just the reverse happens, if the bubble be greasy; in regard, there, the force whereby the water and the bubble repel each other, is greatest where the water is highest. Two clean bubbles, and two greasy ones always run towards each other; as being attracted: a greasy and a clean one always fly each other; as being repelled.

**REQUEST**, in law, a supplication, or petition preferred to a prince, or a court of justice; begging relief in some conscientious cases where the common law grants no immediate redress. See **PETITION**, **SUPPLICATION**, **LAW**, **EQUITY**, &c.

The term *request* is now, since the institution of chancery, much disused; together with the court of *requests*, where *requests* were cognizable.

The **Court of REQUESTS**, was an ancient court of equity, instituted about the 9th year of Henry VII. of like nature, though inferior authority, with the court of chancery; being appointed chiefly for the relief of petitioners who in conscientious cases should address themselves, by way of *request*, to his majesty.

The chief judge of this court was the lord privy seal, assisted by the *masters of request*, who corresponded to our masters of chancery. See **MASTER**.

In the 40th and 41st of year of queen Elizabeth, it was adjudged, upon solemn argument in the court of common pleas, that the court of *requests* was then no court of equity. See **COURT**, **CHANCERY**, &c.

In France, *requetes civiles*, civil requests, still obtain for the annulling of contracts, &c. made by surprize. See **PLAINT**.

They have eighty *masters of requests*, to take cognizance of causes between the officers of the crown, the servants of the household, &c.

**REQUEST**, in hunting, is when the dogs have lost the quest or track of the beast, and must *request*, or *quest* it again. See **QUEST**—They say, to *call to the request*, *come to the request*, &c. See **HUNTING**.

To *request* the game, is chiefly used when after having run it down the night before, they seek it again the next morning with the blood-hound, or the like. See **Blood-HOUND**.

**REQUIEM**, a mass sung in the Romish church for the rest of the soul of a person deceased. See **MASS**.

It is thus called, because the introit begins with, *Requiem æternam dona eis domine*, &c.

**RE-REWARD**, *arrieregarde*. See **REAR** and **GUARD**.

**RES**, *thing*. See **REALITY**, **ENS**, **ESSE**, **SUBSTANCE**, &c.

**RES Mancipi**. See **ABALIENATION**.

**RES Naturales**.

**RES Non Naturales**, &c. } See { **NATURALS**.  
                                              }       { **NON Naturals**, &c.

**RESCEIT**, **RECEPTIO**, in law, an admission or receiving of a third person to plead his right, in a cause formerly commenced between other two.

As, were an action is brought against a tenant for life or years, and he makes default; in such case he in the reversion may come in and pray to be *received*, to defend the land, and to plead with the demandant.

**RESCEIT** is sometimes also applied to an admittance of plea, though the controversy be only between two—He in reversion may come into court and pray to be *received* in a suit against his particular tenant.

**RESCEIT of homage**, **RECEPTIO homagii**, denotes the lord's receiving homage of his tenant, at his admission to the lands. See **HOMAGE**.

**RESCISION\***, **RESCISSIO**, in the civil law, an action intended for the annulling or setting aside of any deed, contract, or the like.

\* The word is formed from the Latin, *re* and *scindo*, q. d. I cut or divide again.

A thing's being found damaged or sold at above double the just value, is a good cause of *rescission*. See **REDHIBITION**.

The deed or contract thus annulled, or *rescinded*, is sometimes called a *rescissory*, though that denomination be more properly given to the action brought for *rescinding* or setting it aside: *actio rescissoria*.

**RESCOUS**, or **RESCUE**, **RESCUSSUS**, in law, an illegal taking away and setting at liberty a distress taken, or a person arrested, by process, or course of law.

This is properly a *rescous in fact* — If one distrain beasts for damage feasant in his ground, and as he drives them along the highway towards the pound, they enter into the owner's house, and he withholds them there, and will not deliver them upon demand: this detainer is a *rescous in law*.

*Rescous*, in matters relating to treason, is deemed treason; and in matters concerning felony, is felony. See **TREASON**, &c.

—He that commits such a *rescue* or *rescous*, is called *rescussor*.

**RESCOUS** is also used for a writ which lies for this fact; called *breve de rescussu*.

**RESCRIPT**, **RESCRIPTUM**, an answer delivered by an emperor, or a pope, when consulted by particular persons, on some difficult question or point of law; to serve as a decision thereof.

The civil and canon laws are full of such *rescripts*. See **CIVIL** and **CANON law**.

When the *Rescript* was made in answer to the inquiry of a community, it was called a *pragmatic sanction*. See **PRAGMATIC**.

The papal *rescripts* are a kind of bulls or monitories beginning with these words, *significavit nobis dilectus filius*, &c.

They never obtained either in England or France, when contrary to the liberties of the English and Gallican churches; but were declared abusive. See **BULL**.

Among the Romans the contending parties, and even the magistrates themselves, frequently consulted the emperor on the measures they were to take in certain nice and difficult cases; and the answers returned by the emperors on such consultations, were called *rescripts*—These had not, indeed, the full force of laws, but were deemed a strong prejudice or presumption.

Justinian has inserted a great number of them in the Code; and by that means given them the authority they before wanted. See **CODE**.

The author of the life of the emperor Macrinus observes of that prince, that he would have his officers judge by laws, not by *rescripts*; as esteeming it absurd to admit the wills of ignorant men, such as Commodus, and Caracalla, for rules of judging; and because Trajan never gave any *rescripts* at all, as being loath to countenance a custom, where what is frequently granted as a favour, in particular cases, might be afterwards pleaded as a precedent—'Tis added, that Macrinus had a design to strip the *rescripts* of all their authority.

M. Schulting, in his dissertations, does not at all approve of this design; and to the emperor's reasons answers, that indeed all *rescripts* are not to be admitted; that those which appear dictated out of favour, are to be thrown aside; but those which appear founded in reason, and natural equity are, with Justinian, to be allowed—He adds, that it cannot be denied but the worst emperors have frequently made good laws, and useful *rescripts*.

As to what is urged of the emperor Trajan's never giving any *rescripts*; it appears but ill supported — For what is it but a *rescript* that he delivers to Pliny on the subject of the Christians, *lib. 10. epist. 28*? Or that on the Isestici, *lib. 10. epist. 120*? The Digest, and Pliny's epistles, need only to be opened and compared, to find *rescripts* of Trajan.

**RESCUE**. See the article **RESCOUS**.

**RESEANTISSA**, or **RESEANTISA**, in law. See **ESSOIN**.

**RESEARCH\***, a diligent search or enquiry into any thing.

\* The word is formed of the French, *recherche*, and literally denotes a *second search*.

**RESEARCH**, in music, is a kind of prelude or voluntary, played on the organ, harpsicord, theorbo, &c. Wherein the composer seems to *search*, or look out for the strains, and touches of harmony, which he is to use in the regular piece to be played afterwards. See **PRELUDE**.

This is usually done off-hand, and consequently requires a master's skill—When in a motetto the composer takes the liberty to use any thing that comes in his head, without applying any words to it, or subjecting himself to the sense and passion thereof; the Italians call it *fantasia ricercata*; the French, *recherche*; and the English *research*.

**RESEARCHING**, in sculpture, the repairing of a cast figure, &c. with proper tools; or the finishing it with art and exactness, so as the minutest parts may be well defined. See **FIGURE**, **STATUE**, **FOUNDRY**, &c.

**RESEISER**, **RESEISIRE**, in law, a taking again of lands into the king's hands, where a general livery, or ouster le main, was formerly misused; contrary to order of law. See **RESUMPTION**.

**RESEMBLANCE**. See the article **SIMILITUDE**.

**RESERVATION**, **RESERVATIO**, in law, an action or clause whereby something is *reserved*, i. e. retained, kept, or secured to one's self. See **RESERVE**.

Thus, when a man lets his land, he *reserves* a rent to be paid to himself for his maintenance, &c. See **LEASE**, **TENANT**, **RENT**, &c.

William the conqueror getting all the lands of England, except those belonging to the church and religious houses, into his hands by right of conquest; bestowed a great part thereof among his followers, *reserving* some retribution of rents and services to him and his heirs; which *reservation* is now, as it was before the conquest, called the tenure of the lands. See **TENURE**, **SERVICE**, &c.

Sometimes, *reservation* signifies as much as an exception: as, when a man lets an house, and *reserves* to himself one room, that room is excepted out of the demise. See **EXCEPTION**.

**Mental RESERVATION** is a proposition, which strictly taken, and according to the natural import of the terms, is false; but if qualified with something *reserved* or concealed in the mind, becomes true.

**Mental reservations** are the great refuge of religious hypocrites; who use them to accommodate their consciences with their interests: the Jesuites are zealous advocates for mental *reservations*; yet are they real liars, as including an intention to deceive.

**RESERVE**, in law, the same with *reservation*. See **RESERVATION**.

He has settled the whole estate on his son, and has not made any *reserve*—Benefices are sometimes resigned with *reserve* of a pension—By the canon law, no person may *reserve* to himself a pension out of a benefice, unless he hath served it ten years. See **RESIGNATION**.

In the Romish church, the ordinary priests have only a power to absolve, in *reserve* of certain cases; hence called *reserved cases*, as being *reserved* to the bishop. See **ABSOLUTION** and **CASE**.

The court *reserves* the cognizance of such an affair to itself—The lawyers say, that no prince ever grants such a power by his letters or patents, but he *reserves* to himself a greater.

**Body of RESERVE**, *corps de RESERVE*, in war, the forces disposed in the third or last line of an army drawn up for battle. See **LINE**, **GUARD**, and **REAR**.

They are thus called, because *reserved*, or destined to sustain the rest as occasion requires; and not to engage but in case of necessity.

**RESERVED cases**. See the article **CASE**.

**RESERVOIR**, **RECEPTACLE**, a place where water is collected and reserved, to be conveyed occasionally, through pipes, &c. or to be spouted up, &c. See **WATER**, **FLUID**, &c.

The *reservoir* in a building is a large basin usually of wood, lined with lead, where water is kept to supply the occasions of the house—At Cannons, the noble seat of the duke of Chandos, is a very large *reservoir* a-top of the house; to which the water is raised by a very curious engine contrived for the purpose—This *reservoir* is of such capacity, as that besides supplying all parts of the house by means of pipes and cocks, it likewise turns a mill.

The *reservoir* is sometimes also a large basin of strong masonry, clayed or paved at the bottom: where the water is reserved to feed jets d'eau, or spouting fountains. See **FOUNTAIN**, &c.

Such is that huge one on the top of Marly, called *trou d'enfer*, hell-mouth, whose surface, Daviler tells us, contains fifty acres, and it's depth such, as under that superficies to contain a hundred thousand cubic fathom of water.

**RESERVOIR**, in anatomy. See the article **RECEPTACLE**.

**RESET**, in law, the receiving or harbouring an outlawed person. See **OUTLAW**—Hence a receiver of an outlawed person, is called a *resetter*.

**RESIANCE**, **RESIANTIA**, in law, a man's abode or continuance in a place.

The word has the same signification with regard to lay-men, as *residence* with regard to ecclesiastics. See **RESIDENCE**.

Glanville observes, that in the ancient law, *resiance* properly signified a disease, whereby the person was disabled from stirring out of doors—Whence their *essoin de resiantia*, was the same as our *essoin de malo lecto*. See **ESMOIN**.

**RESIDENCE**, **RESIDENTIA**, in canon and common law, the abode of a person or incumbent upon his benefice; and his assiduity in attending on the same. See **PARSON**, **BENEFICE**, &c.

The default of *residence*, called *non-residence*, unless where the party has a dispensation for the same, with us, is the forfeiture of ten pounds for each month. See **NON-residence**.

By the canon law, beneficiaries are obliged to *residence*, under pain of deprivation of their benefices—The original reason is, that in the primitive church none were promoted to holy orders, but such as had a benefice in promptu; which they were obliged to serve: so that this service was necessarily attached to the orders; and whoever was honoured therewith, at the same time was obliged to personal service. See **ORDERS** and **ORDINATION**.

But this strict discipline was not observed long—The beneficiaries by degrees got dispensations from serving their benefices themselves; and thus pluralities got footing. See **PLURALITY**.

France, of all other countries, seems to be that where *residence* is the most strictly regarded—All their cures, or ministers who have cures of souls, are obliged to actual *residence*; and the parliaments have declared all the dispensations granted by popes, &c. abusive; as esteeming the obligation of *residence* to be jure divino.

Under Charles IX. there was even a design to re-establish the primitive discipline in all its severity; and in 1561, a declaration was registered, appointing all bishops to *reside*, conformably to the ancient canons, in their bishoprics—The same parliament also forbade the bishops to assume the quality of counsellors of the king; in regard such a quality was deemed inconsistent with the indispensable obligation they were under to *reside* in their bishoprics.

Du Pin adds, that the procureur general, or attorney general Buordin, even seized the temporalities of such bishops as continued in Paris fifteen days after this declaration; having first certified them, that if they had any business there, he would undertake the management thereof.

**RESIDENCE**, in chymistry, &c. the *settling*, or what remains of a liquor, or other substance in the vessel, after the chief part of it has been poured or taken out; to change the manner of the operation on what is left. See **SEDIMENT**.

**RESIDENT**, a public minister, who manages the affairs of a king in the court of a prince, or petty state; or the affairs of a prince, or petty state; in the court of a king or prince. See **MINISTER**.

Thus the king of England has *residents* in the courts of the electors, and other princes of Germany, and Italy; at the republics of Genoa and Lucca: and they reciprocally, have *residents* in the court of Great-Britain.

*Residents* are a class of public ministers inferior to ambassadors and envoys; but like them are under the protection of the laws of nations. See **EMBASSADOR** and **ENVOY**.

**RESIDENT**, **RESIDENS**, in our ancient customs, was a tenant who was obliged to *reside* on his lord's land, and not to depart from the same; called also, *homme levant and couchant*; and in Normandy, *resseant du fief*. \*

\* *Quantumque de aliis teneat ei magis obnoxius est, & ejus residens esse debet cujus legius est. Leg. H. 1.*

**RESIDENTIARY**, **RESIDENTIARIUS**, a canon installed to the privileges and profits of residence. See **CANON** and **PREBENDARY**.

**RESIDUAL figure**, in geometry, the figure remaining after subtraction of a lesser from a greater. See **FIGURE**.

**RESIDUAL root**, is a root composed of two parts or members, only connected together with the sign—

Thus,  $a - b$ , or  $5 - 3$ , is a *residual* root; and is so called, because it's true value is no more then it's *residue*, or difference between the parts  $a$  and  $b$ , or 5 and 3. See **ROOT**.

**RESIDUE**, **RESIDUUM**, the remainder or reliqua of an account, debt, or obligation. See **REMAINDER** and **RELIQUA**.

St Paul in his epistle to the Romans, speaks of a *residue* according to the election of grace; meaning a remnant or small number of people preserved from idolatry by an effect of the grace of God.

**RESIGNATION**, **RESIGNATIO**, in the canon law, the surrender, or giving up of a benefice into the hands of the collator or bishop. See **BENEFICE** and **COLLATION**.

*Resignation* is of equal import with *surrender*; only the former is restrained to spiritual benefices, and the latter to temporal offices or employments. See **SURRENDER**.

*Res-*

*Resignations* are either *simple*, or *conditional*.

**Simple** or *pure* RESIGNATIONS, are those whereby the incumbent strips himself of all his right, absolutely, and without any conditions or reserve of pension—These are made to the bishop, or collator.

RESIGNATIONS in *favour*, or *conditional* RESIGNATIONS, are such as are only made on condition that such other persons shall be invested therewith; so that the *resignations* are null, unless the conditions be punctually executed.

These *resignations* in *favorem* are not above 200 years standing—Strong opposition was made at first to them, they being esteemed a kind of succession or transmission of benefices, as of patrimonies belonging to a family. Accordingly, these *resignations* are not made into the hands of the ordinary, or collator, as *pure resignations* are; but to the collator paramount, who in the Romish church is the pope: there being a suspicion of simony, or other unlawful paction therein, where admitted of in prejudice to the lay-patron.

RESIGNEE, in law, the party to whom a thing is resigned. See RESIGNATION.

RESIN, RESINA, a fat, viscid, sulphurous juice, oozing either spontaneously, or by incision, from several kinds of trees, particularly the pine, fir, &c. See JUICE, PLANT, &c. Camphor is a kind of *resin*. See CAMPHOR—Mastic is the *resin* of the lentisk. See MASTIC—The best of all the class of *resins* is turpentine. See TURPENTINE—The coarsest is what we commonly call *rosin*. See ROSIN.

*Resin* is properly a juice of the bark only. See BARK—Boerhaave will have it to be the oil of the bark farther inspissated by the heat of the sun, &c. so as to become friable. He adds, that it may be produced from any vegetable oil, by boiling it much and long. See OIL.

If turpentine be set over a gentle fire, it first dissolves and becomes an oil, then a balsam, then pitch, and then *rosin*; in which state it is friable in the cold, fusible by fire, and withal inflammable and combustible, and dissoluble in spirit of wine, but not in water, which are the characters of a *resin*. See DISSOLVENT, &c.

There are two kinds of *resins*, the one *liquid*, the other *dry* and hard—The first is the natural *resin*, as it flows from the tree—The second only differs from the first in that it is condensed by the heat of the sun, or by that of a culinary fire.

*Resins* will incorporate with oil, or rectified spirits, but not with an aqueous menstruum. See PRECIPITATION.

The difference betwixt *Resins* and *gums*, consists in this, that *resins* are more sulphurous, and *gums* more aqueous; so that the first dissolve in oil or spirit of wine, and the last in water. See GUM.

M. Tournefort makes a kind of intermediate class of vegetable juices which he calls *gum-resins*; which dissolve partly in spirit of wine, partly in water—Such are *galbanum*, *bdellium*, *opopanax*, *sagapenum*, &c. See GUM-*resin*.

The *resins* of several vegetables which abound with *resinous* particles, but not so as to yield any by incision, as jalap, benzoin, scammony, turbith, &c. are thus obtained—The vegetable being grossly powdered, is put into a matras, and rectified spirits of wine poured on it, to the height of four fingers above the matter. Then the neck of another matras being luted into the former, to make a double vessel, the matter is digested three or four days in a sand heat, till it have given a good tincture to the spirit of wine. Then the dissolution is filtrated, and two thirds of the clear liquor evaporated off, and the remainder poured into a large vessel of water, where it turns into a kind of milk; whence the *resin*, in time, precipitates to the bottom in a white powder—This when washed and dried in the sun, grows into the ordinary consistence of a *resin*.

RESISTENCE, or RESISTING force, in physics, any power which acts contrarily to another, so as to destroy or diminish it's effect. See POWER.

Of *resistence* there are various kinds, arising from the various natures and properties of the *resisting* bodies, and governed by various laws: As, the *resistence* of solids, the *resistence* of fluids, the *resistence* of the air, &c. The doctrine of each whereof will be seen under the following articles.

RESISTENCE of *solids*, in mechanics, is the force wherewith the quiescent parts of solid bodies oppose the motion of others contiguous therewith. See SOLIDITY, &c.

Of this there are two kinds—The first, where the *resisting* and the *resisted* parts, *i. e.* the moving and quiescent bodies, are only contiguous, and do not cohere; *i. e.* where they constitute separate bodies or masses.

This *resistence* is what M. Leibnitz calls *resistence of the surface*; and we, properly, *friction*; the consideration whereof, being of the last importance in the doctrine of machines, see it's laws under the article FRICTION.

The second case of *resistence* is where the *resisting* and *resisted* parts are not only contiguous but cohere, *i. e.* are parts of the same continued body or mass—This *resistence* is what we may properly call *renitency*; and was first considered by Galileo.

Theory of the RESISTENCE of the fibres of solid bodies—To

conceive an idea of this *resistence* or renitency of the part, suppose a cylindrical body suspended vertically by one end—Here, all it's parts being heavy, draw downwards; and tend to separate the two contiguous planes, where the body is the weakest: but all the planes *resist* this separation by the force wherewith they cohere, or are bound together: here then are two opposite powers; *viz.* the weight of the cylinder which tends to break it, and the force of cohesion of the parts which *resists* the fracture. See COHESION.

If the base of the cylinder be encreased, without encreasing its length; it is evident the *resistence* will be encreased in the same ratio as the base: but the weight also encreases in the same ratio; whence it is evident that all cylinders of the same matter and length, whatever their bases be, have an equal *resistence*, when vertically suspended.

If the length of the cylinder be encreased without increasing the base, it's weight is increased without increasing it's *resistence*; consequently the lengthening it weakens it—To find the greatest length a cylinder of any matter may have without breaking, there needs nothing but to take any cylinder of the same matter, and fasten it to the greatest weight it will sustain before it break; and then see how much it must be lengthened by the addition of it's weight, till it equals it's former weight with the addition of a foreign weight—By this means Galileo found a copper-wire, and of consequence any other cylinder of copper, might be extended to 4801 braccio's, or fathoms of six foot each.

If one end of the cylinder were fixed horizontally into a wall, and the rest suspended thence, it's weight and *resistence* would then act in a different manner; and if it broke by the action of it's weight, the rupture would be at the end fixed into the wall. A circle or plane contiguous to the wall, and parallel to the base, and consequently vertical, would be detached from the contiguous circle within the plane of the wall, and would descend. All the motion is performed on the lowest extremity of the diameter, which remains immovable, while the upper extremity describes a quadrant of a circle, and till the circle which before was vertical become horizontal; *i. e.* till the cylinder be entirely broken.

In this fracture of the cylinder it is visible two forces have acted, and the one has overcome the other: the weight of the cylinder, which arose from it's whole mass, has overcome the *resistence* which arose from the largeness of the base; and as the centres of gravity are points wherein all the forces arising from the weights of the several parts of the same bodies, are conceived to be united, one may conceive the weight of the whole cylinder applied in the centre of gravity of it's mass, *i. e.* in a point in the middle of it's axis; and the *resistence* of the cylinder applied in the centre of gravity of it's base, *i. e.* in the centre of the base: it being the base which *resists* the fracture.

When the cylinder breaks by it's own weight, all the motion is on an immoveable extremity of a diameter of the base—This extremity, therefore is the fixed point of a lever, whose two arms are the radius of the base, and half the axis; and of consequence the two opposite forces do not only act of themselves, and by their absolute force, but also by the relative force they derive from their distance with regard to the fixed point of the lever.

Hence it evidently follows, that a cylinder, *e. gr.* of copper, which, vertically suspended, will not break by it's own weight if less than 480 fathom long, will break with a less length in a horizontal situation; in regard the length in this latter case contributes two ways to the fracture; both as it makes it of such a weight, and as it is an arm of a lever to which the weight is applied—Hence, also, the smaller the base is, the less length or weight will suffice to break it; both because the *resistence* is really less, and because it acts by a less arm of a lever.

If two cylinders of the same matter, having their bases and lengths in the same proportion, be suspended horizontally; it is evident that the greater has more weight than the lesser, both on account of it's length, and of it's base. But it has less *resistence* on account of it's length, considered as a longer arm of a lever, and has only more *resistence* on account of it's base—Therefore it exceeds the lesser in it's bulk and weight, more than in *resistence*; and consequently must break more easily.

Hence, we see why upon making models and machines in small, people are apt to be mistaken as to the *resistence* and strength of certain horizontal pieces, when they come to execute their designs in large; by observing the same proportion as in the small—Galileo's doctrine of *resistence* therefore is no idle speculation, but becomes applicable in architecture and other arts.

The weight required to break a body placed horizontally, being always less than that required to break it in a vertical situation; and this weight being to be greater or less according to the ratio of the two arms of the lever: the whole theory is always reducible to this; *viz.* to find what part of the absolute weight the relative weight is to be, supposing the figure of the body known, which indeed is necessary, because it

is

is the figure that determines the two centres of gravity, or the two arms of the lever—For if the body, *e. gr.* were a cone, its centre of gravity would not be in the middle of its axis, as in the cylinder; and if it were a semi-parabolical solid, neither its centre of gravity would be in the middle of its length or axis, nor the centre of gravity of its base in the middle of the axis of its base. But still, wheresoever these centres fall in the several figures, it is these that regulate the two arms of the lever.

It may be here observed, that if the base whereby the body is fastened into the wall be not circular, but, *e. gr.* parabolical, and the vertex of the parabola a-top, the motion of the fracture will not be on an immoveable point, but on a whole immoveable line; which may be called the *axis of equilibrium*: and it is with regard to this, that the distances of the centres of gravity are to be determined.

Now, a body horizontally suspended, being supposed such, as that the smallest addition of weight would break it; there is an equilibrium between its positive and relative weight; and of consequence those two opposite powers are to each other reciprocally as the arms of the lever to which they are applied—On the other hand, the *resistance* of a body is always equal to the greatest weight which it will sustain in a vertical situation, without breaking, *i. e.* is equal to its absolute weight. Therefore, substituting the absolute weight for the *resistance*, it appears that the absolute weight, of a body suspended horizontally, is to its relative weight, as the distance of its centre of gravity from the axis of equilibrium, is to the distance of the centre of gravity of its base from the same axis.

The discovery of this important truth, at least of an equivalent hereto, and to which this is reducible, we owe to Galileo—From this fundamental proposition are easily deduced several consequences—As, for instance, that if the distance of the centre of gravity of the base from the axis of equilibrium, be half the distance of the centre of gravity of the body; the relative weight will only be half the absolute weight: and that a cylinder of copper horizontally suspended, whose length is double the diameter, will break, provided it weigh half what a cylinder of the same base, 4801 fathoms long, weighs. See **WEIGHT**.

On this system of *resistance* of Galileo, M. Mariotte made a very subtle remark, which gave birth to a new system—Galileo supposes that where the body breaks, all the fibres break at once; so that the body always *resists* with its whole absolute force; *i. e.* with the whole force all its fibres have in the place where it is to be broke—But M. Mariotte finding that all bodies, even glass itself, bends before it breaks, shews that fibres are to be considered as so many little bent springs, which never exert their whole force till stretched to a certain point; and never break till entirely unbent. Hence, those nearest the axis of equilibrium which is an immoveable line, are stretched less than those farther off; and of consequence employ a less part of their force.

This consideration only takes place in the horizontal situation of the body: in the vertical, the fibres of the base all break at once; so that the absolute weight of the body must exceed the united *resistance* of all its fibres: a greater weight is therefore required here, than in the horizontal situation; *i. e.* a greater weight is required to overcome their united *resistance*, than to overcome their several *resistances* one after another—The difference between the two situations arises hence, that in the horizontal there is an immoveable point or line, a centre of motion, which is not in the vertical.

M. Varignon has improved on the System of M. Mariotte, and shewn that to Galileo's system, it adds the consideration of the centre of percussion—The comparison of the centres of gravity, with the centres of percussion, afford a fine view; and set the whole doctrine in the most agreeable light. See **CENTER**.

In each system, the base whereby the body breaks, moves on the axis of equilibrium, which is an immoveable line in the same base; but in the second, the fibres of this base are continually stretching more and more; and that in the same ratio as they recede farther and farther from the axis of equilibrium, and of consequence are still exerting a greater and great part of their whole force.

These unequal extensions, like all other forces, must have some common centre where they all meet; and with regard to which they make equal efforts on each side: and as they are precisely in the same proportion as the velocities which the several points of a rod moved circularly would have to one another; the centre of extension of the base whereby the body breaks, or tends to break, must be the same with its centre of percussion—Galileo's hypothesis, where fibres stretch equally, and break all at once, corresponds to the case of a rod moving parallel to itself; where the centre of extension or percussion does not appear, as being confounded with the centre of gravity.

The base of fracture being a surface whose particular nature determines its centre of percussion; it is necessary to be first known to find on what point of the verticle axis of that base

it is placed; and how far it is from the axis of equilibrium—Indeed, we know, in the general, that it always acts with so much more advantage as it is farther from it, in regard it acts by a longer arm of a lever; and of consequence it is the unequal *resistance* of the fibres in M. Mariotte's hypothesis, which produces the centre of percussion; but this unequal *resistance* is greater or less according as the centre of percussion is placed more or less high on the vertical axis of the base, in the different surfaces of the base of the fracture.

To express this unequal *resistance*, accompanied with all the variations it is capable of, regard must be had to the ratio between the distance of the centre of percussion from the axis of equilibrium, and the length of the vertical axis of the base—In which ratio, the first term, or the numerator, is always less than the second or the denominator: so that the ratio is always a fraction less than unity; and the unequal *resistance* of the fibres in M. Mariotte's hypothesis is so much the greater, or which amounts to the same, approaches so much nearer to the equal *resistance* in Galileo's hypothesis, as the two terms of the ratio are nearer to an equality.

Hence it follows, that the *resistance* of bodies, in M. Mariotte's system, is to that in Galileo's, as the least of the terms in the ratio, is to the greatest—Hence, also, the *resistance* being less than what Galileo imagined, the relative weight must also be less; so that the proportion already mentioned between the absolute and relative weight, cannot subsist in the new system, without an augmentation of the relative weight, or a diminution of the absolute weight: which diminution is had by multiplying the weight by the ratio, which is always less than unity. This done, we find that the absolute weight multiplied by the ratio, is to the relative weight, as the distance of the centre of gravity of the body from the axis of equilibrium, is to the distance of the centre of gravity of the base of fracture, from the same axis. Which is precisely the same thing with the general formula given by M. Varignon, for the system of M. Mariotte. In effect, after conceiving the relative weight of a body, and its *resistance* equal to its absolute weight, as two contrary powers applied to the two arms of a lever, in the hypothesis of Galileo; there needs nothing to convert it into that of M. Mariotte, but to imagine that the *resistance*, or the absolute weight is become less, every thing else remaining the same.

We have here only considered bodies as to be broke by their own weight—It will amount to the same, if we suppose them void of weight themselves, and to be broken by a weight applied to their extremities: only it is to be observed, that a foreign weight acts by an arm of a lever equal to the whole length of a body; whereas their own weight being all united in their centre of gravity, is only the distance of that centre from the axis of equilibrium.

One of the most curious, and perhaps the most useful questions in this research, is to find what figure a body must have, that its *resistance* may be equal in all its parts; whether it be conceived as loaded with a foreign weight; or as only sustaining its own weight—We shall, here, only consider the latter case, from which the former will be easily determined.

For a body, then, suspended horizontally, to resist equally in all its parts; it is necessary some part of it being conceived as cut off in a plane parallel to the base of fracture of the body, the weight of the part retrenched be to its *resistance*, in the same ratio, as the weight of the whole to its *resistance*; these four powers acting by arms of levers peculiar to themselves—Now the weight of any body thus conceived, is its whole weight multiplied by the distance of the centre of gravity of the body, from the axis of equilibrium; and the *resistance* is the plane of the base of fracture multiplied by the distance of the centre of gravity of the base from the same axis: consequently these four quantities are to be proportional in the whole, and in each part of a solid of equal *resistance*.

From this proportion M. Varignon easily deduces two solids, which shall *resist* equally in all their parts. Galileo had found one before: that discovered by M. Varignon, is in form of a trumpet, and is to be fixed into the wall at its greater end; so that its bigness and weight is always diminished in proportion as its length, or the arm of the lever whereby its weight acts, increases. It is added, (which seems very remarkable) that howsoever different the two systems may be, the solids of equal *resistance* are the same in both.

For the **RESISTANCE** of a solid supported at each extreme; as, of a beam between two walls. See **BEAM**.

**RESISTANCE** of fluids, in hydrostatics, is the force wherewith bodies moving in fluid mediums, are impeded and retarded in their motions. See **FLUID** and **MEDIUM**.

**Laws** of **RESISTANCE** of the fluid mediums—A body moving in a fluid, is resisted from two causes; the first, the cohesion of the parts of the fluid—For a body in its motion

separating the parts of a liquid, must overcome the force with which those parts cohere. See *COHESION*.

The second is the inertia, or inactivity of matter, whereby a certain force is required to move the particles from their places, in order to let the body pass. See *VIS INERTIÆ*.

The retardation from the first cause, is always the same in the same space, the same body remaining; be the velocity what it will—Hence, the resistance encreases, as the space run through; in which ratio the velocity also encreases; therefore the *resistance* is as the velocity itself. See *VELOCITY*. The *resistance* from the second cause, when the same body moves through different fluids, with the same velocity, follows the proportion of the matter to be removed in the same time; which is as the density of the fluid. See *DENSITY*.

When the same body moves through the same fluid with different velocities, this *resistance* increases in proportion to the number of particles struck in an equal time; which number is as the space run through in that time, that is, as the velocity. But farther, it increases in proportion to the force with which the body strikes against every part; which force is also as the velocity of the body. And therefore if the velocity be triple, the *resistance* is triple, from a triple number of parts to be removed—It is also triple from a stroke three times stronger against every particle; therefore the whole *resistance* is ninefold, that is, as the square of the velocity. Hence a body moved in a fluid, is *resisted* partly in a ratio of the velocity, and partly in a duplicate ratio of it.

The *resistance* from the cohesion of parts in fluids, except glutinous ones, is not very sensible, in respect of the other *resistance*, which increases in the ratio of the squares of the velocities, but the first in the ratio of the velocity itself. By how much the velocity increases, by so much more do these *resistances* differ; wherefore in swifter motions the *resistance* alone is to be considered, which is as the square of the velocity.

If a fluid be included in a vessel of a prismatic figure, and there be moved along in it, with equal velocity and in a direction parallel to the sides of the prism, two bodies, the one spherical, the other cylindric; so that the diameter of the base of the latter be equal to the diameter of the sphere; and the cylinder be moved in the direction of its axis; these bodies will suffer the same *resistance*.

To demonstrate this, suppose the bodies at rest, and that the fluid moves in the vessel, with the same velocity that the bodies had: by this, the relative motion of the bodies, and the fluid is not changed: consequently the actions of the bodies on the fluid, and of the fluid on the bodies, are not changed—The retardation which the liquor suffers in passing by the body, arises only from this, that in that place it is reduced to a narrower space; but the capacity of the vessel is equally diminished by each body; therefore each body produces an equal retardation. And because action and re-action are equal to one another, the fluid acts equally upon each body; wherefore also each body will be equally retarded, when the bodies are moved, and the fluid is at rest.

*Resistance* and retardation are used indifferently for each other, as being both in the same proportion; and the same *resistance* always generating the same retardation—But with regard to different bodies, the same *resistance* frequently generates different retardations; the *resistance* being the quantity of motion, and the retardation the celerity—For the difference and measure of the two, See *RETARDATION*.

The retardations from this *resistance* may be compared together, by comparing the *resistance* with the gravity—It is demonstrated, that the *resistance* of a cylinder, which moves in the direction of its axis (to which the *resistance* of a sphere of the same diameter is equal) is equal to the weight of a cylinder of that fluid through which the body moves, having its base equal to the body's base, and its height equal to half the height from which the body falling in vacuo, may acquire the velocity with which the cylinder moves through the fluid.

From the given celerity of the body moved, the height of the fluid cylinder is found, as also the weight of it, from the known specific gravity of the liquid, and diameter of the body—Let a ball, for instance, of three inches diameter be moved in water with a celerity wherewith it would go sixteen foot in a second: from experiments on falling bodies, and others made on pendulums, it has been found that this is the celerity which a body acquires in falling from a height of four foot; therefore the weight of a cylinder of water, of three inches diameter, and two foot high, that is, a weight of about six pound and three ounces, is equal to the *resistance* of the aforesaid ball. See *DESCENT*.

Let the *resistance* so discovered be divided by the weight of the body, which determines its quantity of matter, and you will have the retardation.

*RESISTENCE of fluid mediums to the motion of pendulums*—The arch described by a pendulum oscillating in vacuo, with the celerity it has acquired in descending, is equal to the

arch described by the descent; but the same does not happen in a fluid, and there is a greater difference between those arches, the greater the *resistance* is; that is, the greater the arch is which is described in the descent.

Let the *resistance* of the fluid be in proportion to the velocity; and let two pendulums, entirely alike, oscillating in a cycloid, perform unequal vibrations, and begin to fall the same moment; they here begin to move by forces that are as the arches to be described. If these impressions alone, which are made the first moment be considered; after a given time the celerities will be in the same ratio, as at the beginning; for the retardations, which are as the velocities themselves, cannot change their proportions, the ratio between quantities not being changed by the addition and subtraction of quantities in the same ratio. Therefore in equal times, however the celerities of bodies are changed in their motion by the *resistance*, the spaces gone through are as the forces in the beginning; that is, as the arches to be described by the descent: therefore, after any times, the bodies are in the correspondent point of those arches. But in these points the forces generated are in the same ratio as in the beginning, and the proportion of the celerities, which is not varied by the *resistance*, suffers no change from the gravity. In the ascent, gravity retards the motion of the body; but in correspondent points, its actions are in the same ratio as in descents. And therefore every where in correspondent points, the celerities are in the same ratio. But as in the same moments the bodies are in their correspondent points, it follows that the motion of both is destroyed in the same moment, that is, they finish their vibrations in the same time. The spaces run through in the time of one vibration, are as the forces by which they are run through; that is, the arches of whole vibration are as the arches described by the descent, the doubles whereof are the arches to be described in vacuo. The deficiencies of the arches to be described in fluids, from the arches to be described in vacuo, are the differences of quantities in the same ratio, and are as the arches described in the descent. See *PENDULUM*.

*RESISTENCE of fluid mediums to the motion of falling bodies.*

—The *resistances* are as the squares of the celerities, and therefore every where in correspondent points, as the squares of the arches described by the descent; in which ratio also, the retardations are: but as each of them retain the same proportion in corresponding points, the sums of them all will be in the same proportion; that is, the whole retardations, which are the defects of the arches described in the fluid, from the arches to be described in vacuo, or which is the same, the difference between the arches described in the descent, and the next ascent. Therefore these differences, if the vibrations are not very unequal, are nearly as the squares of the arches described by the descent: which is also confirmed by experiments in greater vibrations; for in these the proportion of *resistance*, here considered, obtains.

A body freely descending in a fluid is accelerated by the respective gravity of the body, which continually acts upon it, yet not equally, as in a vacuum: the *resistance* of the fluid occasions a retardation, that is, a diminution of acceleration, which diminution increases with the velocity of the body. Now there is a certain velocity, which is the greatest a body can acquire by falling; for if its velocity be such that the *resistance* arising from it becomes equal to the respective weight of the body, its motion can be no longer accelerated; for the motion here continually generated by the respective gravity, will be destroyed by the *resistance*, and the body forced to go on equably. A body continually comes nearer and nearer to this greatest celerity, but can never attain to it.

When the densities of a fluid body are given, the respective weight of the body may be known; and by knowing the diameter of the body, it may be found from what height a body falling in vacuo, can acquire such a velocity, as that the *resistance* in a fluid shall be equal to that respective weight, which will be that greatest velocity above mentioned—If the body be a sphere, it is known that a sphere is equal to a cylinder of the same diameter, whose height is two third parts of that diameter; which height is to be increased in the ratio wherein the respective weight of the body exceeds the weight of the fluid, in order to have the height of a cylinder of the fluid, whose weight is equal to the respective weight of the body; but if you double this height, you will have a height from which a body falling in vacuo, acquires such a velocity as generates a *resistance* equal to this respective weight, and which therefore is the greatest velocity which a body can acquire by falling in a fluid from an infinite height. Lead is eleven times heavier than water, wherefore its respective weight is to the weight of water as ten to one; therefore a leaden ball, as it appears from what has been said, cannot require a greater velocity in falling in water, than it would acquire in falling in vacuo, from an height of  $13\frac{1}{3}$  of its diameters.

A body lighter than a fluid, and ascending in it by the action of the fluid, is moved exactly by the same laws as

an heavier body falling in the fluid. Wherever you place the body, it is sustained by the fluid, and carried up with a force equal to the difference of the weight of a quantity of the fluid of the same bulk as the body, from the weight of the body. Therefore you have a force that continually acts equably upon the body; by which not only the action of gravity of the body is destroyed, so as that it is not to be considered in this case, but the body is also carried upwards by a motion equably accelerated; in the same manner as a body heavier than a fluid descends by it's respective gravity; but the equability of the acceleration is destroyed in the same manner by the *resistance*, in the ascent of a body lighter than the fluid, as it is destroyed in the descent of a body heavier.

When a body specifically heavier than a fluid is thrown up in it, it is retarded upon a double account; on account of the gravity of the body, and on account of the *resistance* of the fluid: consequently, a body rises to a less height than it would rise to in a vacuo with the same celerity. But the defects of the height in a fluid from the height to which a body would rise in vacuo with the same celerity, have a greater proportion to each other than the heights themselves; and in less heights the defects are nearly as the squares of the heights in vacuo.

**RESISTENCE of the air**, in pneumatics, is the force wherewith the motion of bodies, particularly projectiles, is retarded by the opposition of the air or atmosphere. See AIR and PROJECTILE.

The air being a fluid, the general laws of the *resistance* of fluids obtain therein; only the different degrees of density in the different stages or regions of the atmosphere, occasion some irregularity. See ATMOSPHERE.

**Different RESISTENCE of the same medium to bodies of different figures**—Sir Isaac Newton shews, that if a globe and a cylinder of equal diameters, be moved with equal velocity in a thin medium, consisting of equal particles, disposed at equal distances, according to the direction of the axis of the cylinder; the *resistance* of the globe will be less by half than that of the cylinder.

**Solid of the least RESISTENCE**—From the last proposition the same author deduces the figure of a solid, which shall have the *least resistance* of any containing the same quantity of matter and surface. See SOLID.

The figure is this—Suppose DNFG (*Tab. Mechanics*, fig. 57.) to be such a curve, as, that if from any point N, be let fall a perpendicular NM, to the axis AB; and from a given point G, be drawn a right line GR, parallel to a tangent to the figure in N, and cut the axis when continued in R: MN be to GR as GR cub. to 4 BR  $\times$  GBq: a solid described by the evolution of this figure about it's axis AB, moving in a medium from A towards B, is less *resisted* than any other circular solid of the same area, &c. *Newt. Princ.* p. 300.

**RESISTENCE of a globe**, perfectly hard and in a medium, whose particles are so too; is to the force wherewith the whole motion may either be destroyed or generated which it has at the time, when it has described four thirds of it's diameter; as the density of the medium, to the density of the globe—Hence also, infers Sir Isaac Newton that the *resistance* of a globe, is cæteris paribus, in a duplicate ratio of it's velocity. Or it's *resistance* is cæteris paribus, in a duplicate ratio of it's diameter. Or, cæteris paribus, as the density of the medium. Lastly, that the actual *resistance* of a globe is in a ratio compounded of the duplicate ratio of the velocity, and of the duplicate ratio of the diameter, and of the ratio of the density of the medium.

In these articles, the medium is supposed to be discontinuous, as air probably is; if the medium be continuous, as water, mercury, &c. where the globe does not strike immediately on all the particles of the fluid generating the *resistance*, but only on those next it, and those again on others, &c. the *resistance* will be less by half. And a globe in such a medium undergoes a *resistance* which is to the force wherewith the whole motion it has after describing eight thirds of it's diameter, might be generated or taken away, as the density of the medium to the density of the globe.

**RESISTENCE of a cylinder** moving in the direction of it's axis, is not altered by any augmentation or diminution of it's length, and therefore is the same with that of a circle of the same diameter moving with the same velocity in a right line perpendicular to it's plane.

The *resistance* of a cylinder moving in an infinite unelastic fluid, arising from the magnitude of a transverse section, is to the force wherewith it's whole motion while it describes four times it's length may be taken away or generated, as the density of the medium to that of the cylinder, very nearly.

Hence, the *resistances* of cylinders moving length-wise, in infinitely continued mediums, are in a ratio compounded of the duplicate ratio of their diameters, the duplicate ratio of their velocities, and the ratio of the density of the mediums.

The *resistance* of a globe in an infinite unelastic medium is to

the force whereby it's whole motion while it describes eight thirds of it's diameter, might be either generated or taken away, as the density of the fluid, to the density of the globe, quam proximè.

Mr James Bernoulli demonstrates the following theorems.

**RESISTENCE of a triangle**—If an isosceles triangle be moved in a fluid according to the direction of a line perpendicular to it's base; first, with the vertex foremost, and then with it's base; the *resistances* will be as the legs, and as the square of the base, and as the sum of the legs.

**The RESISTENCE of a square** moved according to the direction of it's side, and of it's diagonal, is as the diagonal to the side.

**The RESISTENCE of a circular segment**, less than a semicircle carried in a direction perpendicular to it's basis, when it goes with the base foremost, and when with it's vertex foremost, (the same direction and celerity continuing;) is as the square of the diameter, to the same, less  $\frac{1}{2}$  of the square of the base of the segment.—Hence the *resistances* of a semicircle, when it's base and when it's vertex go foremost, are to one another in a sesquialterate ratio.

**RESISTENCE of a parabola**—A parabola moving in the direction of it's axis, first with it's basis, and then it's vertex foremost, has it's *resistances* as the tangent to an arch of a circle, whose diameter is equal to the parameter, and the tangent equal to half the basis of the parabola.

The *resistance*, if the vertex go foremost, may be thus computed—Say, as the sum (or difference) of the transverse axis, and latus rectum, is to the transverse axis; so is the square of the latus rectum to the square of the diameter of a certain circle, in which circle apply a tangent equal to half the basis of the hyperbola or ellipsis—Then say again, as the sum (and difference) of the axis and parameter, is to the parameter; so is the aforesaid tangent to another right line. And farther, as the sum (or difference) of the axis and parameter, is to the axis; so is the circular arch corresponding to the aforesaid tangent, to another arch. This done, the *resistances* will be as the tangent to the sum (or difference) of the right line thus found, and the arch last mentioned.

In the general, the *resistances* of any figure whatever, going now with it's base foremost, and then with it's vertex, are as the figures of the base to the sum of all the cubes of the element of the base, divided by the squares of the element of the curve line.

All which rules may be of use in the construction of ships, and in perfecting the art of navigation universally: as also for determining the figures of the balls of pendulums for clocks, &c. See SHIP, NAVIGATION, PENDULUM, &c.

**RESOLUTION, RESOLUTIO, or SOLUTIO**, in physics, the reduction of a body into it's original, or natural state, by a dissolution, or separation of it's aggregated parts. See DISSOLUTION.

Thus, snow and ice are said to be *resolved* into water; a compound is *resolved* into it's ingredients, &c. See THAWING, DECOMPOSITION, &c.—Water *resolves* into vapour by heat; and vapour is again *resolved* into water by cold. See VAPOUR, HEAT, &c.

Some of the modern philosophers, particularly Mr Boyle, M. Mariotte, Boerhaave, &c. maintain that the natural state of water is to be congealed, or in ice; inasmuch as a certain degree of heat, which is a foreign and violent agent, is required to make it fluid: so that near the pole, where this foreign force is wanting, it constantly retains it's fixed or icy-state. See WATER—On this principle, the *resolution* of ice into water, must be an improper expression. See FREEZING.

**RESOLUTION**, in chemistry, is the reduction of a mass or mixed body into it's component parts, or first principles; by a proper analysis. See PRINCIPLE, ANALYSIS, &c.

The *resolution* of bodies is performed variously; by distillation, sublimation, dissolution, fermentation, &c. See each operation under it's proper article, DISTILLATION, &c.

**RESOLUTION**, in logic, is a branch of method, called also *analysis*. See METHOD and ANALYSIS.

The business of *resolution* is to investigate, or examine the truth, or falshood of a proposition by ascending from some particular known truth, as a principle, by a chain of consequences, to another more general one in question. See PROPOSITION, TRUTH, &c.

*Resolution*, or the analytic method, stands in direct opposition to *composition*, or the synthetic method; in which last we descend from some general known truths to a particular one, in question. See COMPOSITION.

For an instance of the method of *resolution*—Suppose the question this: whether on the supposition of man's existence, we can prove that God exists?

To *resolve* this, our method is thus—"Mankind did not always exist. It is evident from a thousand considerations, the species had a beginning; and that according to all history, not 6000 years ago; but if it had a beginning; there must be some cause of it's beginning; something to induce

"duce it to exist then more than it did before; in effect there must be a cause or author of it's existence, for from nothing, nothing arises: this cause, whatever it is, must at least have all the faculties we find in ourselves; for none can give more than he has: nay, he must have others which we have not, since he could do what we cannot do, *i. e.* create, make man exist, &c.—Now, this cause either exists still, or has ceased to do so: if the former, he did not exist from eternity; for what is from eternity is necessary, and can neither by itself nor any other cause be reduced to nothing: if the latter, it must have been produced from some other; and then the same question will return upon the producer—There is then some first cause; and this cause has all the properties and faculties we have; nay more, existed from eternity, &c. Therefore, from the supposition of man's existence, it follows there is a God, &c.

**RESOLUTION, or SOLUTION**, in mathematics, is an orderly enumeration of the several things to be done, to obtain what is required in a problem. See **PROBLEM**.

Wollius makes a problem to consist of three parts—The *proposition* (which is what we properly call the *problem*) the *resolution*, and the *demonstration*. See **PROPOSITION**, &c.

The general tenor of all problems is, those things being done which are enjoined by the *resolution*; the thing is done which was to be done.

As soon as a problem is demonstrated, it is converted into a theorem; whereof the *resolution* is the hypothesis; and the proposition the thesis. See **THEOREM**, **THESIS**, &c.

The process of a mathematical *resolution*, see in the following article.

**RESOLUTION**, in algebra, or algebraical, is of two kinds; the one practised in numerical problems, the other in geometrical ones. See **ALGEBRA**.

To *resolve a given numerical problem algebraically*, the method is thus: 1<sup>o</sup>. distinguish the given quantities from the quantities sought; and note the former with the first letters of the alphabet, and the latter with the last. See **QUANTITY** and **CHARACTER**.

2<sup>o</sup>. Find as many equations as there are unknown quantities: if that cannot be, the problem is indeterminate; and one or more of the sought quantities may be assumed at pleasure—The equations, unless they be contained in the problem itself, are found by theorems relating to the equality of quantities. See **EQUATION** and **EQUALITY**.

3<sup>o</sup>. Since, in an equation, the unknown quantities are mixed with the known; it must be reduced, in such manner as that only one unknown quantity be found on one side, and none but known quantities on the other—This reduction is performed by adding the subtracted quantities, dividing the multiplied quantities, and multiplying the divided ones, extracting the roots out of powers, raising roots to their powers, &c. so as that the equality may be still preserved. See **REDUCTION**.

To *RESOLVE a geometrical problem algebraically*—The process in the former article is to be observed throughout; but as it rarely happens we come at an equation in geometrical problems by the same means as in numerical ones; there are some farther things to be noted: first then, suppose the thing done which was proposed to be done—2<sup>o</sup>. Examine the relations of all the lines in the diagram, without any regard to known or unknown; in order to find which depend on which; and from which being had, what others are had, whether by similar triangles, or rectangles, &c.—3<sup>o</sup>. To obtain the similar triangles or rectangles, the lines are to be frequently produced, till they become either directly or indirectly equal to given ones, or intersect others, &c. Parallels and perpendiculars to be frequently drawn: points to be frequently connected; and angles to be made equal to others.

If thus you do not arrive at a neat equation; examine the relations of the lines in another manner—Sometimes it is not enough to seek the thing directly, but another thing must be sought, whence the first may be found.

The equation being produced, the geometrical construction is to be deduced therefrom, which is done in various manners, in the various kinds of equations. See **CONSTRUCTION of equations**.

**Problematical RESOLUTION**. See **PROBLEMATICAL**.

**RESOLUTION**, in medicine, that coction, or alteration of the crude, peccant matter of any disease, either by the natural strength of the patient, or of it's own accord, or by the application of remedies; whereby it's bulk, figure, cohesion, &c. are so far changed, as that it ceases to be morbid, and becomes laudable. See **COCTION**, **DISEASE**, &c.

This, the learned Boerhaave observes, is of all others the most perfect cure, where it is effected without any evacuation; as supposing the matter favourable, the constitution excellent, and the medicines good. See **CRISIS**, &c.

**RESOLUTION**, in music, is when a canon or perpetual fugue is not wrote all on the same line, or in one part; but all the voices that are to follow the guida, or first voice, are wrote separately, either in score, *i. e.* in separate lines, or separate

parts, with the pauses each is to observe, in the beginning, and in the tone proper to each.

**RESONANCE, RESOUNDING**, in music, &c. a sound returned by the air inclosed in the bodies of string-musical-instruments as lutes, &c. or even in the bodies of wind-instruments, as flutes, &c. See **SOUND**, **MUSIC**, **INSTRUMENT**, &c.

Elliptic, and parabolic vaults, *resound* strongly, *i. e.* reflect or return the sound. See **ECHO**.

The mouth, and the parts thereof, as the palate, tongue, teeth, nose, and lips, Monf. Dodart observes, contribute nothing to the tone of the voice; but their effect is very great as to the *resonance*. See **VOICE**.

Of this we have a very sensible instance in that vulgar instrument called the *Jous-bourp*, or *trempe de Beurn*: for, if you hold it in your hand, and strike the tongue or spring thereof, which yields all the sound of the instrument, it scarce makes any noise at all. But, holding the body of the instrument between the teeth, and striking the spring as before, it makes a musical buzz, which is heard to a good distance, and especially the lower notes.

So also in the haut-boys, the tone of the reed is always the same; being a sort of drone: the chief variety is in the tone of the *resonance*, produced in the mouth by the greater or less aperture, and the divers motions of the lips. See **HAUT-BOY**.

**RESOLVENTS, RESOLVENTIA**, in medicine, remedies proper to resolve and dissipate tumours and gatherings, to soften indurations, and by their tenuity and warmth, evacuate redundant or peccant humours through the pores. See **RESOLUTION**.

Under this class come various unguents, emplasters, &c. See **DISCUTIENT**.

**RESORT**. See the article **RESSORT**.

**RESPECTU computi vicecomitis habendo**, a writ for the respiting a sheriff's account, upon just occasion, directed to the treasurer and barons of the exchequer. See **SHERIFF**.

**RESPECTUANDO homagio**. See **HOMAGIO**.

**RESPIRATION, RESPIRATIO**, the act of *respiring*, or breathing the air. See **AIR**.

*Respiration* is an involuntary motion of the breast, whereby the air is alternately taken in and thrown out: it therefore includes two contrary motions; the one called *inspiration*, whereby the fluid is received into the cavity of the lungs—The other, *expiration*, whereby it is again expelled. See **INSPIRATION** and **EXPIRATION**.

The principal organs of *respiration* are the lungs, trachea, larynx, &c. the descriptions whereof see under their proper articles, **LUNGS**, **TRACHEA**, **LARYNX**, &c.

For the manner wherein *RESPIRATION* is performed—It is to be observed, that the lungs, when suspended in the open air, by the contractive power of the muscular fibres which tie together the squamous parts of the bronchia, are reduced to less space than they possessed while in the cavity of the thorax: and when thus contracted, if a quantity of new air be injected through the glottis, they again become distended, so as to possess an equal, nay a greater space than that assigned them in the thorax. See **MUSCLE**.

Hence it appears, that the lungs, by their proper force, are always endeavouring to contract themselves into less compass than they possess when inclosed in the thorax; and that therefore they are always in a state of violent dilatation while the man lives—For the air that encompasses them in the thorax, shut up between their external membrane and the pleura, is not of equal density with common air.

In effect, the ingress of the air through the glottis into the lungs, is always free; but that on the outside wherewith they are compressed, is impeded by the diaphragm, so as it cannot enter the thorax in quantity sufficient to make an equilibrium.

Since then, in inspiration, the air enters the lungs in greater quantity than it was before; it will dilate them more, and will overcome their natural force—The lungs therefore are wholly passive in the matter: what it is that acts must be learnt from the phenomena.

1<sup>o</sup>. Then, it is observed, that in inspiration, the nine upper ribs articulated to the vertebrae and the sternum, rise archwise towards the clavicles; and the three lower are turned downwards; and the eighth, ninth, and tenth, are drawn inwards.

2<sup>o</sup>. That the abdomen is dilated; and 3<sup>o</sup>. the thorax enlarged. 4<sup>o</sup>. The diaphragm is brought from it's convex and sinuous position to a flat figure.

Now, as these are the only visible actions in inspiration, the cause of the operation must be referred to them; or rather to the muscles of these parts, which are the intercostals, the subclavian, &c.

The capacity of the thorax being enlarged by the action of these muscles on the ribs, &c. a space is left between the pleura and the surface of the lungs; so that the air entering the glottis, inflates them till such time as they become contiguous to the pleura and diaphragm—In this case, now, the

air

air presses the lungs as much as the thorax resists them. And hence, the lungs become at rest; the blood passes less freely, and is forced in less quantity into the left ventricle of the heart, and so less comes into the cerebellum, and its nerves, and the arterial blood acts less on the intercostal muscles and diaphragm.

The causes, therefore, which at first dilated the thorax, grow weaker; consequently the ribs become depressed, the distended fibres of the muscles of the abdomen restore themselves, the viscera thrust the diaphragm up again into the thorax, the space whereof being thus contracted, the air is drove out of the lungs; and thus is *expiration* performed. Immediately, the blood being quickened in its motion, begins to flow stronger and more plentifully to the cerebellum and muscles; and thus the causes of the contraction of the intercostals and diaphragm, being renewed, inspiration is repeated—Such is the true, immediate, adequate manner of vital *respiration*. See *HEART*.

For the uses and effects of *respiration*, they are greatly disputed among anatomists—The learned Boerhaave takes the principal uses thereof to be the farther preparation of the chyle, it's more accurate mixture with the blood, and it's conversion into a nutritious juice proper to repair the decays of the body. See *NUTRITION*.

Borelli takes the great use of *respiration* to be the admission and mixture of air with the blood, in the lungs, in order to form those elastic globules it consists of; to give it its red florid colour; and to prepare it for many of the uses of the œconomy: but how such admission should be effected is hard to say—It is impossible it should be done in the pulmonary arteries; nor can it be proved in the pulmonary veins—In effect, such a communication must be hindered and obstructed by the air's distending the vesiculæ, and compressing the veins in inspiration; by the slimy humour that lubricates the membrane lining the inside of the trachea.

Add to this, the difficult passage of air through such small pores as will admit water; and the ill effect air ordinarily has when admitted into the blood. See *PORE* and *WATER*.

As to the arguments for such communication, *viz.* the florid colour the blood here first assumes, and the absolute necessity of *respiration* to life; they are both well accounted for otherwise. See *BLOOD*.

Other authors, as Sylvius, Etmuller, &c. take a great use of *respiration* to be, by the neighbourhood of the cold nitrous air, to cool the blood coming reeking hot out of the right ventricle of the heart, through the lungs; and to act as a refrigeratory. See *REFRIGERATORY*.

Mayow, and others, assert one grand use of expiration to be to throw off the fuliginous vapours of the blood along with the expelled air; and for inspiration, he asserts that it conveys a nitro-aerial ferment to the blood, to which the animal spirits and all muscular motion are owing.

But Dr Thurston rejects all these from being principal uses of *respiration*, which he shews to be, to move or pass the blood from the right to the left ventricle of the heart, and so to effect the circulation. See *CIRCULATION*.

Whence it is that persons hanged, drowned, or strangled, so suddenly die, *viz.* because the circulation of the blood is stopped; and for the same reason it is that animals die so speedily in the air-pump. See *DROWNING*, *VACUUM*, &c. He instances an experiment made by Dr Croon, before the royal society, who, by strangling a pullet, so as not the least sign of life appeared; yet by blowing into the lungs through the trachea, and so setting the lungs a playing, he brought the bird to life again—Another experiment of the same kind is that of Dr Hook, who after having a dog, cut away the ribs, diaphragm, and pericardium, as also the top of the wind-pipe, that he might tie it on to the nose of a pair of bellows; and thus by blowing into the lungs he restored the dog to life; and then ceasing to blow, the dog would soon fall into dying fits, but recover again by blowing: and thus alternately as long as he pleased.

This use of *respiration* Dr Drake not only confirms, but carries farther; making it the true cause of the diastole of the heart; which neither Borelli, Dr Lower, nor Mr Cowper had well accounted for. See *DIASTOLE*.

The weight of the incumbent atmosphere, he shews, is the true antagonist to all the muscles, serving both for ordinary inspiration, and the contraction of the heart—As in the elevation of the ribs, that author observes, the blood by the passage opened for it, is in a manner solicited into the lungs; so in the depression thereof by the subsidence of the lungs, and the contraction of the blood vessels consequent thereon, the blood is forcibly driven through the pulmonary vein into the left ventricle of the heart. And this, together with the general compression of the body by the weight of the atmosphere, is that power which causes the blood to mount in the veins, after the force impressed on it by the heart is spent; and which forces the heart itself, from its natural state of contraction, to that of dilatation. See *HEART*.

The reciprocal dilatation and contraction of the superficial dimensions of the body consequent on *respiration*, are so ne-

cessary to animal life, that there is no animal how imperfect soever as to want it.

Though most kinds of fishes and insects want both lungs and moveable ribs, and consequently have no dilatable thorax, yet that want is made up to them by an analogous mechanism. Fishes, for instance, have gills which do the office of lungs, receiving and expelling alternately the water, whereby the blood-vessels suffer the same alteration of dimensions as they do in the lungs of more perfect animals. See *GILLS*. Insects having no thorax, or separate cavity for the heart and lungs or air-vessels, have the latter distributed through the whole trunk of their bodies; by which they communicate with the external air through several spiracles or vent-holes, to which are fastened so many little tracheæ or wind-pipes, which send their branches to all the muscles and viscera, and seem to accompany the blood-vessels all over the body, as they do in the lungs only, of the more perfect animals—By this disposition, in every inspiration, the whole body of these little animals is inflated, and in every expiration compressed; consequently the blood-vessels must suffer a vicissitude of extension and compression. See *INSECT*.

The only animal exempted from this necessity of breathing, is a foetus: but this, while included in the womb, seems to have little more than a vegetative life, and ought scarce to be reckoned among the number of animals: It is rather a graft on, or branch of the mother. See *FOETUS*.

The laws of *RESPIRATION*, are of the last importance to a right understanding of the animal œconomy; for which reason a computation of the force of the *respiring* organs, and of the stress and pressure of the air upon the same, will not be unacceptable—It may therefore be observed, that by blowing into a bladder, a considerable weight will be raised by the mere force of the breath: for with a bladder that is oblong, nearly of a cylindrical figure, and tied at both ends, if a pipe be fixed at one end, and a weight at the other, and the pipe fastened at such a distance from the ground, as just allows the weight to rest upon the ground; the bladder by an easy inspiration will raise seven pound weight, and by the greatest inspiration of a pretty strong man, twenty eight pound weight. Now, the force by which the air enters this pipe, is that force by which it is driven out of the lungs; if therefore the force by which the air enters the pipe can be determined, we shall have the force by which the air is drove into the trachea—But the pressure of air upon the bladder is equal to twice the weight it can raise; because the upper part of the bladder being fixed, it resists the force of the air, just as much as at the weight at the other end. And again, since the air presses every way equally, the whole pressure will be to that part of it which presses on the orifice of the pipe, as the whole surface of the bladder is to the orifice of the pipe; that is, as the surface of a cylinder, whose diameter, for instance, is four inches, and axis seven, is to the orifice of the pipe.

Thus, if the diameter of the pipe be 0.28, and its orifice 0.616; the surface of the cylinder will be 88. Therefore, as 88 : 0.616 :: 14. double the least weight raised, to 0.098. which is almost 2 ounces; and in raising the greatest weight, it is near 7 ounces.

These therefore are the forces by which the air is drove through the trachea, in an easy and strong expiration—Now if we consider the lungs as a bladder, and the larynx as a pipe; the pressure upon the orifice of the trachea, when the air is drove out, will be to the pressure upon the lungs, as the whole surface of the lungs to the orifice of the trachea.

Suppose, *e. gr.* the diameter of the larynx to be 5; the orifice of the larynx will be 0.19. And suppose the two lobes of the lungs to be two bladders, or spheres, whose diameters are each six inches; their surfaces are each 113 inches, and the pressure on the larynx will be to the pressure upon the whole external surface, as 0.19 to 226, which is as 1 to 1189; and therefore if the pressure upon the larynx in an ordinary breathing be two ounces, the pressure upon the whole external surface of the lungs will be 148 pounds; and the utmost force, when the pressure upon the larynx is seven ounces, will be equal to 520 pounds—But the lungs are not like an empty bladder, where the air presses only upon the surface; for they are full of vesicles, upon the surface of each of which the air presses as it would upon the surface of an empty bladder: and therefore to know the whole pressure of the air, we must determine the internal surfaces of the lungs.

To do this, suppose that  $\frac{1}{3}$  part of the lungs is taken up with the branches of the trachea, that another third part the blood-vessels fill, and the remainder is vesicles, where we suppose the chief pressure upon the blood-vessels to be made: now, both lobes of the lungs contain 226 solid inches, of which one third, or 75 inches, are full of vesicles—Let the diameter of each vesicle be  $\frac{1}{16}$  part of an inch, the surface of a vesicle will be .001256, and the solidity 0000043, by which sum if we divide 75 (the space filled by the vesicles) the quotient gives us 17441860 for the number of vesicles

in both lobes of the lungs—This number multiplied by .001256, the surface of a vesicle gives the sum of the surfaces of all the vesicles, to wit, 21906.976 inches. And therefore the pressure upon the larynx will be to the pressure upon the whole surface of the lungs, as 0.19 to 21906.976; and consequently, when in an ordinary expiration the pressure upon the larynx is two ounces, the pressure on the whole internal surfaces of the lungs will be 14412 pound weight; and the utmost force of the air in breathing, when the pressure upon the larynx is seven ounces, will be 50443 pound weight. Though these seem to be prodigious weights, yet it must still be understood, that the pressure upon each part of the surface of the lungs equal to the orifice of the larynx, is not greater than it is at the larynx; and that these vast weights arise from the vast extent of the surfaces of the vesicles upon which it was necessary that the blood should be spread in the smallest capillary vessels, that each globule of blood might, as it were, immediately receive the whole force and energy of the air, and by that be broke into smaller parts fit for secretion and circulation.

And hence we may learn the mechanical reason of the structure of the lungs: for, since the whole blood of the body was to pass through them in order to receive the effect of the air, and that this could not be unless the blood were diffused in small capillary vessels; it was necessary that the surfaces upon which they were to be spread, should be proportioned to their number: which is admirably well provided for by the wonderful fabric of the lungs.

If the gravity of the air was always the same, and if the diameter of the trachea, and the time of every expiration were equal in all; this weight upon the lungs would be always the same. But since we find by the barometer, that there is three inches difference between the greatest and the least gravity of the air, which is a tenth part of its greatest gravity; there must be likewise the difference of a tenth part of its pressure upon the lungs at one time and another: for the momenta of all bodies, moved with the same velocity, are as their gravities. See BAROMETER.

This is a difference which such as are asthmatic must be very sensible of; especially if we consider that they likewise breathe thicker, that is, every expiration is performed in less time; if in half the time, and the same quantity of air be drawn in, then the weight of the air upon the lungs must be 57648 pounds, of which a tenth part is 5764 pounds: and consequently asthmatic people upon the greatest rise or fall of the barometer, feel a difference of the air, equal to above one third of its pressure in ordinary breathing. See ASTHMA, WEATHER, &c.

Again, if the trachea be small, and its aperture narrow, the pressure of the air increases in the same proportion as if the times of expiration were shorter; and therefore a shrill voice is always reckoned amongst the prognostic signs of a consumption, inasmuch as that proceeds from the narrowness of the larynx or trachea; and consequently increases the pressure of the air upon the lungs, which upon every expiration beats the vessels so thin, that at last they break, and a spitting of blood comes on apace. See PHTHISIS.

**RESPITE\***, **RESPECTUS**, in law, &c. a delay, forbearance, or prolongation of time, granted any one for the payment of a debt, or the like.

\* Menage derives the word *respite* from the Latin, *respectus*; as *despite* from *despectus*.—Du Cange will rather have it come from *respirare*, to breathe; *respite* being, in effect, a breathing-while, granted a debtor, &c.

**Letters of RESPITE**, or **CREDIT**, are instruments antiently granted by sovereign princes to honest, but unfortunate debtors, to screen them from their too rigorous creditors. See LETTER.

These still obtain in France.—They were first introduced by pope Urban II. in favour of the Croises, i. e. of persons who went to the holy war. See CROISES.

S. Louis granted three years *respite* to all who made the voyage of the holy land with him.—In the customary of Normandy, *respite* is a judicial delay, or demur, given to procedures.

**RESPITE of homage**, is a forbearance of the homage due from the vassal or tenant holding by homage, or by knight-service to his lord. See HOMAGE, &c.

Antiently those who held by these tenures, paid a small sum every fifth year into the Exchequer, to be *respited* doing their homage or service.

By Stat. 12 Car. II. this *respite* of homage is taken away, as a charge arising from knight-service; which is thereby likewise annulled. See TENURE, &c.

**RESPONDEAT superior**, a law phrase.—Where the sheriffs are removeable, as in London, for insufficiency; *respondeat superior*, that is, the mayor and commonalty are to answer for them. See SHERIFF, &c.

For the insufficiency of a bailiff of a franchise, *respondeat superior*, that is, the lord of the franchise is to answer.

**RESPONDENT**, **RESPONDENS**, in the schools, a

person who maintains a thesis in any art or science. See THESIS.

He is thus called as being to answer all objections proposed by the opponent or impugner, &c. See OPPONENT.

The *respondent's* business is to see whether the opposition made by the contrary party be just and legitimate; or whether some of the laws and conditions of opposition be not broke, which is called *ignoratio elenchi*.—He is also to examine the moods and figures of the syllogisms, to see whether the premises be just, &c. And through the whole to answer rather by distinguish's than by direct negation. See SYLLOGISM, MOOD, FIGURE, DISTINCTION, &c.

**RESPONDENT\***, in law, a person who undertakes to answer for another; or binds himself as security for the good behaviour of another. See SURETY.

\* The word is formed from the Latin, *respondere*, to answer; q. d. *pro alio spondere*, to promise for another.

The *respondent* is to answer for the damages done by the person for whom he *responds*.—There are four ordinances of the kings of France, whereby the citizens are expressly forbid to take servants without *respondents*, bound in writing.

**RESPONSALIS**, in law, he who appears for another in court at a day assigned. See PROCTOR.

Fleta makes this difference between *responsalis attornatus*, and *effonator*: that the *effonator* comes only to alledge the cause of the parties absence, be he demandant or tenant; whereas *responsalis* comes for the tenant, not only to excuse his absence, but to signify what trial he means to undergo, the combat or the country. See ATTORNEY.

**RESPONSARY song**, an anthem in which the choristers sing by turns. See ANTHEM.

**RESPONSE**, **RESPONSAL**, **RESPONSATIO**, an answer, reply, or reparty. See REPLICATION and REPARTY.

The word is chiefly used in speaking of the answers made to the priest, by the people, in the litany, the psalms, and other parts of the office.

It has its use too in speaking of the opinions or answers of the antient juriconsulti; when consulted on points of law. See CIVIL law and JURISCONSULTUS.

The fifty books of the *digest* are composed of *responsa prudentum*, the *responses* of Papinian, Ulpian, Scaevola, &c. collected by Justinian, who afterwards gave them the force of laws. See DIGEST.

The *responses* of the emperors were more properly called *rescripts*. See RESCRIPT.

**RESPONSIONS**, **RESPENSIONES**, a term used in the military orders for certain pensions or charges which the knights, or the commanderies they held, paid to the order. Such a knight-templer paid a *responsion* of fifty pounds *per annum* to his order, on account of such a commandery. See COMMANDERY and CONVENTUAL.—In *Rot. Parl.* 9 Richard II. it is written *responsions*.

**RESSAULT\***, in architecture, the effect of a body which either projects or falls back; i. e. stands either more out or in than another; so as to be out of the line, or range therewith. See RETURN.

\* The term is French; and but little used in English; though the want of a word of equal import, plead for its naturalization.

**RESSORT**, or **RESORT**, a term purely French, yet frequently used by our late writers, to signify the jurisdiction or authority of a court.

The word in its popular meaning signifies *spring*, or the force of elasticity.—Hence it is also used for a jurisdiction, and the extent or district thereof; as when we say such a thing belongs to his *ressort*; a judge out of his *ressort* has no authority. But its chief use among us is in speaking of a court or tribunal, where appeals are judged; or of a court or person who judges finally and ultimately, and whence there is no appeal. See COURT, APPEAL, &c.

The house of lords judge in the last *ressort*, *en dernier ressort*.—Presidials judge in the last *ressort* of all criminals prosecuted by the provosts of the marshals.

**RESSORT**, or **RESORT**, is also used in a writ of avel or coufenage, in the same sense, as *descent* in a writ of right. See DESCENT, AVEL, RIGHT, &c.

**RESSOURCE\***, a term purely French, yet used by English writers, to denote a means or foundation of a man's recovering himself from his fall or ruin; or an after-game for the repairing his damages.

\* Skinner derives the word from the French, *refoudre*, to resolve: a *ressource* strictly and literally, expresses a means which presents itself a-fresh.

This merchant has credit and friends still left; he has great *ressources*.—His last *ressource* was to throw himself into a convent.—The jargon of a distinction, is the ordinary *ressource* of a divine at a pinch.

**REST**, *quies*, in physics, the continuance of a body in the same place: or it's continual application or contiguity to the same parts of the ambient and contiguous bodies. See SPACE. *Rest* is either *absolute* or *relative*; as place is. See PLACE. Some define *rest*, the state of a thing without motion; and hence,

hence, again, *rest* becomes either absolute or relative, as motion is. See MOTION.

Sir Isaac Newton defines true or absolute *rest* to be the continuance of a body in the same part of absolute and immoveable space: and relative *rest* to be the continuance of a body in the same part of relative space.

Thus, in a ship under sail, relative *rest* is the continuance of a body in the same region of the ship, or the same part of its cavity.—True, or absolute *rest* is its continuance in the same part of universal space, wherein the ship with its cavity and contents are all contained.

Hence, if the earth be really and absolutely at *rest*, the body relatively at *rest* in the ship, will really and absolutely move; and that with the velocity wherewith the vessel moves.—But if the earth do likewise move, there will then arise a real and absolute motion of the body at *rest*, partly from the real motion of the earth in absolute space; and partly from the relative motion of the ship on the sea.—Lastly, if the body be likewise relatively moved in the ship, its real motion will arise partly from the real motion of the earth in immoveable space, and partly from the relative motion of the ship on the sea, and of the body in the ship.

Thus, if that part of the earth where the ship is, move eastward with a velocity of 10010 parts; and the vessel be carried by the winds westward 10 parts; and at the same time a seaman aboard walk with a velocity of 1 part: the seaman will be moved really and absolutely in immoveable space eastwards with 10001 parts of velocity; and relatively on the earth, with nine parts of velocity westwards. See EARTH.

It is an axiom in philosophy, that matter is indifferent as to *rest*, or motion. See MATTER.—Hence, Sir Isaac Newton lays it down as a law of nature, that every body perseveres in its state either of *rest* or uniform motion; except so far as it is disturbed by external causes. See NATURE.

The Cartesians will have firmness, hardness, or solidity of bodies to consist in this, that their parts are at *rest*, with regard to each other: and this *rest* they establish as the great nexus, or principle of cohesion, whereby the parts are connected together. See FIRMNESS, HARDNESS, &c.

Fluidity, they add, consists in a perpetual motion of the parts, &c.—But the Newtonian philosophy furnishes us with much better solutions. See SOLIDITY, FLUIDITY, and COHESION.

REST, *repose*, or *pause*, in poetry, is used for the cæsure, which in Alexandrine verses, falls on the sixth syllable; and in verses of ten or eleven syllables, on the fourth. See CÆSURA.

This verse is naught, there wants a *rest* or pause in it.—The *rest* should never fall on a monosyllable, whereon the voice may not dwell: It is called *rest*, because the ear, and the pronunciation have both a repose or respite. See PAUSE.

REST, in music, is a pause or interval of time, during which there is an intermission of the voice or sound. See PAUSE and TIME.

*Rests* are sometimes used in melody, that is in music of a single part, to express some simple passion, or even for variety sake; but more frequently in harmony, or compositions of several parts, for the sake of the pleasure of hearing one part move on while another *rests*; and this interchangeably. See MELODY and HARMONY.

*Rests* are either for a whole bar, or more than a bar, or but for a part of a bar.—When the *rest* is for a part, it is expressed by certain signs corresponding to the quantity of certain notes of time; as minim, crotchet, &c. and is accordingly called *minim-rest*, *crotchet-rest*, &c.

The characters or figures, whereof, see under CHARACTERS of music; where the notes and corresponding *rests* are found together.

When any one of those characters occurs either on a line or space; that part is always silent for the time of a minim, or crotchet, &c.—Sometimes a *rest* is for a crotchet and quaver together; or for other quantities of time, for which there is no particular note: In which case the signs of silence are not many *rests*, but such silence is expressed by placing together as multiplied; of different time, as make up the designed *rest*. When the *rest* is for a whole bar, the semibreve *rest* is always used.—If the *rest* be for two measures, it is marked by a line drawn a-crofs a whole space.—For three measures it is drawn a-crofs a space and a half; and for four measures a-crofs two spaces. But to prevent ambiguity, the number of bars is usually writ over the sign.

Some of the more antient writers in music, make these *rests* of different value in different species of time.—E. gr. The character of a minim-*rest*, in common time, say they, expresses the *rest* of three crotchets in triple time; in that of the triples  $\frac{3}{4}$ ,  $\frac{6}{8}$ ,  $\frac{12}{16}$ , it always marks an half measure, how different soever these may be among themselves.

They add that the *rest* of a crotchet in common time is a *rest* of three quavers in the triple  $\frac{3}{4}$ ; and that the quaver *rest* of common time is equal to three semi-quavers in the triple  $\frac{3}{8}$ . But this variety in the use of the same character is now lay'd aside.

RESTAUR, RESTOR, in antient customs, the remedy or

recourse which assurers have against each other, according to the date of their assurances; or against the masters, if the average arise through their default, as through ill loading, want of caulking, or want of having the vessel tight. See ASSURANCE.

The word is also used for the remedy or recourse a person has against his guarantee or other person, who is to indemnify him from any damage sustained.—Hence *restaurant* and *restauration*.—In the lower Latin they also use the words, *restor* and *restour*.

RESTAURATION, RESTAURATIO, RESTORATION, the act of re-establishing, or settling a thing in its former good estate. See RESTITUTION, REDINTEGRATION, &c.

Thus we say, the *restauration* of a minor to the possession of his effects, alienated in the time of his minority. In the French laws is an antient formula, used for the *restoring* a person to his good name, after he has been wrongfully accused and condemned.

Sour and decayed beer and ale are *restored* various ways.—By a handful of wheat thrown into the vessel, or by salt made of the ashes of barley-straw, put into the vessel and stirred.

Glauber commends three or four handfuls of beech ashes applied in the same manner.—Chalk scraped into it, renders it drinkable immediately. The same effect is produced by calcined oyster-shells, burnt egg-shells, sea-shells, or crab's eyes. See BEER, ALE, BREWING, &c.

In England we say, the RESTAURATION, by way of eminence, for the return of king Charles II. in 1660; after the civil wars.

The 29th of May is an anniversary festival held in commemoration of the *restauration*; the *restauration* of regal, and episcopal government.

RESTAURATION, in architecture the act of repairing all the parts of a building gone to decay, either through the course of time, or other injuries; in such manner, as that it is not only re-established in its first form, but considerably augmented. See REPAIR and REPARATION.

It is evident from the plinths of the corinthian columns of the Pantheon, which are almost wholly under ground, that the pavement of this temple is only a *restauration* made in the time of Septimius Severus. Daviler.

The temple of concord, behind the capitol at Rome, having been burnt long after it was built, and having angular bases different from the rest; seems to have been *restored* from the ruins of several ancient buildings. Id.

RESTAURATION, in sculpture, is the repairing of a mutilated statue, &c. See REPAIRING.

Most of the antique statues have undergone a *restauration*; as the Farnese Hercules, the Faunus in the Villa Borgheze at Rome, the wrestlers, in the gallery of the great duke of Florence; the Venus of Arles in the gallery at Versailles.—But these *restaurations* have all been made by the ablest sculptors. Daviler.

RESTINCTION, RESTINCTIO, in chymistry, the quench of a metal or mineral in some liquor; in order either to correct, or to exalt it, by giving it some new quality, power, &c. See EXTINCTIO, &c.

RESTITUTION, RESTITUTIO, in physics, the returning of elastic bodies forcibly bent, to their natural state: by some called, the *motion of restitution*. See ELASTICITY.

Contraction being the proper and natural action of muscular fibres, some authors ascribe dilatation to a motion of *restitution*; but the expression, as well as the idea, is very faulty. See FIBRE, MUSCULAR, &c. See also HEART, &c.

RESTITUTION, in a moral and legal sense, is the act of restoring a person to his right; or of returning something unjustly taken or detained from him. See RESTAURATION.

*Restitution* is reducible to commutative justice; and till it be made, the casuists determine the party all the while guilty of theft. See JUSTICE, INJURY, &c.

The illegal incumbents of benefices are condemned to a *restitution* of the fruits of the benefices.—In the Romish church usurers, &c. are obliged to a *restitution* of their ill-gotten goods, otherwise the priest has no authority to give them absolution. See USURY.

RESTITUTION in *integrum*, is used for what is otherwise called *rescission*. See RESCISSION.

Religious obtain *restitution* against their vows, i. e. are freed from their obligation, when they protest against them within five years of their profession. See VOW, &c.

In the history of Germany for the XVIIth century, the first day of January 1624, is called the *term of restitution*: because by the peace of Munster, then concluded, the Lutheran and Calvinist princes were obliged to *restitute*, restore what they had taken from the Roman catholic churches in their territories, till that day.

RESTITUTIONS of medals, or RESTITUTED medals, is a phrase used by antiquaries, for such medals as were struck by the

the emperors, to renew or retrieve the memory of their predecessors. See MEDAL.

Hence it is that in several medals we find the letters REST.—Claudius was the first who begun this practice, by striking a-fresh several medals of Augustus. Nero did the same; and Titus, after the example of his father, struck *restitutions* of most of his predecessors.

Gallienus struck a general *restitution* of all the preceding emperors in two medals, the one bearing an altar, the other an eagle, without the REST.—F. Joubert chuses rather to call them *conservations*, than *restitutions*; as being done quite a-new.

**RESTITUTIONE** *extrañi ab ecclesia*, a writ antiently granted for the restoring a man to the church or sanctuary from which he had been forced away. See SANCTUARY.

**RESTITUTIONE temporalium**, a writ which lies where a man is elected and confirmed bishop of a diocese; for the recovery of the temporalities or barony of the said bishopric. See BISHOP, TEMPORALITIES, &c.

It is directed from the king to the escheator, or rather sheriff of the county.

**RESTIVE**, or **RESTY**, a term applied to a horse, &c. that stops, or runs back, instead of advancing forwards.

In the manage, a *restive* horse is a rebellious, refractory, ill-broken horse; which only goes where it will, and when it will.—The word is formed from the Latin, *restivus*, which signifies the same thing.

**RESTOR**. See the article RESTAUR.

**RESTORATION**. See the article RESTAURATION.

**RESTORATIVE**, in medicine, a remedy proper for the restoring and retrieving of strength and vigour. See MEDICINE.

*Restoratives* belong to the class of balsamics; and are otherwise called *analeptics*. See BALSAMIC and ANALEPTIC.

The medicines that come under this denomination are of an emollient, softening nature, but nutritive withal; and are rather administered to repair the wastes of the constitution, than to alter and rectify its disorders. See NUTRITION.

Such are the leaves of white, and black maiden-hair, black hellebore; rocket, eruca; scabious; colts-foot; bohea-tea; chich-peas; hops; chocolate; pistachio-nuts; balsam of Tolu; bdellium; benzoin; storax; eryngo; iris; satyrion, &c. See HELLEBORE, TEA, PISTACHIO, CHOCOLATE, BALSOM, BDELLIUM, STORAX, &c.

**RESTRAINT**, is when an action is hindered or stopped, contrary to volition, or the preference of the mind. See LIBERTY, NECESSITY, WILL, VOLITION, VOLUNTARY, &c.

**RESTRICTION**, the act of modifying, limiting, or restraining a thing to narrower bounds.

General laws always bear some *restriction*.—In contracts 'tis usual to have *restrictive clauses*, which bind the covenants down to certain bounds. See CLAUSE, CONDITION, &c.

**Mental RESTRICTION**. See RESERVATION.

**RESTRICTION**, among logicians, is understood of the limiting a term, so as to make it signify less than it usually does.

In which sense the name Philosopher is *restrained* to Aristotle; Great to Alexander; City to Rome, &c.

It is observed to be good arguing affirmatively from a non-restrained to a restrained term; but not contrarily: And negatively, from a restrained to a non-restrained term; but not contrarily.

**RESTRICTIVE proposition**. See the article PROPOSITION.

**RESTRICTIVE future**. See the article SUTURE.

**RESTRINGENT**, in medicine. See ASTRINGENT.

**RESTY**. See the article RESTIVE.

**RESULT**, what is gathered from a conference, an enquiry, meditation, discourse, or the like; or the conclusion and effect thereof.

The assembly was so tumultuous that there was no knowing the *result*.—The usual *result* of disputes, Mr Bayle observes, is that each person remains more attached to his own opinion.

**RESUMMONS**, **RESUMMONITIO**, a second summons, or calling a man to answer an action where the first summons is defeated, or suspended by any accident; as the death of a party, &c. See SUMMONS.

**RESUMPTION**, **RESUMPTIO**, in a law sense, signifies the taking again into the king's hands such lands or tenements as before, upon false suggestion, or other error, he had delivered to the heir, or granted by letters patent to any man.

**RESUMPTION**, in the schools, a summary repetition, or running over of an argument, or of the substance thereof, in order to refute it.

The respondent *resumed* all the points of the objection, and answered them one by one. See RECAPITULATION, &c.

**RESUMPTION** is also used by logicians for the reduction of some figurative or quaint proposition, to a more intelligible and significant one. See REDUCTION.

As, Peter is half-seas over; that is, he is half fuddled.—The meadows smile; that is, look pleasant.

**RESUMPTIVE**, in pharmacy, an epithet given to a kind of unguent, used to recruit and restore arid languishing constitutions, and to dispose the dry body to receive nourishment.—It is called in Latin, *unguentum resumptivum*. See RESTORATIVE and UNGUENT.

**RESURRECTION**, **RESURRECTIO**, **RESUSCITATION**, the act of returning, to a new, or second life, after having been dead. See LIFE and DEATH.

The great argument for the truth of christianity, and that urged with the most force and conviction for the same; is drawn from the *resurrection* of our Saviour.—The circumstances thereof are such as almost admit of a demonstration; which has accordingly been attempted on the strict principles of the geometricians. See DITTON on the *resurrection*.

The christians generally believe the *resurrection* of the same identic body, the very same flesh and bones at the day of judgment.—The two principal philosophical objections against it are these.

1<sup>o</sup>. That the same piece of matter or substance may happen to be a part of two or more bodies—Thus a fish feeding on a man, and another man afterwards feeding on the fish; part of the body of the first man becomes first incorporated with the fish, and afterwards in the fish, with the last man. Again, instances have been known of one man's feeding immediately on another; and among the cannibals of the West-indies the practice is frequent. See ANTHROPOPHAGI.

Now, where the substance of one is thus converted into the substance of another, each cannot arise with his whole body; and to which shall the common part be allotted?

To this objection some answer, that as all matter is not fit or disposed to be assimilated to the body, and incorporated with it: human flesh may very probably be of this kind, and therefore what is thus eaten, may be again excreted and carried off—But Mr Leibnitz's answer seems the more solid—All that is essential to the body, he urges, is the original stamen, which existed in the semen of the father; nay, and on the footing of the modern theory of generation, which existed in the semen of the first man. This we may conceive as the most minute speck or point imaginable, and therefore not to be separated, or tore asunder, and any part of it united with the stamen of any other man. All this bulk we see in the body, is only an accretion to this original stamen; an addition of foreign matter, of new juices to the primary, solid stamen. There is therefore no reciprocation of the proper matter of the human body. See STAMINA, SOLID, &c.

The second objection is this—The human body, we know by the late discoveries in the animal œconomy, is continually changing: a man has not entirely the same body to day as he had yesterday; and it is even computed, that in less than seven years time, his whole body undergoes a change, and not a particle of the same body remains—Which of those many bodies, then, which the same person has in the course of his life, is it that shall rise? or does all the matter that has ever belonged to him, rise again? or does only some particular system thereof? the body, *e. gr.* he had at 20, at 30, or at 60 years old? if only this or that body arise, how shall it be rewarded or punished for what was done by the other? with what justice does one person suffer, &c. for another?

To this it may be answered, on Mr Lock's principles, that personal identity, or the sameness of a rational being, consists in self-consciousness; in the power of considering it self the same thing in different times and places—By this every one is to himself what he calls *self*; without considering whether that self be continued in the same or divers substances. So far reaches the identity of that person. It is the same self now it was then, and it was by the same self which now reflects on an action, that action was performed.

Now, it is this personal identity is the object of rewards and punishments, which we have observed may exist in different successions of matter; so that to render the rewards and punishments just and pertinent, nothing needs but that we rise again with such a body as that we retain the consciousness of our past actions. See IDENTITY.

**RESUSCITATION**. See RESURRECTION and REVIVIFICATION.

**RETAIL**, in commerce, &c. the buying of goods in the great, or by wholesale, and selling them out again in small parcels—*Qui rem integram ementes, per minutiores eam partes distrahebant*. See COMMERCE.

To **RETAIN**, spoken of mares, signifies to hold, *i. e.* to conceive after covering.

**RETAINER**, in law, a servant not menial or domestic, that is, not continually dwelling in the house of his lord or master, but only wearing his livery, and attending on special occasions. See SERVANT.

This livery was antiently given by a great man, and frequently for the maintenance of quarrels; whence it was justly prohibited

hibited by several statutes: as, under Richard II. on pain of imprisonment, and grievous forfeiture to the king. See LIVERY, YEOMAN, &c.

It was farther prohibited by other statutes of the succeeding kings, whereby the delinquents were subjected to make ransom at the king's pleasure; and knights and esquires hereof duly attained, where to lose their said liveries, and forfeit their fees for ever.

Edward IV. added a special penalty of five pounds per month on every man that gave such livery, and as much on every person so retained, either by writing, word, or oath — But most of these statutes are repealed by a statute 3 Car. I.

RETAINING-fee, is the first fee given in any cause to a serjeant or counsellor at law, whereby to make him sure, that he shall not be on the contrary side. See FEE.

RETALIATION, RETALIATIO, the act of returning like for like. See TALIONIS lex.

RETARDATION, RETARDATIO, in physics, the act of *retarding*, that is, of delaying the motion or progress of a body, or of diminishing its velocity. See MOTION.

The *retardation* of moving bodies arises from two great causes: the *resistance of the medium*, and the *force of gravity*.

The RETARDATION from the *resistance* is frequently confounded with the resistance itself; because with respect to the same moving body, they are in the same proportion. See RESISTENCE.

With respect to different bodies, however, the same resistance often generates different *retardations* — For if bodies of equal bulk, but different densities, be moved through the same fluid with equal velocity, the fluid will act equally on each; so that they will have equal resistences, but different *retardations*. And the *retardations* will be to each other as the velocities which might be generated by the same forces in the bodies proposed: that is, they are inversely as the quantities of matter in the bodies, or inversely as the densities.

Suppose, then, bodies of equal density, but of unequal bulk, to move equally fast through the same fluid; the resistences increase according to their superficies, that is, as the squares of their diameters; but the quantities of matter are increased in proportion to the cubes of the diameters: the resistences are the quantities of motion, the *retardations* are the celerities arising from them; and dividing the quantities of motion by the quantities of matter, you will have the celerities; therefore the *retardations* are directly as the squares of the diameters, and inversely as the cubes of the diameters, that is, inversely, as the diameters themselves.

If the bodies be equal, move equally swift, and are of the same density, but moved through different fluids; their *retardations* are as the densities of those fluids. See FLUID.

When bodies equally dense, and of bulk equal, are carried through the same fluid with different velocities, the *retardations* are as the squares of the velocities. See DENSITY, &c.

The RETARDATION from gravity is peculiar to bodies projected upwards — A body thrown upwards is *retarded* after the same manner as a falling body is accelerated; only in the one case the force of gravity conspires with the motion acquired: and in the other acts contrary to it. See ACCELERATION.

As the force of gravity is uniform, the *retardation* from that cause will be equal in equal times. See GRAVITY.

Hence, as it is the same force which generates motion in the falling, and diminishes it in the rising body, a body rises till it has lost all its motion; which it does in the same time wherein a body falling would have acquired a velocity equal to that wherewith the body was thrown up. See PROJECTILE.

Thus also, a body thrown up will rise to the same height from which falling it would acquire the velocity wherewith it is thrown up: therefore the heights which bodies thrown up with different velocities can rise to, are to each other as the squares of the velocities. See PROJECTILE and DESCENT.

Hence the *retardations* of motions may be compared together: for they are first, as the squares of the velocities; secondly, as the densities of the fluids, through which the bodies are moved; thirdly, inversely, as the diameters of those bodies; lastly, inversely, as the densities of the bodies themselves. The numbers in the ratio compounded of those ratios, express the proportion of the *retardations*; multiplying the square of the velocity by the density of the fluid, and dividing the product by the product of the diameter of the body, multiplied into its density, and working thus for several motions; the quotients of the divisions will have the same compound ratio to one another.

Laws of RETARDATION of motion — 1°. If the motion of a body be uniformly *retarded*; that is, if its celerity be diminished equally in equal times, the space it passes over is one half of that it would pass over in the same time by an uniform motion.

VOL. II. N° CXXXIII.

2°. The spaces described in equal times by an uniformly *retarded* motion; decrease according to the uneven numbers, 9, 7, 5, 3, &c. — See further under ACCELERATION.

RETCHING, or REACHING, the effort or endeavour to vomit. See NAUSEA and VOMITING.

RETE *mirabile*, in anatomy, a small plexus, or net-work of vessels in the brain, surrounding the pituitary gland. See PLEXUS and BRAIN.

The *rete mirabile* is very conspicuous in brutes, but either not existent in man, or so very minute that its existence is fairly doubted.

Willis will have it to consist of arteries, veins, and nerves; Vieussens of arteries only; and others, of arteries and small veins. Vieussens asserts, with many other anatomists, that there is no *rete mirabile* in man, in the horse, dog, &c. But it is found in the calf, sheep, goat, &c.

It was observed and described by Galen; who upon finding it in some brutes, concluded it to be likewise in man: but all we see like it in man, is, that on the sides of the pituitary gland, where its place should be, the carotid arteries make a double flexure, in form of  $\omega$ , before they penetrate the dura mater.

The use of the *rete mirabile*, Galen takes to be for concocting and elaborating the animal spirits; as that of the epididymides is for elaborating the seed. See SPIRIT and SEED.

Dr Willis thinks, with more probability, it may serve to bridle the too rapid incursions of the blood into the brain of those creatures whose head hangs down much to separate some of the superfluous serous parts of the blood, and send them to the salivary glands as the blood enters the brain; and to obviate obstructions which may happen in the arteries.

RETE penny, in antient records, a customary due of one penny for every person to the parish-priest.

RETEINER or RETAINER. See RETAINER.

RETENTIO, RETINENTIA, in our law books, is sometimes used to signify *retinue*. See RETINUE.

RETENTION, RETENTIO, a faculty of the human mind, whereby in order to a farther progress in knowledge, it keeps or *retains* those simple ideas which it before received by sensation or reflection. See FACULTY, IDEA, &c.

This is done two ways — First, by keeping the idea which is brought into the mind, for some time, actually in view; called *contemplation*. See CONTEMPLATION.

Secondly, by reviving those ideas in our minds which have disappeared, and have been, as it were, laid out of sight: this is *memory*, which is, as it were, the repository of our ideas. See MEMORY, RECOLLECTION, and REMINISCENCE.

Our ideas being nothing but actual perceptions in the mind, which cease to be any thing, when there is no perception of them; this laying up of our ideas in the repository of the memory, amounts to no more than this, that the mind has a power in many cases to revive perceptions it once had: with this additional perception annexed to them, that it has had them before. See PERCEPTION.

It is by the assistance of this faculty, that we are said to have all those ideas in our understanding which we can bring in sight, and make the objects of our thoughts, without the help of those sensible qualities, which first imprinted them there. See UNDERSTANDING.

Attention and repetition help much to the fixing ideas in our memories; but those which make the deepest and most lasting impressions, are such as come accompanied with pleasure and pain — Ideas but once taken in, and never again repeated, are soon lost; as those of colours, in such as lose their sight when very young.

The memory in some men is tenacious, even to a miracle; but yet there seems to be a constant decay of all our ideas, even of those which are struck deepest; and in the minds the most *retentive*: so that if they be not sometimes renewed, the print wears out, and at last there remains nothing to be seen. See TRACE.

Those ideas which are often renewed by a frequent return of the objects or actions that produce them, fix themselves best in the memory, and remain longest there: such are the original qualities of bodies; viz. solidity, extension, figure, motion, &c. and those that almost constantly affect us, as heat and cold; and those that are the affections of all kinds of beings, as existence, duration, number; which are seldom quite lost, while the mind retains any ideas at all. See QUALITY, HABIT, &c.

RETENTION, is also used in medicine, &c. for the state of contraction in the solids, or vascular parts of the body, which makes them hold fast their proper contents. See SOLID, VESSEL, &c.

In this sense retention stands opposed to *evacuation* and *excretion*. See EVACUATION and EXCRETION.

Retention and excretion make one of the six non-naturals. See NON-NATURAL.

RETENTION is also frequently considered as a disorder; and

defined the act of retaining the excrements, humours, &c. so as they cannot be voided out of the body. See EXCREMENT.

It is the *retention* of peccant humours which causes such a disease — A *retention* of urine is very painful and dangerous. See URINE.

RETIIARI\*, in antiquity, a kind of gladiators, thus denominated from a net which they made use of against their antagonists, who were called *secutores*, and sometimes *mir-millones*. See GLADIATOR and SECUTOR.

\* The word is formed from the Latin, *rete*, net; or perhaps from *retejaculum*, for they called their net *jaculum*, and sometimes in one word, *retejaculum*.

This net they carried under their buckler, and when opportunity served, cast it over the head of their antagonist, and in this condition killed him with a trident which they bore in the other hand.

Lipius, and others observe that they fought in tunics, and were furnished with sponges to wipe off the sweat, blood, &c. and to stop their wounds.

RETICENCY, RETICENTIA, a figure in rhetoric, whereby we make oblique mention of a thing, in pretending to pass it over unmentioned. See FIGURE.

Thus: *To say nothing of the nobility of his ancestors: I forbear to speak of his courage, and pass over the severity of his morals.* See PRETERITION.

RETICULA, RETICULE, in astronomy, a contrivance for the exact measuring the quantity of eclipses; introduced about fifty years ago by the royal academy of Paris. See ECLIPSE.

The *reticule* is a little frame, consisting of thirteen fine filken threads, equidistant from each other, and parallel; placed in the focus of object-glasses of telescopes; that is, in the place where the image of the luminary is painted, in it's full extent — Of consequence, therefore, the diameter of the sun or moon is hereby seen divided into twelve equal parts or digits; so that to find the quantity of the eclipse, there is nothing to do but to number the luminous and the dark parts. See DIGIT.

As a square *reticle* is only proper for the diameter, not for the circumference of the luminary; it is sometimes made circular, by drawing six concentric equidistant circles, which represents the phases of the eclipse perfectly.

But it is visible that the *reticule*, whether square or circular, ought to be perfectly equal to the diameter or circumference of the star, such as it appears in the focus of the glass; otherwise the division cannot be just.

Now this is no easy matter to effect, by reason the apparent diameter of the sun and moon differ in each eclipse; nay that of the moon differs from itself in the progress of the same eclipse.

Another imperfection in the *reticule* is, that it's bigness is determined by that of the image in the focus; and of consequence will only fit one certain magnitude.

But M. de la Hire has found a remedy for all these inconveniences, and contrived that the same *reticule* shall serve for all telescopes, and all altitudes of the luminary in the same eclipse — The principle whereon his invention stands, is, that two object-glasses applied against each other, having a common focus, and there forming an image of a certain magnitude; this image will increase in proportion as the distance between the two glasses is increased, as far as a certain limit.

If then a *reticule* be taken of such a magnitude as just to comprehend the greatest diameter the sun or moon can ever have in the common focus of two object-glasses applied to each other; there needs nothing but to remove them from each other, as the star comes to have a less diameter, to have the image still exactly comprehended in the same *reticule*.

Another improvement is, that whereas the filken threads are subject to swerve from the parallelism, &c. by the different temperature of the air; a *reticule* may be made of a thin looking-glass, by drawing lines or circles thereon, with the fine point of a diamond; which shall be safe from any alteration of the air.

RETICULAR body, corpus RETICULARE, in anatomy, a body of vessels lying immediately under the cuticle or scarfskin. See CUTICLE, &c.

These vessels contain a mucous liquor, from the tincture whereof Malpighi imagines the colour of the skin to be derived; founding his conjecture on this, that the cutis as well as cuticle of blacks, is white; and that they differ in no other circumstance from those of Europeans, but in this particular. See NEGRO. See also CUTIS and PAPILLA.

RETICULAR, *plexus*, *plexis*, RETICULARIS, sometimes denotes the choroides, which is thus called, because it's fibres are interwoven like a net. See CHOROIDES.

RETICULUM, the *caul*, or *omentum*; a name sometimes given this part from it's net-like structure. See OMENTUM.

RETIFORMIS *lasis*, in anatomy, the same with rete mirabile. See RETE.

RETINA, in anatomy and optics, one of the tunics of the eye; called also *amphibleptroides*, *retiformis*, and *reticularis tunica*, as being woven in manner of a net. See TUNIC and EYE.

The *retina* is the last or innermost of the coats of the eye, lying immediately under the choroides. See CHOROIDES. It is formed of an expansion of the medullary part of the optic nerve; whence it is found very thin, soft, white, &c. resembling the substance of the brain, with the transparency of the horn of a lantern. See OPTIC nerve — When separated from the choroides, it runs into a mucous mass, or lump.

The *retina* is usually supposed to be the great organ of vision, which is effected by means of the rays of light reflected from each point of objects, refracted in their passage through the aqueous, vitreous, and crystallin humours, and thus thrown on the *retina*; where they paint the image of the object; and where they make an impression, which is continued thence, by the fine capillaries of the optic nerves, to the sensory. See VISION.

Indeed, whether the *retina* or the choroides be the principal organ of vision, and that whereon the images of objects are represented; has been much controverted between several members of the royal academy, particularly Mess. Mariotte, Pecquet, Perrault, Mery, and de la Hire — Mariotte first stood up for the choroides, and was seconded by Mery: the rest asserted the cause of the *retina*.

The *retina* was always judged to have all the characters of the principal organ — It is situate in the focus of the refraction of the humours of the eye; and of consequence receives the vertices of the cones of rays, proceeding from the several points of objects. It is very thin, and consequently very sensible. It has it's origin from the optic nerve; and is itself wholly nervous, and it is the common opinion that the nerves are the vehicles of all sensations. Lastly, it communicates with the substance of the brain, where all sensations terminate. See BRAIN, SENSATION, &c.

As to the choroides, it's use was supposed to be to stop the rays, which the extreme tenuity of the *retina* should let pass; and to do the same office to the *retina* which the quicksilver does to a looking-glass; especially in animals wherein it is black. See CHOROIDES.

But from an experiment of a cat plunged into water, M. Mery conceived a different opinion — He observed the *retina* to disappear absolutely on that occasion, as well as all the other humours of the eye; while the choroides still appeared distinctly, and even with all the lively colours it has in that animal — Hence he concluded, that the *retina* was as transparent as the humours, but the choroides opaque: consequently the *retina* was not a proper instrument to terminate and stop the cones of rays, or to receive the images of objects: but that the light must pass through it, and could only be stopped on the choroides; which therefore would become the principal organ of vision.

The black colour of the choroides in man is extremely favourable to this sentiment: the principal organ should seem to require that the action of the light should terminate on it, as it arrives; which it is certain it here does in the black that absorbs all the rays, and reflects none; and it should also seem necessary that the action of the light should be stronger on the organ of sight than any where else: now, it is certain that the light being received and absorbed in a black body, must excite a greater vibration there than any where else; and hence it is that black bodies are kindled by a burning glass much sooner than white ones. See BLACKNESS, &c.

The situation of the choroides behind the *retina* is another circumstance on it's side; M. Mery having observed the same position of the principal organ behind a mediate organ in the other senses: which makes a happy analogy — Thus the cuticle extended over the skin, is the mean organ of feeling; but the cutis underneath is the principal organ. The like is observed in the ear, nose, &c.

The *retina*, therefore, should seem, a kind of mediate or secondary organ, serving to break the too strong impression of the light on the choroides, or to preserve it; which is the use ascribed to the cuticle — Add to all this, that the *retina* is insensible, as having it's origin from the medullary substance of the brain, which is so too; and the choroides, on the contrary, very sensible, as arising from the pia mater, which is certainly sensible in a great degree. See NERVE, MEDULLA, MENINX.

This last argument being doubted of, M. Mery was engaged to prove it; which he did before the royal academy, where he shew'd that the optic nerve is not composed like the other nerves, of fibres; that it is only a train of the medulla inclosed in a canal, out of which it is easily separable. See OPTIC nerve.

This structure of the optic nerve, hitherto unknown, shews that the *retina* can be no membrane; it is only a dilatation of the

# R E T

the medulla, inclosed under two membranes, and a pith or medulla seems no proper substance to be the seat of sensation — It can scarce serve for any thing but to filtrate the spirits necessary for the action of vision — The vibration whereby the sensation itself is effected, must be made on a part more solid, more firm, and more susceptible of a brisk impression.

**RETINUE, RETINENTIA**, the attendants or followers of a prince, or person of quality; chiefly in a journey.

In law, those persons are properly said to be of a nobleman's *retinue* who belong to him in quality either of servants or retainers. See **RETAINER**, and **LIVERY**.

**RETIRADE**, in fortification, a kind of retrenchment made in the body of a bastion, or other work, which is to be disputed inch by inch, after the first defences are dismantled. See **RETRENCHMENT**, &c.

It usually consists of two faces, which make a re-entering angle — When a breach is made in a bastion, the enemy may also make a *retirade*, or a new fortification behind it. See **BASTION**.

**RETIRED flank**, in fortification. See **FLANK**.

**RETORNO** *falso brevium*. See the article **FALSO**.

**RETORT, RETORTA**, in chymistry, a kind of crooked matrass, or a round, bellied vessel, either of earth or glass, with a slender crooked beak, or nose, to which the recipient is to be fastened. See **MATRASS**.

When the *retort* is of glass, it is usually lined with a lute of paste an inch thick; to enable it to bear the fire the better. See **LUTE** and **HEAT**.

The *retort* serves to draw spirits and oils from woods, gums, minerals, earths, and other matters which require a strong fire. See **SPIRIT**, &c.

The *retort* is a kind of compendium or improvement on the cucurbit and bolt-head; answering all the purposes of both, without the assistance of a capital or head, which the other frequently require. See **CUCURBIT**.

**RETRACTATION, RETRACTATIO**, the act of unsaying what a person had said, or wrote. See **PALINODY**.

Galileo made a public *retraction* of his doctrine of the world, *de mundo*, after it's being censured and condemned by the pope. Among St Augustin's works is a book of *retractions*; where, however, the word is to be understood in a new sense; not as if he recanted or unsaid any thing he had taught, but only treated of the same matter, or handled the same subject a second time — This sense the word will very well bear; being a compound of *re*, again, and *tracto*, I handle, treat of.

**RETRACTION\***, **RETRACTIO**, in anatomy, the contraction or shortening of a part. See **CONTRACTION**.

\* The word is formed from the Latin, *retrahere*, to draw back. A *retraction* of the nerves takes away the use of the limbs. See **NERVE**.

**RETRACTIS**, among horsemen, pricks in a horse's feet, arising from the fault of the farrier in driving nails that are weak, ill-pointed, or driven amiss. See **SHOE**.

These, unless timely prevented, fester, and prove very dangerous. — When the farrier, in shoeing, perceives the horse to shrink at every blow on the nail; it is a sign of a *retract*, and the nail is to be pulled out again, which is done without any harm.

When the horse halts immediately after he is shod, it is concluded some of the nails press the veins, or touch him in the quick.

To find where the grievance lies, they knock the nails round with a hammer, till the horse's shrinking upon hitting a particular nail, discovers the place.

Some farriers give this as a rule, that throwing water on the hoof, the place where he is hurt will be dry sooner than any of the rest. The places where the horses are most usually pricked, are the heel in the fore-foot, and the toe in the hind-foot. See **HOOF**.

**RETRACTOR** *alæ nasi*, in anatomy, a pair of muscles, called also *elevator labii superioris*. See **ELEVATOR**.

**RETRAHENS auriculæ**, in anatomy, a pair of muscles, of the external ear; consisting of a parcel of fleshy fibres, which in some bodies are divided into three distinct muscles arising from the os temporale, and fixed to the hind part of the concha. See **AURICLE**.

But these muscles are so small in men, that the auricle is seldom moveable at all. See **EAR**.

**RETRAXIT**, in law, is where the plaintiff comes into court in person, alone, or with the defendant; and declares he will proceed no further in his action.

A *retraxit* is peremptory, and a perpetual bar; and may be pleaded as such to the plaintiff in the same action for ever.

**RETREAT**, in war, the retiring or moving back again of an army, or part thereof.

We say, to sound a *retreat*, secure a *retreat*, &c. What they call a *retreat* in the armies, is really a flight; only a flight made by design, and with conduct.

The skill and ability of the general, is known by his *retreats*, more than his engagements. — The *retreat* of the ten thou-

# R E T

sand Greeks under the command of Xenophon, has been admired in all antiquity.

**RETREAT, or RELAY**, in masonry, denotes a little recess or diminution of the thickness of a wall, rampart, &c. in proportion as it is raised. See **WALL**, &c.

The *retreat* is properly the diminution of a wall, without side; or the contraction of it's upper courses more than the foundation. — Where the foundation is very large, they usually make two or three *retreats* — Parapets are always built with *retreats*.

**RETRENCHMENT\***, literally signifies something cut off, or taken from a thing: In which sense it coincides with abstraction, diminution, &c.

\* The word is French, *retrenchment*, formed of *re*, and *trancher*, to cut.

By a gradual *retrenchment* of the ordinary quantity of food, a man may bring himself to a great degree of abstinence. See **ABSTINENCE, FASTING, FOOD**, &c.

The reformation of the calendar in 1582, occasioned a *retrenchment* of ten days which had crept into the account more than there should have been. See **CALENDAR**.

The frugality so much boasted of among the antient Romans, St Evremont observes, did not so much consist in a voluntary abstinence or *retrenchment* of things superfluous, as a coarse and sordid way of employing or using them.

**RETRENCHMENT**, in architecture, carpentry, &c. is used not only for what is cut off from a piece when too large, in order to a better proportioning it, or some other convenience; but also for the projections taken out of streets, public ways, &c. to render them more even, and in a line.

**RETRENCHMENT**, in war, denotes any kind of work cast up to strengthen, or defend a post against the enemy. See **FORTIFICATION, DEFENCE, WORK**, &c.

Such are ditches, with parapets, gabions, fascines, &c. for a covering, &c. See **DITCH**, &c.

The enemy came with design to oblige them to raise the siege, but could not force the *retrenchments*.

**RETRENCHMENT**, is more particularly used for a simple *retirade* made on a horn-work, or bastion; when it is intended to dispute the ground inch by inch. See **RETIRADE**.

It is usually a re-entering angle, whose faces flank each other; and fortified with ditches, parapets, gabions, &c.

**RETRIBUTION, RETRIBUTIO**, a handsome present, gratuity, or acknowledgement given in lieu of a formal salary or hire, to persons employed in affairs that do not so immediately fall under estimation, nor within the ordinary commerce of money. See **HONO.**

Those who ministered at the altar antiently lived of *retributions*, which they received for the services they did the church. But these *retributions* were afterwards judged proper to be fixed to precise sums. See **TITHE**.

**RETRIEVE, RETROUVER**, to recover, get again, or repair a thing lost or damaged. See **RECOVERY, REPARATION**, &c.

To *retrieve* in falconry, signifies to spring or find partridges again, which have been once sprung before. See **HAWKING**.

**RETROACTIVE\***, in law, that which has an influence or effect on time past.

\* The word is compounded of the latin, *retro*, backwards, and *ago*, I act.

New laws and statutes, we say, have no *retroactive* effect; that is, they have no force or effect as to what is already passed; nor can be alledged as rules for any thing done before their promulgation. — Their authority is wholly as to what is to come.

Indeed we have some instances of laws that have a retrospect, or *retroaction*, i. e. are made with express design to extend to things already passed — These we usually call laws *ex post facto*. See **LAW**, &c.

**RETROCESSION, RETROCESSIO**, the act of going backwards; more usually expressed by *retrogression*, or *retrogradation*. See **RETROGRADATION**, &c.

**RETROCESSION** of the equinox. See **PRECESSION**.

**RETROCESSION** of curves, &c. See **RETROGRADATION**, *contrary FLEXURE*, &c.

**RETROGRADATION, or RETROGRESSION**, the act or effect of a thing moving backwards. See **RETROGRADE**.

**RETROGRADATION**, in astronomy, is an apparent motion of the planets, wherein they seem to go backwards in the ecliptic, and to move contrary to the order, or succession of the signs. See **PLANET, ECLIPTIC**, &c.

When a planet moves in *consequentia*, i. e. towards the following signs, or according to the order of the signs, as from Aries to Taurus, from Taurus to Gemini, &c. that is, from west to east, it is said to be direct. See **DIRECT**.

When it appears for some days in the same point of the heavens, it is said to be *stationary*. See **STATIONARY**.

And when it goes in *antecedentia*, i. e. towards the antecedent signs, or contrary to the order of the signs, viz. from east to west, it is said to be *retrograde*. See **ANTECEDENTIA, SIGN**, &c.

The

The sun and moon always appear direct—Saturn, Jupiter, Mars, Venus, and Mercury, sometimes direct, sometimes stationary, and sometimes *retrograde*. See SATURN, JUPITER, VENUS, &c.

The superior planets are *retrograde* about their opposition with the sun; the inferior ones about their conjunction. See OPPOSITION and CONJUNCTION.

The intervals of time between two *retrogradations* of the several planets, are unequal—In Saturn it is a year and 13 days; in Jupiter a year and 43 days; in Mars two years 50 days; in Venus one year 220 days; in Mercury 115 days. Again, Saturn continues *retrograde* 140 days, Jupiter 120, Mars 73, Venus 42, Mercury 22: yet are not the several *retrogradations* of the same planet constantly equal.

These changes of the courses and motions of the planets are not real, but apparent: when viewed from the centre of the system, *i. e.* from the sun, they appear always uniform and regular—The inequalities arise from the motion and position of the earth whence they are viewed, and are thus accounted for.

Suppose PNO (*Tab. Astronomy*, fig. 58.) a portion of the zodiac, ABCD the earth's orbit, and EMGHZ the orbit of a superior planet, *e. gr.* Saturn. And suppose the earth in A, and Saturn in E; in which case he will appear in the zodiac at the point O—If now Saturn remained without any motion, when the earth arrives at B, he would be seen in the point of the zodiac L, and would appear to have described the arch OL, and to have moved according to the order of the signs from west to east. But because while the earth is passing from A to B, Saturn likewise moves from E to M, where he is seen in conjunction with the sun, he will appear to have described the arch OQ greater than that OL. In this state the planet is direct, and it's motion, from west to east, or according to the order of the signs. And it's motion, now that it is in conjunction with the sun and most remote from us, is quicker than at any other time. See DIRECTION.

The earth arriving at C, while Saturn describes the arch MG, he will be observed in the zodiac at R. But the earth being advanced to K, and Saturn to H, so as the line KH joining the earth and Saturn, be for some time parallel to itself, or nearly so; Saturn will be seen all that time in the same point of the zodiac at P, and with the same fixed stars; and is therefore stationary. See STATION.

But the earth being come to D, and Saturn arrived in opposition to the sun in Z, he will appear in the zodiac in V, and will seem to have been *retrograde*, or to have gone backwards through the arch PV—Thus the superior planets, on optical considerations, are always *retrograde*, when in opposition to the sun. See SUN, OPPOSITION, &c.

The arch which the planet describes while thus *retrograde*, is called the *arch of retrogradation*. See ARCH.

The arches of *retrogradation* of the several planets are not equal—That of Saturn is greater than that of Jupiter; that of Jupiter than that of Mars, &c.

RETROGRADATION of the nodes, is a motion of the line of the nodes, whereby it continually shifts it's situation from east to west, contrary to the order of the signs; completing its *retrograde* circulation in the compass of about 19 years: after which time either of the nodes having receded from any point of the ecliptic returns to the same again. See NODE.

RETROGRADATION of the sun—When the sun is in the torrid zone, and has his declination, AM, (*Tab. Astronomy*, fig. 59.) greater than the latitude of the place AZ, but either northern or southern as that is; the sun will appear to go backwards, or to be *retrograde* both before and after noon. See SUN and ZONE.

For, draw the vertical circle ZGN to be a tangent to the sun's diurnal circle in G, and another ZON, through the sun rising in O—It is evident all the intermediate vertical circles cut the sun's diurnal circle twice: first, in the arch GO, and the second time in the arch GI—Wherefore, as the sun ascends through the arch GO, it continually arrives at further and further verticals. But as it continues it's ascent through the arch GI, it returns to it's former verticals; and therefore is seen *retrograde* for some time before noon—The same, it may be shewn after the same manner, it does for some time after noon.

Hence, as the shadow always tends the opposite way to that of the sun, the shadow will be *retrograde* twice every day in all places of the torrid zone, where the sun's declination exceeds the latitude. See SHADOW.

RETROGRADATION, or RETROGRESSION, in the higher geometry, is the same with what we otherwise call *contrary flexion*. See CONTRARY FLEXION.

The *retrogression* of curves may be thus conceiv'd—Suppose a curve line AFK, (*Tab. Geometry*, fig. 82.) to be partly concave, partly convex, in respect of the right line AB, or in respect of the determinate point B; the point F which separates the concave part of the curve from the convex, or which makes the end of one, and the beginning of the other,

is called the *point of contrary flexion*, when the curve is continued from F towards the same side as before—When the curve is continued backwards towards A, then is F the point of *retrogression*. Set POINT and CURVE.

RETROGRADE\*, RETROGRADUS, something that goes backwards, or in a direction contrary to the natural one—Such is the motion of the lobster, the crab, &c.

\* The word is formed from the Latin, *retro*, backwards, and *gradior*, I go.

If the eye and the object move both the same way, but the eye much faster than the object; the object will appear to be *retrograde*, *i. e.* to go back, or to advance the contrary way from what it really does. See VISIBLE.

Hence, the planets in some parts of their orbits appear to be *retrograde*. See PLANET and RETROGRADATION.

RETROGRADE order, in matters of numeration, is when in lieu of accounting 1, 2, 3, 4, we count 4, 3, 2, 1. See PROGRESSION, SERIES, NUMBER, &c.

RETROGRADE *verses* are such as give the same words, whether read backwards or forwards; called also *reciprocal verses*, and *recurrents*.

Such is—*Signa te signa temere me tangis et angis.*

RETROGRESSION, or RETROCESSION, the same with *retrogradation*. See RETROGRADATION.

RETROMINGENTS\*, in natural history, a class or division of animals, whose characteristic is, that they stale, or piss backwards; both males and females—Such are lions, cats, &c. See ANIMAL.

\* The word is compounded of the Latin, *retro*, backwards, and *mingo*, I make water.

RETROPANNAGIUM\*, RETROPANNAGE, in our ancient law-books, *afterpannage*; or what is left when the beasts have done, or eat the best. See PANNAGE.

\* *Et debent habere retropannagium a festo sancti Martini usque ad festum pur. beatæ Mariæ. Petit. in parl. temp. Edw. III.*

RETROSPECT, a look or view backwards. See RETROACTIVE.

RETURN, RETURNA or RETORNA in law, hath divers acceptations—A

RETURN of writs by sheriffs and bailiffs, is a certificate made to the court by the sheriff, bailiff, &c. of what is done with regard to the execution of the writ directed to them. See WRIT.

Such also is the *return of a commission*, which is a certificate, or answer of what is done by the commissioners, to whom such commissions, precepts, mandates, or the like, are directed. See COMMISSION.

RETURN is also used in case of a replevin. If a man distrain cattle for rent, &c. and afterwards justify or avow his act, so as it is found lawful; the cattle before delivered unto him that was distrained, upon security given to prosecute the action, shall now be *returned* to him that distrained them. See DISTRESS, REPLEVY, and RETURN.

RETURNS, RETURN-days, or days in bank, are certain days in each term, peculiarly set a-part for the several kinds of proceedings, in any cause to be determined. See TERM, DAY, &c.

Hillary term has four such *returns*—viz. *octabis hillarii*, eight days after hillary day *quindena hillarii*, fifteen days; *crastina purificationis*, the day after the purification; and *octabis purificationis*, eight days after, inclusive.

Easter term has five *returns*, viz. *quindena paschæ*, fifteen days after easter; *tres paschæ*, three weeks after; *mensis paschæ*, the day-month after easter; *quinque paschæ*, the day five weeks from easter; and *crastina ascensionis domini*, the day after ascension-day.

Trinity term has four *returns*; viz. *crastina trinitatis*, the day after trinity; *octabis trinitatis*, eight days after, inclusive; *quindena trinitatis*, fifteen days after; and *tres trinitatis*, three weeks after.

Michaelmas term has six *returns*; viz. *tres michaelis*, three weeks after michaelmas; *mensis michaelis*, the day month after michaelmas; *crastina animarum*, the day after all-souls; *crastina martini*, the day after martinmas day, *octabis martini*, eight days after, inclusive; and *quindena martini*, fifteen days. See TERM.

RETURN, in building, denotes a side, or part that falls away from the fore-side of any straight work. See RESSAUT.

RETURNS, of a trench, in fortification, are the turnings and windings which form the lines of a trench. See TRENCH.

RETURNO habendo, or RETURNUM averiorum, a writ which lies for him who has avowed a distress made of cattle, and proved his distress to be lawfully taken; for the *return* of the cattle distrained unto him, which before were replevied by the party distrained, upon surety given to pursue the action. See DISTRESS, RETURN, &c.

The same writ is granted when the plaint or action is removed by recordare, or accedas ad curiam, into the court of common-pleas; and he whose cattle were distrained, makes default, and does not prosecute his action.

RETURNUM irreplegiabile, a judicial writ, sent out of the common-pleas to the sheriff, for the final restitution or *resant*,

return of cattle to the owner, unjustly distrained damage-  
sefant, and so found by the jury before justices of assize in  
the county, or otherwise through default or prosecution. See  
RETURN, DISTRESS, REPLEVY, &c.

REVE\*, REEVE, or GREVE, in antient customs, the bai-  
liff of a franchise, or manor; thus called, especially in the  
western parts. See GREVE and BAILIFF.

\* M. du Cange derives the word from the Latin, *roga* of *rogare*,  
to ask; as being a tribute antiently granted princes at their re-  
quest, as a free-gift.

Hence, *shire-reve*, sheriff, *port-greve*, church-reve, &c. See  
SHEFF, PORT-GREVE, &c.

REVE, REVA, is also used in antient customs for a duty or im-  
position on merchandizes imported. See DUTY and CUS-  
TOM.

REVEALED religion. See RELIGION and REVELA-  
TION.

REVEALED theology. See the article THEOLOGY.

REVEILLE\*, a beat of drum in the morning, intended to  
give notice that it is day-break; and that the foldiers are to  
rise, and the sentries forbear challenging. See DRUM.

\* The word is French, formed of the verb *reveiller*, to awake.

REVELATION\*, REVELATIO, the act of revealing, or  
making a thing public which before was a secret, or un-  
known.

\* The word is formed from the Latin, *revelo*, of *re* and *velum*,  
*q. d.* to unveil.

The *revelation* of a confession made by the confessor, is ad-  
judged in the Romish church, to deserve the most exemplar-  
y punishment. See CONFESSION.

REVELATION is used, by way of eminence, for the discoveries  
made by God to his prophets, &c. and by them to the world.  
See PROPHECY.

The Romanists have two huge volumes of the *revelations* of  
St Bridget. See LEGEND, VISION, &c.

REVELATION, is more particularly used for the discovery which  
God has made to the world, by the mouths of his prophets,  
of certain points of faith and duty, which they could not  
learn from natural reason. See NATURE, REASON,  
FAITH, &c.

Religion is divided into natural religion, and *revelation* or *re-  
vealed* religion. See RELIGION.

The Christian *revelation* is that made by Christ, and his apo-  
stles, in the new testament—The Jewish *revelation* is that  
made by Moses and the prophets, in the old testament. See  
BIBLE, PROPHET, &c.

A late author observes, somewhat invidiously, that it is the  
common method of all new *revelations*, to be built on prece-  
dent ones—Thus, the mission of Moses to the Israelites, sup-  
poses a former *revelation* to Abraham, &c. The mission of  
Christ supposes that of Moses; and the pretended mission of  
Mahomet, supposes the mission of Christ. The mission of  
Zoroaster to the Persians, supposes the religion of the Ma-  
gi, &c.

The general foundation of all *revelation* is this, that God is  
pleased man should know something relating to himself, his  
own nature, dispensation, &c. which the natural faculties he  
was pleased to create him withal, could not attain to; and  
that he requires some duty or service at our hands, more than  
what necessarily follows from the relation we are under to  
him as our creator, preserver, &c.

Particular or occasional *revelations* have their particular ge-  
nius's, characteristics, and designs—That made by Moses  
and the prophets, chiefly related to the nation of the Jews,  
considered as the descendants of Abraham: it's design seems  
to have been to rescue that people from their slavery; to settle  
them in a new plantation; to give them a set of laws; to  
new form their manners; to support them under difficulties  
and dangers of their enemies, from an opinion of their being  
under the immediate direction and appointment of God; to  
keep them from intermixing again with their neighbours,  
from an opinion of their being a chosen people, and of a Mes-  
siah to be born among them; and to lay a foundation for a  
restoration, in case of their being oppressed, from the opini-  
on of a deliverer—To some or other of these ends do all the  
old testament prophecies seem to tend.

The Christian *revelation* is founded on a part of the Jewish.  
The Messiah promised in the one, is *revealed* in the other.  
All the rest of the Jewish *revelation*, which related peculiar-  
ly to the Jewish people, is here set aside; and only that part  
of it which was to affect the world in general, we mean that  
relating to the coming of the Messiah, is here built upon.  
See MESSIAH.

Indeed it must be owned the Jews ever looked on this as pec-  
uliar to themselves, as any of the rest: the Messiah was prom-  
ised to them; he was to be their deliverer, their restorer,  
&c.—But upon the taking place of this new *revelation*, a new  
scene was opened—This part of the old *revelation*, it was  
shewn, was all typical, or allegorical; and the prophecies re-  
lating hereto, not to be understood in their primary or literal  
sense. The Messiah was not to be the restorer of the Jewish  
sovereignty and liberties, which were now fallen into the

hands of the Romans, but to restore and re-establish the  
world, who had lost their original righteousness, and were  
become slaves of sin; to preach repentance and remission; and  
at last to suffer death, that all who believed in him, might  
not die, but have everlasting life.

Such is the tenour and design of the Christian *revelation*, which  
in the event, was so far from being what it had been appre-  
hended to be, by the people to whom it was first promised;  
that it proved the very reverse; and instead of re-establishing  
and confirming the other branches of their *revelation*, super-  
seded, and set them all aside—The pale was now broken  
down, and the being of the seed of Abraham, ceased to be  
a privilege; all the world being invited on the same terms  
with the Jews.

The consequence was, that the Jews denying this to be the  
Messiah that had been promised to them, as not able to see  
the prophecies fulfilled in him, for want of the typical mean-  
ings thereof, were generally excluded from the privileges of  
that mission which had been supposed wholly intended for  
them; and had their ruin completed from the very means  
whence they expected their redemption. See TYPE, PRO-  
PHECY, &c.

REVELS\*, entertainments of dancing, masking, gaming,  
acting comedies, farces, &c. antiently very frequent in inns  
of courts, at certain seasons, and in noblemen's houses, &c.  
but now much disused.

\* The word is formed from the French, *reveiller*; to awake, as  
alluding to the night season, when they were chiefly held.

The officer who has the direction, or ordering of the *revels*,  
at court, is called the *master of the revels*. See MASTER.

REVENUE\*, the yearly rent, or profits arising to a man  
from his lands, possessions, &c. See RENT.

\* The word is French, formed from *revenir*, to return—Whence  
*revenue* is sometimes also used in antient authors for a return:  
as the *revenue* of Easter. See RETURN.

The *revenue* of this manor consists in tiths, rents, &c. See  
MANOR, TITH, &c.

The *revenues* of the English clergy were first fixed by king  
Ethelwolf, anno 855; who granted them for ever, the tithe  
of all goods, and the tenth part of all the lands of England,  
free from all secular service, taxes, impositions, &c. See  
TITHE and CLERGY.

The certain *revenues* of the king of England were antiently  
greater than those of any king in Europe; and till the time  
of the civil wars they enjoyed in domains and fee-farm rents  
almost enough to discharge all the ordinary expences of the  
crown, without any tax or imposition on the subject. See  
TAX, &c.

Upon the restauration, the crown *revenues* being found much  
alienated, and the crown charges increased; the parliament  
settled a yearly revenue of 1,200,000 *l.* upon the king; so  
much as the former crown *revenues* fell short of that sum, to  
be raised on goods exported and imported, upon liquors, and  
fire-hearths. See DUTY, &c.

At the death of king Charles II. the *revenue* amounted to  
1,800,200 *l.* per ann.—In king James the second's time, it  
was raised to 2,000,000 *l.* which was computed to be one  
tenth of the *revenues* of the whole kingdom.

At the same time, the *revenues* of the king of France were  
computed at seven millions sterling; and those of the states  
of Holland, at three millions—For more particulars of this  
kind, see POLITICAL arithmetic.

Auditors of the REVENUE. See AUDITOR.

REVENUE, REVENU, in hunting, a fleshy mass or lump formed  
chiefly of a cluster of whitish worms on the heads of deer,  
and occasioning them to cast their horns, by gnawing the  
roots thereof. See HEAD, &c.

The *revenue* distilled, is said to help women in travel.

REVENUE is also used for a new tail of a partridge, growing  
out after the loss of a former—The *revenue* is measured by  
fingers: thus they say a partridge of two, three, four fin-  
gers *revenue*.

REVERBERATION\*, REVERBERATIO, in physics,  
the act of a body repelling or reflecting another, after it's im-  
pinging thereon. See REFLECTION.

\* The word is formed from the Latin, *re* and *verbero*, *q. d.* I beat  
again.

In the glass-mens furnaces the flame *reverberates*, or bends  
back again, to scorch the matter on all sides. See GLASS  
and FURNACE. Echoes are occasioned by the *reverberation*  
of sounds from arched obstacles. See ECHO.

*Reverberation* and *reflition* refer to the same action; only the  
one to the agent, the other to the patient—A polished body  
*reverberates* the rays all around; the *reflition* of the rays does  
not arise from their striking against the solid parts of bodies.  
See REFLECTION.

REVERBERATION, in chymistry, denotes a kind of circula-  
tion of the flame, by means of a *reverberatory*; or the return  
of the flame from the top of the furnace, back to the bottom,  
chiefly used in calcination. See REVERBERATORY, CALX,  
and CALCINATION.

*Reverberation* is of two kinds—The first with a *close fire*; that

that is, in a *reverberatory* furnace, where the flame has no vent a-top; being covered with a dome, or capital, which repels it's action back on the matter, or the vessel that contains it, with increased vehemence.

After this manner, are refining, the distillation of acid spirits, &c. performed. See DISTILLATION and REFINING.

*Reverberation* with an open fire, is that performed in a furnace or *reverberatory*, whose registers are all open; used in calcination, &c. See CALCINATION, FIRE, HEAT, AIR, &c.

**REVERBERATORY**, or **REVERBERATING furnace**, is a chymical furnace built close all around, and covered a-top with a capital of bricks or tiles, so as not to give any vent to the heat or flame, but to determine it to *reverberate* or turn back from the brick work with new force, upon the matters placed at bottom. See REVERBERATION.

When the fire has no vent or passage a-top, it is a whole *reverberatory*; when the middle of the capital is open, and only the sides close, so that there is only a half circulation of the flame, it is called a *half reverberatory*.

The *reverberating* furnace is chiefly used in the fusion and calcination of metals, and minerals, and on other occasions where the most intense heat is required, as in assaying, &c. Whence it is also called the *melting furnace*, and *assaying furnace*. See FURNACE, FIRE, FUSION, ASSAY, &c.

**REVEREND**, **REVERENDUS**, a title of respect given to ecclesiastics. See TITLE and QUALITY.

The religious abroad are called *reverend* fathers; abbesses, prioresses, &c. are called *reverend* mothers. See ABBOT, RELIGIOUS, &c.

With us, bishops are *right reverend*; and archbishops *most reverend*—In France their bishops, archbishops, and abbots, are all alike *reverendissime's*, *most reverend*. See BISHOP, &c.

**REVERIE**, a term purely French, frequently used of late in English, to signify a delirium, raving, or distraction—It is an ill sign when the patient falls into a *reverie*. See DELIRIUM.

Hence also **REVERY** comes to be used for any ridiculous, extravagant imagination, action, or proposition; a chimera or vision—Thus we say, authors obtrude abundance of their *reveries* upon us for solid truths.

But the most ordinary use of *revery* among English writers is for a deep, disorderly musing, or meditation; equivalent to what we popularly call a *brown-study*—Thus: a little distraction I would allow; but for that continued series of *reveries* some people are guilty of, who are even absent from the place where you see them, and are never present any where, it is inexcusable.

**REVERS**. *Battery de REVERS*. See the article BATTERY.

**REVERSATA arma**. See the article ARMA.

**REVERSE\***, in law, &c.—To *reverse*, signifies to undo, repeal, or make void. See REPEAL, ANNUL, &c.

\* The word is formed of the Latin, *re*, again, and *versus*, turned.

**REVERSE**, of a medal, coin, &c. denotes the second, or back-side; in opposition to the head or principal figure. See COIN, MEDAL, &c.

F. Chamillart, a jesuit, has an express dissertation on this point, whether or no the *reverses* of medals have always a regard to the emperors or empresses whose heads are represented on the front side of the medal? he says, that till of late the antiquaries have made no doubt of it; but that there are now several authors of another opinion.

**REVERSE**, in fencing, a back-stroke. See GUARD, FENCING, &c.

**REVERSED**, in heraldry, a thing turned backwards, or upside down. See INVERSE and INVERSION.

**REVERSED talon**, in architecture. See TALON.

**REVERSING**, or **RENVERSING**, in music, the inverting the order of the parts; that is, placing the higher part or treble, in the room of the lower part or bass. See PART, BASS, TREBLE, &c.

*Reversing* is frequently practised in figurative counterpoint, where the bass serves as treble; and the treble, at the same time, as bass; and all this, in such manner, as that the harmony, though very different, is yet as correct as before the *reversing*, when the parts were in their natural order.

To know how to dispose the parts, so as the *reversing* may not do any damage, is a secret, whereon M. Broffard has promised a treatise express.

A *reversed* fugue or counterfugue, called by the Italians, *per contrarii movementi*, is when the guida falls, and the other instead of imitating by falling, imitates by rising; or a figure *per arsin and thesin*. See ARSIS.

**REVERSION**, **REVERSIO**, in law, is defined by Coke, a returning of lands, &c. into the possession of the donor, or his heirs; after the expiration of the term for which they were given or granted to another. See DONATION, &c.

The word has a double acceptation—The first is, *jus revertendi cum status possessionis defecerit*, which is no more than an interest in the land, when the occupation or possession of it shall fall.

The second is, when the possession and estate, which was

parted with for a time, ceaseth, and is determined in the person of the alienees, assignees, grantees or their heirs; or effectually returns to the donor, his heirs or assigns, whence it was derived.

This is the most proper signification of the word, which is derived from *revertor*: *Et aptè dici non potest reversione antequam revertatur in factu*. Littlet.

The difference between a *reversion* and a *remainder* consists in this, that a remainder is general, and may remain or belong to any man but him that granteth or conveyeth the land, &c. See REMAINDER.

Whereas a *reversion* is to himself, from whom the conveyance of the land, &c. proceeded, and is commonly perpetual, as to his heirs also—And yet sometimes *reversion* is confounded with remainder.

For the values of *reversions*, or estates in *reversion*, the little book of tables for renewing and purchasing college and church leases, printed at Cambridge in 1700, and recommended by Sir Isaac Newton, furnishes us with a very useful table, which shews what one pound due at the end of any number of years to come, not exceeding 40, is worth in ready money, at 5, 6, 7, 8, and 10 per cent. per annum.

Suppose, it required, what 1 *l.* due a year hence, is worth in ready money: to find this by the common operations, the method is this—Let 100 *l.* with the interest of a year added to it, be the first term in the rule of three; 100 *l.* the second, and 1 *l.* the third; (for as 100 *l.* with it's interest going on to the end of the year, is to a bare 100 *l.* then due: so must 1 *l.* with it's growing interest, be to the decrease of 1 *l.* at the year's end) then, at 6 *l. e. gr.* and 10 *l.* per cent, the work will stand thus:

As, 106 . 100 :: 1 . . 0,9433071, or 18 *s.* 10 *d.*  $\frac{1}{4}$ .

110 . 100 :: 1 . . 0,90909, or 18 *s.* 2 *d.*

Whence it appears, that 1 *l.* due a year hence, at 6 *l.* per cent, is worth 18 *s.* 10 *d.*  $\frac{1}{4}$ ; and at 10 per cent, to 18 *s.* 2 *d.* So that 18 *s.* 10 *d.*  $\frac{1}{4}$  ready money, is worth 20 *s.* to be paid a year hence at 6 per cent; and 18 *s.* 2 *d.* ready money, is worth 20 *s.* to be paid a year hence at 10 per cent. See INTEREST.

But this table shortens the work—To find by it how to renew a lease of 21 years, that hath but one year lapsed, at the rate of 10 per cent; look into the same, and under the rate of interest mentioned, and right against 21 years, in the common angle of meeting, you have 2 *s.* 8 *d.*  $\frac{1}{2}$ , which is the fine to be paid to renew one year lapsed in the said lease; supposing the rent to be 1 *l.* per annum. For it is 21 years before the lease is compleated, in which time the fine of 2 *s.* 8 *d.*  $\frac{1}{2}$ , will amount to 20 *s.* and therefore by paying that fine, the lease may fairly be made up again.

Suppose again, an estate in fee-simple, whose real value is 100 *l.* but mortgaged, or leased out for 20 years; what is the *reversion* of it now worth at 6 *l.* per cent. interest?—By the table you find, that 1 *l.* to be paid 20 years hence, is worth but 6 *s.* 2 *d.*  $\frac{1}{4}$ , and multiplying that with 100, you will find 100 times 6 *s.* is 30 *l.* 00 *s.* 00 *d.* 100 times 2 *d.* or 200 *d.* makes 00 *l.* 16 *s.* 8 *d.* and 100 times  $\frac{1}{4}$ , or 300 *q.* makes 00 *l.* 6 *s.* 3 *d.* the sum is 31 *l.* 2 *s.* 11 *d.* which is the present value of 100 *l.* to be paid 20 years hence.

A TABLE

A TABLE of *reversions* shewing what 1*l.* due any number of years hence, under 41, is worth in ready money at 5, 6, 7, 8, and 10 per cent.

Years.	5 per Cent.	6 per Cent.	7 per Cent.	8 per Cent.	10 per Cent.
	s. d. q.	s. d. q.	s. d. q.	s. d. q.	s. d. q.

40	2 10 0	1 11 0	1 4 0	0 11 0	0 5 1

REVERSION of *series*, in algebra, is a method of finding a natural number from it's logarithm given; or the sine from it's arch; or the ordinate of an ellipsis from an area given to be cut off from any point in the axis. See SERIES. See also LOGARITHM, SINE, ORDINATE, &c.

REVERT, in law—A thing is said to *revert* when it returns or falls back to its first owner. See REVERSION.

All honours, and royal fees, alienated, *revert* to the crown; or are *revertible*—Apanages, or portions of younger sons of kings, are granted on condition of *reversion*. See APANAGE.

REVESTIARY or REVESTRY. See VESTRY.

REVIEW, in war, the shew or appearance of a body of troops, ranged in form of battle, and afterwards made to file off; to see if the companies be compleat, as to number and good condition; or to receive their pay, or the like.

The general always *reviews* his troops before they go into winter quarters, &c. See QUARTER.

REVIEW in chancery—A bill of REVIEW is, where the cause has been heard, and a decree therein signed and enrolled; but some error in law appears in the body of the decree or some new matter is discovered in time after the decree made. See DECREE—A bill of *review* is not exhibited but by leave of the court. See BILL, CHANCERY, &c.

REVISE, among printers, a second proof of a sheet to be printed, taken off after correcting the first. See PRINTING.

REVIVER. See the article REVIVOR.

REVIVIFICATION, or RESUSCITATION, in chymistry, the art of restoring a mixed body to it's first state, after it had been altered and disguised by dissolution, calcination, or the like.

Thus cinnabar and other preparations of mercury are *revived* or *revivified* into fluid mercury—Olaus Borrichius assures us, that having tormented mercury with several fires, for the space of a whole year; having reduced it into water, turbit, into ashes, &c. it *revivified*, and resumed it's first form in the middle of the flames, by the attraction of salt of tartar. See MERCURY.

Gold and other metals, it is said, may be recovered or *revivified* into running mercury, by the use of certain salts, which penetrating the substance of the metals, absorb the fixing ful-

phur or cement by which the mercury was before bound into a malleable mass. See METAL, GOLD, &c.

REVIVIFIED *antimony*. See the article ANTIMONY.

REVIVING, in law, a renewing of rents and actions, after they had been extinguished. See RENT, EXTINGUISHMENT, &c.

REVIVOR, or REVIVER in law—A bill of REVIVOR is where a bill has been exhibited in chancery against one who answers; but before the cause is heard, or at least before the decree is inrolled, one of the parties dies.

In this case, a bill of *revivor* must be brought, praying the former proceedings may stand *revived*; and be put in the same condition as at the time of the abatement. See BILL.

REVOCATION, REVOCATIO, in law, the act of *revoking*, calling back, or annulling a power, grant, &c. made before. See REPEALING.

The *revocation* of an offer after it is accepted of is invalid—All preceding wills or testaments are *revoked* by the last—A prior claustral is *revocable* at pleasure—The *revocation* of the edict of Nants was fatal to the French protestants. See EDICT.

REVOLUTION\*, in politics, denotes a grand turn or change of government. See GOVERNMENT.

\* The word is formed from the Latin, *re-volvere*, to roll backwards.

There are no states in the world but have undergone frequent *revolutions*—The abbot de Vertot has furnished us with two or three good histories of the *revolutions* of Sweden, the *revolutions* of Rome, &c.

The REVOLUTION, used by way of eminence, denotes the great turn of affairs in England in 1688; when king James II. abdicating, the prince and princess of Orange were declared king and queen of England, &c. See ABDICATION.

REVOLUTION, in geometry. The motion of any figure quite round a fixed line as an axis, is called the *revolution* of that figure; and the figure so moving is said to *revolve*. See AXIS.

Thus a right angled triangle revolving round one of it's legs, as an axis, generates by that *revolution*, a cone. See CONE.

REVOLUTION, in astronomy, denotes the period of the star, planet, comet, or other phenomenon; or it's course from any point of it's orbit, till it return to the same. See PLANET, PERIOD, &c.

The planets have a twofold *revolution*—the one about their own axis, usually called their *diurnal rotation*, which constitutes what we call their *day*. See DIURNAL and DAY—The other about the sun, called their *annual revolution*, or *period*; constituting their *year*. See ANNUAL and YEAR.

Saturn according to Kepler, makes his *annual revolution* in the space of 29 years, 174 days, 4 hours, 58' 25" 30". Jupiter in 11 years, 317 days, 14 hours, 49' 31" 56". Mars in 1 year, 321 days, 23 hours, 31' 56" 49". Venus in 224 days, 17 hours, 44' 55" 14". Mercury in 87 days, 23 hours, 14' 24". See SATURN, JUPITER, MARS, &c.

REVULSION, REVULSIO, in medicine, the turning a flux of humours, from one part of the body to another either neighbouring, or opposite part. See HUMOUR. DERIVATION, &c.

In very dangerous wounds, where the loss of blood is great, and the stopping it speedily enough, impracticable; it is usual to open a vein in some remote part, to cause a *revulsion*; that is, to turn the course of the blood from the former part, to that where the aperture is made. See PHLEBOTOMY.

*Revulsions* were also caused by cupping, friction, &c. See CUPPING and FRICTION.

REVULSION is also used for a spontaneous turn, or re-flux of humours in the body—Sudden diseases are occasioned by great *revulsions* of humours, which fall all at once on certain parts.

RHABDOIDES, *ῥαβδοειδής*, in anatomy, a name given the second true future of the skull; called also the *sagittal future*. See SUTURE and SAGITTALIS.

\* The word is formed from the Greek, *ῥαβδος*, rod, or staff, and *ειδής*, form.

RHABDOLOGY, or RABDOLOGY, in arithmetic, a name sometimes given to the method of performing the two most difficult and operose rules, *viz.* multiplication and division, by the two easiest, *viz.* addition and subtraction; by means of two little rods or laminæ, whereon are inscribed the simple numbers, and which are to be shifted according to certain rules.

These rods are what we popularly call *Nepair's bones*, from their inventor, a Scottish baron, who likewise invented logarithms—For their description and use, see NEPAIR'S-BONES.

RHABDOMANCY\*, an ancient method of divination, performed by means of rods, or staves. See DIVINATION.

\* Whence it's name, from the Greek, *ῥαβδος*, rod, and *μαντεια*, divination.

St Jerom makes mention of this kind of divination, in his commentary on Hoseah, chap. iv. 12. where the prophet says in the name of God, *my people ask council at their stocks; and their staff declareth unto them*: which passage that father understands of the Grecian *rhabdomancy*.

The same he finds over again in Ezekiel xxi. 21, 22, where the prophet says, *for the king of Babylon stood at the parting of the way, at the head of the two ways, to use divination; he made his arrows bright: or as St Jerom renders it, he mixed his arrows, he consulted with images, he looked in the liver.*

If it be the same kind of divination that is mentioned in the two passages; *rhabdomancy* must have been the same superstition with *belomancy*. See *BELOMANCY*.

In effect the two are ordinarily confounded — The seventy themselves translate the *רֹמֶשׁ* of Ezekiel by *ῥαβδος*, a rod; through in strictness it signifies an arrow.

This, however, is certain, the instruments of divination mentioned by Hoseah, are different from those of Ezekiel. In the former, it is, *עֵצוֹ מַקְלוֹ* *etso maklo*, his wood is staff: in the latter, *רֹמֶשׁ* *hitim*, arrows. Though it is possible they might use rods or arrows indifferently; the military men arrows, and the rest rods.

It appears by the laws of the Frisones, that the antient inhabitants of Germany practised *rhabdomancy* — The Scythians were likewise acquainted with the use hereof; and Herodotus observes, *lib. iv.* That the women among the Alani sought and gathered together fine straight rods or wands, and used them in the like superstition.

**RHACHITIS**, *ῥαχίτις*, in medicine. See *RICKETS*.

**RHAGADES**, *ῥαγάδες*, in medicine, a Greek term used for the chaps or clefts in the lips, hands, anus and other soft parts of the body.

*Rhagades* are a sort of fissures, or little chapped ulcers of the oedematous kind; formed of a sharp saline humour, and occasioning a great contraction, and streightening of the part, which is by this means shrivelled up like a wet parchment when held to the fire. See *OEDEMA*.

They are chiefly on the fundament, the neck of the womb, the præputium, lips, &c. sometimes even in the mouth; in which case the patient is not able to speak, chew, or the like. They are sometimes moist, and of a cancerous nature, eating deep, and difficult of cure; but are more commonly of a less malignant tendency, being the consequences of a diarrhæa, dysentery, or the like. See *TUMOUR*, *ULCER*, &c.

**RHAGOIDES**\*, *ῥαγοειδής*, in anatomy, the second coat, or tunic of the eye; more usually called *uvea*. See *UVEA* and *CHOROIDES*.

\* It has its name *rhagoides*, as resembling a grape-stone.

In the tunica *rhagoides* is the hole called the *pupil*. See *PUPIL*.

**RHAPONTICUM**\*, a medicinal root, in form resembling rhubarb; and nearly of the same virtues, whence it is sometimes called Turkish *rhubarb*.

\* It was called *rhaponticum*, *q. d.* root of Pontus; because chiefly produced in the country of Pontus in Asia.

It is frequently mixed with rhubarb by those who send that drug into Europe: they are distinguished by this, that the rhubarb is usually in roundish pieces, the internal streaks or lines whereof run transverse, and *rhaponticum* in longish pieces, having its streaks running lengthwise — Besides, that *rhaponticum* chewed in the mouth, leaves a viscosity behind it, which rhubarb does not. See *RHUBARB*.

The scarcity of the *rhaponticum* of the Levant, occasions the mountain *rhaponticum*, or monk's rhubarb, to be frequently substituted for it, which is a wild sort of lapathum, by botanists called *alpinum* — They are distinguished by this, that the former is yellow without, and reddish within; but the latter blackish without and yellow within.

Dr. Quincy, however, confounds the two, when he says, the *rhaponticum* grows plentifully in England; and that it is only used as an alterative, and does not come up to a cathartic.

It is certain, what now obtains in the shops, under the name of *rhaponticum*, is no other than the mountain *rhaponticum*, or monk's rhubarb; and is much inferior in virtue to the *rhaponticum verum*.

**RHAPSODI**, *ῥαψοδοί*, **RHAPSODISTS**, in antiquity, persons who made a business of singing pieces of Homer's poems.

Cuper informs us, that the *rhapsodi* were clothed in red when they sung the *Iliad*; and in blue when they sung the *Odyssey*.

They performed on the theatres; and sometimes for prizes, in contest of poetry, singing, &c.

After the two antagonists had finished their parts, the two pieces, or papers they were wrote in, were joined together again: whence the name, *viz.* from *ῥαπσω*, *suō*, I join together; and *ὠδή*, ode, song.

But there must have been other *rhapsodi* of more antiquity than these; people who composed heroic poems, or songs in

praise of heroes and great men, and sung their own compositions from town to town for a livelihood: of which profession was Homer himself.

Hence, some critics instead of the former origin, fetch the word *rhapsodist* from *ῥαβδος ὀδῶν*, to sing with a laurel rod in the hand, which it seems was the badge of the primitive *rhapsodi*.

Philocorus, again, derives the word from *ῥαπσω τὰς ὠδὰς*, *q. d.* *συνθῆναι*, to compose songs or poems as if they were the authors of the poems they sung. This opinion, to which Scaliger inclines, reduces these *rhapsodi* to the second kind.

In effect, it is probable that they were all of the same class, whatever distinction some authors may imagine; and that their business was to sing or rehearse poems, either of their own, or other people's composition, as might best serve their purpose, the getting of a penny — So that we do not apprehend it any injury to them, to set them on the foot of our ballad-singers; many of whom, no doubt, pen their own ditties. After Homer's time, it is no wonder they confined themselves altogether to his pieces, for which the people had the utmost veneration; nor is it surprising they should erect stages, &c. and dispute the point of recitation in fairs and markets.

**RHAPSODOMANCY**, *ῥαψοδομαντία*, an antient kind of divination performed by pitching on a passage of a poet at hazard, and reckoning on it as a prediction of what was to come to pass. See *DIVINATION* and *CHANCE*.

There were various methods of practising *rhapsodomancy* — Sometimes they wrote several verses or sentences of a poet, on so many pieces of wood, paper, or the like; shook them together in an urn, and drew out one, which was accounted the lot.

Sometimes they cast dice on a table, whereon verses were wrote; and that whereon the dye lodged, contained the prediction.

A third manner was by opening a book, and pitching on some verse, at first sight. This method they particularly called the *sortes prænestinæ*; and, afterwards, according to the poet thus made use of *sortes Homericae*, *sortes Virgilianæ*, &c. See *SORTES*.

**RHAPSODY**, *ῥαψῳδία*, in antiquity, a discourse in verse, sung or rehearsed by a *rhapsodist*. See *RHAPSODI*.

Others will have *rhapsody* properly to signify a collection of verses, especially those of Homer; which having been a long time dispersed in pieces and fragments, were at length by Pisistratus's order, digested into books, called *rhapsodies*: from the Greek *ῥαπσω*, *suō*, I sew; and *ὠδή*, song.

Hence among the moderns, *rhapsody* is also used for an assemblage of passages, thoughts, and authorities, raked together from divers authors, to compose some new piece — Lipsius's politics makes such a *rhapsody*, wherein there is nothing of the author's own, but conjunctions, and particles.

**RHETORIANS**, **RHETORII**, a sect of heretics in Egypt, denominated from their leader Rhetorius.

The distinguishing doctrine of this heresiarch, as represented by Philastrius, was, that he approved of all the heresies before him; and taught that they were all in the right — But what Philastrius mentions of him appears so absurd and ridiculous that St Augustin, *Hæres. 7.* could not persuade himself it was true.

**RHETORIC**\*, **RHETORICA**, the art of speaking copiously on any subject, with all the advantages of beauty and force. See *SPEAKING*.

\* The word is Greek, formed from *ῥητορικόν*, of *ῥηω*, *dico*, I speak; whence *ῥητορ*, speaker, orator, &c.

Lord Bacon defines *rhetoric*, very philosophically, the art of applying and addressing the dictates of reason to the fancy, and of recommending them there, so as to effect the will and desires — The end of *rhetoric*, the same author observes, is to fill the imagination with ideas and images, which may assist nature, without oppressing it. See *IMAGE* and *IMAGINATION*.

Vossius defines *rhetoric* the faculty of discovering what every subject affords of use for persuasion — Hence, as every author must invent arguments to make his subject prevail; dispose those arguments thus found out in their proper places: and give them the embellishments of language proper to the subject; and, if this discourse be to be delivered in public, utter them with that decency and force which may strike the reader: *rhetoric* becomes divided into four parts, *invention*, *disposition*, *elocution* and *pronunciation*; each whereof see under its proper head, *INVENTION*, *DISPOSITION*, *ELOCUTION*, and *PRONUNCIATION*.

*Rhetoric* and *oratory* differ from each other as the theory from the practice; the *rhetorician* being he who prescribes the rules of eloquence; and the orator he who uses them to advantage and speaks elegantly, &c. — Ordinarily, however, the two are used indifferently for each other. See *ORATORY*.

*Characters in RHETORIC*. See the article *CHARACTER*.

*RHETORICAL Numbers*. See the article *NUMBER*.

**RHEUM**,

**RHEUM\***, **RHEUMA**, *ῥευμα*, a thin serous humour, occasionally oozing out of the glands about the mouth and throat. See **HUMOUR**.

\* The word is formed from the Greek, *ῥέω, fluo*, I flow.

A fluxion of *rheum*, usually happening after taking cold, occasions excoriations and inflammations of the fauces, lungs, &c. See **FLUXION** and **DEFLUXION**.

**RHEUM** is also used for a *catarrh*, or a defluxion of such humours on the trachea, and the neighbouring parts; occasioning a coughing, spitting, hoarseness, running at the nose, &c. See **CATARRH**, **COUGH**, **HOARSENESS**, &c.

The *rheum* is not caused by a pituita falling from the brain on these parts, as the ancients imagined, there being no passage from the brain thither; but from a thin, sharp, serous humour, oozing out of the extremities of the glands about the fauces and throat.

The most ordinary occasion of *rheums*, is external cold; especially the being exposed to it when the body is much heated, —And hence the disorder itself is popularly called a *cold*.

*Rheums* falling on the breast, lungs, &c. are dangerous; others, not very violent, serve to clear the head, &c. The usual remedies are astringents, agglutinants and absorbents. See **ASTRINGENT**, &c.

**RHEUMATISM**, *ῥευματισμός*, in medicine, a painful disorder felt in various external parts of the body, accompanied with heaviness, difficulty of motion, and frequently a wandering fever.

A *rheumatism* is a pain usually wandering, but sometimes fixed in the muscular and membranous parts of the body; happening chiefly in autumn.

The proper seat of the *rheumatism* is supposed to be in the *membrana communis* of the muscles; which it renders rigid and unfit for motion without great pain. See **MEMBRANE**.

The *rheumatism* is either *universal* or *particular*.

**Universal RHEUMATISM** is that which attacks all the parts of the body, even the internal ones.

**Particular RHEUMATISM** is that which is confined to particular parts.

In which case the pains are usually erratic, passing from one side to another; but sometimes fixed. This is also called a *windy* or *scorbutic rheumatism*.

The *rheumatism* bears a great analogy to the gout; whence some call it the *universal gout*—The difference between them consists chiefly in this, that the *rheumatism* attacks not only the joints, as the gout does, but also the muscles and membranes between the joints. See **GOUT**.

A fit of the *rheumatism* is frequently preceded by a fever of two or three days; and sometimes by a shivering.—The attack happens in various parts of the body, as the hands, arms, thighs, legs, feet, &c. a redness, swelling, and lameness often succeeding.

The pain sometimes fixing on the loins, and reaching as far as the *os sacrum*; this disorder is called *lumbago*; and bears a near resemblance to the nephritis; being only distinguishable therefrom by this, that the latter is attended with a vomiting, which the former is not.

The *rheumatism* is supposed to arise from a sharp serous humour thrown on the sensible parts, and occasioning a pain by its vellication—Dr Quincy says, it proceeds from the same cause, as that whereby the mucilaginous glands become stiff and gritty in the gout. See **GOUT**.

Dr Musgrave takes it to be occasioned by a sharp alkaline salt, rather than an acid one; from this consideration, that the urine of *rheumatic* people does not afford above a thirtieth part of the alkaline salt found in that of healthful people.

Hence, he conjectures, that the salt is retained in the blood, implicated and embarrassed in the pituita; by which means it forms a viscosity which occasions all the pains and tumours of the *rheumatism*.

The exposing of the body too suddenly to the cold air, after having heated it to a great degree, is the most usual remote cause.—The cure is by evacuation; chiefly, according to Sydenham, by repeated phlebotomy, with a plentiful use of volatiles and diluters—Schmitzius recommends sudorifics; and Musgrave, cathartics, and emetics.

The *rheumatism* usually proves a tedious, lasting disease; holding for several months, sometimes years; not continually, but by paroxysms. In aged persons, and those of weak constitutions, and decayed viscera, it sometimes seizes the head.

**RHEXIS\***, or **RHEGMA**, among oculists, denotes a rupture of the cornea of the eye. See **CORNEA**.

\* The word is formed from the Greek, *ῥήγναι, ruptare*, of *ῥήγνυμαι, frango*, I break.

**RHIME**, or **RIME**, in poetry. See **RHYME**.

**RHINE-GRAVE**, in Germany, a count-palatine of Rhine. See **GRAVE** and **PALATINE**.

**RHINE-LAND-Rod**, in fortification, &c. a measure of two fathom, or 12 foot, used by the Dutch and German engineers, &c. See **MEASURE**, **FOOT**, and **DECEMPEDA**.

**RHODIUM lignum**, rhodian-wood. See **ASPALATH**.

**RHODON**, in pharmacy, from *ῥόδον, rosa*; a name given

VOL. II. N<sup>o</sup> 133.

to some compositions wherein roses are the chief ingredient; as *diarrhodon*, &c. See **DIARRHODON**, &c.—Hence also, **RHODOSACCHARUM**, i. e. *sugar of roses*, &c. See **ROSE**.

**RHOMBOIDES**, in geometry, a quadrilateral figure, whose sides and angles are unequal; but the opposite ones equal. See **FIGURE**.

Or, *rhomboides* is a quadrilateral figure, whose opposite sides and angles are equal; but is neither equilateral nor equiangular.

Such is the figure **NOPQ**. *Tab. Geometry, fig. 24.*

For the method of finding the area of a *rhomboides*, see **RHOMBUS**.

**RHOMBOIDES**, in anatomy, a muscle thus called from its figure—See *Tab. Anat. (Myol.) fig. 6. n. 29.* See also **MUSCLE**.

It lies under the cucullaris, and arises from the two inferior spines of the neck, and four superior of the back; and is inserted fleshy into the whole basis of the scapula, which it draws backwards, and a little upwards.

**RHOMBUS\***, *ῥόμβος*, in geometry, an obliqueangular parallelogram; or a quadrilateral figure, whose sides are equal and parallel, but the angles unequal: two of the opposite ones being obtuse, and the other two acute—Such is the figure **ABCD**. *Tab. Geometry, fig. 83.* See **FIGURE**.

\* The word is formed of the Greek *ῥομβος*, of *ῥέμειν*, to incompass, turn round.

To find the area of a rhombus, or rhomboides—Upon **CD**, which is here assumed as a base, let fall a perpendicular **Ae**; which will be the altitude of the parallelogram: multiply the base by the altitude, the product is the area—Thus, if **CD** be = 456, and **Ae** = 234; the area will be found 102704.

For it is demonstrated that an obliqueangular parallelogram is equal to a rectangle upon the same base **CD**, *fig. 25.* and of the same altitude **Ae**. (See **PARALLELOGRAM**.) But the area of a rectangle is equal to the factum of the base into the altitude. Therefore the area of an obliqueangular triangle is equal to the same. See **RECTANGLE**.

**RHOMBUS**, among surgeons, denotes a sort of bandage of a *rhomboidal* figure. See **BANDAGE**.

**RHOPALIC verses**, among the ancients, a kind of verses which began with monosyllables, and were continued in words growing gradually longer and longer to the last, which was the longest of all. See **VERSE**.

They had their name from the Greek *ῥοπαλον*, a club, which, like them begins with a slender tip, and grows bigger and bigger to the head—Such is that verse of Homer,

Ω μακαρ Ἀτρεΐδῃ μοι γέννηται, ὀλοῖο δαίμων.

And this Latin one of Ausonius:

*Spes deus æternæ stationis conciliator.*

**RHOPOGRAPHI\***, *ῥοπογράφοι*, in antiquity, an appellation given to certain painters, who confined themselves to low subjects; such as animals, plants, landscapes, &c.

\* The word is formed from the Greek *ῥοπος*, toys or odd ware, and *γραφω*, I write, I paint.

The same appellation was also given to such as cut figures of men, &c. in box, phleria, yew, &c. in gardens.

**RHUBARB**, **RHABARBARUM**, a medicinal root, large, compact and heavy; yellow without, of a nutmeg colour within; an astringent, bitterish taste; and an agreeable, aromatic smell: of great use in medicine, as a purgative. See **ROOT** and **PURGATIVE**.

Considering the mighty use of this drug, it is surprising we should know so little of the place where the plant grows that produces it—Some say it comes from the kingdom of Boutan, in the extremities of India; others, that it is found in the provinces of Xensi and Suchen in China. Others will have it only grow in Persia; and others on the confines of Muscovy; deriving its name from *rha*, the river among us called *Volga*, and *barbarum*, q. d. root found by the barbarians on the river *rha*.

*Rhubarb*, in Latin, *rhabarbarum officinarum*, was not known to the ancients; and their *rhaponticum*, which indeed resembles it, is not the real *rhubarb*. See **RHAPONTICUM**.

Good *rhubarb* steeped in water gives it a saffron colour; and when broke, looks bright, with somewhat of a vermillion cast.—Some druggists have the art of renewing their old roots, by dyeing them of a yellow hue; but the cheat is easily known by handling them; the powder wherewith they colour them sticking to the fingers.

*Rhubarb* is esteemed an excellent cathartic; proper in diarrhæas, to fortify the stomach, and to create an appetite.

M. Boulduc informs us, in the memoirs of the royal academy, that he drew extracts from *rhubarb* both with water and spirit of wine; but the purgative virtue, he says, was much more visible in the former than the latter; which shews that it consists more in a salt than an oil.—He observes, however, that *rhubarb* taken in substance, has a still better effect; and adds, that of all the operations he performed on it,

10 Z

none

none gave any credit to the common opinion, which ascribes an affringent quality to *rhubarb*.

**Monks RHUBARB.** See the article RHAPONTICUM.

**White RHUBARB.** See the article MECOACAN.

**RHUMB, RUMB, or RUM,** in navigation, a verticle circle, of any given place; or the interfection of a part of such a circle with the horizon. See VERTICAL.

*Rhumbs* therefore coincide with *points* of the world, or of the horizon. See POINT and HORIZON.

And hence the mariners distinguish the *rhumbs* by the same names as the points, and winds. See WIND.

They usually reckon 32 *rhumbs*; which are represented by the 32 lines in the rose, or card of the compass. See COMPASS.

Aubin defines a *rhumb*, a line on the terrestrial globe, sea-compass, or sea-chart, representing one of the 32 winds which serve to conduct a vessel—So that the *rhumb* a vessel pursues is conceived as it's rout, or course. See COURSE.

*Rhumbs* are divided, and subdivided like points—Thus, the whole *rhumb* answers to the cardinal point—The half *rhumb*, to a collateral point, or makes an angle of 45 degrees with the former—The quarter *rhumb* makes an angle of 22° 30' therewith—And the half-quarter *rhumb* makes an angle of 11° 15'. See CARDINAL, COLLATERAL, QUARTER, &c.

A table of the *rhumbs*, or points, and their distances from the meridian. See under the article WIND.

**RHUMB-LINE, loxodromia,** in navigation, is the line which a ship keeping in the same collateral point or *rhumb*, describes, throughout it's whole course. See LOXODROMY.

The great property of the *rhumb-line*, or loxodromia, and that from which some authors define it, is, that it cuts all the meridians under the same angle. See MERIDIAN.

This angle is called the *angle of the rhumb*, or the *loxodromic angle*. See ANGLE.

The angle which the *rhumb-line* makes with any parallel to the equator is called the *complement of the rhumb*. See COMPLEMENT.

An idea of the origin and properties of the *rhumb-line*, the great foundation of navigation, may be conceived thus—A vessel beginning it's course, the wind wherewith it is driven makes a certain angle with the meridian of the place; and as it is supposed the vessel runs exactly in the direction of the wind, it makes the same angle with the meridian which the wind makes.

Supposing, then, the wind to continue the same; as each point or instant of the progress may be esteemed the beginning, the vessel always makes the same angle with the meridian of the place where it is each moment, or in each point of it's course, which the wind makes.

Now, a wind, *e. gr.* that is north-east, and which of consequence makes an angle of 45°, with the meridian, is equally north-east wherever it blows; and makes the same angle of 45°, with all the meridians it meets—A vessel therefore driven by the same wind, always makes the same angle with all the meridians it meets withal on the surface of the earth.

If the vessel sail north and south, it makes an angle infinitely acute with the meridian, *i. e.* it is parallel to it, or rather fails in it—If it run east and west, it cuts all the meridians at right angles.

In the first case it describes a great circle; in the second, either a great circle, *viz.* the equator, or a parallel to it.—If it's course be between the two, it does not then describe a circle; since a circle drawn in such a manner would cut all the meridians at unequal angles, which the vessel cannot do.

It describes, therefore, another curve, the essential property whereof is, that it cuts all the meridians under the same angle—This curve is what we call the *loxodromic curve*, *rhumb-line*, or *loxodromy*. See CURVE.

It is a kind of spiral, which, like the logarithmic spiral, makes an infinity of circumvolutions without ever arriving at a certain point to which it still tends, and towards which it approaches every step. See SPIRAL.

This asymptotic point of the *rhumb-line* is the pole; to which were it possible for it to arrive, it would find all the meridians conjoined, and be lost in them. See POLE.

The course of a vessel, then, except in the two first cases is always a *rhumb-line*; which line is the hypotenuse of a rectangle-triangle, whose two other sides are the ship's way or distance run in longitude, and latitude. Now the latitude is usually had by observation (see LATITUDE) and the angle of the *rhumb*, with one or other of the two sides, by the compass. See COMPASS.

All therefore that is required by calculation in sailing, is the value of the length of the *rhumb-line*, or the distance run. See COURSE.

But as such curve line would prove very perplexing in the calculation; it was necessary to have the ship's way in a right line; which right line however must have the essential property of the curve line, *viz.* to cut all the meridians at right

angles—The method of effecting which see under the article CHART.

If PA, PF, PG, &c. (Tab. Navigation, fig. 19.) be supposed meridians, AI the equator, and AE another great circle of the sphere: AO will represent a *rhumb-line*, the angles whereof with the several meridians, being less than those of the great circle; it follows, that the *rhumb* is not a great circle of the sphere—If a ship therefore be at first directed towards E, and constantly persist in the same *rhumb*, it will never arrive at the place E, but at the place O, which is further from the equator AI.

Hence, as on the surface of a sphere, the shortest way between A and O is an arch of a great circle between A and O; the *rhumb-line* is not the shortest way, or least distance from one place to another. See CIRCLE, SPHERE, DISTANCE, &c.

**Use of the RHUMB-LINES in navigation.** 1°. If the meridians PA, PC, PD, &c. (fig. 20.) be not very far apart, the *rhumb-line* A I H G is divided by the equidistant parallels BI, KH, FG, &c. into equal parts.

Hence, 1°. the parts of the *rhumb* AI, and AG, are as the latitudes AL and AN of the places I and G—2°. Since the arches AB, IK, HF, are equal in magnitude, and therefore unequal in number of degrees; the sum of the arches, called the *latus mecodynamicum*, or *miles of longitude*, is not equal to the difference of longitude AB of the places A and G. See MECODYNAMICUM.

2°. The length of the *rhumb-line* AG is to the change or difference of latitude GD, in the same ratio, as the whole sine to the co-sine of the angle of the *rhumb*.

Hence, 1°. the *rhumb* failed on being given, together with the difference or change of latitude, turned into miles; the length of the *rhumb-line*, or the distance from the place A to the place G upon the same *rhumb*, is had by the rule of three—2°. The *rhumb* being given, together with the quantity of the ship's way on the same *rhumb*, *i. e.* the length of the *rhumb* AG; the difference of latitude DG, is had by the rule of three, in miles to be converted into degrees of a great circle—3°. The difference of latitude DG being given in miles; as also the length of the *rhumb-line* AG: the angle of the *rhumb*, and consequently the *rhumb* failed on is had by the rule of three—4°. Since the co-sine is to the whole sine as the whole sine to the secant; the difference of latitude GD, is to the length of the *rhumb-line* AG, as the whole sine to the secant of the angle of the *rhumb*.

3°. The length of the *rhumb-line*, or of the ship's way in the same *rhumb* AG, is to the *latus mecodynamicum*, or *mecodynamic side* AB+IK+HF, as the whole sine to the sine of the *loxodromic angle* GAP.

Hence, 1°. the *rhumb*, or angle of the *rhumb*, being given, as also the ship's way in the same *rhumb-line* AG; the *mecodynamic side* is had by the rule of three, in miles; *i. e.* in the same measure wherein the length of the *rhumb* is given—2°. In like manner the *mecodynamic side* AB+IK+HF being given, as also the *rhumb-line* or ship's way AG; the *rhumb* failed in is found by the rule of three.

4°. The change of latitude GD, is to the *mecodynamic side* AB+IK+HF; as the whole sine, to the tangent of the *loxodromic angle* PAG or AIB.

Hence, the *rhumb*, or *loxodromic angle* PAG, and the change of latitude GD, being given; the *mecodynamic side* is found by the rule of three.

5°. The *mecodynamic side* AB+IK+HF is a mean proportional between the aggregate of the *rhumb* AG, and the change of latitude GD and their difference.

Hence, the change of latitude GD, and the *rhumb-line* AG, being given in miles; the *mecodynamic side* is found in the same measure.

6°. The *mecodynamic side* AB+IK+HF being given; to find the longitude AD.

Multiply the change or difference of latitude GD by six, which reduces it into parts, of ten minutes each; divide by the product the *mecodynamic side*; the quotient gives the miles of longitude answering to the difference of latitude in ten minutes. Reduce these miles of longitude in each parallel into differences of longitude, from a *loxodromic table*. The sum of these is the longitude required. See LONGITUDE.

7°. If a ship sail on a north or south *rhumb*, it describes a meridian; if on an east or west *rhumb*, it describes either the equinoctial, or a parallel thereto. See SAILING.

8°. To find the *rhumb* between two places, by calculation, or geometrically. We have two canons, or proportions: the first—As the radius, is to the co-sine of the middle latitude; so is the difference of longitude to the whole departure from the meridian, in the course between the two places proposed. The second—As the radius is to the half sum of the co-sines of both latitudes; or (rather for geometrical schemes) as the diameter, is to the sum of the co-sines of both latitudes; so is the difference of longitude, to the departure from the meridian.

For an example of the former proportion—Let the *rhumb* be required between Cape Finisterre, latitude 43°, longitude 7° 20',

20', and St Nicholas Isle, latitude 38°, longitude 352°. The middle latitude is 40° 30', the complement 49° 30'; and the difference of longitude 15° 20'. Out of these lesser equal parts, prick down 15° from C to L, (*fig. 21*) and describe the arch BD with 60° of the chords, and make it equal to 49° 30', and draw CD continued farther to A—From L take the nearest distance to AC which is equal to LM, and make it one leg of a right angled triangle; make the other leg the difference of latitude 5°, which prick from the equal parts from L to B—Then, the extent MB measured on the same parts, shews the distance to be 13° 24'; which allowing 20 leagues to a degree, is almost 268 leagues—Then, with the radius CB setting one foot at M, cross the rhumb triangle at GH; which extent measured on the greater chord is almost 22°, the complement whereof is 68°; and so much is the rhumb from the meridian between the two places, amounting to 6 points, and upwards of 80 minutes.

For an instance of the latter proportion—Let it be required to find the rhumb and distance between the Lizard and Bermudas. The latitude of the Lizard being 56°, and that of Bermudas 32°, 20', or 32°, 41 centesims, and their difference of longitude, 55 degrees; draw the lines AC and CD (*fig. 21. No. 2.*) at right angles, and with 60° of the lesser chords describe the quadrant HI, and prick the radius from I to D; so is CD the diameter; then count both latitudes from H to F and G, the nearest distance from F to CI, is the co-sine of Bermudas latitude, which prick from C to E: Again, the nearest distance from G to CI, is the co-sine of the Lizard's latitude, which place from C to S, so is CS the sum of both co-sines; draw DS, and prick down 55 degrees, the difference of longitude from C to V, out of the greatest equal parts, and draw VB parallel to DS, so is CB the departure from the meridian in the course between both places—Making that therefore, one leg of a right-angled triangle, prick down 17°, 59 centesims, the difference of latitude between those places, out of the same equal parts from C to L, and draw BL—This represents the course and distance between the Lizard and Bermudas; and the extent LB measured on the same equal parts, shews the distance to be 44°, 31 centesims, which allowing 20 leagues to a degree, is 886 leagues.

Then, to find the course—With 60° of the chords, setting one foot in L, with the other make marks at Y and Z; then the extent ZY, measured on the chord, shews the rhumb to be 66°, 37' from the meridian. This proportion in the present example, holds very just, according to Mercator's chart; whereas the former proportion, by the middle latitude, would have given the rhumb 67°, 2', from the meridian, and the distance 902 leagues.

Again, making CA equal to CV, a line joining LA would be the course and distance according to the same longitudes and latitudes laid down on the plain chart; whereby the course should be 72°, 17' from the meridian, and the distance 1155 leagues. See SAILING, CHART, &c.

**RHYAS\***, *ῥυαs*, in medicine, a diminution or consumption of the caruncula lachrymalis situate in the great canthus or angle of the eye. See CARUNCULA.

\* The word is formed from the Greek, *ῥω*, to flow.

The *rhyas* is used in opposition to the *encanthis*, which is an excessive augmentation of the same caruncle. See ENCANTHIS.

The cause of the *rhyas* is a sharp humour falling on this part; and gnawing and consuming it by degrees; though it is sometimes also produced by the too great use of cathartics in the fistula lachrymalis—It is cured by incarnatives.

**RHYME, RHIME, RYME, or RIME**, in poetry, the similar sound, or cadence and termination of two words which end two verses, &c. See VERSE.

Or, *rhyme* is a similitude of sound between the last syllable or syllables of one verse, and the last syllable or syllables of a verse succeeding either immediately or at a distance of two or three lines.

*Rhyme* is a modern invention, the product of a Gothic age: Milton calls it the *modern bondage*. Yet some authors will have it, that the English, French, &c. borrow their *rhyme* from the Greeks and Latins—The Greek orators, say they, who endeavoured to tickle the ears of the people, affected a certain cadence of periods, which ended alike, and called them *ῥυμωδία*. The Latins, who imitated them, called these chiming terminations, *similiter definitia*.

This affectation increased as the Latin tongue declined; so that in the later Latin writers, scarce any thing is more common than *rhyming* periods.

The French, and from them the English, &c. adopted this cadence of *rhyme*, which seemed to them more pretty, and agreeable than the metrical verses of the Greek and Roman poets. See MEASURE, QUANTITY, VERSIFICATION, &c.

This kind of Latin poetry in *rhyme* was much in vogue in the XIIth century; and the verses thus running were called

*leonine verses*; for what reason Camden owns he does not know; (for a lion's tail, says he, does not answer to the middle parts as these verses do) but doubtless they had their name from a canon called *Leoninus*, who first composed them with success, and of whom we have several pieces remaining, addressed to pope Adrian IV. and Alexander III. See **LEONINE verses**.

Camden has given us a collection of Latin *rhymes* of our antient English writers; among whom Walter de Mapes, archdeacon of Oxford, in the time of king Henry II. makes a principal figure: especially for two pieces, the one in praise of wine, beginning,

*Mihi est propositum in taberna mori,  
Vinum sit oppositum morientis ori;  
Ut dicant, cum venerint, angelorum chori,  
Deus sit propitius huic potatori.*

The other against the pope, for forbidding the clergy to have wives; beginning,

*Prisciani regula penitus cassatur,  
Sacerdos per hic & hæc olim declinatur;  
Sed per hic solummodo, nunc articulatur,  
Cum per nostrum præfulem hæc amoveatur.*

Since the restoration of learning in the 16th century, attempts have been made to banish *rhyme* out of the modern poetry, and to settle the English and French verses on the footing of the antient Greek and Latin ones; by fixing the quantities of the syllables, and trusting wholly to those, and the numbers or measure. See QUANTITY, NUMBERS, &c.

This, Milton has done with great success, in his *Paradise Lost*, and other pieces; and after him Philips, Addison, and some others—Verses of this kind we call *blank verses*.

The French have attempted the same, but not with the same success—Jodelet made the first essay; and after him Pasquier; but they failed. Paerlat and Rapin followed them, and failed like them. Their hexameter and sapphic verses were neither imitated nor approved; and the cadence of *rhyme* was preferred to quantity, or the use of long and short syllables. Des Portes likewise made some essays of verses constructed of long and short verses without *rhyme*, but the attempt only served to convince the world that this kind of measure is inconsistent with the genius of the French tongue.

To succeed in such kind of verses there must be a liberty of varying the order of the words, or of changing their situation as may best suit the occasions of the poet; of making the substantive either go before, or follow after the verb, as the verse requires, &c. Now none of the modern tongues admit of such an arbitrary situation of the words equally with the antient; yet none more than the English, nor less than the French. See CONSTRUCTION.

*Rhymes* are either *single*, or *double*, or *treble*; though the two last are now disused.

**Single RHYMES** are divided into perfect or whole *rhymes*, and imperfect or half *rhymes*.

A *whole* or *perfect RHYME* is where there is a similitude of sound, without any difference; or where a thorough identity of sound appears in the pronunciation of the two syllables, notwithstanding that there may by some difference in the orthography.

An *imperfect* or *half RHYME* is where there is a similitude with a difference, either in respect of the pronunciation or the orthography; but chiefly the former.

In the time of S. Louis, the French began to be more exact in their versification; and to distinguish their *rhymes* into *masculine* and *feminine*; and to observe a regular mixture of the two, in their verses—The invention of this mixture is usually attributed to Marot; however it was Ronfard who first practised it with success. See MASCULINE.

The *feminine RHYME* is that where the last syllable of the *rhyme* ends with an *e* mute or quiescent: as in *dove*, *belle*, &c.

**Masculine RHYMES** are those of all other words.

Menage observes that masculine *rhymes* close the periods better: but that feminines, being the softer and more languishing, end more agreeably, especially in mournful subjects.

**Double RHYMES** by the French called *rich rhymes*, are those where the two words terminate alike through the whole two last syllables, as *squabble* and *rabble*, &c.

**Plain RHYMES** are those where the two *rhyming* verses succeed immediately to each other.

**Cross RHYMES**, those where the verses are so disposed as that the first *rhymes* with the third, and the second with the fourth, &c.

**Assonant RHYMES**. See the article ASSONANT.

**RHYPTICS, RHYPTICA**, *ῥυπτικά*, in medicine, detergent remedies, or cleansers. See DETERGENT.

**RHYTHM, RHYTHMUS**, *ῥυθμός*, in music, the variety in the movement as to the quickness or slowness, length and shortness of the notes. See NOTE and HETERORHYTHMUS.

Or, the *rhythmus* may be defined more generally, the proportion which the parts of a motion bear to each other. See RHYTHMICA.

Aristides among the antient musicians, applies the word *rythmus*

*mus* three ways: viz. either to immoveable bodies, when their parts are rightly proportioned to each other; as a well-made statue, &c. or to things that move regularly, as in handsome walking, in dancing, in the dumb shews of the pantomimes, &c. or thirdly, to the motion of sound, or the voice; in which, the *rythmus* consists of long and short syllables or notes joined together in succession in some kind of order, so as their cadence on the ear may be agreeable.

This, in oratory constitutes what we call a *numerous stile*, and when the tones of the voice are well chosen, an *harmonious stile*. See *STYLE* and *NUMBERS*.

In effect, *rythmus* in the general is perceived either by the eye or ear; and may either be with or without metre: but the strict musical *rythm* is only perceived by the ear, and cannot exist without it—The first either exists without sound, as in dancing; or with sound; it may be either without any difference of acute and grave, as in a drum, or with a variety of these as in a song.

The *rythmus* of the antients Mr Malcom observes, was very different from that of the moderns—The former was only that of the long and short syllables of the words and verses: it depended altogether on the poetry, and had no other forms or varieties than what the metrical art afforded. The changes therein are none but those made from one kind of metre to another, as from Iambic to Choric, &c.

In the modern music, the constitution of the *rythmus* differs from that of the verse, so far, that in setting music to words, the thing chiefly regarded is to accommodate the long and short notes to the syllables in such manner, as that the words be well separated, and the accented syllable of each word so conspicuous, that what is sung may be distinctly understood. See *MELODY*.

Vossius in his book *de poematum cantu & viribus rhythmi*, extols the antient *rythmus*—Though he owns it was confined to the metrical feet; yet so well did they cultivate their language, especially in what relates to the *rythmus*; that the whole effect of the music was ascribed to it, as appears by that saying of theirs, το παν παρα μουσικης ε ερυθμος. See *MUSIC*, *PANTOMIME*, &c. See also *ODE*, &c.

**RHYTHM, RHYTHMUS**, in the antient poetry, denotes the measure of the feet, or the number and combination of long and short syllables; called also *metre* and *quantity*. See *MEASURE*, *QUANTITY*, &c.

Vossius attributes the whole force of the antient music to their happy *rythmus*: but this is somewhat inconceivable. Mr Malcolm rather takes it, that the words and sense of what was sung had the chief effect: hence it was that in all the antient music the greatest care was taken, that not a syllable of the words should be lost, lest the music should be spoiled.

Pancirollus seems of this opinion; and the reason he gives why the modern music is less perfect than the antient, is, that we hear sounds without words. See *MUSIC*.

Vossius says, the *rythm* which does not express the very forms and figures of things, can have no effect; and that the antient poetical numbers alone are justly contrived for this end—He adds, that the modern languages and verse is altogether unfit for music; and that we shall never have any right vocal music till our poets learn to make verses capable of being sung, i. e. till we new model our languages, restore the antient quantities and metrical feet, and banish our barbarous rhymes.

Our verses, says he, run all as it were on one foot; so that we have not any real *rythmus* at all in our poetry: he adds, that we mind nothing farther than to have such a number of syllables in a verse, of whatever nature, and in whatever order. But this is an unjust exaggeration. See *VERSE*.

**RHYTHMICA, RHYTHMICE**, *ῥυθμικα*, in the antient music, that branch of music which regulated the *rythmus*. See *RHYTHMUS*.

The *rythmica* considered the motions; regulated their measure, order, mixture, &c. so as to excite the passions, keep them up, augment, diminish, or allay them.

Aristides and other antient musical writers, divided artificial music into *harmonica*, *rythmica*, and *metrica*. See *MUSIC*. But the *rythmica* with them likewise comprehended dumb motions, and in effect, all *rythmical*, i. e. regular motion. Porphyry divides music into *harmonica*, *rythmica*, *metrica*, *organica*, *poetica*, and *hypocritica*. See *HARMONICA*, &c.

The antients seem to have had no rhythm in their music beside the long and short syllables of their words and verses, which were sung, and always made a part of their music; so that the *rythmica* with them was only the application of the metrical feet, and the various kinds of verses used by them—The modern goes much farther. See *RHYTHM*.

**RHYTHMOPOEIA**, one of the musical faculties, as they are called, which prescribes rules for the motions, or *rythm*. See *RHYTHM*.

The antient *rythmopoeia* is very defective—We find nothing of it in the books of the antients but some general hints; which can scarce be called rules. In their explications there

appears nothing but what belongs to the words and verses of their songs, which is a strong presumption they had no other. See *RHYTHMICA*.

**RIAL**\*, or **RYAL**, a Spanish silver coin; being the eighth part of the piafter or pieces of eight. See *PIECE of eight*.

\*The word in the original Spanish, *real*, signifies *royal*.

The *rial* is equal to about six pence  $\frac{1}{4}$  sterling. See *COIN*.

The silver *rial* is equal to 34 silver maravedis; the copper *rial* to 44 copper maravedis, which only amounts to 18 silver maravedis. See *MARAVEDI*.

There are also *rials* of eight, *rials* of four, *rials* of two, and half *rials*—The *rials* of eight are the piafters; those of four, half piafters, &c.

Great quantities of *rials*, or *rials* of eight, are carried into the East-Indies, where they are divided into three classes, and received on different footings, viz. the *old rial*, known by the chaplet around, whereof 100 are current for 215 rupees: the *second*, known by the largeness of it's bead, current at 212 $\frac{1}{2}$  rupees for 100; and the *new* at 208 $\frac{1}{2}$  rupees for 100 *rials*. See *RUPEE*.

**RIAL** or **ROYAL** is also the name of a piece of gold, antiently current among us for ten shillings. See *COIN*.

In 1 Henry VI. by indenture of the mint, a pound weight of gold of the old standard was coined into 45 *rials*, going for ten shillings a-piece, or a proportional number of half *rials*, going at five shillings a-piece: or *rial farthings*, which went at 2 s. and 2 d.

In 1 Henry VIII. the gold *rial* was ordered to go at 11 s. 3 d.—In 2 Elizabeth gold *rials* were coined at 15 s. a-piece, when a pound weight of old standard gold was to be coined into 48 *rials*.—In 3 James I. rose *rials* of gold were coined at 30 s. a-piece, and *spur-rials* at 15 s. See *MONEY*.

**RIBBAND**, or **RIBBOND**, a narrow sort of silk, chiefly used for head ornaments, badges of chivalry, &c. See *SILK*. The knights of the garter wear a blue *ribbond*, those of the thistle, a green *ribbond*, &c. scarfwise. See *COLLAR*, *GARTER*, &c.

**RIBBAND**, or **RIBBON**, in heraldry, is the eighth part of a bend. See *Tab. Herald. fig. 82*. See also the article *BEND*. It is borne a little cut off from the out-lines of the escutcheon; thus; he beareth or, a *ribband* gules.

**RIBBING nails**. See the article *NAIL*.

**RIBS**, *costæ*, in anatomy, long, arched bones; serving to form or sustain the inner sides of the thorax, or breast—See *Tab. Anat. (Osteol) fig. 7. lit. p. p. &c.* see also *BONE* and *THORAX*.

The *ribs* are in number 24; twelve on each side—Their figure is an imperfect segment of a circle, harder, rounder, and more incurved towards their articulation with the vertebrae, than at the other extremity towards the sternum, which is thinner, broader, and more spungy.

The *ribs* are divided into *true* or genuine, and *spurious*.

The *true RIBS* are the seven upper pair, which are thus distinguished, as forming the most perfect arches, and as having a strong articulation with the sternum—See *Tab. Anat. (Osteol) fig. 3. lit. a. a. &c.* see also *STERNUM*.

The five lower are called *nothæ*, or *spurious RIBS*, as being smaller, shorter, and more cartilaginous than the rest, and not reaching so far as the sternum, which makes their articulation very lax; in regard they terminate in long, soft cartilages, which bending upwards are joined to the upper ribs.—See *Tab. Anat. (Osteol) fig. 3. lit. c. c. &c.*

On the inside of the *true ribs*, except the lowest, and sometimes the next to it, runs a pretty deep sinus, reaching from the end next the spine, almost to it's juncture with the cartilage.

All the *ribs*, together with the sternum, are raised by the respiratory muscles, in the action of inspiration; by which means, and the descent of the diaphragm in that action, the cavity of the thorax is enlarged for the more commodious expansion of the lungs. See *RESPIRATION*.

**RIBS of a ship**, are the timbers of the futtocks, when the planks are off; so called because they are bent like the *ribs* of a carcase or skeleton.

**RICE**, *oriza*, a grain or a seed of a leguminous plant of the same name; frequent in the East-Indies, in Greece, and Italy. See *LEGUMINOUS*.

The grains of *rice* which grow in clusters each terminated with a spica or beard, are inclosed severally in yellow rough capsulæ, or cases. When stript of their skin they appear almost oval; of a shining white colour, and as it were transparent. *Rice* grows in moist marshy places.

Throughout the East, and a great part of the Levant, *rice* is the principal food, and serves for bread—In the Indies the women thrash and dress all the *rice*, which is a very painful office, that the men leave to them either out of idleness, or disrespect.

*Rice* is a great food in the Roman Catholic countries in time of Lent—The ordinary preparation is by first steeping it in water, then boiling it in milk—Some make it into a sort of farina, or flower, by pounding it in a mortar, after having first put it hot water, and again washed it out in cold.

*Rice*

*Rice* is of some use in medicine, being esteemed proper to soften and thicken sharp humours, to moderate fluxes of the belly, &c. — The northern nations eat their fowls and other meats with *rice* and saffron — The Chinese make a wine of *rice*, which is of an amber colour, tastes like Spanish wine, and serves them for their common drink — In some parts of Europe they also draw a very strong brandy or spirit from *rice*. See BRANDY and SPIRIT.

**RICKETS, RHACHITIS**, in medicine, a disorder affecting the bones of children, and causing a considerable protuberance, incurvation, or distortion thereof. See CHILDREN, BONE, &c.

It sometimes arises from a fault in swathing the child; rolling him too tight in some places, and too loose in others; placing him in an inconvenient, or too often in the same posture, or suffering him to be long wet — It is likewise attributed to the want of proper motion, and the using of the child to be borne in one arm only; whence the legs and knees remain too long in the same incurvated situation.

Or it may be occasioned by some fault in the digestion, occasioning the aliment to be unequally applied to the body, by which some parts of the bones increase in bulk more than the rest.

The *rickets* usually appear between the first eight months, and the sixth year of the child's age: the part it affects grows lax, flaccid, and weak; and if it be the legs, they become unable to support the body — All the parts subservient to voluntary motion are likewise debilitated and enfeebled; and the child grows pale, sickly, slothful, and cannot sit erect.

His head generally becomes too large for the trunk, and cannot be supported or managed by the muscles of the neck, which gradually wear away. Swellings, and knotty excrescences appear in the wrists, ancles, and tips of the ribs; and the bones of the legs and thighs grow bowed or crooked — The like disorder sometimes also seizes the bones of the arms.

If the symptoms continue long, the thorax becomes strait, a difficulty of respiration ensues, as also a cough, and a hectic fever; the abdomen swells, the pulse grows weak and languid, and the symptoms increasing, at length prove mortal.

When the child is able to talk before he can make use of his legs, he is presumed to have the *rickets*.

When the disorder is taken early, it may be remedied by proper bolsters and bandages, suited to the parts affected: but when the bones are grown rigid and inflexible, other mechanical contrivances, as padding, strait boots, and several sorts of machines or engines, made of paste-board, whale-bone, tin, &c. are made use of; to restore the distorted bones to their natural straitness.

Cold bathing is also found of service in the *rickets*, before the distemper comes to be confirmed, during May and June; continuing the child in the water two or three seconds at each plunge.

Others chuse a liniment of rum and palm oil; and others a plaister de minio and oxycroceum, applied along the back, to cover the whole spine — Dry frictions over the whole body, with a warm linnen cloth before the fire, especially on the parts affected, are found of service. The oil of snails is very famous for the same intention, being what drops from them, after bruising and suspending them in a flannel bag. With this the limbs and spinal bone are anointed.

**RIDDLE**. See the article **ÆNIGMA**.

**RIDE**, of hazle, or other wood, is a group or plump of sprigs shooting out of the same root, or foot.

**RIDE**, in the manage — To *ride* signifies to learn to *ride* — Thus, he rides under a good master. See HORSE, HEEL and GENET.

**RIDE**, in the sea language, is a term variously applied — Thus, a ship is said to *ride*, when her anchors hold her fast, so that she drives not away by the force of the wind or tide.

A ship is said to *ride well*, when she is built so as not to overbeat herself into an head sea, as that the waves over-rake her (that is, over wash her) from stem to stern.

A ship *rides a cross*, when she *rides* with her main-yards and fore yards hoisted up to the hounds; and both yards and arms topped alike.

She is said to *ride a peak* when one end of the yard is peeked up, and the other hangs down: this is also said of a ship when in weighing, she is brought directly over her anchor. See PEAK.

She is said to *ride athwart*, when her side is to the tide — and to *ride betwixt wind and tide*, when the wind hath equal force over her one way and the tide another — If the wind have more power over her than the tide, she is said to *ride wind road*.

She is said to *ride hawseful*, when in a stress of weather she falls so deep, that the water runs in at her hawses.

She is said to *ride por-toise*, when her yards are struck down upon the deck, or when they are down a-port-laft.

VOL. II. N<sup>o</sup> CXXXIV.

**RIDEAU\***, in fortification, a small elevation of earth, extending itself lengthways on a plain; serving to cover a camp, or give an advantage to a post.

\* The word in it's original French signifies a curtain or cover; formed from the Latin, *ridellum* — Borel derives it from *ridere*.

A *rideau* is also convenient for those who would besiege a place at a near distance, and to secure the workmen in their approaches to the foot of a fortress.

**RIDEAU**, is sometimes also used for a trench, the earth whereof is thrown up on it's side; to serve as a parapet for covering the men. See TRENCH.

**RIDERS**, in a ship, are great timbers both in the hold and aloft, which are bolted on to other timbers to strengthen them when the ship is discovered to be too slightly built. — See *Tab. Ship*, fig. 2. n. 47. 49. 50.

**RIDER** is also used for after-clauses, added to bills, whilst they are depending in parliament. See BILL and PARLIAMENT.

**Out-RIDERS**. See the article **OUT-riders**.

**RIDER-roll**. See the article **ROLL**.

**RIDGE**, in building, the highest part of the roof or covering of a house. See ROOF.

*Ridge* is particularly used for the piece of wood wherein the rafters meet. See RAFTER.

**RIDGE-TYLE**. See the article **TYLE**.

**RIDGES** of a horse's mouth, are wrinkles or risings of the flesh in the roof of the mouth, running a-cross from one side of the jaw to the other, with interjacent furrows. See HORSE. It is commonly in the third or fourth *ridge* that the farriers strike with the horn in order to bleed a horse whose mouth is over-heated.

**RIDGLING**, or **RIDGEL**, among farriers, &c. the male of any beast that has been but half gelt. See GELDING.

**RIDICULE**. See LAUGHTER, RISIBILITY, &c.

**RIDING**, a division of Yorkshire; whereof there are three, viz. the East-riding, West-riding, and North-riding.

In indictments in that county, it is necessary the town and riding be expressed.

**RIDING-CLERK**, one of the six clerks in chancery, who in his turn, for one year, keeps the controllment books of all grants that pass the great seal that year. See CLERK, GRANT, &c.

**RIENS arrear**, in law, a kind of plea used to an action of debt, upon arrearages of accounts; whereby the defendant alleges that there is *nothing in arrear*. See ARREAR.

**RIENS passe par le fait**, nothing passes by the deed, is the form of an exception taken in some cases to an action. See EXCEPTION and DEED.

**RIENS par descent**, nothing by descent, is the plea of an heir, when sued for his ancestor's debt, though he had no lands from him by descent, nor has assets in hand. See DESCENT.

**RIER**, or **REER-COUNTY**, **RETRO COMITATUS**, is used in our law books in opposition to *open county*. See COUNTY.

This appears to be some public place, which the sheriff appoints for the receipt of the king's money, after the end of the county court — Fleta says it is *dies crastinus post comitatum*.

**RIGADOON\***, a kind of dance, borrowed originally from Provence; performed in figure, by a man and a woman — The *rigadoon* is gay, merry, &c.

\* The word is formed from the French *rigodon*, which signifies the same.

**RIGEL**. See the article **REGEL**.

**RIGGING**, of a ship, includes her whole cordage; or all the ropes belonging to her masts, and yards, &c. — See *Tab. Ship*, fig. 1. see also CORDAGE, ROPE, &c.

A ship is said to be *well-rigged* when all her ropes are of their fit size, in proportion to her burden — She is *over-rigged*, when her ropes are too big for her; which wrongs her much in her sailing, and is apt to make her heel. See SHIP.

**RIGHT**, in geometry, something that lies evenly, and without inclining or bending one way or another.

Thus, a *right line* is that whose several points all tend the same way. See LINE, INCLINATION, and PARALLEL.

In this sense *right* signifies as much as *straight*, and stands opposed to *curved* or *crooked*. See CURVE.

**RIGHT angle** is that formed by two lines falling perpendicularly on one another. See PERPENDICULAR.

The quantity or measure of a *right angle* is a quadrant of a circle, or 90° — All *right angles* therefore are equal. See ANGLE.

In this sense the word *right* stands opposed to *oblique*. See OBLIQUE.

**RIGHT-angled** is understood of a figure when it's sides are at right angles, or stand perpendicularly one upon another. See FIGURE.

This sometimes holds in all the angles of the figure, as in squares and rectangles; sometimes, only in part, as in *right angled triangles*.

**RIGHT-conc**. See the article **CONE**.

**RIGHT lined angle.** See the article **ANGLE**.

**RIGHT sine.** See the article **SINE**.

The word here stands contradistinguished to *versed*. See **VERSED**.

**RIGHT sphere,** is that where the equator cuts the horizon at right angles—Or, that wherein the poles are in the horizon, and the equator in the zenith. See **SPHERE**.

Such is the position of the sphere with regard to those who live directly under the equator—The consequences hereof are, that they have no latitude nor elevation of the pole—They can see nearly both poles of the world; all the stars rise, culminate, and set with them, and the sun always rises and descends at right angles to their horizon, and makes their days and nights equal. See **LATITUDE**, **STAR**, **RISING**, **DAY**, **NIGHT**, &c.

In a *right sphere* the horizon is a meridian; and if the sphere be supposed to revolve, all the meridians successively become horizons, one after another. See **HORIZON**, &c.

**RIGHT Ascension,** of the sun, or a star, is that degree of the equinoctial, accounted from the beginning of aries, which rises with the sun or star in a *right sphere*. See **ASCENSION**.

**Angle of RIGHT ascension.** See **ANGLE**.

**Parallax of RIGHT ascension.** See **PARALLAX**.

**RIGHT descension.** See the article **DESCENSION**.

**Parallax of RIGHT descension.** See **PARALLAX**.

**RIGHT, sailing,** is when a voyage is performed on some one of the four cardinal points. See **SAILING** and **CARDINAL point**.

If a ship sail under the meridian, that is, on the north or south points, she varies not in longitude at all, but only changes the latitude, and that just so much as the number of degrees she hath run. See **LATITUDE**.

If a ship sail under the equinoctial, upon the very east or west points, she alters not her latitude at all, but only changes the longitude, and that just so much as the number of degrees she has run. See **LONGITUDE**.

If she sail directly east or west, under any parallel, she there also altereth not her latitude, but only the longitude; yet not according to the number of degrees of the great circle she hath sailed in, as under the equinoctial, but more according as the parallel is remoter from the equinoctial towards the pole. For the less any parallel is, the greater is the difference of longitude. See **RHUMB**.

**RIGHT circle,** in the stereographical projection of the sphere, is a circle at right angles to the plane of projection, or that which passes through the eye. See **CIRCLE**, **PROJECTION** and **STEREOGRAPHIC**.

**RIGHT, RECTUM,** in logics and ethics. See **RECTITUDE**.

In this sense the word stands opposed to *wrong*, *erroneous*, *false*, &c. See **ERROR**, **FALSHOOD**, &c.

**RIGHT, jus,** in law, signifies not only a property, for which a writ of right lies, but also any title or claim, either by virtue of a condition, mortgage, or the like, for which no action is given by law, but only an entry. See **PROPERTY**. Such are, *jus proprietatis*, a right of property: *jus possessionis*, a right of possession, and *jus proprietatis & possessionis*, a right both of property and possession. See **POSSESSION**, &c.

This last was formerly called *jus duplicatum*—As, if a man be disseised of an acre of land, the disseisee hath *jus proprietatis*; the disseisor hath *jus possessionis*, and if the disseisee release to the disseisor, he hath *jus proprietatis & possessionis*.

**Hereditary RIGHT.** See the article **HEREDITARY**.

**Pretensed RIGHT.** See **PRETENSED**.

**RIGHT of reformation.** See **REFORMATION**.

**Writ of RIGHT.** See the article **WRIT**.

**RIGHT in court.** See **RECTUS in curia**.

**RIGHT distillation.** See **DISTILLATION**.

**RIGHT the helm,** a sea phrase, ordering to keep the helm even with the middle of the ship. See **HELM**.

**RIGID marble.** See the article **MARBLE**.

**RIGIDITY,** among philosophers, a brittle-hardness; or that kind of hardness supposed to arise from the mutual indentation of the component particles within one another. See **HARDNESS**.

**Rigidity** is opposed to ductility, malleability, &c. See **DUCTILITY**.

**RIGLET.** See the article **REGLET**.

**RIGOL,** a kind of musical instrument, consisting of several sticks bound together, only separated by beads—It makes a tolerable harmony, being well struck with a ball at the end of a stick.

**RIGOR,** in medicine, a convulsive shuddering, from severe cold, an ague-fit, or other disorder. See **HORROR**, **FEVER**, **AGUE**, &c.

**RILL, or RIVULET.** See the article **RIVER**.

**RIM,** in a watch or clock, the circumference, or circular part of a wheel. See **WHEEL**, **WATCH**, **CLOCK**, &c.

**RIMA,** literally denotes a fissure, or chink. See **FISSURE** and **RHAGADES**.

Hence, it is applied to several parts of the body that bear a

resemblance thereto: as *rima pudendi*, fissura magna, the same with *vulva*; *rima laryngis*, the aperture of the larynx, called the *glottis*. See **GLOTTIS**, &c.

**RIMA,** is also used for a narrow aperture of a small cavity under the fornix, opening into the infundibulum; called also the third ventricle of the brain. See **BRAIN** and **VENTRICLE**.

**RIME in poetry.** See the article **RHYME**.

**RIND,** the skin of any fruit that may be cut off, or pared. See **SKIN**, **FRUIT**, &c.

The outer coat of the chestnut, set with prickles, is particularly called the *urchin-like rind*.

**RIND,** is also used for the inner bark of trees; or that soft, whitish, juicy substance, adhering immediately to the wood. See **TREE** and **WOOD**.

Through this it is that the sap, in the modern theory of vegetation, is supposed to return from the extremities of the branches to the root; the vessels hereof being supposed to do the office of arteries; whence Mr Bradley calls them *arterial vessels*. See **BARK**. See also **PLANT** and **VEGETATION**.

**Grafting in the RIND.** See **ENGRAFTING**.

**RING, annulus,** a little moveable, put on the finger, either by way of ceremony, or of ornament.

The bishop's *ring*, makes a part of the pontifical apparatus; and is esteemed a pledge of the spiritual marriage between the bishop and his church. See **BISHOP**.

The episcopal *ring* is of a very antient standing—The fourth council of Toledo, held in 633, appoints, that a bishop condemned by one council, and found afterwards innocent by a second, shall be restored, by giving him the *ring*, staff, &c. From bishops, the custom of the *ring* has passed to cardinals, who are to pay, I know not what sum, *pro jure annuli cardinalitii*. See **CARDINAL**.

**Origin of RINGS**—Pliny, lib. xxxvii. cap. i. observes, that we are in the dark as to the person who first invented, or wore the *ring*; for that what is said of Prometheus, as also of Midas's *ring*, are fables. The first among whom we find the *ring* in use, are the Hebrews, Gen. xxxviii. where Judah, Jacob's son, gives Tamar his *ring* or signet, as a pledge of his promise: but the *ring* appears to have been in use at the same time among the Egyptians, from Gen. xii. where Pharaoh puts his *ring* upon Joseph's hand as a mark of the power he gave him. And in the first book of Kings, chap. xxi. Jezebel seals the warrant she sent for the killing of Naboth with the king's *ring*.

The antient Chaldeans, Babylonians, Persians and Greeks, had likewise the use of the *ring*; as appears from several passages in Scripture, and from Quintus Curtius, who tells us that Alexander sealed the letters he wrote into Europe, with his own seal; and those into Asia with Darius's *ring*.

The Persians will have Guiamschild the fourth king of their first race, to have first introduced the *ring*, to seal his letters and other acts withal—The Greeks, Pliny thinks, knew nothing of the *ring* in the time of the Trojan war: the reason he gives is, that we find no mention thereof in Homer, but that when letters, &c. were to be sent away, they were tied up, and the strings knotted.

The Sabins had *rings* in Romulus's time; and it is to them probably, the practice first came from the Greeks; and from them passed to the Romans, though it was some time before it got footing there—Pliny cannot learn which of the kings of Rome first adopted it; but there are no signs of it in any of their statues, before those of Numa, and Servius Tullus. He adds, that it was in use among the antient Gauls and Britons. See **SEAL**.

**Matter of RINGS**—There were some of one single metal, and others of a mixture, or of two. For the iron and silver were frequently gilt; or at least the gold was enclosed within the iron, as appears from Artemidorus, lib. ii. cap. 5. — The Romans were contented with iron *rings* a long time; and Pliny assures us, that Marius first wore a gold one in his third consulate, which was in the year of Rome 650. Sometimes the *ring* was iron, and the seal gold; sometimes it was hollow, and sometimes solid; sometimes the stone was engraven, and sometimes plain; and the graving sometimes in relieve, and sometimes in creux; the last were called *gemmæ edtype*; the former *gemmæ sculptura prominente*.

The *manner of wearing the RING* has been various: from Jeremy, chap. xxii. it appears that the Hebrews wore it on their right hand. Among the Romans, before they came to be adorned with stones, and while the graving was yet on the metal itself, every body wore them with pleasure, on what hand and finger he listed—When stones came to be added; they wore them altogether on the left hand; and it would have been held an excessive foppery to have put them on the right.

Pliny says, they were at first wore on the fourth finger, then on the second or index; then on the little finger; and at last on all the fingers, excepting the middle one—The Greeks wore them altogether on the fourth finger of the left hand, as we are informed by Aul. Gellius, lib. x. and the reason he

gives

gives for it is, that having found from anatomy, that this finger had a little nerve that went straight to the heart, they esteemed it the most honourable, by reason of this communication with that noble part—Pliny says, the Gauls and ancient Britons wore it on the middle finger.

At first they only wore a single ring; then one on each finger; and at length several on each finger. Martial, lib. xi. epig. 60. At last one on each joint of each finger. Aristoph. in *Nub.* &c.—Their delicacy, at length went to that pitch, that they had their weekly rings. Juvenal, sat. 7. speaks of *annuli semestres*; as also of winter and summer rings. But of all others Lampridius, cap. 32. observes, Heliogabalus carried the point farthest, who never wore the same ring, or the same shoe twice.

Rings have been also wore in the nose, as pendants in the ears—Barthlin has an express treatise, *de annulis narium*, of rings of the nostrils. St Augustin assures us, it was the fashion of the Moors; and Pietro della Valle observes the same of the modern Orientals.

In effect, there is no part of the body where it has not been wore—Several East-India travellers affirm, that the natives commonly wear them on their nose, lips, cheeks, and chin. Ramusio tells us, that the ladies of Narfingua in the Levant, and Diodorus Siculus, lib. 3. that those of Ethiopia, used to adorn their lips with iron rings.

As to the ears, the custom still obtains of wearing rings therein, both by men and women, all over the world. See PENDANT.

The Indians, particularly the Guzerattes, have wore rings on their feet—And when Peter Alvarez had his first audience of the king of Calicut, he found him all covered with stones set in rings; bracelets and rings both on the hands and fingers, and even the feet and toes. Louis Bartome represents a king of Pegu, as still more extravagant, having rings set with precious stones on every toe.

*Use of RINGS*—The ancients had three different kinds: the first served to distinguish conditions or qualities. Pliny assures us, that the senators at first were not allowed to wear the gold ring, unless they had been ambassadors at some foreign court. Nor was it even allowed them to wear the gold ring which was given them, in public; except on public occasions. At other times they wore an iron one. And those who had had a triumph, observed the same rules.

At length the senators and knights were allowed the common use of the gold ring; but Acron on Horace, lib. ii. sat. 7. observes, they could not do it unless it were given them by the prætor.

In after days the gold ring became the badge of the knights; the people wearing silver rings, and the slaves iron ones. Though the gold ring was sometimes also allowed the people, and Severus granted it his common soldiers. Augustus allowed it the liberti, or freedmen; and though Nero made a regulation to the contrary, yet it was soon set aside.

A second kind of rings were the *annuli sponsalitii*, wedding-rings. Some carry the origin of this custom as far back as the Hebrews, on the authority of a text in Exodus xxxv. 22—Leo of Modena, however, maintains that the ancient Hebrews did not use any nuptial ring. Selden, in his *Uxor Ebraica*, lib. ii. cap. 14. owns, that they gave a ring in the marriage, but that it was only in lieu of a piece of money of the same value, which had used to have been given before—The Greeks and Romans did the same; and from them the Christians took it up very early, as appears from Tertullian, and in some ancient liturgies, where we find the form of blessing the nuptial ring. See MARRIAGE.

The third kind of rings were those used as seals, called *circographi*, or *circographi*, an account whereof see under the article SEAL.

Richard bishop of Salisbury, in his constitutions, anni 1217, forbids the putting of *rust-rings* or any the like matter, on women's fingers, in order to the debauching them more readily: and he insinuates the reason of his prohibition, that there were some people weak enough to believe, that what was thus done in jest was a real marriage.

De Brevil in his antiquities of Paris, says, it was an ancient custom to use a *rust-ring* in the marriage of such as had had an affair together before marriage. See CONCUBINE, &c.

RING, in astronomy—The ring of Saturn is a thin, luminous circle, encompassing the body of that planet, but without touching the same. See SATURN.

The discovery hereof is owing to M. Huygens, who after frequent observation of Saturn, perceived two lucid points, or *ansæ*, arising out from the body, in a right line. See ANSÆ.

Hence, as in subsequent observations, he always found the same appearance, he concluded that Saturn was encompassed with a permanent ring; and accordingly produced his new system of Saturn in 1659.

The plane of the ring is inclined to the plane of the ecliptic in an angle of 23° 30'—It sometimes appears oval; and ac-

cording to Campani, it's greatest diameter is double it's least. See PLANET.

RING, is also the name of an instrument used in navigation, for taking the altitudes of the sun, &c. See ALTITUDE. It is usually of brass, about 9 inches diameter, suspended by a little swivel, 45° from the point whereof is a perforation, which is the centre of a quadrant of 90° divided in the inner concave surface.

To use it, they hold it up by the swivel, and turn it to the sun, till the sun-beams falling through the hole, make a spot among the degrees, which is the altitude required.

This instrument is preferred to the astrolabe, by reason the divisions are here larger than on the astrolabe. See ASTROLABE.

RING is also used for the sound or tone of a bell. See BELL, SOUND, &c.

Base RING. See the article BASE.

RING-Bone, among farriers, &c. a hard callous substance growing in the hollow circle of the little pastern of a horse, above the coronet. See HORSE.

It sometimes goes quite round like a ring; whence it's name: sometimes it is hereditary, derived from the stallion, or mare, but oftener comes by accident, as a strain, blow of a horse, &c.

Corniche RING. See the article CORNICHE.

RING-dial, is a kind of a dial, usually small, and portable, consisting of a brass ring, or rim, seldom exceeding two inches in diameter, and one third of an inch in breadth. See DIAL.

In a point of this rim, is a hole, through which the sun-beams being received, make a lucid speck on the concavity of the opposite semicircle, which gives the hour of the day in the divisions marked therein.

But it only holds good about the times of the equinox—To have the dial perform throughout the whole year, the hole is made moveable; and the signs of the zodiac, or the days of the month are marked on the convex side of the ring; by means whereof the dial is rectified for the time.

To use it, put the moveable hole to the day of the month, or the degree of the zodiac the sun is in; then suspending it by the little ring, turn it towards the sun, till his rays, as before, point out the hour among the divisions on the inside.

Universal, or astronomical RING-dial, is a ring-dial which serves to find the hour of the day in any part of the earth; whereas the former is confined to a certain latitude—It's figure see represented in *Table Dialling*, fig. 7. See also DIAL.

It consists of two rings, or flat circles, from two to six inches in diameter; and their breadth, &c. proportionable—The outward ring, A, represents the meridian of any place you are at; and contains two divisions of 90° each, diametrically opposite to one another; serving, the one from the equator to the north, the other to the south pole—The inner ring represents the equator, and turns exactly within the outer, by means of two pivots in each ring at the hour of 12.

Across the two circles goes a thin reglet or bridge, with a curvor, C, that slides along the middle of the bridge. In the curvor is a little hole for the sun to shine through.

The middle of this bridge is conceived as the axis of the world, and the extremities as the poles; and on the one side are drawn the signs of the zodiac, and on the other the days of the month. On the edge of the meridian slides a piece, to which is fitted a ring to suspend the instrument by.

*Use of the universal RING-dial*—Place the line *a* (on the middle of the sliding piece) over the degree of latitude of the place (*e. gr.* 51° for London) put the line which crosses the hole of the curvor to the degree of the sign, or day of the month. Open the instrument so as the two rings be at right angles to each other, and suspend it by the ring H, that the axis of the dial, represented by the middle of the bridge, may be parallel to the axis of the world. Then turn the flat side of the bridge towards the sun, so as his rays striking through the little hole in the middle of the curvor, fall exactly on a line drawn round the middle of the concave surface of the inner ring; in which case the bright spot shews the hour of the day in the said concave surface of the ring.

Note, The hour of 12 is not shewn by this dial; by reason the outer circle being then in the plane of the meridian, hinders the sun's rays from falling on the inner: nor will this dial shew the hour when the sun is in the equinoctial, by reason his rays, then, fall parallel to the plane of the inner circle.

Fairy RING.

Natal RING.

Reinforced RING.

Trunnion RING.

RING-walk, among hunters, a round walk. See HUNTING.

RING-worm, in medicine. See the article SERPICO.

RIO, in law, the forcible doing of an unlawful thing, of a private nature, by three or more persons assembled together for that purpose.

The

The word is formed from the Latin, *riota*, of *aristare*, to run at each other as rams do. Though, from an antient Gaulish version of the bible, quoted by Skinner, *riot* should rather seem originally to signify luxury and excess: whence our law *riot* might proceed; in regard these are frequently attended with quarrels.

For the difference between a *riot*, rout, and unlawful assembly. See **ROUT** and **UNLAWFUL Assembly**.

Kitchen gives us the following cases of *riots*, viz.—The breach of inclosures, banks, conduits, parks, pounds, barns, the burning of stacks of corn, &c. Lambard adds, the beating a man, and entering on a possession forcibly.

By a late act of parliament, made on occasion of the frequent pulling down of meeting-houses, &c. by mobs, or riotous assemblies, about the time of the last rebellion; a *riot* was made felony, if the *rioters* did not disperse after reading a proclamation made for that purpose.

**RIPENERS**, in medicine, a sort of topical remedies, called also *drawers*, *digestives*, *maturantia*, *suppuratives*, &c. See **DIGESTIVES**, **SUPPURATIVES**, &c.

**RIPENING**. See **MATURATION**, **DIGESTION**, **SUPPURATION**, &c.

**RISIBILITY**, the faculty of laughter. See **LAUGHING**.

*Risibility* is commonly supposed an attribute peculiar to man; as being the only creature capable of judging of what is ridiculous—Some philosophers go so far as to assert, that the degree of judgment is always seen in that of laughter; fools either have too little or too much.

Authors do not agree as to the peculiar mechanism in man, whereby laughter is raised—It is usually attributed to the communication between the plexus nervosus, and the diaphragmatic nerves. See **CONSENT of parts**.

**RISING**, in astronomy, the appearance of the sun, a star, or other luminary above the horizon, which before was hid beneath it. See **HORIZON**, **SUN**, **STAR**, &c. See also **AMPLITUDE**.

By reason of the refraction of the atmosphere, the heavenly bodies always *rise* before their time, i. e. are seen above the horizon, while they really are below it. See **REFRACTION**.

There are three poetical kinds of *rising* of the stars—The *cosmical* **RISING**, when a star rises at the same time with the sun. See **COSMICAL**.

*Acronycal* **RISING** is when the star rises at the same time that the sun sets. See **ACRONYCAL**.

*Heliacal*, *solar*, or *apparent* **RISING**, is when the star emerges out of the sun's rays near the horizon, and is no longer hid in his brightness; which happens about 20 days after the conjunction of such star with the sun; more or less, according to the magnitude of the star, it's distance, &c. See **HELICAL**.

Hesiod long ago observed, that Sirius was hid 40 days; viz. 20 days before his *cosmical rising*, and 20 after—Some nations of America, and among others the savages of Cayenna, regulate their civil year by the course of Sirius; beginning it with the *helical rising* of that star. See **CANICULA** and **CANICULAR**.

To find the rising, &c. of the sun and stars by the globe. See **GLOBE**.

**RISK**, or **RISQUE**, the hazard or chance of a loss, damage, &c. See **CHANCE**.

There is a great *risk* run in letting goods go upon credit to great lords, wives not authorised by their husbands, and young people not yet arrived at the age of majority.

Skinner derives the word from the Spanish, *risco*, steep: Covarruvias, from *riego*. In the barbarous Greek, they say, *εἰς κίνδυνον*, for *periclitator*, I hazard; and *εἰς κίνδυνον*, for lot or chance; which words as well as *risque*, Skinner thinks, may be deduced from *ῥίσις*, for *αναγγέλλω τον κίνδυνον*, I cast the dye.

To prevent any *risk* in invoices of merchandizes by sea, 'tis usual to insure them. See **POLICY of insurance**.

The *risk* of merchandises commences from the time they are carried aboard—In matters of insurance, it is a maxim, that all is never to be *risked* on one bottom, or in the same vessel; to denote, that assurers must act with discretion in the signing of policies, and not hazard too much on each vessel; there being more to be expected from several than from one.

**RISUS**, *laughter*. See the article **LAUGHTER**.

**RISUS caninus** is a kind of laughter wherein the lips are contracted, so as to shew all the teeth.

**RISUS sardonius**, sardonian laughter, is a forced, spiteful laughter; or a laughter that does not go beyond the teeth.

The phrase is by some said to be founded on this, that in Sardinia there is a venomous plant, which occasions such a contraction of the muscles of the face in persons it kills, that they seem to die laughing.

**RITE**, **RITUS**, in school divinity, denotes the particular manner or form of celebrating or performing the religious ceremonies, which obtains in this or that place. See **CEREMONY**.

The Eastern people, Armenians, &c. celebrate divine service

according to the Greek *rite*—The Western world follow the Latin *rite*; or that of the Roman church.

The English observe the *rite* of the church of England, prescribed in the book of Common-prayer, &c. See **RITUAL**.

**RITORNELLO**, or **REFRET**, in music, the burthen of a song, or a repetition of the first verses of the song, at the end of each stanza or couplet. See **REPETITION**.

The word is Italian, and signifies properly a *little return*, or a short repetition, such as that of an *eccho*, or of the last words of a song; especially when the repetition is made after a voice, by one or more instruments.

But custom has extended the use of the word to all symphonies, played before the voices begin, and which serve by way of prelude or introduction to what follows.

In the partitions or score of the Italian music, we frequently find the *ritornello's* signified by the words *si suona* to shew that the organ, spinnet, or the like, are to repeat what the voice has been singing. See **REPEAT**.

**RITUAL**, **RITUALE**, a church-book, directing the order and manner of the ceremonies to be observed in celebrating divine service, in a particular church, diocese, religious order, or the like. See **RITE**, **CEREMONY**, &c.

The antient heathens had, likewise, their *rituals*, *rituales libri*; whereof those of the Hetrurians were famed—These books contained the rites and ceremonies to be observed in the building a city, in the consecrating a temple or an altar, in sacrificing, deifying, in dividing the curiæ, tribes, centuries, and in general, all their religious ceremonies. See **SACRIFICE**, **APOTHEOSIS**, **ALTAR**, &c.

There are several passages in Cato's books, *de re rustica*, which may give us some idea of the *rituals* of the antients.

**RIVAGE**, **RIVAGIUM**, a toll antiently paid to the king in some rivers, for the passage of boats or vessels therein. See **FERRY**.

**RIVAL**, **RIVALIS**, a term of relation, applied to two persons who have the same pretension. See **CORRIVAL**.

It is properly used for a competitor in love; and figuratively for an antagonist in any other pursuit—The intrigues of comedies and romances usually turn on the jealousies of *rivals*, who dispute for the same mistress.

The lawyers derive the word from the Latin, *rivus*, stream, *quod ab eodem rivo aquam hauriant*. Donatus supposes it to have been formed hence, that beasts coming to drink at the same brook, or fountain, frequently quarrel.

Cælius says, that *rivales* were originally such whose fields were parted by a brook or rivulet; the course whereof being liable to be varied several ways, occasioned frequent disputes and law-suits.

**RIVER**, *fluvius*, or *flumen*, in geography, a stream or current of fresh water, flowing in a bed or channel, from a source or spring, into the sea. See **WATER**, &c.

If the stream be not large enough to bear boats, or small vessels, loaden; it is properly called in English, by the diminutive, *rivulet* or *brook*; by the Latins, *rivus*; and the French, *riviere*—If it will only bear such vessels, the Latins call it *amnīs*—If it be considerable enough to carry larger vessels, it is called by the general name *river*; by the Latins, *fluvius*, and *flumen*; and by the French, *fleuve*—In all which, the difference is only as to greater and less.

Some will have none to be properly *rivers*, except those which bear the same name from their source to their mouth. Others, none but those which empty themselves immediately into the sea; and not into any other river. See **SEA** and **OCEAN**.

*Rivulets*, have their rise, sometimes, from great rains, or great quantities of thawed snow; especially in mountainous places; as in the long ridges in Africa, India, Sumatra, &c. But the generality of *rivulets* arise from springs. See **SPRING**.

*Rivers* themselves all arise either from the confluence of several *rivulets*, or from lakes, nor is there any great *river*, such as the Rhine, Elbe, &c. known to flow from a single spring—The Volga, e. gr. consists of above two hundred *rivulets*, all flowing into it, before it reach the Caspian; and the Danube receives as many. Pliny, indeed, and Cardan, say, that the Nile receives none; but the later travellers into Abyssinia assure us of the contrary.

The Rhine, Rhone, Danube, Borysthenes, &c. arise originally from springs in the mountains; the Nile, Volga, the great *river* of St Laurence, &c. from lakes. See **LAKE**.

*Phænomena and variations of RIVERS*—*Rivers* are found subject to great alterations, at different seasons of the year, day, &c. from frequent rains and melted snow—Thus in Peru and Chili many of the rivers are almost insensible in the night-time, and only flow by day, as being then augmented by the dissolution of the snow on the mountains Andes—Thus the Volga abounds in water in May and June, so as to cover the sand-banks, &c. which all the rest of the year lie bare, so as scarce to allow a passage to the loaden ships.—Thus also the Nile, Ganges, Indus, &c. are frequently so increased as to overflow; and that either in the winter, from rain, or in the summer, from the melting of the snow.

Some

Some *rivers* bury themselves under ground in the middle of their course, and break out again in other places, like new *rivers* — Thus the Niger, which some cosmographers derive by a subterraneous channel from the Nile, because it swells at the same time with the Nile without any other apparent cause of its swelling: The Niger itself meeting the mountains of Nubia, is hid under them, and rises again on the western side of the mountains. Thus also the Tygris is lost in the mountain Taurus, &c.

Aristotle, and the poets, mention several such *rivers* about Arcadia: Alpheus, a *river* of Arcadia, is particularly famed — This, being swallowed up in the ground, is supposed by the Greek authors to continue its progress under earth and sea, into Sicily; were breaking up near Syracuse, it forms the *river* Arethusa. The great reason of this opinion is, that every fifth summer the *river* Arethusa in Sicily, casts up the dung of cattle about the time of the celebration of the olympic games, in Achaia, when the dung of victims was used to be cast into the Alpheus.

Some *rivers* empty themselves into the sea by one mouth, some by several — Thus the Danube opens into the Euxine sea by seven mouths, the Nile by seven, and the Volga by at least seventy. The cause of this variety of mouths Varenius attributes principally to banks of sand, &c. formed therein; which gradually increasing, form islands, whereby the channel is divided into several branches — Indeed, the antients tell us that the Nile formerly only emptied itself at one mouth, called the *ostium canobicum*; and add, that the other six are artificial.

The channels of *rivers*, except such as were formed at the creation, Varenius endeavours to prove to be all artificial, and dug by men — His reasons are, that when a new spring breaks forth, the water does not make itself a channel, but spreads over the adjacent land; so that the people have been necessitated to cut it a channel to secure their grounds; and that a great number of channels of *rivers* are certainly known, from history, to have been dug by men, &c.

As to the question, whether those *rivers* which run into others, have made themselves that way by their own motion, or have been turned thither in canals cut by men? he takes the latter to be the more probable; and concludes the same of the arms or branches of *rivers*; and of the turns whereby islands are formed in the Tanais, Volga, &c.

To the question, why we have no salt *rivers*, when there are so many salt springs? he answers, that it is because men having no occasion for salt water, have not dug channels to conduct the water of salt springs; salt being procureable at less expence. See SALT.

The water of most *rivers* flows impregnated with particles of metals, minerals, sands, oily and fat bodies, &c. — Thus some *rivers* bring sands intermixed with grains of gold; of which kind is, 1°. A *river* in Japon; 2°. Another in the island Lequeo, near Japon; 3°. A *river* in Africa called Arroee, breaking out of the roots of the mountains of the moon, wherein are gold mines: 4°. A *river* in Guinea, where the negroes separate the gold dust from the sand, and sell it to the Europeans, who traffic hither for that very purpose. 5°. In some *rivulets* near the city of Mexico, are grains of gold taken up, especially after rain; which is to be understood of all the other *rivers*; none of which yield any thing considerable except in rainy seasons. 6°. In Peru, Sumatra, Cuba, Hispaniola, and Guiana. Lastly, there are several brooks in the countries about the Alps, especially Tirol, out of whose waters gold is drawn, though there be no grains conspicuous therein. Add to this, that the Rhine in many places affords a golden mud. See GOLD.

As to *rivers* that bring grains of silver, iron, copper, lead, &c. we find no mention of them in authors; though doubtless there are great numbers of each; and many of the medicinal effects of mineral waters are doubtless owing thereto. We must not here omit a *river* in Germany which is ordinarily supposed to change iron into copper — The truth is, there is no real conversion of the metal; all that is done is, that the cuprine, and vitriolic particles in the water, corrode the iron, and detaching parts thereof by means of the motion of the water, succeed in their room. See TRANS-MUTATION.

From this variety in the mixture of the *river* water, result various qualities, different specific gravities, different colours, &c. See MINERAL WATER.

Some *rivers*, at certain seasons of the year, swell, so as to overflow their banks, and drown the neighbouring lands — Of these the most eminent is the Nile, which rises so as to cover all Egypt, except the hills. The inundation begins about the 17th day of June, and increases for the space of forty days; and decreases for as many: during which period the cities of Egypt, which are all built on hills, appear as so many islands. See NILOMETER.

To these inundations Egypt owes all its fertility; the heavens there affording no rain, or at least none in any respect considerable — Hence as the inundation is great or small, Egypt for that year is fruitful or barren.

VOL. II. N° 134.

The antient Greeks, &c. were mistaken as to the cause of this inundation; no body in those days having travelled up to the source of the *river*: but the modern English and Portuguese traders into Congo, Angola, Monomotapa, &c. have let us into the secret — From them we learn that the spring or source of the Nile is in a large lake called Zaire, round which are a great number of huge mountains, called the mountains of the moon. Now as these lie in the southern hemisphere, their winter will be at the time of our summer: but by reason of their nearness to the equator (being only 10° distant from it) they never feel any notable cold: hence it is, that instead of snow in the winter, they have rain every day, at least two hours before, and two after noon. In effect, the tops of these mountains are always covered with clouds, and the rains almost continual. Hence torrents are constantly gushing down from the mountains; all ending in the lake of Zaire: whence they flow into the channel of the Nile, and other *rivers* arising from the same lake, as the Cuamar, the Zaire, &c. Hence the inundation of the Nile.

The other *rivers*, which have any notable stated inundations, are, the Niger, or Gambia, which overflows at the same time with the Nile. Leo Africanus says, it begins on the 15th day of June, increases for 40 days, and decreases as long — The Zaire, a *river* of Congo, proceeding from the same lake with the Nile, and therefore affected in the same manner: the Rio de la Plata in Brasil, which Maffius observes, overflows at the same time with the Nile: the Ganges: the Indus; both which last overflow in June, July, and August; at which times the natives save great quantities of the water in ponds, to serve them the rest of the year: several *rivers* flowing out of the lake Chama, into the bay of Bengal, which overflow in September, October, and November. These all bring a very great fertility with them to the ground; the *river* Macoa in Camboia: the *river* Parana or Paranaguasa, which some will have to be the same with the silver *river*: several *rivers* in Coromandel, a part of India, which overflow in the rainy months from the great quantity of water issuing from the mountain Gatis: the Euphrates, which overflows Mesopotamia certain days in the year. Lastly, the *river* Sus in Numidia.

The *rivers* most celebrated for their length, breadth, swiftness of current, &c. are — The Nile, which runs almost in a straight course 2520 geographical miles. The Niger, which runs 2400 miles. The Ganges, 1200 miles. The Ob, 1600 miles. The Jenissea in Asia about the same length with the Ob. The *river* Orellana in America, 60 miles broad at its mouth, and 5000 miles long. The Rio de la Plata, 80 miles broad at the mouth. The Omarannan, another *river* of Brasil: and the great *river* of St Laurence, near 2500 miles long. See DANUBE and VOLGA.

RIVER, in physics, denotes a stream of water running by its own gravity, in a channel open above — Such is A E Tab. *Hydrostatics*, fig. 34 — See also WAVE.

Laws of the motion of RIVERS — The modern philosophers endeavour to bring the motion and flux of *rivers* to precise laws; and with this view have applied geometry and mechanics thereto: so that the doctrine of *rivers* is become a part of the new philosophy.

The Italian authors have distinguished themselves herein; and it is chiefly to them we are indebted for the improvement; particularly S. Guglielmini, who in his treatise, *della Natura de Fiumi*, has abundance of new observations and discoveries relating thereto.

*Rivers*, he observes, usually have their sources in mountains or elevations of ground; and it is in their descent from these, that they acquire the velocity or acceleration which maintains their future current — In proportion as they advance farther, this velocity diminishes; by reason of the continual friction of the water against the bottom and sides of the channel, of the various obstacles they meet withal in their progress, and of their arriving at length in plains, where the descent is less, and their inclination to the horizon, of consequence, greater — Thus the Reno, a *river* of Italy, which gave occasion in some measure to these speculations, is found near its mouth, to have scarce a descent of 52 seconds.

If the acquired velocity be quite spent through the many obstacles; so that the current becomes horizontal; there will then nothing remain to propagate the motion, and continue the same, but the depth, or the perpendicular pressure of the water which is always proportional to the depth — And, happily for us, this resource increases as the occasion for it increases: for in proportion as the water loses of the velocity acquired by the descent, it rises and augments in depth.

The upper parts of the water of a *river*, and those at a distance from the banks, may continue to flow from the single cause or principle of declivity, how small soever it be; for not being detained by any obstacle, the minutest difference of level will have its effect: but the lower parts, which roll a long the bottom, will scarce be sensible of so small a declivity, and will only have what motion they receive from the pressure of the superincumbent waters.

10 B b

The

The natural viscosity and cohesion of the particles of water, and that implication, as it were, which they seem to have with one another, make the lower, which are moved by means of the depth, carry along with them the upper, which in a horizontal channel would have no motion at all, or in a channel very little inclined, next to none. So that the lower, in this case, communicate to the upper, a part of the motion they have received from the pressure of it. Hence the pressure of it frequently happens that the greatest velocity of a river is about the middle of its depth; such middle parts having the advantage of being pressed with half the depth of the river, and of being free, at the same time, from the friction of the bottom.

To find whether the water of a river almost horizontal, flows by means of the velocity acquired in its descent, or by the pressure of its depth; set up an obstacle perpendicular thereto: if the water rise and swell immediately against such obstacle, it runs in virtue of its fall; or if it stop a little while, in virtue of its pressure.

Rivers according to this almost author, always make their own beds—If the bottom originally have been a large declivity; the water in consequence hereof falling with a great deal of force, will have swept away the most elevated parts of the soil, and carrying them lower down, will gradually render the bottom horizontal; where the stream is swiftest, there will the earth be most dug up, and consequently there the greatest cavity will be made.

The water having made its bed horizontal, becomes so itself, and consequently rakes with the less force against the bottom; till at length that force becomes only equal to the resistance of the bottom. The bottom is now arrived at a state of permanency, at least for a considerable time: and the longer, according to the quality of the soil; clay and chalk resisting longer than sand or mud.

On the other hand, the water is continually gnawing and eating off the brims of its channel; and this with the more force as by the direction of its stream it impinges more perpendicularly against them. By this means it has a continual tendency to render them parallel to its own course; and when it has arrived as near that as possible, it ceases to have any effect that way. At the same time that it has thus rectified its edges, it has enlarged its own bed; that is, has lost of its depth, and consequently of its force and pressure: this it continues to do till there is an equilibrium between the force of the water and the resistance of its banks, upon which they will remain without farther mutation—And it is evident from experience, that these equilibriums are all real; inasmuch as we find that rivers only dig and widen to a certain pitch.

The very reverse of all these things does also on some occasions happen—Rivers whose waters are thick and muddy, raise their bed by letting part of the heterogeneous matters contained in them fall to the bottom: they also contract their banks by a continual apposition of the same matter in brushing over them. This matter being thrown aside far from the stream of water, might even serve, by reason of the obscurity of the motion, to form new banks.

Now, these opposite effects seem almost always to concur, and are differently combined, according to the circumstances; whence it is very difficult judging of the result. Yet must this combination be known very accurately, before any measures can be taken about rivers, especially as to the diverting their courses—The Lamona, which emptied itself into the Po, being turned another way to make it discharge itself into the Adriatic, was so altered, and its force so far diminished, now that its waters were left to themselves, that it raised its bed a great height, by continual depositions of mud; till it became much higher than the Po, in its utmost accretions, and needed very high banks or dykes to keep it from overflowing. See ALLUVION.

A little river may be received into a large one, without either augmenting its width or depth—This seeming paradox arises hence, that the addition of the little river may only go towards moving the waters before at rest near the banks of the large one, and thus augmenting the velocity of the stream, in the same proportion as it does that of the quantity of water—Thus the Venetian branch of the Po swallowed up the Ferrarese branch, and that of Panaro, without any enlargement of its own dimensions. And the same may be concluded proportionably of all other accessions to rivers; and in the general, of all new augmentations of water.

A river offering to enter into another, either perpendicularly, or in an opposite direction, will be diverted by degrees from that direction, and obliged to make itself a new and more favourable bed towards the mouth.

The union of two rivers into one, makes it flow the swifter; by reason, in lieu of the friction of four shores, they have only two to surmount, and that the stream, being farther distant from the banks, goes on with the less interruption; beside that a greater quantity of water moving with a greater velocity digs deeper in the bed, and of course retrenches of its former width—Hence also it is that rivers, by being united, take up less space on the surface of the earth, and are more ad-

vantageous to low grounds which discharge their superfluous moisture into them, and have likewise less occasion for dykes to prevent their overflowing.

These advantages are so considerable, that S. Guglielmini thinks them worthy of nature's having had a view to them in her contriving to make the confluences of rivers so frequent as we find them.

To determine more precisely the general laws of the motion of rivers, it may be observed that a river is said to remain in the same state, or to be in a permanent state, when it flows uniformly, so as to be always at the same height in the same place. 2<sup>o</sup>. That a plane, which cutting a river is perpendicular to the bottom, as  $p o n q$ , is called the section of a river—See *Tab. Hydrostat. fig. 34*.

Hence, when a river is terminated by flat sides, parallel to each other, and perpendicular to the horizon, and the bottom also is a plane, either horizontal or inclined, the section of the river with these three planes makes right angles, and is a parallelogram.

Now in every river that is in a permanent state, the same quantity of water flows in the same time through every section; for unless there be in every place as great a supply of water, as what runs from it, the river will not remain in the same state. This will hold good, whatever be the irregularity of the bed, or channel, from which in other respects several changes in the motion of the river may arise: for example, a greater friction, in proportion to the inequality of the channel.

The irregularities in the motion of a river may be infinitely varied, nor can any rules be given to settle them.—To ascertain their general course, all irregularities must be set aside; only the general tenor or flux be considered.

Suppose then, the water to run in a regular channel, without any sensible friction, and that the channel is terminated with plane sides, parallel to one another, and vertical; and also that the bottom is a plane, and inclined to the horizon—Let  $A E$  be the channel into which the water runs from a greater receptacle or head; and let the water always remain of the same depth at the head, so that the river may be in a permanent state: the water here descends along an inclined plane, and is accelerated; whereby, because the same quantity of water flows through every section, the depth of the water, as you recede from the head of the river, is continually diminished, and its surface will acquire the figure  $i q s$ .

To determine the velocity of the water in different places; suppose the aperture of the channel  $A D C B$  to be shut up with a plane; if there be an hole made in the plane, the water will spout the faster through the hole, as the hole is more distant from the surface of the water  $h i$ ; and the water will have the same celerity that a body falling from the surface of the water to the depth of the hole below it, would acquire: all which arises from the pressure of the superincumbent water—There is the same pressure, that is, the same moving force, when the obstacle at  $A C$  is taken away, upon which every particle of water enters into the channel with the celerity a body would acquire in falling from the surface of the water to the depth of the particle. This particle is moved along in an inclined plane in the channel, with an accelerated motion; and that in the same manner, as if falling vertically, it had continued its motion to the same depth below the surface of the water in the head of the river.

So, if you draw the horizontal line  $i t$ , the particle at  $r$  will have the same celerity as a body falling the length  $i C$ , and running down  $C r$  can acquire; which is the celerity acquired by the body in falling down  $t r$ . Therefore the celerity of a particle may be every where measured, by drawing from it a perpendicular to the horizontal plane, which is conceived to run along the surface of the water in the head of the river; and the velocity which a body acquires in falling down that perpendicular, will be the celerity of the particle; which is greater, the longer the perpendicular is. From any point, as  $r$ , draw  $r s$  perpendicular to the bottom of the river; this will measure the height or depth of the river—Since  $r s$  is inclined to the horizon, if from the several points of that line, you draw perpendiculars to  $i t$ , they will be shorter the more distant they are from  $r$ , and the shortest of them will also be  $s v$ : therefore the celerities of the particles in the line  $r s$ , are so much the less, the nearer they are to the surface of the river, and the lower water is moved faster than the upper water.

Yet the celerities of those waters, as the river runs on, continually approach nearer and nearer to an equality: for the squares of those celerities are as  $r t$  to  $s v$ , the difference of which lines, as you recede from the head of the river is continually lessened, because of the depth  $r s$ , which is also continually diminished as the lines themselves are lengthened. Now as this obtains in the squares, it will much more obtain in the celerities themselves, whose difference therefore is diminished as they increase.

If the inclination of the bottom be changed up to the head of the river, so as to become  $y Z$ , and a greater quantity of water flow into the channel, it will be deeper every where in the

the *river* but the celerity of the water will not be changed—For this celerity does not depend on the depth of the water in the *river*, but, on the distance of the moved particle from the horizontal plane of the surface at the head continued over the said particle; which distance is measured by the perpendicular *rt*, or *sv*: but these lines, are not changed by the afflux of water, provided the water remain at the same height in the basin or head.

Suppose the upper part of the channel stopped by an obstacle, as *X*, which descends a little way below the surface of the water; here, the whole water which comes cannot run through, therefore it must rise: but the celerity of the water below this cataract is not increased; and the water that comes on, is continually heaped up, so that at last it must rise so as to flow over the obstacle, or the banks of the *river*. If the banks be raised, and the obstacle be continued; the height of the water would raise above the line *it*: but before that, the celerity of the water cannot be increased; in which case the height of all the water in the head will be increased; for, as we suppose the *river* in a permanent state, there must continually be as great a supply of water to the head, as there runs from it down the channel; but if less water runs down, the height must necessarily be increased in the head, till the celerity of the water flowing under the obstacle be increased to such degree, that the same quantity of water shall run under the obstacle, as used to run in the open channel before. See *WAVE*.

**RIVULET**, a diminutive of *river*. See *RIVER*.

**RIXDOLLAR**, or **RIXDALLER**, a silver coin, struck in several states and free cities of Germany; as also in Flanders, Poland, Denmark, Sweden, &c. See *COIN*.

There is but little difference between the *rixdollar* and the *dollar*, another silver coin struck in Germany; each being nearly equal to the French crown of three livres, the Spanish piece of eight, or 4 s. 6 d. sterling. See *DOLLAR*, *CROWN*, &c. The *rixdollar* is one of the most current and universal coins in the world—it is used equally in the commerce of the Levant, the North, Muscovy, and the East-Indies.

**ROACH-fishing**. See the article *FISHING*.

**ROAD, VIA**, an open way or passage, forming a commodious communication between one place and another. See *WAY*.

The Romans, of all people took the most pains in their *roads*: the labour and expences they were at to render them spacious, straight, smooth, and agreeable to the very extremities of their empire, are incredible. See *Bergier's History of the great roads of the Roman empire*.

Usually, they strengthened the ground by ramming it, laying it with flints, pebbles, or sand; sometimes by a lining of masonry, rubbish, bricks, potshards, &c. bound together with mortar.

F. Menestrier observes, that in some places in the Lyonnais he has found huge clusters of flints cemented with lime, reaching 10 or 12 foot deep, and making a mass as hard and compact as marble itself; and which, after resisting the injuries of time for 1600 years, is still scarce penetrable by all the force of hammers, mattocks, &c. and yet the flints it consists of are not bigger than eggs.

Sometimes they even paved their *roads* regularly, with large, square free-stones: such are the Appian and Flaminian ways, &c. See *PAVING*.

The *roads* paved of very hard stones they usually called *viae ferreae*, either because they resembled iron, or because they resisted the iron of the horse's feet, chariots, &c.

*Roads* are either *natural* or *artificial*: *terrestrial* or *aquatic*, *public* or *private*.

**Natural ROAD** is that which has been frequented for a long succession of time, and subsists with little expence, by reason of it's disposition, &c.

**Artificial ROAD** is that made by labour of the hand, either of earth, or masonry; and in the making whereof several difficulties were to be surmounted, such are most of those along the banks of rivers, through marshes, lakes, &c.

**Terrestrial, or land ROADS**, are not only those made upon the ground, but also those formed of earth heaped up in manner of a bank, and sustained by spurs, buttresses, and counter-forts.

**Aquatic ROAD**, is a *road* made in the waters, whether current, as over rivers, &c. or stagnant, as banks and causeways over morasses, &c. See *CAUSEWAY*.

Under this denomination are also comprehended navigable rivers, and artificial canals; as those in Italy, Holland, &c.

**Public ROAD**, or *grand road*, is any common road, whether straight, or a-crois, military or royal, &c.—*Private road* is that made for the convenience of some particular house, &c.

**Military ROADS**, so called among the Romans, were grand roads appointed for the marching of their armies into the provinces of the empire, for the assistance of their allies, &c. See *MILITARY*.

The principal of these *roads* in England, are Watling-street, Ikenild-street, Foss-way, and Erminage-street; which see under the article *WAY*.

**Double-ROADS**, among the Romans, were roads for carriages, having two pavements, or cause-ways; the one for those going one way, the other for those returning the other; to prevent clashing, stopping, and confusion.

These two ways were separated from each other by a bank raised in the middle, paved with bricks, for the convenience of foot-people, with borders, mounting stones from space to space, and military columns to mark the distance—Such was the *road* from Rome to Ostia, called *Via Portuensis*. See *MILITARY*.

**Subterraneous ROAD**, is that dug in a rock, with the cliff, and left vaulted—Such is that of Puzzuoli near Naples, which is near half a league long, fifteen foot broad, and as many high. See *SUBTERRANEAN*.

Strabo says it was made by one Cocceius, a relation, probably, of Nerva's; but it has since been widened by Alphonsus king of Arragon and Naples, and made straight by the viceroys—There is another of the same kind in the same kingdom, between Baiæ and Cumæ, called the *Grotto of Virgil*, because mentioned by that poet in the sixth book of his *Æneid*. See *GROTTO*.

**ROAD**, in navigation, denotes a place of anchorage, at some distance from shore, and sheltered from the winds; where vessels usually moor, to wait for a wind or tide proper to carry them into harbour, or to set sail. See *HARBOUR*, *MOORING*, *ANCHOR*, &c.

When the bottom is clear of rocks, and the hold firm; and the place well covered from the wind; the *road* is said to be good—An open *road* is one which has but little land on any side.

The *roads* within his majesty's dominions are free to all merchant vessels, either of his subjects or allies—Captains and masters of ships who are forced by storms, &c. to cut their cables, and leave their anchors in the *roads*, are obliged to fix up marks or buoys, on pain of forfeiture of their anchors, &c. See *BUOY*.

The masters of ships coming to moor in a *road*, must cast anchor at such distance as that the cables, &c. may not mix, on pain of answering the damages: when there are several vessels in the same *road*, the outermost to the seaward, is obliged to keep a light in his lantern in the night-time, to apprize vessels coming in from sea. See *MOORING*.

**Cock-ROAD**. See the article *COCK-road*.

**ROADER**, among sailors, a ship that rides at anchor in a *road*. See *ROAD* and *ANCHOR*.

**ROB**, in pharmacy, *sapa*; a preparation antiently much used, consisting of the juices of fruits, purified, and boiled to a consumption of two thirds of their moisture. See *MEDICINE*, &c.

There are *robs* made of quinces, sloes, cherries, mulberries, elderberries, barberries, gooseberries, and other fruits, for various diseases—The juice of grapes thus prepared is more particularly called *rob* or *sapa simplex*, which is almost of the consistence of honey. See *SAPA*.

When only one third of the humidity is boiled away, it is called *disfrutum*: and when only boiled to the consistence of a soft electuary, a *resin*.

The word *rob* is pure Arabic; and signifies, originally, a juice dried in the sun, or over the fire; that it may keep the longer without damage.

Sometimes it also denotes a composition of some juice made up with honey or sugar; in which sense it is confounded with *loche* or *lohoc*. See *LOHOC*.

The *rob* is a form now much out of use: though there are several directed in the college dispensatory; as *robs* of black cherries, of sloes, of quinces, &c.

**ROBBERY, ROBBERIA, or ROBERIA**, in law, a felonious taking away another man's goods, from his person, presence, or estate, against his will; putting him in fear, &c.—This is sometimes also called *violent theft*; and it's punishment, be the value of the thing taken ever so small, is death. See *THEFT*, *FELONY*, &c.

The word is said to have taken it's rise hence, that antiently *robbers* only took away the *robes*, or clothes from travellers. Though my lord Coke, in the third of his Institutes, takes the name to have had it's rise from Robin Hood, who lived under Richard I. in the borders of England and Scotland, by *robbery*, burning houses, rape and spoil—Hence also, *Robbers-men* or *roberds-men*, mentioned in several statutes for mighty thieves.

**ROBBING**. See the article *HOUSE-robbing*.

**ROBE, ROBA**. See the article *GOWN*.

**Master of the ROBES**, is an officer of the household, who has the ordering of all his majesty's *robes*; as those of the coronation, those of St George's feast, of parliament, &c. as also of his wearing apparel, collar of SS's, &c.

He has several officers under him, as a clerk of the *robes*, a yeoman, three grooms, a page, a brusher, sempstresses, laundresses, starcher, keeper of the wardrobe at Whitehall, &c.

See *WARDROBE*.

**ROBERVALLIAN lines**, a name given to certain lines, used

used for the transformation of figures; thus called from their inventor M. de Roberval. See TRANSFORMATION, &c.

The abbot Gallois, in the memoirs of the royal academy, an. 1693. observes, that the method of transforming figures, explained at the latter end of M. de Roberval's *treatise of indivisibles*, is the same with that since published by Mr James Gregory, in his *universal geometry*; and that, by a letter of Torricelli's, it appears that Roberval was the inventor of this manner of transforming figures, by means of certain lines which Torricelli called *Robervallian lines*.

He adds, that it is highly probable that J. Gregory first learned the method in the journey he made to Padua in 1668; the method itself having been known in Italy from the year 1646; though the book was not published till the year 1692. This account Dr David Gregory has endeavoured to refute, in vindication of his brother — His answer is inserted in the *Phil. Transact.* an. 1694, and the abbot has rejoined in the French memoirs of the academy, an. 1703. See ABBOT.

ROBIGALIA, or RUBIGALIA, in antiquity. See RUBIGALIA.

ROBORANTIA, in medicine, *strengtheners*; or such medicines as strengthen the parts, and give new vigour to the constitution. See STRENGTHENER.

ROCAMBOLES, a mild sort of garlic, by some called Spanish garlic; being much of the nature of shallot; and well known in cookery, in quality of a sauce.

ROCHE, or ROCH allum. See the article ALLUM.

ROCHET\*, or ROCKET, a law garment, wore by bishops and abbots; resembling a surplice, except in this, that the sleeves are gathered at the wrist; whereas the surplice is quite open.

\* Menage derives the word from the Latin, *rochetus*, a diminutive of *rochus*, used in writers of the lower latin for *tunica*, and formed originally from the German, *rok*.

The regular canons of St Augustin do also wear *rochets* under their copes.

ROCHETS also denote the mantles wore on days of ceremony, by the peers sitting in the English parliament. See PEER and PARLIAMENT.

Those of viccounts have two bands or borders and a half; those of earls, three; those of marquisses, three and an half; and those of dukes four. *Larrey*.

ROCHET fishing. See the article FISHING.

ROCK\*, RUPES, a large mass or block of hard stone, rooted in the ground. See STONE.

\* The word is formed of the Greek *ῥωξ*, *rima*, cleft, chink; and *ῥωξ* from *ῥηγμα*, I break; whence *ῥαξια*, a stony shore.

There are various ways of breaking rocks with wood, gunpowder, &c. See QUARRY, WOOD, &c.

We have roads, grotto's, labyrinths, &c. dug through rocks. See ROAD, GROTTO, LABYRINTH, &c.

ROCK allum. See the article ALLUM.

ROCK-crystal, or crystal of the rock, is that supposed to be formed by a congelation of the lapidific juice which trickles down in rocks, and caverns. See CRYSTAL and STALACTILES.

ROCK-Salt. See the article SALT.

ROCKET, in pyrotechny, an artificial fire-work, consisting of a cylindrical case of paper, filled with a composition of certain combustible ingredients; which being tied to a stick, mounts in the air to a considerable height, and there bursts. See PYROTECHNY and FIRE-WORKS.

The rocket has a great part in all fire works of entertainment, being not only used singly, but sometimes, also, as an ingredient in others.

Besides the rocket here defined, which is properly called the *sky-rocket*, there is another, which from the sphere it moves in, the water, is denominated *water-rocket*—The mechanism, preparation, &c. of each whereof, we shall here describe.

*Method of making Sky-ROCKETS* — 1°. A concave cylindrical mould, or frame, AB (*Tab. Miscellany, fig. 7.*) is turned, of hard wood, with a base BD, and a capital HC, usually adorned with architectural mouldings—The cylinder is to be open at both ends, and it's dimensions, for rockets of various sizes, as in the following article—When large, it is sometimes also made of brass or tin; and when small, of bone.

2°. Of the same matter with the cylinder, is prepared a quadra, or foot E; in the middle whereof is turned a hemisphere G, considerably less than that of the cavity of the frame; making the cap or head of another cylinder IK, and reaching up within the case; where it is kept steady by a pin LM.

Authors do not agree about the proportions — Simionowitz prescribes those that follow. If the diameter of the aperture HN be equal to that of a leaden-ball of a pound, or at most two pound weight; the height of the cylinder, with the base and capital HC, to be seven diameters, and the height of the quadra FE  $1\frac{1}{2}$ . The altitude of the cylinder KI, 1. The diameter IN  $\frac{1}{2}$ . The diameter of the hemi-

sphere G,  $\frac{2}{3}$ . The height of the capital AC, 1—The same author adds, that he finds by abundant experience, that if the diameter of the aperture be divided into 100 parts, according to the different weight of the leaden-balls to whose diameter it is equal, the following numbers being multiplied by 7 give the height HE.

Weight of Leaden-Ball.	Subseptuple of Altitude H E.	Weight of Leaden-Ball.	Subseptuple of Altitude H E.
1	100	20	86
2	98	30	82
4	96	40	78
6	94	50	75
10	91	70	67
15	88	100	57

The mould being ready, a wooden cylinder or mould AB (*fig. 8.*) is provided, whose diameter is  $\frac{1}{2}$  of the aperture of the frame, and it's length equal to the height of the same; to which is fixed a haft or hilt AD. About this mould is a thick strong paper rolled, till such time as it fill the cavity of the frame. This done, where the haft is joined to the cylinder, as at A, it is choaked, i. e. firmly bound round with fine pack-thread, so as to constrict or straighten the cavity thereof — The part thus choaked or bound up FG (*fig. 9.*) to be equal to the hemisphere G (*fig. 7.*)

The case is now taken of the mould, and put into the cavity of the frame, *fig. 7.* the choak GF upon the hemisphere; and in this disposition is filled with a composition described in the following article, rammed strongly in by means of a wooden cylinder or rammer fitting the cavity, and a mallet.

When filled, a paper cap of a conical form is glued over the end of the case filled last; and the space left a-top filled with whole gun-powder, to the height of about one diameter; then the rocket bound, or choaked in E, as before in G. Lastly, the rocket is bored, as is represented in AL *fig. 9.* care being taken to do it in the middle — Some, indeed, bore the rocket as they fill it, by thrusting a long, sharp spike through the lower basis, and drawing it out again when the rocket is full: But it is best not to bore till the rocket be used.

The boring is to go two thirds of the height of the rocket, abating one diameter of the cavity. The diameter of the bore in G is to be  $\frac{1}{3}$  of the diameter of the cylinder; and in L  $\frac{1}{2}$  of the lower diameter.

To make the rocket mount straight up, it is tied fast to the end of a long slender stick, MD, eight times as long as the rocket; in such manner as that when poised on the finger near the touch-hole F, the stick (which is usually made biggest at this end, and sloping gently to the other) may preponderate though very little—The rocket thus equipped, is hung at freedom, and lighted with port-fire.

*Note*, Some instead of a stick to make the rocket mount, furnish it with two wings, as MN (*fig. 10.*) which have the same effect: and instead of paper some make the cases of wood covered with leather; others of a thin iron plate. And some, instead of a wooden stick use an iron wire, with a plummet at the end of it.

The composition wherewith rockets are filled, consists of the three following ingredients, viz. Salt-petre, charcoal and sulphur; all well ground: but the proportions of these are various for rockets of various sizes: as in the following table. Noting, that in small rockets gun-powder dust is added.

Compositions for ROCKETS of various sizes.

Weight of Rocket.	Salt- pet.	Sul- phur.	Char- coal.	Gun-powder Dust.
100 or 60	30	10	20	
50	30	7	18	
20	18	12	26	
15	12	8	16	
10	9	9	20	
9	6	5	10	
5	4	8	16	
3	2	2	15	
1		2	6	32
Ounces.	Oun.	Oun.	Oun.	Ounces.
9	4	1	2	9
6	12	$1\frac{1}{2}$	4	15
3	2	$\frac{1}{2}$	$1\frac{1}{2}$	12
1			2	15

*Note*, several rockets being disposed round the circumference of a wheel, whether circular or polygonous, the head of the one applied to the tail of another, and the wheel put in motion; as one rocket is spent another will take fire: and the wheel be continued in it's rotation.

As

## ROE

As an additional ornament to *rockets*, it is usual to furnish them either with stars or with serpents, or sparks, which take fire when the *rocket* bursts: and sometimes little *rockets* are inclosed in great ones, to take fire when the great one is at it's greatest height.

**To make stars for ROCKETS**—Mix 3 pound of salt-petre, with 11 ounces of sulphur, 3 ounces of beaten gun-powder, and 10 of antimony. Moisten the mass with gum-water, and form them into little balls of the size of filberds; drying them well, either in the sun or an oven. When dry inclose a number of them in the conical cap of the *rocket*.

**Method of making a water-ROCKET**—Make a *rocket* A B after the usual manner, excepting in the number of choaks, expressed in fig. 11—Let it's diameter be equal to that of a leaden-ball of two or three inches diameter, and let it be bored to a third part of it's height. Inclose the *rocket* in a hollow paper cylinder; which smear over with melted pitch or wax, that it may resist the moisture.

**Note**, The weight of the *rocket* is to be so proportioned to that of the water, that the whole cylinder may be immersed—Some instead of a cylinder use a truncated cone, or even a spheroid; and some hang a weight to the end at which it is lighted.

**Theory of the flight of sky-ROCKETS**—Mariotte takes the rise of *rockets* to be owing to the impulse or resistance of the air against the flame: Dr Defaguliers accounts for it otherwise.

Conceive the *rocket* to have no vent at the choak, and to be set on fire in the conical bore; the consequence would be, either that the *rocket* would burst in the weakest place, or that if all it's parts were equally strong and able to sustain the impulse of the flame, the *rocket* would burn out immoveable—Now, as the force of the flame is equable, suppose it's action downwards, or that upwards sufficient to lift 40 pounds. As these forces are equal, but their directions contrary, they will destroy each other's action. See ACTION and REACTION.

Imagine, then, the *rocket* opened at the choak: by this means the action of the flame downwards is taken away, and there remains a force equal to 40 pounds acting upwards, to carry up the *rocket*, and the stick it is tied to—Accordingly, we find that if the composition of the *rocket* be very weak, so as not to give an impulse greater than the weight of the *rocket* and stick, it does not rise at all: or if the composition be slow, so that a small part of it only kindles at first, the *rocket* will not rise.

The stick serves to keep it perpendicular: for if the *rocket* should begin to tumble, moving round a point in the choak, as being the common centre of gravity of *rocket* and stick, there would be so much friction against the air, by the stick between the centre and the point, and the point would beat against the air with so much velocity, that the reaction of the medium would restore it to it's perpendicularity.

When the composition is burnt out, and the impulse upwards is ceased, the common centre of gravity is brought lower towards the middle of the stick; by which means the velocity of the point of the stick is decreased, and that of the point of the *rocket* increased: so that the whole will tumble down, with the *rocket*-end foremost.

All the while the *rocket* burns, the common centre of gravity is shifting and getting downwards, and still the faster and the lower as the stick is the lighter: so that it sometimes begins to tumble before it be burnt out: but when the stick being a little too heavy, the weight of the *rocket* bears a less proportion to that of the stick, the common centre of gravity will not get so low, but that the *rocket* will rise straight, though not so fast.

**ROCKET**, used for a habit. See ROCHET.

**ROD, VIRGA, VERGE**, a wand, or long slender stick or staff. See VERGE, STAFF, &c.

**ROD**, is also used for a land measure of 16 foot  $\frac{1}{2}$ : the same with *perch* and *pole*. See PERCH.

**ROD**, in gauging. See GAUGING-rod.

**ROD-knights**, in ancient customs. See REDMANS.

**Black-ROD**. See BLACK-rod and USHER.

**Ezekiel's ROD**. See the article EZECHIEL.

**Fishing-ROD**. See the article FISHING.

**Rhineland-ROD**. See the article RHINELAND.

**ROE**, of a fish, is that part which contains the sperm or seed thereof. See FISH, SEED, &c.

That of male-fishes is usually distinguished by the name of *soft-ro*, or *milt*; that of the female by *hard roe*, or *spawn*.

The soft *roe* when squeezed, yields a liquor resembling milk; whence it's name *milt*: the French call it expressly *milk*, *laite*. See MILK.

M. Petit found 342144 ovula or little eggs in the hard roe of a carp 18 inches long. Lcwenhoeck, Tom. 1. p. 216, only found 211629 eggs in a carp; but four times the number in a cod; and page 188 he says, that a cod contains 9344000 eggs; and that the eggs of a fish of one year old, are as big

VOL. II. No 134.

## ROG

as those of a fish of 25 years old. *Mem. Acad. R. Scienc. an.* 1733. p. 290,

**ROE**, is also one of the beasts of chase. See BEAST and GAME.

**ROE-BUCK**, a beast of chase or forest. See BEAST, GAME, &c. The *Roe-buck* is called an *hind* the first year; *gyrl* the second; *henuse* the third; *roe-buck of the first head* the fourth; and a *fair roe-buck* the fifth.

The *roe-buck* is a deer well known in Germany; and seems to have also been formerly found in England, though now the race be extinct. See HUNTING.

**ROFFENSIS textus**. See the article TEXTUS.

**ROGA** \*, *Poya*, in antiquity, a donative, or present which the augusti or emperors made to the senators, magistrates, and even the people; and the popes or patriarchs to their clergy. See DONATIVE.

\* The word is derived by some from the Latin *erogare*, to give, distribute; according to others from *rogo*, I ask; hence, say they, it is that St Gregory the great calls such distributions *precaria*; as being to be demanded, in order to be had—Others, again, derive it from the Greek *ρογο*, sometimes used for corn; because it antiently consisted in corn distributed among the populace, the soldiery, &c.

The emperors used to distribute these *rogæ* on the first day of the year, or on their birth day; or on the natalis dies of the cities—The popes and patriarchs, in passion week.

This custom of *rogæ*, or largesses, was first introduced by the tribunes of the people, to gain the populace more effectually over to their interest. The emperors at length took it up, and made such distributions to the people, and even to the soldiery, who are hence called by the Greek writers of the middle age *POGATOPEE*.

**ROGA** is also used for the ordinary pay of the soldiery.

**ROGATIO, ROGATION**, in the Roman jurisprudence, a demand made by the consuls, or the tribunes, of the Roman people, when a law was proposed to be passed. See LAW.

The demand was made in these terms: *do you will and appoint that (for instance) war be declared against Philip?* this was the *rogatio*; and what the people returned in answer, as, *the Roman people do appoint war to be made against Philip*, was the *decretum*, decree, or resolve.

The word **ROGATIO** is frequently also used for the decree itself; to distinguish it from a *senatus consultum*, or decree of the senate. See SENATE.

Frequently, also, **ROGATIO** is used in the same sense with *law*; because there never were any laws established among the Romans, but what were done by this kind of *rogation*—Otherwise they were null. See LAW.

**ROGATION-week**, the week immediately preceding Whitunday; thus called from three fasts therein, viz. on the Monday, Tuesday, and Wednesday, called also *rogations*, or *rogation days*, because of the extraordinary prayers, and processions then made for the fruits of the earth. See PROCESSION.

The first who appointed these *rogations* was St Mamertus, bishop of Vienne, who in 474 assembled several bishops, to implore the mercy of God by a fast of three days; on occasion of an incursion then made into the country by a great number of wild beasts—Others say, it was first set on foot by the same Mamertus in 468, on occasion of some public calamities.

**ROGUE**, in law, an idle and sturdy beggar; who by ancient statutes, for the first offence, is called a *rogue of the first degree*; and punished by whipping, and boring through the gristle of the right ear with an hot iron, an inch in compass: and for the second offence is called a *rogue of the second degree*, and ordered to be put to death as felon, if he be above eighteen years of age. See FELONY, &c.

**ROLL**, in the manufactories, something wound and folded up in a cylindrical form. See ROLLING.

Few stuffs are made up in *rolls*, except sattins, gawses, and crapes, which are apt to break, and take plaits not easy to be got out if folded otherwise—Ribbons, however, and laces, galloons, and paduas of all kinds, are thus *rolled*.

**To roll hot**—By an arret of council in 1698, fullers, shear-men, &c. in Poictou, are prohibited to *roll* any stuff *hot*, either by having fire over or under it, or by heating the rollers, or otherwise, on forfeiture of 100 livres for the first offence; or of being degraded from the privileges of mastership in case of a relapse.

The antients made all their books up in form of *rolls*, or little columns; and in Cicero's time, the libraries consisted wholly of such *rolls*—The dearth of parchment, and the cheapness of papyrus, whereof the *rolls* were made, was the reason that scarce any but paper *rolls* were used. See BOOK, PAPER, PARCHMENT, &c.

Vossius says, they pasted several sheets end to end, when filled on one side, and *rolled* them up together; beginning with the last, which they called *umbilicus*, and to which they fastened an ivory or boxen stick, to sustain

10 C c

the

the *roll*—To the other extremity they pasted a piece of parchment, to cover and preserve it. See VOLUME, UMBILICUS, &c.

These *rolls* were placed in the libraries, perpendicularly to the horizon — The Jews still preserve the antient usage of *rolls* for the books they read in their synagogues. See BOOK-binding, &c.

*ROLL of tobacco*, is tobacco in the leaf, twisted on the mill, and wound twist over twist, about a stick or roller.

The generality of tobacco in America is there sold in *rolls*, of various weights: and it is not till after it's arrival in England, Spain, France, and Holland, that it is cut — *Roll tobacco* is what is chiefly used both for chewing and raising. See TOBACCO.

*ROLL, ROTULUS*, in law, denotes a schedule of paper or parchment, which may be wound up by the hand into the fashion of a pipe. See SCHEDULE, &c.

Of these, there are in the Exchequer several kinds, viz. the great *wardrobe-roll*, the *cofferer's-roll*, the *subsidy-roll*, &c. See PIPE, &c.

The word is formed from the French *rolle*, of the latin *rotulus*, because most instruments and expeditions in law were antiently wrote on papers, or parchments sewed or glewed together, and thus rolled up: whence the words *enroll*, *controll*. See INROLMENT, CONTROLL, &c.

*ROLLS of parliament*, are the manuscript registers of the proceedings of our antient parliaments. See PARLIAMENT, REGISTER, &c.

Before the use of printing, and till the reign of Henry VII. our statutes were all engrossed in parchment (and by virtue of the king's writ for that purpose) proclaimed openly in every county.

In these *rolls* we have also a great many decisions of difficult points of law, which were frequently in former times referred to the decision of that high court. See STATUTE, COMMON-LAW, &c.

*Rider-ROLL*, a schedule or small piece of parchment, frequently sewed or added to some part of a *roll*, or record.

Noy observes that the court ex officio, may award a *certiorari*, *ad informandam conscientiam*; and that which is certified shall be annexed to the record, and called a *rider-roll*.

*ROLL*, is also used for a list of the names of several persons of the same condition, or entered in the same engagement. See ROTULUS.

*Court-ROLL*, of a manor, is that wherein the names, rents, and services of each tenant are copied and enrolled. See COURT, MANOR, TENANT, RENT, COPYHOLD, &c.

*Muster-ROLL*, that wherein are entered the soldiers of every troop, company, regiment, &c. See MUSTER.

As soon as a soldier's name is wrote down on the *roll*, it is death for him to desert. See DESERTION.

*Calves-head-ROLL*, is a *roll* in the two Temples, wherein every benchman is taxed yearly at 2 s. every barrister at 1 s. 6 d. and every gentleman under the bar, at 1 s. to the cook, and other officers of the house, in consideration of a dinner of calves-heads, provided in Easter term. See TEMPLE.

*Ragman's ROLL*, or *Ragimund's-ROLL*, is a *roll* denominated from *Ragimund*, a papal legate in Scotland, who calling before him all the people who held benefices in that kingdom, caused them upon oath to give in the value of their estates; according to which they were taxed in the court of Rome.

*ROLLS*, or *office of ROLLS*, in Chancery-lane, London, is an office appointed for the custody of the *rolls* and records in chancery. See CHANCERY, RECORD, &c.

The master of this office is the second person in that court; and in the absence of the lord-chancellor, sits as judge. See MASTER of the rolls.

This house or office was antiently called *domus converforum*, as being appointed by king Henry III. for the use of converted Jews; but their irregularities occasioned king Edward III. to expell them thence: upon which the place was deputed for the custody of the *rolls*. See CONVERSORUM.

*ROLL or ROUL* among military men. See ROUL.

*Bead-ROLL.* } See the articles } *BEAD-roll.*  
*Check-ROLL.* }  
*Counter-ROLL.* } *CHECK-roll.*  
 } *COUNTER-roll.*

*ROLL of parchment*, denotes the quantity of sixty skins. See PARCHMENT.

*ROLL*, in antiquity — From the time of Anastasius, we find in the hands of the emperors, on medals, a kind of narrow long *roll* or *fachel*, the meaning whereof has puzzled the antiquaries.

Some imagine it to be a *roll* or bundle of papers, memoirs, petitions, &c. presented occasionally to princes, consuls and the like — Others take it to be a plaited handkerchief, which the persons who presided at the games, cast forth as a signal for their beginning — Others will have it a bag of dust and ashes, presented the emperor at the ceremony of his coronation, and called *AKAKIA q. d. a* means of preserving

innocence, by the remembrance of dust, &c. See ACACIA.

*ROLL*, or *ROLLER*, is also a piece of wood, of a cylindrical form, used in the construction of several machines, and in several works and manufactures; though sometimes under other names. See ROLLING, &c.

It is on such *rolls*, properly called *beams*, that the woollen, filken, and other threads are wound, whereof the weaver's works consist — For which end each loom has usually two, that of the gawse-weavers, three. See LOOM.

In the glass manufacture they have a *running-roll*, being a thick cylinder of cast brass, serving to conduct the melted glass to the end of the table whereon large looking glasses, &c. are to be cast. See GLASS.

The founders also use a *roller* to work the sand which they use in making their moulds. See FOUNDRY.

The presses called *calenders*, as serving to calender stuffs withal, consist, among other essential parts, of two *rollers*. See CALENDER.

It is also between two *rollers* that the waves are given to silks, mohairs, and other stuffs proper to be tabbed. See TABBY.

Prints, or impressions from copper-plates, are also taken by passing the plate and the paper between two *rollers*. See PRINT and ROLLING-press-printing.

*ROLLS*, in coining, are two iron instruments of a cylindrical figure, which serve to draw or stretch out the plates of gold, silver, and other metals, whereof the planks or pieces are to be formed for the species. See COINING.

*ROLLS*, in printing, are two large cylinders or barrels of wood, fastened in the middle of what they call the cradle or galleys of the press; and which by means of a cord, or girt, passing over each, and a handle, which gives motion to one of them, draws the carriage of the press backwards and forwards. See PRINTING.

*ROLLS*, in the sugar-works, are two large iron barrels which serve to bruise the canes, and express the juice — They are cast hollow, and their cavities filled up with wood; the cylinders of which are properly the *rollers*. See SUGAR.

*ROLLS*, or *ROLLERS*, among carpenters, masons, &c. are plain cylinders of wood, seven or eight inches in diameter, and three or four foot long; used for the removing of beams, huge stones, and other like burdens, which are cumbersome, but not exceeding heavy.

These *rollers* are placed successively under the fore-part of the massives to be removed; which, at the same time, are pushed forwards by levers, &c. applied behind, See LEVER.

*Endless ROLLS* — When blocks of marble, or other excessive heavy loads are to be removed; they use what they call *endless-rolls*.

These to give them the greater force, and prevent their bursting are made of wood joined together by cross-quarters: they are about double the length and thickness of the common *roller*; and besides, are girt with several large iron hoops at each end — At a foot's distance from the ends are four mortises, or rather only two, but pierced through and through; into which are put the ends of long levers, which the workmen draw by ropes fastened to the ends; still changing the mortise, as the *roll* has made a quarter of a turn.

*ROLL-rich stones*, in antiquity, a series of huge stones, ranged in a circle, near Morton in Marth, in Oxfordshire — There are a world of fabulous traditions about them — Among the antiquaries, some take them to be a monument of a victory, others a burying-place; and others a place for the coronation of the Danish kings.

Near Penros in Cornwall is a like monument called.

*ROLLER*. See the article *ROLL*.

*ROLLER* in surgery, a long and broad ligature, usually of linen cloth, for binding, surrounding and containing the parts of the human body, and keeping them in, or disposing them to a state of health.

A *Roller* consists of two parts; the *body*, and the two extremities, which some call *heads*, or *chiefs*, and others *tails* — There are single headed *rollers*, that is, such as are rolled at one head only: double headed *rollers*, &c.

Again some are equally rolled and gathered together, as those applied to fractures and dislocated joints — Others are cut into several chiefs or heads; as those for the head, chin, &c. — Others are composed of several swaths gathered and stitched together, as those for the testicles, &c. — Some again are *broad*, as those for the breast, belly, &c. — Others narrow, as those for the lips, fingers, &c. Guidon directs the roller for the shoulder to be six fingers broad; that for the thigh five; for the leg four; for the arm three; and the finger one.

*ROLLING, ROTATION*, in mechanics, a kind of circular motion, wherein the moveable turns round it's own axis, or centre, and continually applies new parts of it's surface to the body it moves upon. See MOTION, REVOLUTION, AXIS, &c.

Such is that of a wheel, a sphere, or the like — Such particularly,

ticularly, are the motions of the earth, the planets, &c. See WHEEL, PLANET, EARTH, &c.

The motion of *rolling* is opposed to that of *sliding*, wherein the same surface is continually applied to the plane it moves along. See SLIDING.

It must be noted, that in a wheel, it is only the circumference that properly *rolls*; the rest proceeds in a compound, angular kind of motion, and partly *rolls*, partly *slides*—The not distinguishing between which two, occasioned the difficulty of that celebrated problem the *rota Aristotelica*, Aristotle's wheel. See ROTA Aristotelica, and ANGULAR-motion.

The friction of a body in *rolling*, or the resistance made to it by the roughness of the plane it moves on, is found to be much less than the friction in *sliding*. See FRICTION.

Hence the great use of wheels, rolls, &c. in machines; as much of the action as possible being laid thereon, to make the resistance the lesser. See WHEEL, MACHINE, &c.

For the laws of bodies *ROLLING on inclined planes*, see Inclined PLANE, DESCENT, &c.

ROLLING-press-printing. See PRINTING and PRESS.

ROMAN, something belonging to the city of Rome—The Roman commonwealth lasted from the expulsion of the Tarquins, to the battle of Pharsalia, 460 years: The Roman empire, from the battle of Pharsalia to the building of Constantinople by Constantine, in the year 330, lasted 378 years; from the building of Constantinople to the taking of it by the Turks in 1453, was a farther period of 1123 years. See COMMONWEALTH, EMPIRE, &c.

A Roman citizen, at first, was only a citizen of Rome; at length the right of citizenship was given to other cities and people, both in Italy and the provinces. It was thus St Paul was a Roman citizen, Acts xvi. 21, 37, 38. xxii. 25, 26, 27. xxiii. 27, the city of Tarsus in Cilicia, a native of which he was, having the right of Roman citizens. See CITIZEN.

For the Roman senate, their magistracy, consuls, soldiery, tribes, courts, names, weights, measures, coins, and other matters relating to the antiquities of that people, their policy, religion, law, customs, &c. see the respective articles in this work.

ROMAN purple, now denotes the dignity of a cardinal. See CARDINAL.

ROMAN, or ROMISH church, is that whereof the pope is head; in opposition to the reformed churches. See CHURCH, POPE, &c.

The Roman law is the civil law, or the written law, as compiled by the emperor Justinian. See CIVIL law.

A ROMAN charity among painters, is a picture of a woman suckling an old man—Roman knight, &c. See KNIGHT, &c.

King of the ROMANS, in our age, is a prince elected, and designed successor to the German empire. See KING, EMPIRE and ELECTOR.

ROMAN games, *ludi ROMANI*, were solemn games held in ancient Rome; thus called by way of eminence, and on account of their antiquity, as having been instituted by Romulus. See GAMES.

They were sometimes, also called, *magni ludi*, from the great pomp and expence thereof; sometimes *consualia*, because performed in honour of the god Neptune, who was also called *confus*, in his quality of god of secret councils. See CONSUALIA.

They also bore the denomination of *ludi circenses*, because held in the circus. See CIRCENSES ludi, &c.

This solemnity, Halicarnassus observes, was originally instituted by Evander, in honour of Neptune under the name of *ιππικός*; whence the festival itself was called *ιππιοκρατία*; and was afterwards renewed by Romulus in honour of the same deity, only under another name.

For Romulus, needing the advice of a god to counsel him in the design he had to furnish his new citizens with wives, applied to the god of secret counsel himself, Confus; proclaimed the consualia, and invited his neighbours all a-round to the first celebration thereof—The consequence was, the rape of the Sabine women, who came to be spectators thereof.

The great ceremony in these games consisted in a cavalcade of horses and asses, adorned with garlands; Neptune being reputed the first author of riding on horseback.

Their horses here were of two kinds, *viz.* *πομπικοί*, or such as were merely led up and down for state; and *δρομικοί*, which were for race and exercise.

The other diversions were fencing, and that till one of the combatants were killed on the spot; fighting with beasts, and castus, or whirlbats; wrestling, running, leaping, sea-fights, horse-races, chariot-races, &c. See CIRCUS, GLADIATOR, GYMNASIASTICS, &c.

These games, Livy tells us, were improved, and rendered much more magnificent by Tarquinius Priscus—Manutius says, they were held on the eve of the nones of September, *i. e.* on the 14th day of the month.

ROMAN order, in architecture, is that more usually called the composite. See COMPOSITE.

ROMAN ballance, *statera ROMANA*, the steelyard. See BALLANCE and STEELYARD.

ROMAN indiction. } See the articles { INDICATION.  
ROMAN year, &c. } YEAR, &c.  
ROMAN language, &c. } LATIN, &c.

ROMANCE, antiently ROMAUNT, and ROMANT, a fabulous relation of certain intrigues and adventures in the way of love and gallantry; invented to entertain and instruct the readers. See FABLE, NOVEL, &c.

M. Fontenelle calls *romance*, poems in prose; and Bossu is not averse to their being admitted as poetical pieces. See POEM and POETRY.

Setting aside the versification, it is certain an epic poem, and a *romance* are almost the same thing—The just notion, therefore of a *romance*, is, that it is a discourse invented with art to please and improve the mind, and to form or mend the manners, by instructions disguised under the allegory of an action or series of actions, related in prose, in a delightful, probable, yet surprizing manner. See EPIC.

A just *romance* consists of two parts, *viz.* a moral, as it's foundation and end; and a fable, or action, as the superstructure and means. See ACTION, FABLE, &c.

It must also have the manners; that is, the characters must be distinguished, and the manners must be necessary, and have all the other qualities of poetical manners. See MANNERS.

The incidents must be delightful, and to that end rightly disposed and surprizing—The sentiments fall under the same rules as in the drama. See SENTIMENT.

But the diction is allowed to be more lofty and figurative; as being a narration; and not having terror or pity, but admiration for it's end. See NARRATION, PASSION, &c.

As compositions of this kind have a long time been little else but histories of amorous adventures, and feats of knight-errantry: the origin of *romances* is referred to that of love histories; and accordingly Dearchus, a disciple of Aristotle, who first wrote of those matters, is usually esteemed the author of *romances*. Though Photius is of opinion that Antonius Diogenes's book on the errors and amours of Dinias and Dercyllis, gave birth to most of the works of this kind. Be this as it will, it is certain the antients have had their *romances* as well as we—Such are the amours of Rhodanis and Sinonides, described in iambics: such is the *romance* of Leucippe and Clitophon, composed by Achilles Tatius, a Greek writer, afterwards a bishop: such are the four books of incredible things, wrote by Damascius: such are the Ethiopics of Heliodorus, wherein he relates the amours of Theagines and Chariclea—Lastly, under the same class may be ranked the fables of Parthenius Nicensus, of Athenagoras, Theodorus Prodromus, Eustathius, and Longus.

Indeed antiquity could scarce be reconciled to such pieces, and always looked on them as abuses—Photius, in his *Bibliotheca*, Cod. LXXXVII. gives a frightful account of that of Tatius: and the Ethiopics of Heliodorus, though one of the modestest and most reserved pieces of the kind, met with very severe treatment—That author was bishop of Tricca in Thessalia in the fourth century. Nicephorus tells us, that a synod, considering the danger which might accrue to youth from reading his *romance*, authorised as it was by the dignity of it's author, proposed it to him, either to suppress his book, or renounce his bishopric; and that he chose the latter—But this history is a little doubtful.

Be this as it will, Heliodorus has served as a model to all the *romances* wrote since; the marriage of Theagenes and Chariclea has produced a very numerous issue; even all the *romances* now extant in the world.

In imitation of the archbishop Turpinus, who passed for author of the *romance* of the feats of Charlemagne and Orlando, a great number of histories of the like kind were wrote in France, during the time of Philip the fair; the authors whereof seemed to improve on each other, contending who should go farthest in the merveilleux—These books, being intended for the polite people, were wrote in the court language of that age; which was called the *romans*, *romant*, or *romanic*; whence the books themselves were called by those names: and thus by degrees *romans*, &c. became the general name of all books of this kind: whence at length our *romance*. See ROMANS.

Others derive the word from the Spanish *romansero*, I invent, as intimating *romances* to be meer fictions—And hence it is that the antient poets of Provence, who were the first great dealers in *romances*, are called *troubadours*, *q. d.* finders, or inventors. See TROUBADOUR.

The French above all other nations, have applied themselves to this kind of writing; whether it be owing to the natural taste and genius of the people, or to the freedom, &c. where-with they converse with the women—They began chiefly with *romances* of chivalry; hence their Amadis, in 24 volumes; Palmerin d'Oliva, and of England, king Arthur, &c. whereof we have an agreeable critique in Don Quixote. See CHIVALRY, &c.

The later *romances* are much more polite; the best of which are the *Astrea* of D'Urfé; the *Cyrus* and *Clelie* of Madeleine de Scudéry; the *Cassandra* and *Cleopatra* of la Calprenède; *Ariane*, *Francia*; and the *Adventures of Telemachus* by the late archbishop of Cambray, worth all the rest.

The Germans, too, have their *romances*; especially *Hercules* and *Herculiscus*, the *Aramena*, *Octavia*, *Arminius* *Otbert*, &c.

The Italians have their *Eromena*, by Biondi; the works of Loredano, Marino, &c.—The Spaniards, their *Diana*, and *Don Quixote*—The English their *Arcadia*, &c. The *Argenis* of Barclay is rather a *satyr* than a *romance*. See *NOVEL*.

**ROMANS, ROMANT, or ROMANIC**, the polite language formerly spoke at the court of France; in contradistinction to the *Waloon*, or ancient Gaulish, spoke by the common people. See *LANGUAGE* and *WALOON*.

The Romans having subdued the Gauls, introduced part of their language among them; a mixture then of half Latin, half Gaulish, or Celtic, constituted the *romans*; whereof the modern French is only an improvement. See *FRENCH*.

Hence to *enromance*, was to write in *romans*, &c. See *ROMANCE*.

**ROME**-*scot.* } See the article *PETER-pence*.  
**ROME**-*penny.* }

**ROMPEE, or ROMPU**, in heraldry, is applied to ordinaries, that are represented as broken; and to chevrons whose upper points are cut off—As in *Tab. Herald. Fig. 83*—He beareth a chevron rompee, between three mullets, argent, by the name of Sault.

**RONDEL**, in fortification, a round tower, sometimes erected at the foot of a bastion. See *TOWER*.

**ROOD**, a quantity of land, equal to the fourth part of an acre; and containing 40 square perches or poles. See *ACRE*, *PERCH*, &c.

**ROOF**, in architecture, the uppermost part of a building; being that which forms the covering of the whole. See *BUILDING*.

The *roof* contains the timber-work and it's furniture of slate or tile, wherewith a house is covered, or that which serves it as a cover.—Though carpenters usually restrain *roof* to the timber-work only. See *COVERING* and *RIDGE*.

The form of the *roof* is various: sometimes it is pointed, in which case the most beautiful proportion is to have it's profile an equilateral triangle.

Sometimes it is square, that is, the pitch or angle of the ridge, is a right angle; which therefore, is a mean proportion between the pointed and the flat form.

A *flat-roof*, is that in the form and proportions of a triangular pediment. See *PEDIMENT*—This is chiefly practised in Italy, and the hot countries, where little snow falls.

Sometimes the *roof* is in the pinnacle form. See *PINNACLE*. Sometimes it has a double ridge—Sometimes it is cut, or mutilated, that is, consists of a true, and a false *roof* which is laid over the former: this last is particularly called a *mansard*, from it's inventor M. Mansard, a famous French architect.

Sometimes, again, it is in form of a platform; as in most of the eastern buildings. See *PLATFORM*.

Sometimes it is truncated, that is, instead of terminating in a ridge or angle, it is cut square off at a certain height, and covered with a terrace, and sometimes also encompassed with a balustrade. See *TERRACE*.

Sometimes it is in manner of a dome, that is, it's plan is square, and the contour circular. See *DOME*, *CUPOLA*, &c.

Sometimes it is round, that is, the plan is round or oval, and the profile spherical—Sometimes the base being very large, it is cut off to diminish it's height, and covered with a terrace of lead, raised a little in the middle, with sky-lights from space to space, to give light to some corridor, or other intermediate piece, which without such an expedient would be too dark. See *HOUSE*, &c.

**ROOF-trees, or RUFF-trees**, are the timbers in a ship which go from the half-deck to the fore-castle.

The term is also used for the upper timbers of any building; whence, in the northern counties, it is common to signify a whole family, by saying, all under such a one's *roof-tree*.

**False ROOF.** }  
**Hip-ROOF.** } See { **FALSE.**  
**Attic of a ROOF.** } { **HIP-roof.**  
**ROOF-tyles.** } { **ATTIC.**  
 } { **TYLE.**

**ROOM**, in building—See *BUILDING*, *HOUSE*, *APARTMENT*, *DISTRIBUTION*, *CHAMBER*, &c.

**Cook-ROOM.** See the article *COOK-room*.

**Flight of ROOMS.** See the article *FUGUE*.

**ROOMER**, in the sea language: a ship is said to be a *roomer*, when she is larger than ordinary. See *SHIP*, *VESSEL*, &c.

**ROOT, RADIX**, in botany, that part of a plant which im-

mediately imbibes the juices of the earth, and transmits them to the other parts, for nutrition. See *NUTRITION*, *PLANT*, *VEGETABLE*, &c.

The *root* consists of woody fibres, covered with bark, more or less thick—It arises from a little point in the seed, called the *radicle*. See *RADICLE*.

It is no small difficulty to conceive, how the *root* should always get downwards, and turn up the stem perpendicularly; considering that in the sowing of plants the *radicle* must frequently happen to be upwards, and the plumule downwards! See *SEED*, *SEMINATION*, *PERPENDICULARITY*, &c.

The *root* is always found in the ground, in terrestrial plants, except in a very few cases: the ivy and cuscuta, being perhaps the only plants where part of the *root* lies bare.

The *root* in plants has been observed to do the office of the stomach in animals, that is, to make the first and principal digestion of the alimentary matter—M. Reneaume shews that the *root* does the office of all the parts in the belly of animals destined for nutrition; it being the *root* that receives the nourishment, that prepares it, digests it, alters and changes it into sap, to be afterwards distributed to all the parts. See *SAP*.

The smell, colour, and even taste, shew how considerable an alteration the juices undergo in the *root*; so that the *root* may be laid down as the principle of vegetation. See *VEGETATION*.

Plants growing at the bottom of the sea have this peculiar to them, that they have no *roots*; at least the parts which do the office of *roots* have nothing of the usual figure of other *roots*—These plants are usually fastened to some solid body, adhering to it by a very smooth polished lamina, which does not send forth any fibre. Add to this, that the body to which they adhere, being frequently a rock or flint, appears very unfit to feed them, in case they had *roots*. M. Tournefort, therefore, conjectures that they are fed by a juice afforded them by the thick oily mud at the bottom of the sea, which they receive by the pores of the exterior surface of this lamina.

Boerhaave observes, that the *root* may have any situation at pleasure, with respect to the body of the plant; nor needs to be either lowest or highest—Accordingly in the aloe, coral, mosses, funguses, &c. the *root* is frequently uppermost, and it's growth downwards. See *CORAL*, *Moss*, &c.

*Roots* are divided by botanists into

1<sup>o</sup>. *Fibrous*, which send out only small strings from the bottom of the plant, distinct from each other—Such are those of most species of grass.

2<sup>o</sup>. *More thick and gross*, which have a body thick and gross, either branched out into subdivisions, or else sending out fibres from it all along.

These last are either *carnous*, which again are either,

1. *Broad* and swelling, or
2. *Long* and slender, which are commonly harder and more woody.

*Broad* and swelling *roots* are either,

1. *Bulbous*, which consist but of one globe or head, and send out fibres from the bottom, and are either,
  - { *Squammose*, and scaly, as lillies, martagon, &c.
  - { *Coated*, which are involved in skins or coats, as cepa, hyacinthus, allium, &c. See *BULB*.
2. *Tuberous*, which are of a carnosous, solid, and continued consistence, and these either,
  - { 1<sup>o</sup>. *Simple*, with but one globe or head, as rapa, crocus, &c.
  - { 2<sup>o</sup>. *Manifold*, as asphodelus, pæonia, &c.

*Long roots* are either,

- (1) *Sarmentous*, i. e. twiggy or branching, which shoot or creep out transverse or in breadth: of these some are geniculated, knotty or jointy; as couch-grass, mints, &c.
- (2) *Cauliformes*, i. e. stemmy or stalky, which shoot down deep directly, though often sending out fibres and strings from the great stem; which also itself is sometimes divided or branching.

**ROOTS**, in medicine—The principal *roots* used in the practice of physic, are rhubarb, rhaponticum, sarsaparilla, ipecacuanha, jalap, zedoary, galangal, cassia, gentian, turmeric, liquorice, madder, &c. See each described under it's proper article *RHUBARB*, *RHAPONTIC*, *SARSAPARILLA*, *IPECACUANHA*, &c.

**ROOT-grafting.** See the article *ENGRAFTING*.

**ROOT**, in mathematics, denotes a quantity which is multiplied by itself; or a quantity considered as the basis or foundation of a higher power. See *QUANTITY*, *POWER*, &c.

Thus if any number, as 2 be multiplied by itself, the product 4 is called the *square*, or second power of 2; and 2 itself, with regard to that power, is called the *root*; or particularly the *square root* of 4. See *SQUARE-root*.

Since,

Since, as unity is to the square *root*, so is the *root* to the square; the *root* is a mean proportional between unity and the square—Thus  $1 : 2 :: 2 : 4$ .  
 If a square number, as 4, be multiplied by its *root* 2, the product 8 is called the *cube*, or third power of 2; and with respect to this cubic number 8, the number 2 is called *root*; or particularly the *cube-root*. See *CUBE-root*.  
 Since as unity is to the *root*, so is the *root* to the square; and as unity is to the *root*, so is the square to the cube; the *root* will be to the square, as the square to the cube, *i. e.* unity, the *root*, the square, and the cube, are in continual proportion: thus  $1 : 2 :: 4 : 8$ . And the *cube-root* is the first of the two mean proportionals between unity and the cube.  
**To extract the *Root* out of a given number, or power, as 8,** is the same thing as to find a number, as 2, which being multiplied by itself a certain number of times, *v. gr.* twice, produces the given number, 8. See *EXTRACTION*.  
**A *root*, whether square or cubic, or of any higher power; if it consist of two parts, is called a binomial root, or simply a binomial;** as 24, or  $20 + 4$ . See *BINOMIAL*.  
**If it consist of three, a trinomial;** as 245, or  $240 + 5$ : Or  $100 + 140 + 5$ . See *TRINOMIAL*.—**If of more than three, it is called multinomial;** as 2456, or  $2450 + 6$ , or  $2400 + 56$ , or  $2000 + 456$ , or  $2000 + 400 + 50 + 6$ . See *MULTINOMIAL*.  
***Root* of an equation, in algebra, denotes the value of the unknown quantity in an equation.** See *EQUATION*.  
 Thus, if the equation be  $a^2 + b^2 = x^2$ , the *root* of the equation is the square root of  $a$ , and that of  $b$ ; expressed thus,  $\sqrt{a^2 + b^2}$ .  
**Real *Root***—If the value of  $x$  be positive, *i. e.* if  $x$  be a positive quantity; *e. gr.*  $x = r$ , the *root* is called a *real* or *true root*. See *POSITIVE*.  
**False *Root***—If the value of  $x$  be negative, *e. gr.*  $x = -5$ , the *root* is said to be false. See *NEGATIVE*.  
**Imaginary *Root***—If the value of  $x$  be the *root* of a negative quantity, *e. gr.*  $\sqrt{-5}$ ; it is said to be *imaginary*.  
 The great use of algebra is to bring problems to equations; then to reduce those equations, or to exhibit them in the most simple terms. See *REDUCTION*.  
 What remains after this to the solution of the problems, is to extract the *roots* of the equations thus reduced, be they lines or numbers. See *RESOLUTION*.  
**Residual *Root*.** See the article *RESIDUAL*.  
**Extraction of the *Roots* of equations.** See *EXTRACTION*.  
***Roots*, *RADICES*, in grammar, are the primitive words of a language, whence others are compounded or derived.** See *PRIMITIVE*, *COMPOUND*, and *DERIVATIVE*.  
 Thus the Latin *flu* is the *root* of *fluctus*, *fluxio*, *flumen*, *fluvialis*, *influxus*, *refluens*, *fluclifer*, *fluclifonius*, *fluclivagus*, &c.—Thus also the Greek,  $\rho\acute{\alpha}\zeta\omicron$ , is the *root* of  $\rho\acute{\alpha}\delta\omicron$ ,  $\rho\acute{\alpha}\delta\iota\omicron$ ,  $\rho\acute{\alpha}\delta\iota\sigma\mu\omicron$ , &c.  
 And thus also, though in a less proper sense, the Danish *rood* is the *root* of the English word *root*; the Latin *radix* the *root* of the French *racine*, as *rado* is the *root* of *radix*; and perhaps  $\rho\acute{\alpha}\delta\omicron$  the *root* of *rado*.  
 The Greek and Hebrew tongues are learnt by *roots*—Of dictionaries, some are in alphabetical order, others are disposed by *roots*, as Scapula, Faber's Thesaurus, and the first edition of the dictionary of the French academy: in the edition of 1718, this last is thrown into the usual alphabetical order. See *DICTIONARY*.  
**ROPE, an assemblage of several twists or strings of hemp, twisted together by means of a wheel: of various uses, as in binding, staying, drawing, suspending, &c.** See *HEMP* and *CORDAGE*.  
 When the *rope* is made very thick, it is called a *cable*, and when very small, a *cord*. See *CABLE* and *CORD*.  
 The greatest consumption of *ropes* is in navigation, for the tackling of ships; where, though *ropes* include the whole cordage. See *TACKLE* and *SHIP*.  
 Yet there are several *ropes* particularly so denominated: as, the *entering rope*, hung at the ladder to help people up—The *top-rope*—A *bolt-rope*, wherein the sail is fowed—*Buoy-rope*, to which the buoy of the anchor hangs—*Guest-rope*, to tow the long-boat—The *keel-rope*—The *bucket-rope*—*Rudder-rope*, to save the rudder if it should chance to be beat off—*Preventer-rope*, to save the yard in case any part of the ties should be broke—*Breast-rope*, to lash the pannels to the masts—*Guy-rope*, to keep the foremast forwards, directly over the hatch-way—And *boat-rope*, by which the boat hangs, or is fastened a-stern of the ship—*Port-ropes*. See *PORT-ropes*.  
**ROPE, cord, or strap, in the manage, is any of these tied round a pillar to which the horse is fastened when they begin to quicken and supple and teach him to fly from the sham-brier, and not gallop fastly or incompactly.** See *PILLAR*.  
 In those manages where there is no pillar, a man stands in the centre of the ground, and holds the end of the *rope*.  
**ROPES of two pillars, are the ropes or reins of a cavezon,**  
 VOL. II. N<sup>o</sup> CXXXV.

used to a horse that works between two pillars. See *PILLAR*.  
**ROPE dancer.** See the article *DANCER*.  
**ROPE deck.** See the article *DECK*.  
**ROPE yarn, is the yarn of any rope untwisted—It commonly consists of cable-ends, which are worn out; and are called junks of the cables—It serves for many purposes among the sailors.**  
**RORIFEROUS-duct, q. d. dew dropping pipe; a name given by some to the thoracic duct; from its slow manner of conveying, and as it were, instilling, the chyle into the common stream of blood.** See *THORACIC-duct*, &c.  
**ROS, dew.** See the article *DEW*.  
**Ros vitrioli, among chymists, is sometimes used for the first phlegm distilled from vitriol in balneo mariae.** See *VITRIOL*.  
**ROSADE, a kind of liquor, prepared of pounded almonds and milk, mixed with clarified sugar.**  
**ROSARUM acetum.** See *ACETUM*.  
**ROSARY, in the Romish church, a chaplet consisting of five, or fifteen decads of beads, to direct the recitation of so many ave maria's, in honour of the virgin.** See *CHAPLET*.  
**ROSARY, also denotes a particular mass or form of devotion addressed to the virgin, to which the chaplet of that name is accommodated.** See *VIRGIN*.  
 Some attribute the institution of the *rosary* to St. Dominic; but F. d'Achery shews it was in use in the year 1100; so that St. Dominic could only make it more celebrated—Others attribute it to Paulus Libycus, and others to St. Benedict; others to the Chartreux; others to venerable Bede; and others to Peter the hermit.  
 Those who ascribe it to St. Dominic, differ as to the particular time of its institution; some referring it to the year 1208, when he preached against the Albigenes; others will have him to have set it on foot in the course of his missions in Spain, before he passed into France.  
**Order of the ROSARY, or of our lady of the ROSARY, is an order of knights, supposed by Schoonebeck, and the jesuit Bonanni, to have been instituted by St. Dominic; but by mistake: for that saint never instituted any order under this name, and these authors apparently make a military order of an army of croisees, who under the command of the count de Montfort, fought against the Albigenes.** See *CROISADE* and *ALBIGENSES*.  
 The abbot Justiniani, and M. Hermant, will have this order to have been established by an archbishop of Toledo, named Frederick, after St. Dominic's death; and to have bore for a badge, a black and white cross, in the middle whereof was represented our lady, holding her little son in one hand, and in the other a *rosary*—F. Mendo adds, that they were obliged to rehearse the *rosary* on certain days—After all, F. Helyot doubts whether or no such an order ever existed. See *ORDER*.  
**ROSATA aloe.**  
**ROSATUM acetum.**  
**ROSATUM aromaticum.**  
**ROSATUM vinum.**  
 } See } **ALOE.**  
 } **ACETUM.**  
 } **AROMATICUM.**  
 } **VINUM.**  
**ROSE, ROSA,  $\rho\acute{\alpha}\delta\omicron$ , a medicinal flower, produced by a shrub of the same name; which gives the denomination to several preparations in pharmacy.** See *FLOWER*.  
 The kinds of *roses* are various: those chiefly used in medicine are the *red* and *damask roses*—The *damask* are a good and safe purgative, administered in infusion, or by way of syrup—The *red* are astringent; and the conserve thereof used with success against distempers of the breast and lungs, and disorders of the eyes. See *CONSERVE*.  
 It is a tradition among the ancients, that the god of love made a present to Harpocrates the god of silence, of a beautiful *rose*, the first that had been known; to engage him not to discover any of the private practices of his mother Venus—And hence it became a custom to have a *rose* placed in their rooms of mirth and entertainment, that under the assurance thereof they might be induced to lay aside all constraint, and speak what they pleased—Thus did the *rose* become a symbol of silence; so that to be *sub rosa*, under the *rose*, denotes as much as to be out of danger of having any conversation divulged.  
**Sugar of ROSES, is made of red rose leaves, dried in an oven, pulverized, and put into a proper quantity of sugar dissolved with a little water in a chafing-dish over the fire.** See *SUGAR*.  
**ROSE-WATER, a water drawn by distillation from red or damask roses.** See *WATER*.  
 It is a good cordial, and was formerly highly esteemed; but is since fallen from its reputation, and is little used but in diseases of the eyes, and in perfumes and wafes.  
 It is however, in great esteem throughout the East, particularly in China and Persia, where the trade thereof is very considerable. The *rose-leaves* remaining at the bottom of the still, have the natural cathartic quality; and are also kept for a perfume.

**Golden Rose**, is a rose which the pope blesses at mass on the first Sunday in Lent, while they sing *letare Jerusalem*; and which, after mass, he carries in procession; and then sends it as a present to some sovereign prince.

The *factious* of the red and white Rose, are famous in our English histories—They had their rise in 1454, under Henry VI. between the houses of York and Lancaster, and ended in Henry VII. who united the two branches—The house of Lancaster had for its badge a *white rose*; that of York a *red* one. See **FACTION**.

**ROSE-WOOD**, *lignum rhodium*, or *aspalathum*. See **ASPALATH**.

**ROSE**, in architecture and sculpture, an ornament cut in resemblance of a rose—See *Tab. Archit. fig. 54. fig. 26. lit. b.* See also **ORNAMENT**.

It is chiefly used in frizes, corniches, vaults of churches, and particularly in the middle of each face of the corinthian abacus. See **ABACUS**—And in the spaces between the modillions; under the plafonds of corniches. See **MODILLION**.

**ROSE nails**. See the article **NAIL**.

**ROSE diamond**. See the article **DIAMOND**.

**ROSE-NOBLE**, an ancient English gold coin, first struck in the reign of Edward III. and then called the *penny of gold*; since called *rose-noble*, because stamped with a rose: It was current at 6 s. 8 d. See **NOBLE** and **COIN**.

**ROSEMARY**, **ROSMARINUS**, a medicinal plant, whose flower, called *anthos*, is of considerable use in the present practice. See **ANTHOS**.

*Rosemary* flowers are esteemed the principal aromatic of our growth—Dr. Quincy speaks of them as good in most nervous complaints, especially such as arise from too great moisture and cold, as they are hot and drying—In epilepsies, apoplexies, palsies, &c. they are rarely omitted in prescription, under one form or other. See **AROMATIC**.

They abound with a subtle detergent oil, which makes them deobstruent and opening, whence their use in uterine obstructions, the jaundice, &c.

They are the basis of the celebrated Hungary water; with a small quantity of which, diluted in common water, the confectioners make conserve of *rosemary* flowers, essence of *rosemary-water*, &c. See **HUNGARY-WATER**.

**ROSCRUCIANS**. See the article **ROSCRUCIANS**.

**ROSIN**, **RESINA**, in pharmacy. See **RESINA**.

**ROSIN**, is particularly used for a resinous matter prepared from the juice of the pine-tree; in ordinary use for the making of wax, &c.

Mr. Bent in the *Phil. Transf.* N<sup>o</sup>. 243, gives us the manner of preparing this coarse drug, in the southern parts of France; thus—The bark being pared off the pine, to make the sap run down into a hole made at bottom to receive it; as the juice runs it leaves a cream or crust a-top; which being tempered with water, is sold, by a cheat, for white bees-wax. See **WAX**.

When they have got a quantity of the juice they strain it through a basket, and what runs through is the common turpentine. See **TURPENTINE**.

What stays behind, they mix with water, and distilling it in an alembic, the matter that rises is the oil of turpentine; and the calx that remains is the common *rosin*.

**ROSOLIS**, or **ROS-SOLIS**, popularly, **ROSA-SOLIS**, *sun-dew*, an agreeable spirituous liquor, chiefly taken after meals, by way of dram, to aid digestion: being composed of burnt brandy, sugar, cinnamon, and milk-water, and sometimes perfumed with a little musk.

It had its name, because anciently prepared wholly of the juice of the plant *ros solis*; but that plant is no longer any ingredient therein.

The best is that of Turin—The French have a particular kind not called *ros solis*, but *du roy*; because used with good effect by the late king Lewis XIV.—It is composed of Spanish wine, wherein are infused anise, fennel, aneth, coriander, &c. for three weeks.

**ROSTING**. See the articles **DRESSING**, **FOOD**, &c.

**ROSTRA**, in antiquity, a part of the Roman forum, wherein orations, pleadings, funeral harangues, &c. were delivered. See **FORUM**.

The *rostrum* was a kind of chapel, taken out of the forum, and furnished with a suggestum, or eminence called more particularly the *rostra*, where the orators stood to speak.

It was adorned, or, as Livy says, built, with the beaks of ships taken from the people of Antium, in a naval engagement; whence the name. See **ROSTRUM**.

**ROSTRALIS corona**, **ROSTRAL crown**, in antiquity. See **CROWN**.

**ROSTRALIS columna**, **ROSTRAL column**. See **COLUMN**.

**ROSTRI-FORMIS processus**, in anatomy, the same as *coracoides*. See **CORACOIDES**.

**ROSTRUM** literally denotes the beak or bill of a bird. See **BIRD**.

Hence the word is also figuratively applied to the beak, or fore-part of the head of a ship. See **HEAD**, **PROW**, **SHIP**, &c. See also **ROSTRA**.

**ROSTRUM**, in chymistry, signifies the nose, or beak of the common alembic, which conveys the liquor distilled into its receiver. See **ALEMBIC**, **RECEIVER**, **DISTILLATION**, &c.

**ROSTRUM**, is also a sort of crooked scissars, which the surgeons in some cases make use of for the dilation of wounds.

**ROSCRUCIANS**, **ROSCRUCIANS**, or *brothers of the Rosy-cross*, a name assumed by a sect or cabal of hermetical philosophers; who arose, or at least became first taken notice of in Germany, in the beginning of the last century. See **HERMETICAL**.

They bound themselves together by a solemn secret, which they swore inviolably to preserve; and obliged themselves at their admission into the order, to a strict observance of certain established rules.

They pretended to know all sciences, and chiefly medicine; whereof they published themselves the restorers—They pretended to be masters of abundance of important secrets; and among others, that of the philosopher's stone; all which they affirmed to have received by tradition from the ancient Egyptians, Chaldeans, the Magi, and Gymnosophists. See **PHILOSOPHER'S stone**.

Their chief was a German gentleman, educated in a monastery, where he learnt the languages—In 1378 he went to the Holy Land, where falling sick at Damascus, he consulted the Arabs, and other Eastern philosophers, by whom he was supposed to be initiated into this wonderful art—At his return into Germany, he formed a society, to whom he communicated the secrets he had brought with him out of the East, and died in 1484.

They have been distinguished by several names, accommodated to the several branches of their doctrine—Because they pretended to protract the period of human life, by means of certain nostrums, and even to restore youth; they were called *immortales*.

As they pretended to know all things, they have been called *illuminati*; and because they have made no appearance for several years, but have kept altogether incognito, they have been called the *invisible brothers*.

Their society is frequently signified by the letters **F. R. C.** with some among them interpret *fratres rois colli*, it being pretended that the matter of the philosopher's stone is dew concocted, exalted, &c.

Some, who are no friends to free masonry, make the present flourishing society of free masons a branch of *Rosicrucians*; or rather the *Rosicrucians* themselves under a new name, or relation; viz. as retainers to building—And it is certain, there are some free masons who have all the characters of *Rosicrucians*; but how the æra and original of masonry, as traced by Mr. Anderson, and that of *Rosicrucianism*, here fixed from Naudæus, who has wrote expressly on the subject, consist, we leave others to judge. See **MASONRY**.

**ROT**, a disease, which in moist years is incident to sheep, in the same ground where in drier years they are free from it; which, yet, arises, not only from the moisture, but from a certain principle of putrefaction, both in the air and the grass. See **PUTREFACTION**.

**ROTA**, in mechanics. See the article **WHEEL**.

**ROTA Aristotelica**, *Aristotle's wheel*, is the name of a celebrated problem in mechanics, founded on the motion of a wheel about its axis; thus called, because first, that we know of, taken notice of by Aristotle.

The difficulty is this—While a circle makes a revolution on its centre, advancing at the same time in a right line along a plane; it describes, on that plane, a right line equal to its circumference. Now if this circle which we may call the *deferent*, carry with it another smaller circle concentric with it, and which has no motion but what it receives from the deferent; which is the case of the nave of a coach-wheel carried along by the wheel; this little circle, or nave, will describe a line in the time of the revolution, equal, not to its own circumference, but to that of the wheel: for that its centre advances in a right line, as fast as that of the wheel does; as being in reality the same therewith.

The matter of fact is certain—But how it should be, seems a mystery—It is obvious, that the wheel advancing during the revolution, must describe a right line equal to its circumference; but how should the nave, which revolves like the wheel, describe a right line so much greater than its circumference?

The solution Aristotle gives is no more than a good explanation of the difficulty—Galileo, who next attempted it, has recourse to an infinity of infinitely little vacuities in the right line described by the two circles; and imagines that the little circle never applies its circumference to those vacuities;

vacuities; but in reality only applies it to a line equal to its own circumference; though it appears to have applied it to a much larger.

But it is evident this is all gratis dictum—The vacuities are imaginary; and why does not the great circle apply its circumference to them? lastly, the magnitude of these vacuities must be augmented or diminished according to the different proportion of the two circles.

F. Tacquet will have it that the little circle making its rotation more slowly than the great one, does on that account describe a line longer than its circumference; yet without applying any point of its circumference to more than one point of its base—But this is no more allowable than the former.

The attempts of so many great men proving vain; M. Dortous de Meyran, a French gentleman, had the good fortune to hit on a solution, which he sent to the royal academy of sciences; where being examined by Mess. de Louville and Saulmon, appointed for that purpose, they made their report that it was satisfactory—The solution is to this effect. The wheel of a coach is only acted on, or drawn in a right line: its circular motion, or rotation arises purely from the resistance of the ground whereon it is applied. Now this resistance is equal to the force wherewith the wheel is drawn in the right line; inasmuch as it defeats that direction: of consequence the causes of the two motions, the one right, the other circular, are equal, and therefore their effects, *i. e.* the motions are equal. And hence, the wheel describes a right line on the ground, equal to its circumference.

For the nave of the wheel, the case is otherwise—It is drawn in a right line by the same force as the wheel, but it only turns round, because the wheel turns, and can only turn with it, and at the same time therewith. Hence it follows that its circular velocity is less than that of the wheel, in the ratio of the two circumferences; and therefore its circular motion is less than its rectilinear one.

Since then it necessarily describes a right line equal to that of the wheel, it can only do it by sliding, or what they call the motion of *raffon*—That is, a part of the circular nave cannot be applied to a part of a right line greater than itself, but by sliding along that part; and that more or less, as the part of the nave is less than that of the circle. See ROLLING and SLIDING.

ROTA, is also used for a particular court or jurisdiction in Rome, established for taking cognizance of beneficiary matters, &c. See BENEFICE, &c.

The *rota* consists of twelve doctors, chosen out of the four nations of Italy, France, Spain, and Germany; three of them being Romans, one a Florentine, one a Milaneze, one of Bologna, one of Ferrara, one a Venetian, one a Frenchman, two Spaniards, and one a German; each having four clerks or notaries under him.

Their office is to judge of all beneficiary causes, both within Rome, and throughout the state of the church, in case of appeal; and of all civil processes for above 500 crowns.

They are also called *chaplains* of the pope, as succeeding the ancient judges of the sacred palace, who held their court in his chapel. See CHAPLAIN.

The denomination *rota*, *wheel*, some will have derived hence, that they officiate by rotation; others, because the most important affairs of the Christian world turn upon them—Du Cange derives it from *rota porphyretica*, because the pavement of the chamber where they formerly sat was of porphyry; and fashioned like a wheel.

ROTATION, ROLLING, in mechanics. See ROLLING, ROTA, &c.

ROTATION, in geometry, the circumvolution of a surface round an immoveable line, called the *axis of rotation*. See AXIS.

By such *rotation* of planes, solids are formed or generated. See GENESIS, SOLID, &c.

The method of cubing solids, generated by such *rotation*, is laid down by M. de Moivre, in his specimen of the use of the doctrine of fluxions—For the fluxions of such solids take the product of the fluxion of the abscissa, multiplied by the circular base; and suppose the ratio of a square to the circle inscribed, be as  $\frac{n}{1}$ : the equation expressing the nature

or property of any circle, whose diameter is  $d$ ; is  $yy = dx - xx$ . Therefore  $\frac{dxx - x^2x}{n}$  is the fluxion of a portion

of the sphere, and consequently, the portion itself  $4\frac{1}{2}dx - x^2x^3$ , and the circumscribed cylinder is  $4\frac{dx - x^3}{n}$  there-

fore the portion of the sphere is to the circumscribed cylinder, as  $\frac{1}{2}d - \frac{1}{2}x$  to  $d - x$ . *Philos. Transact.* N°. 216.

ROTATION, REVOLUTION, in astronomy. See REVOLUTION.

Diurnal ROTATION. See DIURNAL Rotation and EARTH.

ROTATION, in anatomy, the action of the *musculi rotatores*; or the motion which they give to the parts they are fixed to.

See ROTATOR.

There are two muscles, the great and the little obliquus, to perform the *rotation* of the eye—The obturator internus and externus effect the *rotation* of the thighs. See EYE, &c.

ROTATOR, in anatomy, a name given the oblique muscles of the eye; called also from the direction of the fibres, *circularis*, and from the effect of their action, *amatorii*. See AMATORII, OBLIQUUS and EYE.

ROTHER-BEASTS, a word used in old statutes, and still in the northern parts of England, for horned beasts; as oxen, cows, steers, heifers, &c.

Whence *rotber-soil*, in Herefordshire, is taken for the dung or soil of such cattle.

ROTHER-NAILS, are such as have a very full head, and are used to fasten the rudder-irons in ships. See NAIL.

ROTONDO, ROTUNDO, in architecture, a popular term for any building that is round both within and without side; whether it be a church, a salon, a vestibule, or the like. See BUILDING, &c.

The most celebrated *rotondo* of antiquity is the pantheon at Rome, dedicated to Cybele and all the gods, by Agrippa, son-in-law of Augustus; but since consecrated by pope Boniface IV. to the virgin and all the saints, under the title of *Sta. Maria della rotunda*. See PANTHEON.

The chapel of the Escorial, which is the burying place of the kings of Spain, is also a *rotondo*; and in imitation of that of Rome, is also called *pantheon*. See ESCURIAL.

ROT TENNESS, *Putredo*. See PUTRIFICATION.

ROTULA, in anatomy. See the article PATELLA.

ROTULI *magni ingrossator*. See INGROSSATOR.

ROTULORUM *custos*. See the article CUSTOS.

ROTULUS, a roll. See the article ROLL.

ROTULUS *contrarientium*—The earl of Lancaster taking part with the barons against king Edward II. it was not thought fit, in respect of their power, to call them rebels or traitors, but only *contrarientis*: accordingly, we have a record of those times called *rotulus contrarientium*.

ROTULUS *wintonia*, an exact survey of all England, by counties, hundreds, and tithings; made under king Alfred; not unlike that of *domes-day*. See DOMES-DAY.

It was thus called, because anciently kept at Winchester, among other records of the kingdom.

ROTUNDO. See the article ROTONDO.

ROTUNDUS, in anatomy, a name given to several muscles, from the roundness of their body. See MUSCLE.

Such are the *rotundus major*, called also *teres major*; and the *rotundus minor*, called also *teres minor*, and *transversalis*—See *Tab. Anat. (Myl)* fig. 2. n. 13. fig. 6. n. 12, 13. fig. 7. n. 14, 34 and 35. See also TERES, &c.

Pronator radii ROTUNDUS. See PRONATOR.

ROUAGE. *Battery en ROUAGE*. See BATTERY.

ROUGE-crofs, q. d. *red-crofs*. See POURSUIVANTS.

ROUGE-dragon, q. d. *red-dragon*. See POURSUIVANTS.

ROUGH, ROUGHNESS, in mechanics. See FRICTION and RESISTENCE.

ROUGH casting. See PLAISTERING and MORTAR.

ROUGH diamond. See the article DIAMOND.

ROUGH emerald. See the article EMERALD.

ROUGH leaved plants. See the article PLANT.

ROUGH taste. See TASTE, ACERB, AUSTERE, &c.

ROUL, ROLL, or ROWL, in the military art—Officers of the same rank, who mount the same guards, and take their turns in relieving one another, are said to *roul* or *roll*. See GUARD.

ROULADE, in music, a trilling or quavering. See QUAVING.

ROUND, ROTUNDUS, in geometry. See CIRCLE, GLOBE, SPHERE, &c.

ROUND, in anatomy. See the article ROTUNDUS.

ROUND, in music—The Italians call *b round*, what we call a *flat*; and the French *b mol*; and *b square*, what we call a *sharp*. See FLAT and SHARP, &c.

ROUND, is also a military term, signifying a walk or turn which an officer, attended with some soldiers, takes in a garrison or fortified place, *around* the ramparts, in the night-time; to listen if any thing be stirring without the works, and to see that the centries are watchful, and do their duty, and all things in good order. See COUNTER round.

In strict garrison, the *rounds* go every quarter of an hour, that the rampart may be always furnished—The centuries are to challenge at a distance; and to rest their arms as the *rounds* pass, and let no one come near them.

When the *round* is near the corps de garde, the centry calls aloud, *who comes there?* and when the answer is, *the rounds*, he says, *stand*; then calls for the corporal of the guard, who draws his sword, and calls also, *who comes there?* and when it

it is answered, *the rounds*, he that has the word advances and delivers it to the corporal, who receives it with his sword pointed at the giver's breast. See **WORD**.

*Way of the ROUNDS*. See the article **WAY**.

*Counter-ROUNDS*. See **COUNTER-round**.

*Quarter-ROUND*. See the article **QUARTER-round**.

**ROUNDS**, among masons, denotes the broken pieces of statues.

**ROUND-heads**. See **WHIG** and **TORY**.

**ROUND-head nails**. See the article **NAIL**.

**ROUND-HOUSE**, in a ship, is the uppermost room or cabin on the stern of a ship, where the master lies. See **SHIP** and **STERN**.

**ROUND-house** also denotes a kind of prison, for the nightly watch to secure persons in, till they can be carried before a magistrate. See **WATCH**.

**ROUND niche** } See the articles { **NICHE**.  
**ROUND roof** } **ROOF**.  
**ROUND table** } **TABLE**.

**ROUND**, in the academies, denotes a circular piste or tread. See **PISTE**.

To **ROUND a horse**, is a general term for all sorts of maneges upon a volt, or circular tread. See **VOLT**—Hence to *round* a horse upon a trot, gallop, &c. is to make him carry his shoulders and haunches roundly or compactly, upon a large or smaller circle, without traversing or bearing to a side.

**ROUNDELAY\***, or **ROUND**, a kind of ancient poem, thus called, according to Menage, from its form; and because it still turns back again to the first verse, and thus goes round. See **LAY**.

\* The word is formed from *round* and *lay*—The French call it *rondeau*. The Spaniards *glofas*.

The common *roundelay* consists of thirteen verses, eight whereof are in one rhyme, and five in another—It is divided into couplets; at the end of the second and third whereof, the beginning of the *roundelay* is repeated; if possible, in an equivocal or punning sense.

The *roundelay* is a popular poem among the French, but little known among us—Marot and Voiture have succeeded the best in it.

Rapin observes, that if the *roundelay* be not very exquisite, it is stark nought—In all the ancient *roundelays*, Menage observes, the verse preceeding has a compleat sense; and yet joins agreeably with that of the close; without depending necessarily thereon. This rule well observed makes the *roundelay* more ingenious; and is one of the finesses of the poem.

**ROUNDELET**. See the article **RUNDLET**.

**ROUNDNESS**, **ROTUNDITY**, in physics. See **SPHERICITY**.

**ROUND**, or **ROUND**, in music, a kind of burden or ritornello; where the beginning of each couplet is repeated at the end thereof. See **RITORNELLO**.

**ROUPIA**, or **RUPEE**. See the article **RUPEE**.

**ROUSE up a hart**, among hunters. See **HUNTING**.

To **ROUSE**, among falconers, is when a hawk lifts up and shakes himself. See **HAWK** and **HAWKING**.

To **ROUSE a hawser**, or *cable*, in the sea phrase, signifies to hale in part of the hawser or cable, which lies slack in the water. See **CABLE**, &c.

**ROUT\***, **ROUTE**, a public road, highway, or course; especially that which military forces take. See **ROAD**.

\* The word is French, *route*, formed from the Latin, *rupta*, or *ruta*; or the French, *roux*, an old word for horse; or rather from the old Celtic, *rou*, road.

Sanfon and Ogilby have made maps of the *routes* and post-roads of France and England: soldiers are prohibited going out of their *routes*—*Routes* are frequently cut in parks, forests, &c. both for ornament and the conveniencies of hunting. See **HUNTING**.

Some use *route* for a path cut a-crofs a wood; in opposition to *way*, which is a great road. See **WAY**.

**ROUT**, in navigation. See the article **COURSE**.

**ROUT** is also used for the defeat and flight of an army — The serjeants endeavour to rally the soldiers in a *route*. See **RALLYING**.

**ROUT**, in law, is an assembly or combination of three, or more persons, going forcibly to commit an unlawful act; though they do not actually perform it. See **ASSEMBLY**. If they go, ride, or move forwards, after their meeting, it is a *route*, though they do not put their purpose in execution; if they do, it is a *riot*.

A *route*, therefore, seems to be an unlawful assembly; and a riot the disorderly fact committed thereby. See **RIOT**.

Two things, however, there are in common to *route*, *riot*, and *unlawful assembly*: the one, that there be at least three persons together; the other, that, being together, they disturb the peace, either by words, shew of arms, turbulent gesture, or actual violence. See **UNLAWFUL assembly**.

**ROUT of wolves**, among hunters, denotes a herd of these wild beasts. See **HERD**.

**ROUTIER**, in navigation. See **WAGGONER**.

**ROWEL**, among farriers, a kind of issue, made by drawing a skain of silk, thread, hair, or the like, through the nape of the neck, or other part of an horse; answering to what in chirurgery is called a *seton*. See **SETON**.

The **ROWELLING of horses** is a method of cure frequently had recourse to in inward strains, especially about the shoulders or hips; as also for hard swellings not easy to be resolved.

The operation is thus—A little slit being made through the skin, about a handful below the part aggrieved, big enough to put a swan's quill in; the skin is raised from the flesh, the end of the quill put in, and the skin blow'd from the flesh upwards, and all over the shoulder—Then the hole being stopped with the finger, the place blown is beaten with a hazel-stick, and the wind spread with the hand all over; then let go.

This done, horse-hair, or red sarfenet, half the thickness of the little finger, is put in a *rowelling* needle seven or eight inches long; the needle is put into the hole, and drawn through again six or seven inches higher; then the needle is drawn out, and the two ends of the *rowel* tied together: anointing it every day, as well as before the putting it in, with sweet butter and hog's grease, and drawing it backwards and forwards in the skin, to make the putrid matter discharge itself more plentifully.

Others, disliking these *rowels*, as making too great a sore and scar, use the French *rowel*, which is a round piece of stiff leather, with a hole in the midst; laying it flat between the flesh and skin, the hole of the *rowel* just against that in the skin; sowing it with a needle and thread drawn through the hole and the skin; cleaning it once in two or three days, and anointing it a-fresh.

**ROWING**. See **OAR**, **BOAT**, &c.

**ROWS of trees**. See the article **PARALLELISM**.

**ROYAL\***, **REGAL**, something relating to a king. See **KING**.

\* The word is French, formed from the Latin, *regalis*, of *rex* king.

In this sense we say, the *royal family*, the *royal blood*, *royal line*, &c.

In England the prince and princess of Wales, the king's brother, &c. are addressed under the title of *royal highness*. See **PRINCE** and **HIGHNESS**—The duchess of Savoy is called *madame royale*.

**ROYAL abby**, denotes an abby founded by a king, or by a prince who is succeeded by a king. See **ABBY**.

**ROYAL academy of sciences**, &c. See **ACADEMY**, &c.

**ROYAL antler**, among hunters, expresses the third branch of the horn of a hart or buck, that shoots out from the rear or main horn above the back antler. See **ANTLER**, **HEAD**, **ATTIRE**.

**ROYAL army**, is an army marching with heavy cannon, capable of besieging a strong, well fortified city—It is usual to hang up a governor who has the assurance to hold out a petty place against a *royal army*.

**ROYAL assent**, is that assent or approbation which the king gives to a thing done by others; as the election of a bishop by dean and chapter; or a bill passed in both houses of parliament. See **KING**, &c.

The *royal assent* in parliament being given, the bill is endorsed with these words, *Le roy le veult*; that is, it pleases the king—If he refuses it, thus, *Le roy s'avisera*, q. d. the king will advise upon it. See **BILL**, **PARLIAMENT**, &c.

**ROYAL boroughs**. See the article **BOROUGH**.

**ROYAL crown**, is that worn by kings. See **CROWN**.

This they also call an *imperial crown*, being closed a-top.

The English crown is closed by semi-circles of gold meeting at the monde or globe, on which the cross stands; and those semi-circles adorned with crosses and fleur-de-lises: the whole embellished with precious stones.

**ROYAL charter**. See the article **CHARTER**.

**ROYAL African company**. See the article **COMPANY**.

**ROYAL Exchange**, the burs or meeting place of the merchants in London. See **EXCHANGE**.

It was first built in 1566, at the charge of Sir Thomas Gresham; and in a solemn manner, by herald with sound of trumpet, in presence of queen Elizabeth, proclaimed the *royal exchange*—Till that time the merchants met in Lombard-street.

It was built of brick; yet then esteemed the most splendid burs in Europe—An hundred years after its building, at the great fire, it was burnt down; but soon raised again, in a still more magnificent manner; the expence thereof amounting to 50000 *l*.

One half of this sum was disbursed by the chamber of London, the other by the company of Mercers; who, to reimburse themselves, let to hire 190 shops above stairs,

at 20 pounds each; which with other shops, &c. on the ground, yield a yearly rent of above 4000 pounds, yet the ground it stands on does not exceed  $\frac{1}{2}$  of an acre: whence it is observed to be much the richest spot of ground in the world.

It is built quadrangular, with walks a-round, wherein the merchants of the respective countries associate themselves. In the middle of the area or court, is a fine marble statue of king Charles II. in the habit of a Roman Cæsar; erected by the society of merchant adventurers; the workmanship of Grinlin Gibbons. Around are the statues of the several kings since the Norman conquest, ranged.

ROYAL *fishes*, are whales and sturgeons, and, some add, porpoises too, which the king, by his prerogative, is to have whenever cast on shore, or wrecked, in all places of the realm, unless granted to subjects by express words. See FISHES.

ROYAL *Foot*. See the article FOOT.

ROYAL *Fort*. See the article FORT.

ROYAL *franchise*. See the article FRANCHISE.

ROYAL *hospital*. See the article HOSPITAL.

The ROYAL *oak* is a fair spreading tree at Boscobel in the parish of Donnington in Staffordshire, the boughs whereof were all covered with ivy; in the thick of which king Charles II. sat in the day time with colonel Careless, and in the night lodged in Boscobel-house: so that they are mistaken who speak of it as an old hollow oak; it being then a gay flourishing tree, surrounded with many more—The poor remains hereof are now fenced in with a handsome wall, with this inscription over the gate, in gold letters—*Fallicissimam arborem quam in asyllum potentissimi regis Caroli II. Deus ap. max. per quem reges regnant, hic crescere voluit, &c.* Philoloph. Transact. No. 310.

ROYAL *officers*. See the article OFFICER.

ROYAL *Parapet*, or *parapet of the rampart*, in fortification, is a bank about three fathoms broad, and six foot high, placed upon the brink of the rampart, towards the country; to cover those who defend the rampart. See RAMPART and PARAPET.

Port ROYAL. See the article PORT royal.

ROYAL *Society*, is an academy, or body of persons of eminent learning; instituted by king Charles II. for the promoting of natural knowledge. See ACADEMY.

This illustrious body had its original in an assembly of ingenious men, who before the restoration met weekly in Wadham-college, in Oxford, at the lodgings of Dr. Wilkins. Afterwards, from about the year 1658, many of them living in London, held meetings at Gresham-college; till they were at length taken notice of by the king, who was pleased to grant them an ample charter, dated the 22d of April, 1663; whereby they were erected into a corporation, consisting of a president, council, and fellows, for promoting the knowledge of natural things, and useful experiments. Their manner of electing fellows is by balloting. Their council are in number 21, eleven of which are continued for the next year, and ten more added to them, all chosen on St. Andrew's day.

Each member at his admission subscribes an engagement, that he will endeavour to promote the good of the society; from which he may be freed at any time, by signifying to the president, that he desires to withdraw.

The charges are 40 s. paid to the treasurer at admission; and 13 s. per quarter, so long as the person continues a member.

Their design is to “make faithful records of all the works of nature or art, which come within their reach; so that the present as well as after ages may be enabled to put a mark on errors which have been strengthened by long prescription, to restore truths that have been neglected; to push those already known to more various uses; to make the way more passable to what remains unrevealed, &c.

To this purpose they have made a great number of experiments and observations on most of the works of nature; eclipses, comets, meteors, mines, plants, earthquakes, inundations, springs, damps, subterraneous fires, tides, currents, the magnet, &c.—Also, numbers of short histories of nature, arts, manufactures, useful engines, contrivances, &c. The services they have been of to the public, are very great—They have improved naval, civil, and military architecture; advanced the security and perfection of navigation; improved agriculture; and put not only this kingdom, but also Ireland, the Plantations, &c. upon planting.

They have registered experiments, histories, relations, observations, &c. reduced them into one common stock; have from time to time published some of the most immediate use, under the title of *Philosophical Transactions*, &c. and laid the rest up in public registers, to be nakedly transmitted to posterity, as a solid ground-work for future systems. See TRANSACTIONS.

They have a library adapted to their institution; towards

VOL. II. N CXXXV.

which the late earl-marshall contributed the Norfolcian library; and a museum, or repository of natural and artificial rarities, given them by Daniel Colwal, Esq;—Their motto, *Nullius in Verba*.

ROYAL *Spanish academy*. See the article ACADEMY.

ROYAL *sugar*. See the article SUGAR.

ROYALTIES, REGALTIES, the rights of the king; otherwise called the king's prerogative, and the regalia. See PREROGATIVE and REGALIA.

Of these, some the king may grant to common persons; others are inseparable from the crown. See KING, GRANT, &c.

RUBARB, RHABARBARUM, in medicine. See RHUBARB.

RUBBING. See ATTRITION and FRICTION.

RUBIA *Tinctorum*, a root or drug popularly called madder. See Madder.

RUBIFYING\*, in chymistry, &c. the act of turning a thing red by force of fire, &c. See RED and RUBY.

\* The word is formed of the Latin *rubens*, ruddy, and *fit*, I become.

Red arsenic is supposed to be no more than the common orpiment *rubified* by fire, with the addition of nut or olive-oil. See ARSENIC.

RUBIGALIA, or ROBIGALIA, in antiquity, a feast celebrated by the Romans in honour of the god Rubigus, or the goddess Rubigo; and to engage those deities to preserve the corn from blasting, and mildews. See FEAST.

The *rubigalia* were instituted by Numa in the eleventh year of his reign; and were held on the 7th of the calends of May, which is our 25th of April; being the time when the blight or mildew, called by the Latins *rubigo*, uses to attack the corn. See RUBIGO.

Varro fixes it to the time when the sun enters the 16th degree of Taurus—Indeed the true time seems rather to have been on the eighteenth day before the equinox; and the true reason, because then canicula, or the little dog, sets; which is esteemed a malicious constellation.

Hence they sacrificed a dog to rubigo: Ovid says, the entrails of a dog, and those of a sheep: Columella, only a sucking puppy. Festus insinuates, that the victim must be red.

RUBIGO, or ROBIGO, a disease incident to corn, popularly called *mildew*. See SMUT and MILDEW.

The *rubigo* is a species of blight. See BLIGHT.

RUBRICK, RUBRICA, in the canon law, denotes a title or article in certain antient law-books; thus called, because wrote, as the titles of the chapters in our antient bibles are, in red letters. See TITLE—You'll find such a law under such a rubrick.

RUBRICKS, also denote the rules and directions given at the beginning, and in the course of the liturgy; for the order, and manner wherein the several parts of the office are to be performed. See LITURGY.

There are *general rubricks*, and *special rubricks*, a rubrick for the communion, &c.—In the Romish missal and breviary are rubricks for mattins, for lauds, for translations, beatifications, commemorations, &c.

They are called *rubricks*, from the Latin, *ruber*, red; because formerly printed in red-ink, to distinguish them from the rest of the office, which was in black; as they still are in the Romish missal, &c.

The great rubrick for the celebration of Easter, prescribed by the Nicene council, is to this purpose—Easter-day to be the Sunday which falls upon, or next after, the first full moon which immediately succeeds the vernal equinox. See EASTER.

—Dr. Wallis has a particular discourse on the ancient rubricks for the feast of Easter; in the *Philosoph. Transactions*.

RUBY, RUBINUS, a red coloured, sparkling gem, of the first rank among precious stones. See GEM and STONE.

There are but two places in the East where the ruby is found: The kingdom of Pegu, and the isle of Ceylon—The mine in Pegu, where it is found in greatest plenty, is in the mountain Capelan, 12 days journey from Siren, the residence of the king of that country—The finest rubies brought hence do not exceed three or four carats; the king reserving all the larger to himself.

In Ceylon, the rubies are found in a river which descends from the mountains towards the middle of the island: Some few are also found in the ground—The rubies of Ceylon are usually brighter and more beautiful than those of Pegu; but they are rare; the king of Ceylon prohibiting his people to gather them, or traffick with them.

There are rubies also found in Europe, particularly in Bohemia and Hungary; especially the former, wherein is a mine of flints of divers sizes, which upon breaking, are sometimes found to contain rubies as fine and hard as any of the Eastern ones.

The Greeks call the ruby *αργυροειδής*, q. d. resisting the fire—The ancients out of their credulity and superstition attributed many virtues to the ruby; as, that it expels poisons, cures

cures the plague, abates luxury and incontinence, banishes sorrow, &c. See GEM.

Lapidaries usually distinguish three kinds of rubies; the rocky, balasi, and spinell: Some add a fourth kind, viz. the rubacelle. It is the different degree of colour which makes their different value and beauty—The balasi ruby is of a crimson colour with a cast of purple: The spinell ruby is of a bright rosy red. It is said the inhabitants of Pegu have the art of heightening the redness and brilliant of rubies, by laying them in the fire, and giving them a proper degree of heat.

The ruby is formed in a stony substance or marcasite of a rose colour, called mother of ruby; it has not all its colour and lustre at once; but comes to it by degrees—At first it grows whitish, and as it approaches to maturity, becomes red. Hence we have white rubies, others half white, half red; and others blue and red, called sapphire rubies.

When a ruby exceeds twenty carats, it may be called a carbuncle, the name of an imaginary stone, whereof the ancients and moderns have given us so many descriptions. See CARBUNCLE.

They have several manners of counterfeiting rubies; and have carried the imitation to that length, that the most able lapidaries are sometimes over-seen.

Furetiere assures us, though the thing surpasses all belief, that there have been rubies in France of 240 carats—Tavernier tells us, he saw one in the Indies of fifty carats, which he had a mind to have bought. He adds, that the king of France has finer and larger rubies than any in the possession of the Great Mogul.

The value of rubies from one carat, or four grains, to ten carats, is thus given us in the *dictionnaire de commerce*, from a good hand:

	l.	s.	d.
A ruby of one carat, is worth	1	15	0
Of two C.	9	00	0
Of three C.	22	10	0
Of four C.	33	15	0
Of five C.	45	00	0
Of six C.	67	10	0
Of seven C.	84	00	0
Of eight C.	106	00	0
Of nine C.	150	00	0
Of ten C.	216	00	0

Sapphire RUBY. See the article SAPPHIRE.

RUBY, in chymistry, is a name given to several preparations of natural bodies, because of their red colour; as, ruby of arsenic, &c. See RUBIFYING.

RUBY, in heraldry, denotes the red colour wherewith the arms of noblemen are blazoned; being the same which in the arms of others not noble, is called gules. See COLOUR, GULES, &c.

RUCTATION, belching, a ventosity arising from indigestion, and discharging itself at the mouth, with a disagreeable noise. See FLATUS.

There are belches owing to repletion, and others to inanition, or emptiness. See REPLETION, &c.

Dr. Quincy says, hypochondriac and hysteric people are particularly liable to this disorder—They are rather to be cured with proper stomachics, than carminatives and hot liquors—Burnet recommends the iliac pills of Rhasis against ructation.

RUDDER, in navigation, a piece of timber turning on hinges in the stern of a ship, and which opposing sometimes one side to the water, and sometimes another, turns or directs the vessel this way or that—See *Tab. Ship, fig. 2. n. 106*. See also SHIP.

The rudder of a ship is a piece of timber hung on the stern-posts, by four or five iron hooks called pintles; serving, as it were, for the bridle of a ship; to turn her about at the pleasure of the steer's-man. See STEERING.

The rudder being perpendicular, and without side the ship, another piece of timber is fitted into it at right angles, which comes into the ship; by which the rudder is managed and directed—This latter is properly called the helm, or tiller; and sometimes, tho' improperly, the rudder itself. See HELM and TILLER.

The power of the rudder is reducible to that of the lever. See LEVER.

As to the angle the rudder should make with the keel; the author of a late book on the working of ships, shews, that, in order to stay or bear up the soonest possible, the tiller of the rudder ought to make an angle of near 55° with the keel. See WINDMILL.

A narrow rudder is best for a ship's sailing, provided she can feel it, that is, be guided and turned by it; for a broad rudder will hold much water when the helm is put over to any side: yet if a ship have a fat quarter, so that the water cannot come quick and strong to her rudder, she will require a broad rudder.

The aft-most part of the rudder is called, the rake of the rudder.

RUDDLE, RUBRICA, a sort of dusky red chalk or earth found in divers parts of England; chiefly in iron mines, of which mineral it has a copious mixture. See REDDLE.

This some take for the ancient lapis hæmatites. See HÆMATITES.

RUDENTED column. See the article COLUMN.

RUDENTURE, in architecture, the figure of a rope or staff, sometimes plain, sometimes carved, wherewith a third part of the flutings of columns are frequently filled up. See FLUTE.

It is thus called from the Latin, *rudens, cable*; whence some call it a *cabling*, and the columns whose flutings are thus filled, *rudented*, or *cabled columns*. See COLUMN, CABLED, &c.

There are also *rudentures* in relievo, laid on the naked of pilasters not fluted; an instance of which we have in the church of St. Sapienza at Rome.

RUDERATION, RUDERATIO, in building, a term used by Vitruvius for the laying a pavement with pebbles or little stones. See PAVEMENT.

To perform the *ruderation*, it is necessary the ground be first well beaten, to make it firm, and prevent its cracking—Then a stratum of little stones is laid, to be afterwards bound together with mortar made of lime and sand, called by Vitruvius, *statumen*.

If the sand be new, its proportion to the lime may be as 3 to 1; if dug out of old pavements or walls, as 5 to 2. See MORTAR, &c.

RUDERATION, Daviler observes, is also used by Vitruvius, lib. 7. cap. 1. for the coarsest and most artless kind of masonry; where a wall is, as it were, cobbled up. See MASONRY.

RUDIARIUS, in antiquity, a veteran gladiator, who had got a discharge from the service. See GLADIATOR.

He was thus called, because as a mark of dismissal a rod was put into his hand called *rudis*. See RUDIS.

The *rudarii* were also called *spectatores*. See SPECTATOR.

RUDIMENTS, RUDIMENTA, the first principles or grounds of any art or science; called also the *elements* thereof. See ELEMENTS.

RUDIS, a knotty rugged stick, which the prætor among the Romans, gave the gladiators, as a mark of their freedom and dismissal. See GLADIATOR.

Hence the Latin phrase, *rude donare*, to make a gladiator free, to discharge him from fighting any more—They were hence called *rudarii*. See RUDIARI.

RUE, RUTA *hortensis*, a medicinal plant, much used in the present practice—Schroder commends it as an alexipharmic, and cephalic; says it resists poisons and malignities, and is therefore to be used in fevers; and that it is good in all convulsive cases.

It is replete with a fat viscous juice, and by that means yields little to any purpose in distillation, unless where first digested in a spirituous menstruum—Hence its simple water in the shops, according to Dr. Quincy, is nothing worth, though others are of a very different opinion. It ought to be raised with a spirituous liquor, or used in conserve; or which is best of all, the plant eat alone fresh gathered, with bread and butter. It is of service in nervous cases, particularly such as arise from the womb, as it deterges the glands, and by its viscosity, bridles those inordinate motions, which frequently begin there, and affect the whole constitution. See HYSTERIC, UTERINE, &c.

RUELLE, a French term, lately introduced into our language: it is a diminutive of *rue*, street; and signifies, literally, a *little-street*.

Its use among us, is for an alcove, or other genteel apartment, where the ladies receive visits either in bed or up—The poets go reading their works from *ruelle* to *ruelle*, to bespeak the approbation and interest of the ladies.

RUFF-TREES. See the article ROOF-TREES.

RUFTER-HOOD, among falconers, a plain leather-hood, large and open behind, to be worn by an hawk, when she is first drawn. See HOOD, HAWK, HAWKING, &c.

RUINS, a term particularly used for magnificent buildings fallen to decay by length of time; and whereof there only remains a confused heap of materials. See ANTIQUITY. Such are the ruins of the tower of Babel, or tower of Belus, two days journey from Bagdat, in Syria, on the banks of the Euphrates; which are now no more than a heap of bricks, cemented with bitumen; and whereof we only perceive the plan to have been square.

Such, also, are the ruins of a famous temple or palace near Schiras in Persia; which the antiquaries will have to have been built by Ahasuerus; and which the Persians now call Tchelminar, or Chelminar, q. d. the forty columns; because there are so many columns remaining pretty entire, with the traces of others; a great quantity of basso relievo's, and unknown characters, sufficient to shew the magnificence of the antique architecture. See CHELMINAR.

**RULE**, or **RULER**, **REGULA**, a very simple instrument, ordinarily of hard wood, thin, narrow, and strait; serving to direct the drawing of right lines. See **LINE**.

The *rule* is of principal use in all the mechanical arts—To prove whether or no it be just; draw a line by it on paper; then turn the *rule* about, the right end to the left; and apply the same edge this way to the line: if the edge now agree exactly with the line, the *ruler* is true.

Desmarests has a fine poem on the amours of the *rule* and compass—The stone-cutters-*rule* is usually four foot long; and divided into feet and inches.

The Mason's *rule* is 12 or 15 foot long, and is applied under the level, to regulate the courses, to make the piedroits equal, &c.

**Parallel RULE**, or **RULER**. See **PARALLEL**.

**RULE** is also applied to certain instruments which have other considerable uses beside that of drawing lines.—Such are the carpenters *joint-rule*, Everard's, and Coggeshal's *sliding-rules*, &c.

**Carpenters joint-RULE**, is an instrument usually of box, 24 inches long, and one and a half broad; each inch being subdivided into eight parts—On the same side with these divisions, is usually added Gunter's line of numbers.

On the other side are the lines of timber and board-measure; the first beginning at 82, and continued to 36, near the other end: The latter is numbered from 7 to 36, four inches from the other end.

**Use of the carpenters joint-RULE**—The application of the inches in measuring lengths, breadths, &c. is obvious—That of the Gunter's line, see under **GUNTER'S line**—The use of the other side is all we need here meddle with.

1. *The breadth, of any surface, as board, glass, &c. being given; to find how much in length makes a square foot*—Find the number of inches the surface is broad, in the line of board measure; and right against it is the number of inches required.

Thus if the surface were 8 inches broad, 18 inches will be found to make a superficial foot.

Or, more readily thus—Apply the *rule* to the breadth of the board or glass; that end marked 36 being even with the edge; the other edge of the surface will shew the inches and quarters of inches which go to a square foot.

2. *Use of the table at the end of the board measure*—If a surface be one inch broad, how many inches long will make a superficial foot? Look in the upper row of figures for one inch, and under it in the second row is 12 inches, the answer to the question.

3. *Use of the line of timber measure*—This resembles the former; for having learnt how much the piece is square, look for that number on the line of timber-measure: The space thence to the end of the *rule* is the length, which at that breadth, makes a foot of timber—Thus, if the piece be 9 inches square, the length necessary to make a solid foot of timber, is 21  $\frac{1}{3}$  inches—If the timber be small, and under 9 inches square, seek the square in the upper rank of the table; and immediately under it is the feet and inches that make a solid foot—Thus, if it be 7 inches square, 2 foot 11 inches will be found to make a solid foot.

If the piece be not exactly square, but broader at one end than another; the method is to add the two together, and take half the sum for the side of the square—For round timber, the method is to girt it round with a string, and to allow the fourth part for the side of the square—But this method is erroneous; for hereby you lose above  $\frac{1}{3}$  of the true solidity. See **TIMBER**.

**Caliber-RULE**. See **CALIBER-measure**.

**Everard's sliding-RULE**. } See the article } **SLIDING-rule**.

**Coggeshal's sliding-RULE**. }

**RULE**, **REGULA**, also denotes a certain maxim, canon, or precept, to be observed in any art or science. See **CANON**, **MAXIM**, &c.—Thus we say, the *rules* of grammar, of logic, of philosophizing, &c. See **GRAMMAR**, **LOGIC**, **PHILOSOPHIZING**, &c.

School philosophers distinguish two kinds of *rules*, viz. *theoretical*, or *rules of knowing*, which relate to the understanding; being of use in the discovery of truth. (See **UNDERSTANDING**, **CRITERION**, and **TRUTH**)—And *practical*, or *rules of acting*, which relate to the will, and serve to direct it to what is good and right. See **GOOD** and **RECTITUDE**.

For the management and application of these two Sorts of *rules*, there are two distinct arts; viz. *logic* and *ethics*. See **LOGIC**, **ETHICS**, and **MORALITY**, &c.

**RULES of knowing**, *regulæ sciendi*, are such as direct and assist the mind, in perceiving, judging, and reasoning. See **PERCEPTION**, **JUDGMENT**, and **REASONING**.

**RULES of acting**, *regulæ agendi*, are those whereby the mind is guided in her desires, pursuits, &c. See **WILL**.

Authors are extremely divided about the regard to be had to the **RULES** of *poetry* fixed by the antients, Aristotle,

Horace, Longinus, &c. and admitted by the modern critics, as Bossu, &c. some contended that they must be inviolably observed; others pleading for liberty to set them aside on occasion—*Rules*, it is complained, are fetters; rank enemies to genius; and never religiously observed by any, but those who have nothing in themselves to depend on. Voiture frequently neglected all the *rules* of poetry; as a master who scorned to be confined by them. See **POETRY**.

The theatre has its particular *rules*; as the *rule* of 24 hours, the unities of action, time, and place, &c. See **UNITY**. See also **THEATRE**.

If it be true, says Moliere, that plays conducted according to the *rules*, do not please; but those which are not, do: The *rules* must be naught—For myself, when a thing hits and diverts me, I do not enquire whether I have done amiss; nor whether Aristotle's *rules* forbid me to laugh. See **LAW**.

**RULES of philosophizing**. See **PHILOSOPHIZING**.

**RULE**, in arithmetic, denotes a certain operation with figures to find sums or numbers unknown; and to facilitate computations, mercantile, astronomical, &c. See **ARITHMETIC**, **NUMBER**, &c.

Each *rule* in arithmetic has its particular name, according to the use for which it is intended—The four first, which serve as the foundation of the whole art, are called *addition*, *subtraction*, *multiplication*, and *division*; each whereof see under its proper article **ADDITION**, &c.

From these arise several other *rules*: as the *rule of three*, or of *proportion*; called also, *the golden rule*; and distinguished into *direct*, and *inverse*, *simple*, and *compound*.—Also, the *rule of five numbers*—*rule of fellowship*, *simple*, and *with time*—*rule of allegation*, *medial* and *alternate*—*rule of exchange*—*rule of false position*, *single* and *double*.—To which add, *approximation*, *barter*, *combination*, *equation*, *exchange*, *extraction*, *involution*, *progression*, *rebate*, *reduction*, &c. See **FELLOWSHIP**, **ALLEGATION**, **POSITION**, &c.

**RULE of three**, or of *proportion*, commonly called the *golden-rule*, is a rule which teaches how to find a fourth proportional number, to three others given. See **PROPORTION**.

As, if three degrees of the equator contain 70 leagues, how many do 360 degrees, the circumference of the earth, contain?

The *rule* is this—Multiply the second term 70, by the third 360; divide the product 25200, by the first term 3: the quotient 8400 is the fourth term required.

The use of this *rule* is of vast extent, both in common life, and the sciences; but has no place, except where the proportion of the given numbers is known—Suppose, *e. gr.* a large vessel full of water to empty itself by a little aperture; and suppose 3 gallons to flow out in 2 minutes: and it were required to know in what time 100 gallons would be thus evacuated?—Here indeed are three terms given, and a fourth required: But, as it is evident from experience, that water flows faster at first than afterwards, the quantity of flowing water is not proportional to the time; and therefore the question does not come under the *rule of three*.

The things which come under commerce are proportionable to their prices; twice as much of any commodity costing twice as much money, &c. The price, therefore, of any quantity of a commodity being given, the price of any other quantity of the same, or the quantity of the commodity answering to any other given sum, is found by the *rule of three*—*e. gr.* If 3 pounds cost 17 s. what will 30 pounds cost? Since, as 3 pounds are to 30 pounds, so is the value of the former 17 s. to the value of the latter. The question stands thus:

$$\begin{array}{r} 3 \text{ lb.} \text{---} 30 \text{ lb.} \text{---} 17 \text{ s.} \\ 17 \\ \hline 3)510(170 \text{ s.} \quad 8 \text{ l.} \quad 10 \text{ s.} \end{array}$$

Again; if 3 pounds be bought for 17 s. how many will 170 s. buy? Since as 17 s. is to 170 s. so are 3 pounds to the pounds required: The number will be found thus:

$$\begin{array}{r} 17 \text{ s.} \text{---} 170 \text{ s.} \text{---} 3 \text{ lb.} \\ 3 \\ \hline 17)510(30 \text{ lb.} \\ 51 \\ \hline 00 \end{array}$$

If the given terms be heterogeneous, *i. e.* have broken numbers among them, they do not bear the same proportion to each other which the things they express bear—They must therefore be reduced to homogeneous ones; or to the same denomination, as pounds into shillings, shillings into pence, &c. hours into minutes, &c. See **REDUCTION**.

*E. gr.*

# R U L

E. gr. If 3 pounds and 4 ounces cost 2 s. 4 d. what will 2 pounds cost? The operation will be thus:

$$\begin{array}{r}
 3 \text{ lb.} \quad 4 \text{ } \frac{2}{3} \text{ } \text{---} \quad 2 \text{ lb.} \text{---} \quad 2 \text{ s.} \quad 4 \text{ d.} \\
 16 \qquad \qquad \qquad 16 \qquad \qquad \qquad 12 \\
 \hline
 52 \qquad \qquad \qquad 32 \qquad \qquad \qquad 28 \\
 \qquad \qquad \qquad 28 \\
 \hline
 \qquad \qquad \qquad 256 \\
 \qquad \qquad \qquad 64 \\
 \hline
 52)896(17 \text{ d. } \frac{1}{3} \text{ of a penny} \\
 \qquad \qquad \qquad 52 \\
 \hline
 \qquad \qquad \qquad 376 \\
 \qquad \qquad \qquad 364 \\
 \hline
 \qquad \qquad \qquad 12
 \end{array}$$

In many cases of commerce and accounts, we have more compendious ways of working questions that come under the *rule of three*, than by the *rule* itself; which, by reason of their expediting practice, are called *practice*; and constitute a particular *rule* of themselves. See **PRACTICE**.

**RULE of three inverse**, is where the natural order of the terms is inverted—As, if 100 workmen build a house in 2 years, in how long time will 200 workmen build the same?

This is usually considered by the writers of arithmetic, and taught in the schools, as a particular *rule*: being wrought by multiplying the first term 100 by the second 2, and dividing the product 200 by the third term 200; the quotient 1 is the number required.

But there is no necessity for making a particular rule for the matter; this coming naturally enough under the former, by only ranging the terms as the nature of the question requires. Thus it is evident, that as the number of men 200, is to 100, so is the space 2 years, wherein 100 build the house, to the space wherein 200 will build the same—For the less time, the more hands are required. The question then will stand thus :

200 M. ————— 100 M. ————— 2 Y:  
2

200)200(1 year.

**RULE** of five numbers, or 'compound' rule of three, is where two rules of three are required to be wrought, before the number sought be found—As if 300 *l.* in 2 years yield 30 *l.* interest, how much will 1000 *l.* yield in 12 years?

Here the first thing to be done is to find by the *rule of three*, what interest 1000 *l.* will give in 2 years; and then by the same *rule* what it will give in 12 years?

This is considered by the writers, &c. of arithmetic, as a particular *rule*, but without any necessity; a double operation solving it better, as in this example:

300 l. ————— 1000 l. ————— 30 int.  
30

$$\begin{array}{r} 3|00)300|00(100 \text{ int.} \\ 2 \text{ Y.} \underline{\hspace{1cm}} 12 \underline{\hspace{1cm}} 100 \text{ l.} \\ \hspace{10cm} 12 \end{array}$$

2) 12000 (600 int.

But in questions of this kind a single rule of three may do the business: for 300 *l.* give the same interest in two years, which twice 300 give in one year; and twelve times 1000 *l.* give the same interest in one year that 1000 give in 12: omitting therefore the circumstances of time, say, if twice 300 (that is, 600) give 36 *l.* interest, (in one year) what will 12 times 1000 (that is, 12000) give (in one year)?

$$600 \text{ --- } 1200 \text{ --- } 36$$

36

72000  
36000

6|00)4320|00(720 l. int.

**Central** RULE. See the article CENTRAL.

**RULE**, in a monastic sense, is a system of laws or constitutions, whereby religious houses are established and regulated; and which the religious make a vow to observe at their entrance. See **RELIGIOUS**, **MONASTERY**, **VOW**, &c.

The monastic rules are all to be approved of by the pope, to make them valid—The rule of St. Benedict, is by some authors called the *holy rule*. See BENEDICTIN.

Those of St. Bruno, and St. Francis, are of all others the most austere. See CARTHUSIANS, &c.—When a religious cannot support the austerities of his rule, he sues for a dispensation.

**RULE**, in the canon law—The **RULE**, *de verisimili notitia*, of probable notice, renders all provisions to a benefice vacant by death, null; if it appear that from the day of the decease, to the day of the date of the provisions, or to the day when the courier arrives from Rome, there has not been

# R U M

time sufficient for regular notice of the person's decease to be conveyed to the pope. See PROVISION.

Provisions are even null if it be proved the courier set out before the person was deceased—This *rule* is strictly observed in France; in other countries the pope finds frequent occasions to dispense with it.

**RULE of twenty days, regula viginti dierum.** By this rule, if an ecclesiastic resign his benefice; to make the resignation valid, the resigner must survive its admission in the court of Rome twenty days.—If he die before the expiration of the twenty days, the resignation is void; and the benefice becomes vacant by death.

This *rule* does not hold of the provisions of ordinary collators, nor of simple and pure resignations into the hands of the ordinary; but only in case of provisions of the pope, dispatched on resignations *in favorem*. See RESIGNATION.

This *rule* antiently extended to such as resigned in time of health as well as of sickness—Pope Boniface restrained it to the latter; whence it is commonly called, *regula de infirmis resignantibus*.

**RULE de publicandis**—By this rule the resignee of a benefice, if he have a provision from the court of Rome, is obliged to publish the resignation and take possession within six months; or if he have it from the ordinary collator within one month. Otherwise, if the resigner die, the resignation becomes null.

**RUM\***, a species of brandy, or vinous spirit, drawn by distillation from sugar canes. See **SUGAR, SPIRIT, DISTILLATION, &c.**

\* The word *rum* is the name it bears among the native Americans, *Rum* is very hot and inflammable; and is in the same use among the natives of the sugar countries, as brandy among us. See BRANDY.

**RUMB, RUM, or RHUMB,** in navigation. See **RHUMB.**

**RUMB-Line**, or *loxodromia*. See **RHUMB-Line**.

**RUMEN**, the first stomach of animals which chew the cud, hence called *ruminants*. See **STOMACH**, **RUMINANT**, and **RUMINATION**.

The food is transmitted into the *rumen* without any other alteration in the mouth, than being a little rowled and wrapped up together. See **FOOD**.

The *rumen* or paunch is much the largest of all the stomachs; as being to contain both the drink, and the whole crude mafs of aliment, which there lie and macerate together; to be thence remitted to the mouth, to be re-chewed and comminuted, in order to their farther digestion in the other ventricles. See DIGESTION.

In the *rumen*, or first ventricle of camels, are found divers *facculi*, which contain a considerable quantity of water: an admirable contrivance for the necessities of that animal, which living in dry countries, and feeding on dry hard food, would be in danger of perishing, but for these reservoirs of water. See **DRINK, THIRST, &c.**

**RUMINANT, RUMINANS**, in natural history, an animal which chews over again what it has eat before; popularly called *chewing the cud*. See RUMINATION.

Joah. Con. Peyer has an exprefs treatife *de ruminantibus & ruminatione*, where he ſhews, that there are ſome animals which do really *ruminare* ; ſuch are oxen, ſheep, deer, goats, camels, hares, and ſquirrels : whereas others only appear to *ruminare* ; which he calls *ruminantia ſpuria* ; of which number are moles, crickets, bees, beetles, crabs, mullets, and ſeveral other fiſhes.

This latter class, he adds, have their stomachs composed of muscular fibres, by means whereof the food is ground up and down, much as in real *ruminants*.

*Ruminants*, Mr. Ray observes, are all quadrupedal, hairy, and viviparous; some with hollow and perpetual horns, others with deciduous ones. See QUADRUPED, HAIR, HORN, &c.

The horned ruminants have all four stomachs, appropriated to the office; viz. 1°. The κοιλία μεγάλη of Aristotle, the *rumen*, *venter magnus*, or what we call the *paunch* or *inward*, which receives the meat slightly chewed, retains it a-while, and then delivers it back again into the mouth, which is what we call the  *cud*, to be re-chewed—2°. The κισχυράλιον or *reticulum*, which we call the *honey-comb*, from its internal coat being divided into cells, like honey-combs—3°. The σχιστόν, which Mr. Ray thinks hath been wrong translated, *omasus*; and which he chuses to call the *echinus*: This being difficult to clear, our people throw it away, and call it the *manifold*—4°. The πυλῶν of Aristotle, by Gaza called the *abomasus*, among us the *maw*. See RUMEN, OMASUS, ABOMASUS, &c.

Again, all the horned *ruminant* animals want the *dentes primores*, or broad teeth in the upper jaw; and have that kind of fat, called *fuet*, *sebum*, *Σταγ*, which is harder and firmer, and less liquifiable in them, than the adeps of other animals. See **FAT**, **ADEPS**, &c.

**RUMINATION, RUMINATIO**, an action peculiar to a class of animals called *ruminants*; whereby they return the food

food they have formerly swallowed, to be chewed over-again, and rendered more fit for chyle. See RUMINANT and RUMEN.

Peyer defines *rumination*, a natural motion of the stomach, mouth, and other parts; by means of which the food eaten, at first, hastily, is returned back again to the mouth; where it is re-chewed and swallowed a second time; and that much to the benefit of the animal. See FOOD, CHYLE, MASTICATION, &c.

Burnet, in his *Thesaur. med.* gives several instances of men that *ruminated*, from Salmuth, Rhodius, &c.—Dr. Slare in the *Philos. Transact.* gives us a fresher instance in one of our own countrymen, living at Bristol. His account, as it is curious, and may let us see a little how it fares with *ruminating* animals, we shall here add.

“ He begins to chew his meat over again within a quarter of an hour after meals, if he drink with it; if not, somewhat later. His chewing after a full meal lasts about an hour and a half: and if he go to bed presently after meals, he cannot sleep till the usual time of chewing be over. The victuals, upon the return, taste somewhat more pleasantly than at first. Bread, meat, cheese, and drink, return much of such colours as they would be of were they mixed together in a mortar. Liquids, as spoon-meat, return to his mouth all one as dry and solid food. The victuals seem to him to lie heavy till they have passed the second chewing; after that they pass clean away. If he eat variety of things, that which passes down first, comes up again first. If the *ruminating* faculty chance to leave him, it signifies sickness; and it is never well with him till it returns. He is about twenty years of age, and was always thus since he can remember. His father does the like, sometimes; but in small quantities.

RUMMAGE\*, in the sea language, signifies to clear a ship's hold, or remove goods or luggage from one place to another. See HOLD.

\* The Word is probably derived from the Saxon, *raum*, room, or space.

RUN of a ship, so much of her hull as is always under water; growing thinner and lankier by degrees, from the floor timber to the stern-posts. See SHIP.

This is also called the *ship's way astward*.

A ship is said to have a *good run*, when it is long, and the water passes cleverly to her rudder, her tuck not lying too low, which is of great importance to her sailing.—If the water do not come strongly to her rudder, by reason of her being built too broad below, she cannot steer well; and a ship that cannot steer well, cannot keep a good wind, nor will have any fresh way through the sea, but will still be falling to leeward. See RUDDER, STEERING, &c.

And yet a ship with a large and good *run*, loses much stowage, because made narrow below. See HOLD, BURTHER, &c.

RUNDLES, or ROUNDLES, in heraldry, the same as balls or pellets. See PELLET, &c.

RUNDLET, RUNLET, or ROUNDLET, a small vessel, containing an uncertain quantity of any liquor, from three to twenty gallons. See MEASURE, &c.

RUNIC, a term applied to the language and letters of the ancient Goths, Danes, and other northern nations.

Some have been of opinion that Gulphilas, or Ulphilas, a Gothic bishop about the year 370 was the first inventor of the *runic character*: but Olaus Wormius shews at large that Ulphilas could only be the first who taught it to foreigners; for that the *runæ* or characters themselves were older than he. See Wormius *de liter. run.* c. 4. citante Becman, *Hist. orb. terr.* c. 9. sect. 3. §. 15. See also CHARACTER.

In reality, Ulphilas, according to other authors, was so far even from teaching the Character, that he invented an Alphabet of his own, on purpose to put the *runic characters* which had been made subservient to the superstitions of heathenism, out of use. V. Sherringh. *de Anglor. Gent. Orig.* p. 174.

It is supposed they were called *runic*, as being mysterious and scientific; like the Egyptian hieroglyphics. See Wormius *de literatura runica*; and Hicks's *Thesaurus* of the ancient northern languages.

There are some *runic* medals in the closets of the curious; and some modern Danish and English medals, the inscriptions whereof are Latin, and the character *runic*. See TALLISMAN.

RUNNER, in the sea language, a rope belonging to the garnet, and to the two bolt tackles.—It is reeved in a single block fixed to the end of a pennant, and has at one end a noose to hitch into any thing, and at the other end a double block, into which is reeved the fall of the tackle or the garnet, by which means it purchases more than the tackle or garnet could allow.—See *Tab. Ship. fig.* 1. n. 39, 73, 82, 110.

To *overhale the runner*, is to pull down the hooked end, and hitch it into the sling.

VOL. II. N°. CXXXV.

RUNNET, or RENNET, an acid juice, found in the stomachs of calves that have fed on nothing but milk, and are killed before the digestion be perfected. See MILK.

It is this *runnet* is chiefly used to curdle or turn milk for cheese. See CURDLING, CHEESE, &c.

Its proper place is the abomasus.—The like matter is also said to be found in goats and hares. See ABOMASUS.

The longer the *runnet* is kept, the better it is.—Though it readily coagulates milk: yet if put into it when already coagulated, it dissolves it. See COAGULATION and DISSOLUTION.

If salt be put in the milk, before the *runnet* be applied, it prevents its coagulation.—If the salt be put in afterwards it hardens the coagulum. See SALT.

Aristotle will have the *runnet* to be the proper substance of the milk; but he is mistaken when he says it is found in all animals which give milk, especially all ruminants. See RUMINANT.

RUNNING of goods, a clandestine landing of goods without paying the legal customs or duties for the same. See SMUGGLING, OWLER, DUTY, CUSTOM, &c.

RUNNING-saddle. See the article SADDLE.

RUPEE, ROUBIA, or ROUPIAS, a coin very current in the territories of the Great Mogul, and several other parts of the East-Indies. See COIN and MONEY.

*Rupees* are struck both of gold and silver; and both the one and the other have their diminutions; as *half-rupees*, *quarter-rupees*, &c.

The gold *rupee* is worth 1 s. 6 d. sterl. The value of the silver *rupee* is various, according to its quality, and the place where it is coin'd. A general observation is, that the *rupees* are always current for more at the place where they are struck, than else-where; and the new *rupees* for more than the old ones.—The reason of this last difference is, that the Indians being very fond of silver, to save it, use, as soon as they have got a few *rupees* together, to hide them under ground. To prevent which inconvenience, tending to drain the state of current monies, the princes and rajas strike new *rupees* every year, still augmenting the value thereof, without any augmentation of the weight.

Besides this difference of new and old *rupees*, the Indians make three other classes.—The first called *rupees siceas*, which at Bengal are worth 2 s. 11 d. sterl. The second, *rupees of Surat*, worth 2 s. 6 d. sterl.—The third *rupees of Maderas*, worth 2 s. 5 d. sterl. All which is to be understood of the new *rupees*.

As to the old ones, those of Maderas are only current at 1 s. 11 d. sterl. Those of Surat at 2 s. and the Siceas at 2 s. 4 d. Yet in other places, the order and prices vary: at Surat, those struck there have the first place; the Siceas the second; and those of Maderas the third. Along the coast of Coromandel, the Maderas have the first place, and the Siceas the second, &c.

RUPTURE, in medicine, called also *hernia*, and popularly *burstness*; is when the rim, thin film, or caul which holds up the intestines, is broken, or over-strained or stretch'd, so as the guts fall down either into the groin, cod, or flank. See HERNIA.

According as the *rupture* happens in the abdomen, or inguen, scrotum, it is called *exomphalus*, *hernia inguinalis*, or *hernia scroti*. See EXOMPHALUS, &c.

RURAL\*, or RUSTIC, something that relates to the country. See RUSTIC.

\* The word is form'd of the Latin *rus*, *rustis*, country.

RURAL dean, in the ancient church was a temporary dean appointed by the bishop or archbishop, for some particular ministry, without canonical institution. See DEAN.

The *rural dean* is the same with what in the laws of Edward the confessor, is called *decanus episcopi*, the *bishop's dean*.—In some places these deans seem to have been called *chorepiscopi*. See CHOREPISCOPUS.

Heylin observes that each diocese has in it one or more archdeacons for dispatch of ecclesiastical business; and each archdeaconry is subdivided into *rural deanaries*, fewer or more according to the extent thereof; the deans whereof were also called *archipresbyteri*, and *decani christianitatis*. See ARCHPRIEST, &c.

RUSSIA-company. See the article COMPANY.

RUST of a metal, the flowers or calx thereof; procured by corroding and dissolving its superficial parts by some menstruous fluid. See METAL, CALX, FLOWER, MENSTRUUM, &c.

Water is the great instrument or agent in producing *rust*; the air apparently *rusts* bodies, but it is only in virtue of the water it contains. See AIR.

Hence, in a dry air, metals remain a long time without contracting *rust*; and hence oils and other fatty bodies secure metals from *rust*; water being no menstruum to oil, &c. and therefore not able to make its way through it. See WATER, &c.

All metals are liable to *rust*; even gold itself, though generally held incapable thereof, grows *rusty* if exposed to the fumes of sea-salt. See GOLD.

The reason why gold is so rarely found to *rust*, is that sea-salt, which is the only salt that will prey upon it, is of a very fixed nature, and therefore little of its effluvia or exhalations are found floating in the air. See GOLD, AQUA REGIA, VOLATILISATION, &c.

*Rust* is usually supposed a corruption of the metal, but without much foundation: it is the very metal itself, only under another form; and accordingly we find that *rust* of copper may be again turned into copper.

The *rust* of copper, called *æruge*, makes what we call *verdigrise*. See VERDEGREASE—CERUS is made of lead converted into *rust* by vinegar. See CERUSS—Iron, in time, turns wholly into *rust*, unless preserved from the air by paint or varnish. See IRON, PAINTING, &c.

RUSTIC gods, in antiquity, *dii RUSTICI*, were the gods of the country; or those who preside over agriculture, &c. See GOD, &c.

Varro invokes the twelve *dii consentes*, as the principal among the *rustic* Gods; viz. Jupiter, Tellus, the Sun, Moon, Ceres, Bacchus, Rubigus, Flora, Minerva, Venus, Lympha, and Good Luck—Besides these twelve arch-*rustic* gods, there were an infinity of lesser ones: as, Pales, Vertumnus, Tutelina, Fulgor, Sterculius, Mellona, Jugatinus, Collinus, Vallonia, Terminus, Sylvanus, and Priapus—Struvius adds, the Satyrs, Fauns, Sileni, Nymphs, and even Tritons; and gives the empire over all the *rustic* gods to the god Pan. See SATYR, FAUN, NYMPH, DRYADES, &c.

RUSTIC, in architecture, expresses a manner of building in imitation of simple or coarse nature, rather than according to the rules of art. See BUILDING and ARCHITECTURE.

RUSTIC *fasti*. See the article FASTI.

RUSTIC *fountain*. See the article FOUNTAIN.

RUSTIC *freeze*. See the article FREEZE.

RUSTIC *quoins*, by Vitruvius, called *lapides minantes*. See RUSTIC QUOIN.

RUSTIC *work*, is where the stones in the face, &c. of a building, instead of being smooth, are hatched or picked with the point of a hammer.

RUSTIC *order*, is an order decorated with *rustic* quoins, *rustic* work, &c. See ORDER.

Felibien says, it is properly where the several parts, of the five orders are not exactly observed; but this confounds *rustic* with Gothic. See GOTHIC.

RUT, in hunting, &c. a term used for the venery or copulation of deer—For the terms which obtain in respect of other beasts of game, with the noise they make during the act. See HUNTING.

The rutting-time with the hart begins about the middle of September, and holds two months; the older they are, the better, and the more beloved by the hinds, and the earlier do they go to *rut*—At this time they will turn head, and furiously make at any living creature. It is easy killing them now; their whole business being to scent and pursue the track of the females; scarce feeding at all. The young herd are forced to fly with great precipitancy when the hart comes in sight of his mate. If there be any other of bulk, they will dispute it very hotly with their horns—As the season expires, they withdraw and dig themselves holes wherein to lie to assuage the strong favour of their lust: when become a little sweet, they return to their pasture, and live in herds. See HART-HUNTING.

The rutting or touring-time of the roe-buck begins in October, and only lasts 12 or 15 days. This over, he casts his horns. See HEAD—After the hind is filled, she keeps no more company with the male till she be delivered—But the doe always accompanies her paramour, till her time approaches; when she retires, for the safety of her young, which he would otherwise kill. See ROE-BUCK HUNTING.

RYAL. See the article RIAL.

RYME. See the article RHYME.

RYPTICKS, in medicine. See RHYPTICKS.

RUYSCHIANA. See TUNICA.

## S A B

**S**, A consonant, and the eighteenth letter of the alphabet. See LETTER and ALPHABET.  
S is accounted one of the three hissing consonants; the other two being Z and J.—It also held a semi-vowel, as forming a kind of imperfect sound, without the assistance of any vowels.

Some of the Ancients avoided all use of the S very studiously; particularly Pindar, who has whole poems without once mentioning it. And hence also in Plautus, and some others of the Latin poets, we find it cut abruptly off, as in *dignu'*, *omnibu'*, &c.—Others, on the contrary, affected the use of it every where, inserting it where 'twas not wanted; as *Calmenæ* for *Camenæ*, *dulmosæ* for *dumosæ*, *cælna* for *cæna*, &c. Of all others, the S is nearest a-kin to the R; whence it was frequently changed, by reason of its disagreeable sound, into R.—Thus the *Valerii*, *Furii*, &c. were at first call'd *Valefii*, *Fufii*, &c. and what we now call *ara*, *arena*, *carmin*, *feriæ*, *lares*, &c. were antiently wrote *ala*, *alena*, *calmen*, *feliæ*, *lales*, &c. Add to this, that the Latin nouns now terminated in *or*, as *arbor*, *labor*, &c. antiently ended in *s*, as *arbos*, *labos*, &c. See R.

In the inflections of nouns, S is variously changed; sometimes into *rs*, as *flor*, *floris*; sometimes into *n*, as *sanguis* *sanguinis*, sometimes into *d*, as *pes* *pedis*; sometimes into *t*, as *nepos* *nepotis*.—On the contrary, in verbs, it is frequently put for other letters; for *b*, as in *jubeo* *jussi*; for *c*, as in *parco* *parsi*; for *d*, as in *ludo* *lusi*; for *g*, as in *spargo* *sparsi*, &c. See B, D, &c.

The Latins also frequently changed the Greek *s* into *l*, as *Anicæ*, *Annibal*; into *d*, as *πύρον* *medium*, &c.—The double *s* was frequently changed into *x*, as *πύσσα* *pix*; and sometimes even the single one, as *Αἶας* *Ajax*.

The old and the new orthography of the French, differ chiefly on the use of the *s*; the latter omitting it in writing, where it is not heard in the pronunciation, and the former retaining it: thus the followers of the one, particularly the academy in their dictionary, write *tempeste*, *huître*, *flûte*; those of the other, *tempête*, *huitre*, *flûte*, &c. See ORTHOGRAPHY.

**S** was a numerical letter among the Ancients, signifying seven: according to the verse,

*S vera septenas numeratos significabit.*

**S**, in books of navigation, &c. signifies South.—S. E. South-East.—S. W. South-West.—S. S. E. South South-East, &c. See WIND.

**S** sometimes also stands for *socius*, fellow, member, and sometimes for *societas*: as R. S. S. *regiæ societatis socius*, fellow of the royal society.

**S. A.** in medicinal prescriptions is an abbreviation of *secundum artem*, according to the rules of art; chiefly used where some uncommon care or dexterity is required.

**SABÆANS** \*, **SABÆI**, the adherents to *Sabaism*; a sect of idolaters, much antienter than Moses and the Jewish law. See SABAISM.

\* The word is sometimes also written *Sabians*, *Sabaïtes*, *Zabæans*, *Zabians*, *Zabaïtes*, *Tjabæans* *Tjabians* and *Tjabaiſts*.

The *Sabæans* were very numerous throughout the east: in later times they have mixed something of christianity with their superstition. They set a great value on the baptism of St. John; whence they have been also denominated *christians of St. John*. See CHRISTIANS of St. John.

Some, indeed, doubt whether the *Sabæans* be the same with the christians of St. John; but Father Angelo de St. Joseph, a Carmelite missionary, and Maracci, in his notes on the Alcoran, assert it expressly. Be this as it will, Mahomet, in his Alcoran, and the Arabian authors since him, make frequent mention of them. Beidavius, in his comment on the Alcoran, represents them as a kind of mean between the Christians and the Magusians, who are the followers of the Magi, among the Persians: he adds, that they pretend to be of the religion of Noah.—Kessæus notes, that they pretend to be in possession of the books of Seth and Enoch; though they own none of the books of scripture.

Some charge them with worshipping the stars; and others, the angels, or dæmons. Maimonides attributes both to them; as is observed under the Article SABAISM.

Abu Joseph Aschæus, and Kessæus place the *Sabæans* about Charan, or Charres, and Ghezira in Mesopotamia; which opinion is confirmed by this, that their books are in the Chaldee tongue, though in a character very different from the Chaldee.

Hottinger sets aside the common derivation of *Sabæan* from *סבא* *militia*, *host*; and will not have it the name of a sect of religion, but of a people in Arabia Felix, the descendants of *Saba*, Grandson of Cham.—But the criticks, to a man, conspire against this opinion.

**SABAISM**, an ancient kind of idolatry; the first that ever entered into the world. See IDOLATRY.

*Sabaism* consisted in the worship and adoration of the stars; or as the scriptures call them *סְבָא שְׁמַיִם* *tseba schamaim*,  
VOL. II. N°. CXXXV.

## S A B

*seba schamaim*, i. e. host, or militia of heaven; whence some Moderns formed the word *Sabaism*, to denote the worship of the heavenly bodies, and that of *Sabæans* for the worshippers. See SABÆANS. But as the Hebrew word, whence these are formed, is wrote with a *y tzade*, which some express in the modern tongues by an *s*, some by a *z*, others by *ts*, and others by *tz*; hence arises a great many different manners of writing the word among different authors. Some *e. gr.* writing *Sabæans*, others *Zabians*, or *Zabæans*, or *Zabaiſts*, as Buxtorf; others *Tjabians*, others *Tjabæans*, &c. Maimonides makes frequent mention of this idolatry in his *More Nevochim*: it was very general, he observes, in the time of Moses. The retainers hereto taught, that God was the spirit of the sphere, that is the soul of the world. Abraham, he adds, was brought up in the doctrine of the *Sabæans*, who admitted no other gods but the stars, and who in their books, many of which have been translated into Arabic, maintain expressly, that the fixed stars and planets, are inferior gods, and the sun and moon the superior ones. Abraham at length, he tells us, opposing these errors, first asserted the existence of a creator distinct from the sun. The king of the Cuthæans clapt him up in prison; but he still persisting, that prince, from an apprehension of his disturbing the state by teaching a new religion, confiscated his goods, and banished him to the extremities of the east.—This relation, he tells us, is found in a book intitled, *הצבורה הנכסיה* *The religion of the Nabathæans*.

He adds, That the *Sabæans*, to the adoration of the stars, joined a great respect for agriculture; set a high value on cattle and sheep; and taught, that it was unlawful to kill them. He even adds, that they worshipped dæmons, under the form of goats, and eat the blood of animals, (tho' they judged it unclean,) merely because they imagined it was the food of dæmons.

This is a summary of what the Rabbin gives us concerning *Sabaism*; from whence, it is easy judging of what some people tell us, that *Sabaism* is a mixture of Judaism, Christianity, Mahometanism, and Paganism. The Truth is, the worship of the stars was established long before not only Christianity, but even before the law of Moses. Not but some of the later *Sabæans* have given into divers articles of almost all religions. See SABÆANS.

**SABBATARIANS**, a sect of Anabaptists, in the XVIth century; thus called, because they observed the Jewish or saturday-sabbath, from a persuasion that it was never abrogated in the New Testament by the institution of any other. See SABBATH, ANABAPTIST, &c.

**SABBATH** \*, **SABBATUM**, the seventh day of the week, held as a feast among the Jews, in memory of God's resting on the seventh day of the creation. See WEEK.

\* The word is pure Hebrew, *שַׁבָּת*, and signifies *cessation* or *rest*. Philo calls it, *Τὸ κοινὸν γενέσθαι*, The world's birth-day.

The Sabbath was appointed from the beginning, by God himself, Gen. ii. 2, 3. and by him set apart for the commemoration of the great work of the creation; and when it had fallen into neglect after the flood, was re-established by him, upon his settling the Jewish polity after the return out of Egypt. The Christians also apply the word *Sabbath* by extension, to the first day of the week, popularly called *Sunday*, or the *Lord's-Day*; as instituted by the apostles to take place of the Jewish Sabbath, and by us observed in remembrance, not of the creation, but of the work of redemption's being compleated by our Saviour's resurrection on that day. See SUNDAY.

Those who dispute the divine appointment of a Christian Sabbath, yet allow the moral necessity thereof as a wise designation of time for the recruiting of our bodies, and at the same time, keeping up a sense of the great benefits we have received from God, and a spiritual temper of mind. By allowing six days to labour, the poor has time to earn his bread, and the man of business time to dispatch his affairs. Had more time been allotted to labour and business, and none to rest; our bodies would have been too much fatigued and wasted, and our minds too long engaged about worldly matters, so as to have forgotten divine things. Greedy people, without such an injunction, would scarce have spared their own bodies, much less their servants, slaves, cattle, &c.—The creation, therefore, would have suffered, had it not been provided for by the institution of a Sabbath. See SUNDAY.

The Jews had also their **SABBATICK YEAR**, which was every seventh year; wherein they were obliged to set their slaves at liberty, and to let their lands lie idle. See JUBILEE.

**SABBATH**, is also used for a nocturnal assembly which Witches are supposed to hold on saturdays, where the devil appears in form of a goat, around whom they make several dances, and magick ceremonies, amply described in the books of Dæmonomania.

To prepare themselves for this meeting, it is pretended, they take certain soporific drugs; after which they are said to fly

up the chimney, and to be spirited through the air to the Sabbath on a switch.

**SABBATH-day's-journey**, is a Jewish itinerary measure, fixed by critics to the space of 750 paces; or of 2000 Jewish cubits. See **MEASURE**.

**SABBATIANS, SABBATIANI**, a sect of hereticks thus called from *Sabbatius*, their leader, who lived under Dioclesian, was first a Jew, then converted, and made a priest by Marcion; but afterwards left the sect of Marcionites, on account of the celebration of Easter, which he would have to be on the fourteenth day of the moon; whence he, and his adherents, were called *Quartodecimans*. See **QUARTODECIMAN**.

The *Sabbatians* are recorded by ecclesiastical historians, as having a great abhorrence of the left-hand; so as to make it a point of religion, not to receive any thing with it.—This custom, which is now become a piece of manners among us, was then esteemed so singular, that the *Sabbatians* were thence denominated *Αριστεροι*, *q. d. sinistri*, or left-handed.

**SABELLIANS**, a sect of ancient hereticks in the east, who reduced the three persons in the Trinity, to three states or relations; or rather reduced the whole Trinity to the one person of the Father; making the Word and the Holy Spirit to be only virtues, emanations, or functions thereof. See **TRINITY** and **PERSON**.

*Sabellius*, their chief, first broached this doctrine, in the third century, in a city of Lybia, called Ptolemais: he taught, that he, who in heaven is the Father of all things, descended into the virgin, became a child, and was born of her as a Son; and that, having accomplished the mystery of our salvation, he diffused himself on the apostles, in tongues of fire; and was then denominated the Holy Ghost.

Epiphanius tells us, that the God of the *Sabellians*, whom they called the Father, resembled the sun, and was a mere substratum; whereof the Son was the illuminative virtue or quality, and the Holy Spirit the warming virtue.

The Word, they taught, was shot or darted forth like a divine ray, to accomplish the work of redemption; and that, being re-ascended to heaven, as the ray returns to its source, the warmth of the Father was communicated, after a like manner, to the apostles.

The council of Antioch, held by the Eusebians in 345, tells us, that, at Rome, they were called *Patripassians*, who, in the east, were called *Sabellians*. See **PATRIPASSIAN**.

**SABLE**\*, in heraldry, the black colour, in the arms of gentlemen. See **COLOUR**.

\* The name is borrowed from the little animal called *Sable*, which is of a black colour.

In those of nobility, it is called *Diamond*; and in the coats of sovereign princes, *Saturn*. See **DIAMOND**.

It is expressed in engraving by perpendicular and horizontal hatches drawn a-cross each other—as represented in *Tab. Herald. fig. 27*.

**SABRE**\*, a kind of cutting sword, or scimitar, having a very broad, heavy blade; thick at the back, and a little crooked towards the point. See **SWORD**.

\* The word is formed from the German *Sabel*, which signifies the same, of the Slavonic *Sabla*, a sword or hanger.

The Turks are very expert in the use of the *Sabre*, which is the weapon they ordinarily wear by their side, &c.—With this, it is said, they can cleave a man quite down, at a single stroke.

**SAC**\*, or **SAK**, **SACA**, or **SACHA**, in law, a royal privilege which a lord of a manor claims in his court, of holding plea in causes of debate arising among his tenants and vassals, and of imposing and levying fines and amercements touching the same. See **SOC**.

\* The word is Saxon, *Sac*, and literally signifies *cause, contest*, &c. Rastal defines *Sac* by the forfeiture or amercement itself.

**SACÆA, ΣΑΚΑΙΑ**, in antiquity, a feast which the ancient Babylonians, and other Orientals, held annually in honour of the god Anaitis.

The *Sacæa* were in the east what the *Saturnalia* were at Rome, viz. a feast for the slaves. One of the ceremonies hereof, was to chuse a prisoner condemned to death, and allow him all the pleasures and gratifications he could wish, ere he were carried to execution. See **SATURNALIA**.

**SACCADE**, in the manage, a jerk or violent check which the cavalier gives his horse, by drawing both the reins very suddenly; used when the horse bears too heavy on the hand, or obstinately arms himself. See **HORSE**.

The *Saccade* is a kind of correction rarely to be used; for fear of spoiling the horse's mouth.

**SACCHARUM**, or **SACCHAR**. See **SUGAR**.

**SACCOBENITTO**, or **SACOBENITO**. See **SAN-BENI**.

**SACCOPHORI**\*, a sect of ancient hereticks, thus called, because they always went clothed in sackcloth, and affected a world of austerities and penance.

\* The word is Greek, *Σακκοφοροι*; formed of *σακος*, a sack or bag, and *φορος*, I bear.

We know but little of their tenets: in all probability they were the same with the Massilians. See **MASSALIAN**.

The emperor Theodosius made a law against the *Saccophori*, and Manichees.

**SACCULUS**, a diminutive of *Saccus*; used in anatomy, to

express several parts of the body, bearing some resemblance to bags; as,

**SACCULUS Chyliferus**, or *Roriferus*, a passage which makes the beginning of the thoracic duct: called also *receptaculum chyli*. See **RORIFERUS**, **THORACIC**, and **RECEPTACULUM**.

**SACCULUS Cordis**, the pericardium. See **PERICARDIUM**.

**SACCULUS Lacrymalis**, a little membranous bag, into which the puncta lacrymalia of the eye open; and which is, itself, the entrance of a canal, by which the liquor separated in the glandula lacrymalis, is discharged into the cavity of the nose. It is the ulceration of this *Saccus*, that makes the fistula lacrymalis. See **FISTULA**.

**SACCULI Adiposi**, little cells or vesicles, in the membrana adiposa, wherein the fat of the body is contained. See **ADIPOSE** and **FAT**.

**SACCULUS Medicinalis**, denotes a topical medicine, applied to the side, stomach, or other painful part; consisting of herbs, or drugs inclosed in a linen bag.

**SACCULUS Medicinalis**, is also a name given to a bag of ingredients suspended in a liquor, in making diet-drinks; called also *Nodule*. See **NODULE**.

**SACER**, or **SACER DORSI**, in anatomy, a muscle arising from the hind-part of the os sacrum, and running along under the longissimus dorsi—With its several tendons, it lays hold on the spine, and every transverse process of the loins, and the lowest of the back.—It assists in erecting the trunk. See **MUSCLE**.

**SACER Ignis**, } See the articles { **ERYSIPELAS**.

**SACER Morbus**, } See the articles { **EPILEPSY**.

**SACERDOTAL**\*, **SACERDOTALIS**, something belonging to the priesthood. See **PRIEST**.

\* The word is formed from the Latin, *Sacerdos* priest, of *Sacer* holy.

**SACERDOTAL Benefices**, are such as cannot be legally held by any but persons in holy orders; such as are all cures of souls, bishopricks, &c. See **BENEFICE**.

The **SACERDOTAL Ornaments**, are those wherewith the priests are clothed, when they officiate, &c.

**SACK of Wool**, is a determinate quantity, containing just 26 stone; and every stone 14 pounds. 14 E. 3. Stat. 1. c. 2. See **STONE** and **WOOL**.

In Scotland, a *Sack* is 24 stone; each stone containing 16 pounds.

A **SACK of Cotton Wool**, is a quantity from an hundred and half to 400 weight.

**SACKS of Earth, SACS a Terre**, in fortification, are canvas bags full of earth, the largest about a cubic-foot wide, and the lesser somewhat more than half a foot.

They are also called *Earth-bags* and *Canvas-bags*, and are used on several occasions; particularly for making retrenchments in haste, to place on parapets, or the head of the breaches, &c. or to repair them when beaten down.

They are of good use also, where the ground is rocky, and affords not earth to carry on the approaches, because they can easily be brought on, and carried off.

The same bags, on occasion, are used to carry powder in, of which, they hold about fifty pounds a-piece.

**SACBUT**, a musical instrument of the wind kind; being a kind of a trumpet, though different from the common trumpet both in form, and size.

The *Sacbut* is very fit for playing bass; and is contrived so as to be drawn out or shortened, according to the gravity or acuteness of the tones.—The Italians call it *Trombone*, the Latins, *Tuba Ductilis*.

It takes asunder into four pieces, or branches; and hath frequently a wreath in the middle; which is the same tube, only twisted twice, or making two circles in the middle of the instrument; by which means, it is brought down one fourth lower than its natural tone. It has also two pieces or branches on the inside, which do not appear, except when drawn out by means of an iron bar, and which lengthen it to the degree requisite to hit the tone required.

The *Sacbut* is usually eight foot long, without being drawn out, or without reckoning the circles. When extended to its full length, it is usually fifteen foot. The wreath is two foot nine inches in circumference. It serves as bass in all concerts of wind music.

There are *Sacbuts* of different sizes, serving to execute different parts; particularly a small one, called by the Italians, *Trombone piccolo*, and by the Germans, *Cleine alt-posaune*, proper for a counter-tenor. The part assigned it, is usually called *Trombone primo*, or I°. There is another large, called *Trombone maggiore*, which may serve as a tenor: its part is usually called *Trombone secondo*, or II°. or 2°. There is a third still bigger, called *Trombone grosso*; its part is called *Trombone terzo*, or III°. or 3°. Lastly, there is another which exceeds all the rest, and which is much heard in the music, especially in the bass; its part is called *Trombone quarto*, or IV°. or 4°. or simply *Trombone*. It has usually the key of *F*, *ut*, *fa* on the fourth line; though frequently also on the fifth line from the top, by reason of the gravity or depth of the sounds.

**SACKA Arteria**, a branch of the aorta descendens, which descends through the middle of the os sacrum to the pelvis. See **AORTA** and **ARTERY**.

**SACRA Vena**, a vein arising from the os sacrum, and terminating usually in the iliac vein; sometimes in the place where the two iliacs meet the ascending aorta. See **VEIN**.  
**SACRAMENT** \*, **SACRAMENTUM**, in the general, denotes a sign of a holy, or sacred thing. See **SIGN** and **SYMBOL**.

\* The word is formed from the Latin, *Sacramentum*, which signified an oath, particularly that which the soldiers took to be true to their commanders; the words whereof according to Polybius, were *Obtemperaturus sum & facturus quicquid mandabitur ab imperatoribus juxta vires*.

In which sense, the word includes both the *Sacraments* of the law of nature, as sound morality, the manner of offering the bread and wine practised by Melchisedech, &c. and those of the law of Moses, as the circumcision, the paschal lamb, purifications, order of priesthood, &c. See **TYPE**.

**SACRAMENT**, with regard to the Christian church, is defined, a visible sign of a spiritual grace annexed to the use thereof. See **GRACE**, &c.

There are two objects in a *Sacrament*; the one a material sign, the object of the senses; the other the thing signified, which is the object of faith.—Thus it has pleased God to give as it were a body or substance to spiritual mysteries, that our faith might have the assistance of sensible signs.

Roman Catholics own seven *Sacraments*, viz. baptism, confirmation, the eucharist, penance, extreme unction, ordination and marriage. See each under its proper article.—The Protestants admit of only two, viz. baptism and the eucharist, or Lord's supper. See **BAPTISM**, &c.

The Romanists, however, call the eucharist, by way of eminence, the *Holy Sacrament*.—Thus to expose the *H. Sacrament*, is to lay a consecrated host on the altar to be adored.

The procession of the *H. Sacrament*, is that wherein it is carried about the church, or about the town. See **PROCESSION**.

In a like sense they say, the feast of the *H. Sacrament*, the congregation of the *H. Sacrament*, &c.

**SACRAMENT**, was also used in the Roman law, for a pledge or gage of money, which both the plaintiff and defendant, in a real action, laid down in court, to be forfeited by him who should lose the cause.—This was particularly called, *Sacramento provocare, rogare, stipulari*, &c.

**SACRAMENTARIANS**, a general name given to all such as have published, or held erroneous doctrines of the sacrament of the supper.

The term is chiefly applied among Roman Catholics, by way of reproach, to the Lutherans, Calvinists, and other Protestants.

**SACRAMENTARY**, **SACRAMENTARIUM**, an ancient church-book, comprehending all the prayers and ceremonies practised at the celebration of the sacraments.

Pope Gelasius was the first author of the *Sacramentarium*: it was afterwards revised, corrected and abridged by St. Gregory.—It was the same with what the Greeks now call *Euchologium*. See **EUCHOLOGIUM**.

**SACRED**, **SACER**, something holy, or, that is solemnly offered, and consecrated to God with ceremonies, benedictions, unctions, &c. See **CONSECRATION**.

Kings, prelates, and priests, are held *sacred* persons; abbots are only blessed.—The deaconhood, sub-deaconhood, and priesthood, are *sacred* orders, and impress a *sacred*, indelible character. See **ORDER**.

The custom of consecrating kings with holy oil, is derived, according to Gutlingius, from the Hebrews; among whom, he agrees with Grotius, it was never used but to kings who had not an evident right by succession. He adds, that the Christian emperors never used it before Justin the younger; from whom he takes it to have passed to the Goths, &c. See **UNCTION**, **KING**, &c.

**SACRED**, is also applied to things belonging to God, and the church. See **HOLINESS**.

Church lands, ornaments, &c. are held *sacred*.—The *sacred* college is that of the cardinals. See **CARDINAL**.

**SACRED Majesty**, is applied to the emperor, and the king of England; yet Loyseau says it is blasphemy. See **MAJESTY**. The Ancients held a place struck with a thunder-bolt as *sacred*. See **THUNDER-BOLT**.

In the civil law, *sacred* place chiefly denotes that, where a person deceased, has been interred. See **TOMB**, &c.

**SACRIFICE**, **SACRIFICIUM**, an offering made to God on an altar, by means of a regular minister, as an acknowledgment of his power, and a payment of homage. See **ALTAR**.

*Sacrifices* differ from mere oblations, in that in a *Sacrifice* there is a real destruction or change of the thing offered; whereas an oblation is only a simple offering or gift, without any such change at all. See **OBULATION**.

Divines divide *Sacrifices* into *bloody*, such as those of the old law; and *bloodless*, such as those of the new law.

They also divide them again into *impetratory*, which are those offered, to obtain some favour of God, or to thank him for some already received: and *propitiatory*, which are those offered to obtain forgiveness of sins. See **PROPITIATION**.

The Phoenicians are usually held the first authors of *Sacrifices*: Porphyry, indeed, attributes the invention to the

Egyptians; who, he says, first offered the first-fruits of their grounds, to the gods; burning them upon an altar of turf. At length they came to burn perfumes, and at last sacrificed animals; observing that they first eat some herbs, or fruits, regularly offered on the altars.—He adds, that libations were very frequent ere *Sacrifices* of beasts got footing. See **LIBATION**.

Ovid observes, that the very names *victim* and *hostia* import, that they were not slain, till such time as victories were obtained over enemies: indeed, while men lived on herbs and pulse, it is no wonder they obtained from *Sacrifices* of beasts: since the law of *Sacrifices* required, that they should eat some part thereof. In effect, it is supposed to be this that first introduced flesh as a food, and made man a carnivorous animal. See **CARNIVOROUS**.

The truth is, in all antiquity, both sacred and profane, *Sacrifices* were ordinarily nothing else but holy banquets. See **FEAST**, **EPULO**, &c.

The scriptures furnish us a somewhat different account; Noah certainly *sacrificed* animals at his coming out of the ark; and it is even suggested, that Abel himself *sacrificed* the best and fattest of his flocks: though Grotius thinks it more probable, he contented himself with making a mere oblation of his lambs, &c. to God without *sacrificing* them. Macrobius tells us, that the Egyptians, long accustomed to bloodless *Sacrifices*, being at length obliged to admit the worship of Serapis and Saturn, to whom *Victims* were to be *sacrificed*; would not allow their temples to be built in the cities.

These *Victims*, however, or bloody *Sacrifices*, at length obtained, in exclusion of almost all the rest: the most usual among the Ancients, were bulls, oxen, cows, sheep and lambs, in regard these were the most ordinary food of man. The manner of *sacrificing* among the ancient Hebrews, is amply described in the books of Moses. That in use among the Romans, is as follows.—In the choice of the *Victims*, care was taken it were without blemish or imperfection, its tail not too small at the end; the tongue not black, nor ears cleft; and the bulls such as had never been yoked. The *Victim* pitched upon, they gilt his forehead and horns, especially if a bull, heifer, or cow. The head they also adorned with a woollen infula, whence hung two rows of chaplets, with twisted ribbons; and on the middle of the body a kind of stole, pretty large, hung down on both sides: the lesser *Victims* were only adorned with bundles of flowers and garlands, together with white tufts or garlands.

The *Victims* thus made ready, were brought before the altar; the lesser were not led in a string, but driven to the place: the greater were conducted in an halter; if they made any struggle, or refused to go, the resistance was taken for an ill augury, and the *Sacrifice* set aside.—The *Victim* thus brought before the altar, was examined very circumspcally, to see if there were no defect in it: then the priest, being clad in his sacerdotal habit, and accompanied with the *Sacrificers* and other attendants, and being washed and purified according to the ceremonies prescribed, began the *Sacrifice*, with making a loud confession of his unworthiness, acknowledging himself guilty of divers sins; for which he begged pardon of the gods, hoping they would be pleased to grant his requests.—These confessions were like those of the Hebrews; with this difference, that the Pagans confessed the frailty of mankind, and owned their faults; the Jews confessed chiefly the greatness of God, accompanying it with hymns and musical instruments.

The confession over, the priest cried aloud, *hoc age*, i. e. compose yourselves, and mind your business; and presently an usher, holding a rod in his hand, called *Commentaculum*, went through the temple, and made all those withdraw, who were not initiated in the mysteries of religion, or such as were excommunicated.

The custom of the Greeks, from whom the Romans borrowed theirs, was, that the priest coming to the altar, should ask aloud, *Τίς τίς ἐστί;* Who is here? The people answered, *Πολλοὶ καὶ ἀγαθοί*, Many good persons: then the usher went through the temple, crying, *Ἐκας, ἕκας, εἰς βεθήλου*, that is, Out with the wicked. The Romans commonly used the words, *Noctes, profani, abscedite*.—All those who were driven out of the temples among the Greeks, were comprehended under these general words, *βέθηλοι, ἀμύητοι, ἀσάβαροι*. The profane being withdrawn, they cried, *Favete linguis*, or *animis*, and *Pascite linguam*, to require silence, and attention during the *Sacrifice*.

These ceremonies ended, the chief *Sacrificer* being fate down, and the rest of them standing, the magistrates or private persons, who offered *Sacrifice*, came before him, and presented him with the first-fruits and victim, and sometimes made a short discourse, by way of compliment; as we find Homer makes Ulysses do, when he presented the high-priest with Iphigenia to be *sacrificed*.—As any person came to present his offering, he washed his hands in a place appointed in the temple for that purpose.

Lastly, when the offering was made, the priest that officiated, perfumed the victim with incense, and sprinkled it with lustral water; and having washed his hands, and got up again to the altar, he prayed to the god to whom he presented the

*Sacrifice*,

*Sacrifice*, with a loud voice, that he would accept of those offerings, and be pleased with the victim he *sacrificed* to him for the publick good, and for such and such things in particular.—In the close of the offertory and prayer, made by the priest to the gods, he came down the steps of the altar, and from the hand of one of his assistants, received the sacred paste, called *mola salsa*, made of barley or wheat flour, mixed with salt and water, which he threw upon the head of the victim, sprinkling a little wine upon it, which was called *immolatio*.—Servius says, the priest scattered little bits of this paste upon the head of the victim, the altar where the sacred fire burned, and the knives, by way of consecration.

He then took wine in a vessel called *simpulum*, and having tasted it himself first, and made his assistants do the same, to shew that they partook of the *Sacrifice*, he poured it between the horns of the victim, pronouncing these words of the consecration, *Mactus hoc vino inferis esto*; Let this victim be improved and honoured by this wine. This done, he pulled off the hairs from between the horns, and threw them into the fire; and commanded the victimarius (who asked him, *Agon*?, Shall I strike?) to knock down the victim with a blow on the head with an hammer or ax; upon which, another assistant, named *Popa*, presently thrust a knife into his throat; whilst a third received the blood, wherewith the priest sprinkled the altar.

When the victim was slain, they flayed him, if it was not a burnt-offering; (for then they burned skin and all,) took the flesh off the head, and adorning it with garlands and flowers, fastened it to the pillars of temples, as well as the skins, as ensigns of religion; carrying them about in procession in publick calamities.—Not but that the priests oft wore the skins, and others went to sleep upon them in the temples of Æsculapius and Faunus, that they might receive favourable responses in their dreams, or be cured of their maladies. They then opened the victim's entrails, and after circumspectly viewing them, to draw presages therefrom, according to the art of the aruspices, they flowered them with meal, and sprinkled them with wine, and made a present of them to the gods, *reddebant exta diis*, by throwing them into the fire in small bits, boiled or parboiled; and hence the entrails were called *porricæ*.

The entrails being burned, and the other ceremonies finished, they believed the gods to be satisfied; and that they could not fail to find their vows accomplished, which they expressed by the word *litare*, *q. d.* all is finished, and well done; whereas *non litare*, on the contrary, intimated there was something wanting to the perfection of the *Sacrifice*, and that the gods were not appeased.—The priest afterwards dismissed the people with these words, *Ilicet*.

Hence it may be observed, that the *Sacrifices* consisted of four principal parts; the first called *libatio*, or the pouring a little wine upon the victim; the second *immolatio*, when, after they had scattered the crumbs of salted paste thereon, they killed it; the third *redditio*, when they offered the entrails to the gods; and the fourth *litatio*, when the *Sacrifice* was perfected, and accomplished without any fault.

**SACRILEGE**, **SACRILEGIUM**, the crime of profaning sacred things, or things devoted to God; or of alienating to laymen, or common purposes, what was given to religious persons, and pious uses. See **PROFANATION**, &c.

Our fore-fathers were so tender in this case, that, when the order of knights templars was dissolved, their lands, &c. were all given to the knights hospitallers of Jerusalem, for this reason, *Ne in pios usus erogata, contra donatorum voluntatem, in alios usus distraherentur*. See **TEMPLAR**, &c.

**SACRISTA**, or **SACRISTAN**, a church officer, otherwise called *Sexton*. See **SEXTON**.

**SACRISTY**, **SACRISTIA**; a place or apartment in a church, where the vessels and other utensils, and ornaments of the church, are preserved; and where the ministers dress and undress themselves before and after service. The *Sacristy* is also called in ancient authors, *Secretarium*.—Among us *Vestry*. See **VESTRY**.

**SACROLUMBARIS**, or **SACROLUMBUS**, in anatomy, a muscle, that arises fleshy from the superior part of the os sacrum, posterior part of the ilium, and from all the spines and transverse processes of the vertebræ of the loins.—It gives a small tendon to the posterior part of each rib near its root, where a small bundle of fleshy fibres arises and unites with each ascending tendon, to the third, fourth, fifth, and sixth vertebræ of the neck.—See *Tab. Anat. (Myol.) fig. 6. n. 30. 30. fig. 7. n. 16. 16.*

This with the *ferratus posticus inferior*, and *triangularis*, help to contract the ribs in expiration. But they are but of small force; and seem only to accelerate the motion of the ribs, which fall down chiefly by their own gravity, and the elasticity of the ligaments, by which they are tied to the vertebræ. See **MUSCLE**.

**SACRUM OS**, in anatomy, the lower extremity of the spine dorsii; being that part whereon we sit.—See *Tab. Anat. (Osteol.) fig. 3. n. 15. fig. 7. n. 20.* See also the article **SPINE**. It is doubted whence this name should arise: some think it is because the Ancients offered it in sacrifice to the gods;

others, because it is very large; and others, because it incloses the natural parts.

Its figure is triangular: it is hollow within-side, and by that means contributes to the forming of the cavity at the bottom of the hypogastrium, called the *pelvis*. Its fore-part is smooth, by which means, the parts it contains are secured from being wounded: its hind-part rough, that the muscles may fasten the better to it.

It has three different articulations: the first is with the last of the vertebræ of the loins, and is like that of the other vertebræ: the second, with the os coccygis, by synchondrosis: the third, with the bones of the hips.

The os *sacrum* is usually divided into five parts, which are ranked among the number of vertebræ: the highest is the greatest; the rest growing less as they go lower. These vertebræ are easily separated in children, by reason the cartilages which join them, are not yet ossified. But in adults, they are so firm, that they only make one bone. See **VERTEBRA**.

It is in the os *sacrum*, that the cavity which contains the spinal marrow, terminates. See **MEDULLA Spinalis**.

**SADDLE**, in the manage, a kind of stuffed seat, laid on the back of a horse, for the convenience of the rider. See **HORSE**, &c.

The origin of the *Saddle* is not well known: Gorop. Becanus attributes its invention to the Sallii, a people among the ancient Franks; and hence, says he, came the Latin *Sella* saddle.

It is certain, the ancient Romans were unacquainted with the use either of *Saddle* or stirrups; whence Galen observes in several places, that the Roman cavalry, in his time, were subject to several diseases of the hips and legs, for want of having their feet sustained on horse-back. And long before him, Hippocrates had noted, that the Scythians, who were much on horse-back, were troubled with defluxions in their legs, because of their hanging down.

The first time we hear of *Saddles* among the Romans, was Anno 340; when Constantius, endeavouring to deprive his brother Constantine of the empire, made head against his army, and entering the squadron where he himself was, threw him off his *Saddle*, as we are informed by the historian Zonaras.—Before, they made use of square pannels; such as we see in the statue of Antoninus in the capitol.

The use of *Saddles* was first established in England, by a law of Henry VII. whereby the nobility were obliged to ride on *Saddles*.—It is but very lately that the Irish have taken to it.

There are various kinds of *Saddles*; as the

*Running SADDLE*, a very small one, with round skirts.

*Burford SADDLE*, which has the seat and skirts plain.

*Pad SADDLE*, of which there are two kinds; the one made with burs before the seat, the other with bolsters under the thighs.

*French Pad SADDLE*, the burs whereof, came all round the seat.

*Portmantua SADDLE* furnished with a cantle behind the seat, to keep a carriage off the rider's back.

*War SADDLE*, furnished with a cantle, and a bolster both behind and before.

**SADDLE-GALLED**, is when a horse's back is hurt, or fretted with the *Saddle*.

It is cured by bathing the part with urine, or warm wine: when the sore is large, they bathe it with aqua secunda, strewing over it the powder of old ropes of flax, and consuming the proud flesh with vitriol or colcothar.

**SADDUCES**, or **SADDUCEES**, **SADUCÆI**, a sect among the ancient Jews, esteemed as deists, or free-thinkers, rather than real Jews; though they assisted at all the ceremonies of the worship in the temple. See **JUDAISM**.

St. Epiphanius will have the *Sadduces* to have taken their rise from Dositheus, a Samaritan sectary; and Tertullian is of the same opinion. St. Jerom, and other writers add, that the *Sadduces* came near the Samaritans in many things; particularly in this, that they allowed no books of scripture, but the five books of Moses. The Jesuit Serrarius has also embraced this opinion, as seeming to be supported by the authority of Josephus. But Josephus says only this, that they admitted all that was written, *i. e.* all the books of scripture; intimating hereby, that they disowned the unwritten traditions of the Pharisees.—In effect, St. Epiphanius is forced to own, that the *Sadduces* were Jews, not Samaritans; inasmuch, as they assisted at the worship and sacrifices of the temple at Jerusalem: whereas the Samaritans sacrificed on Mount Gerizzim. See **SAMARITANS**.

Some authors ascribe the origin of this sect to one Sadoc, a disciple of Antigonus Sochæus, who frequently inculcated it on his scholars, that God is to be served for his own sake, and not out of view to any reward from him in the next world, as slaves serve their masters merely for recompence.—Sadoc, add they, putting a false interpretation on these words of his master, published, that there was no reward allotted to good actions done in this world. And hence arose the sect of *Sadduces*; thus denominated from their leader Sadoc.—Though St. Epiphanius, and some modern writers after

after him, take the *Sadduces* to have been thus called from the Hebrew, *Sadec*, just, or *Sedec*, justice, in regard of the great justice and equity they shewed in all their actions.

It is observed, Acts xxiii. 8. that the *Sadduces* say, there is no resurrection, neither any angel or spirit; but that the Pharisees believe both the one and the other. These words, *The one and the other*, seem to insinuate, that angel and spirit are one and the same thing. But as the apostles, observes Oecumenius on that passage, do not always use the exactest terms, one may understand by spirit, all spiritual substances; as if the *Sadduces* had believed that God himself was corporeal.—This, however, is not Oecumenius's opinion: he asks, why the scripture says, *The one and the other*, though it spoke of three things, resurrection, angel, and spirit? and he answers, that it is either because angel and spirit are the same thing; or that *one and the other*, which is only properly understood of two things, is, perhaps, here spoke of three: exact propriety of words not being to be required in books wrote by simple illiterate fishermen. It is true, in explaining what goes before, he observes, that the *Sadduces*, being very ignorant, might possibly disbelieve the existence of a God; and on that account, might be represented as denying a resurrection, &c. But he does not say, that by spirit, they might mean all spiritual substance. It is probable, all meant by it, is the immortality of the soul; it being the opinion of the *Sadduces*, that there is nothing immortal in man.

It is certain, they denied all resurrection; and allowed of no happiness but what is enjoyed in this life; believing, that every thing told of the other world, had been invented by the Pharisees.—Hence, also, they denied a divine providence, and attributed all things to free-will; in which, they opposed the opinion of the Pharisees, who admitted a kind of destiny, or fatality, in all our actions. See PHARISEES.

**SAFE-CONDUCT**, *SALVUS CONDUCTUS*, a security given by the prince under his great seal, to a stranger, for his quiet coming in and passing out of the realm.

The *Safe-Conduct* is granted to enemies, the passport to friends. See PASSPORT.

Judges sometimes give *Safe-Conducts* to delinquents, or prisoners, to enable them to act in their affairs.

**SAFE-GUARD**, *SALVA GUARDIA*, in a law sense, a protection given by the king to a person fearing the violence of some other, for seeking his right by course of law.

**SAFE-GUARD**, at sea, denotes a rope which saves, and secures any thing: for instance, that whereby persons walk securely over the bolt-sprit.

**SAFE-GUARD of the Helm**, is a rope which goes through the helm, and is fastened to the futtocks of the ship. See HELM, &c.

**SAFE-PLEDGE**, *SALVUS PLEGIUS*, in law, a security given for a man's appearance on a day assigned. See PLEDGE.

**SAFFRON\***, *CROCUS*, a plant which produces a flower of the same name; whence, also, a drug called *Saffron* or *Crocus* is gathered. See CROCUS.

\* The word is formed from the Arabic, *Zapheran*, which signifies the same. Botanists call the plant *Crocus autumnalis sativus*.

The root which produces the *Saffron*, is a kind of bulb, or onion, covered with several bulbous cartilages: its grassy leaves are long, narrow, thick and soft to the touch: its flower, which appears sometimes before the leaves, and sometimes after them, is a pale purple, streaked with whitish lines: but towards the bottom of the petals the purple is deeper. From the middle of the flower arise three long flame-coloured stamens or chives, crowned with their apices. Under these is the ovary or vasculum feminale, by some called the Pistil of the plant: it is divided into three capsules, wherein the seeds are formed. From the upper part of the ovarium arises the stylus, a long slender tube inclosed within the fistular part of the flower, where it is of a whitish colour, but changes into a yellow before its division, which is into three parts, opposite to the tops of the stamens: 'tis these three parts only that make the true *Saffron* of the shops, for the sake of which alone the plant is cultivated. They are of a yellow colour just at the beginning from the stylus, but afterwards are all of a deep red colour, only their jagged extremities tipped with white inclining to yellow. See a figure and description of the plant by Dr. Douglas in Phil. Trans. N<sup>o</sup> 380. p. 441.

As soon as the flower is gathered, they separate the styles and lay them on hurdles, or in large sieves, or on a little kiln for that purpose, with a little coal-fire underneath to dry them. When dry, the *Saffron* is in its perfection, and fit for use.

It is observed, that five pounds of fresh styles, which some mistakenly call the *chives*, only make one pound of dry *Saffron*.

The good qualities of *Saffron* are, that its styles be long and broad, that they be velveted over with a fine red, of an agreeable smell, free of yellow threads, and very dry.

The best *Saffron* in Europe is that of England, chiefly about Walden in Essex: that brought from Spain is good for nothing; because of the oil the Spaniards mix with it to make it keep.

*Saffron* is used both in food and medicine, to cheer, fortify, and resolve. It is the greatest cordial in medicine; and a sure promoter of a diaphoresis.—It is also used by illuminors, to make a golden yellow colour.

**SAFFRON** is also a name given to several chymical preparations, from the resemblance of their colour to that of vegetable *Saffron*, but more usually called *Croci*. Such are

**SAFFRON of Venus**. See COPPER and VENUS.

**SAFFRON of Mars**. See CROCUS MARTIS.

**SAFFRON of Gold**. See AURUM Fulminans.

**SAGAPENUM**, *Σαγαπέννον*, a medicinal gum, whose smell comes very near that of the pine; whence its name.

It flows by incision, from the trunk of a ferulaceous plant growing in Persia: the best is in bright transparent tears, of a strong, pungent, porraceous smell; and the whiter and freer of dirt, the better. Sometimes it is found as white, both within and without side, as milk; though this is very rare. It is esteemed aperitive and purgative, proper in the epilepsy, asthma and palsy; and is also used externally to assuage pains, and resolve tumours.

**SAGATHEE\***, in commerce, a slight woollen stuff; being a kind of serge, or ratteen; sometimes mixed with a little silk.—It is manufactured chiefly at Amiens; though we have our share in England.

\* The word is formed from the French, *Sayette*, a diminutive of *Saye*, *Say*. See SAY.—The French name *Sayette*, again is derived from that of the thread used herein, which is chiefly prepared and spun in Flanders, about Turcoing, &c. and called *Fil de Sayette*.

**SAGE**, *SALVIA*, a medicinal herb of an agreeable, aromatic taste; esteemed an excellent cephalic of the detergent kind; and on that score likewise used as a vulnerary and diuretic.

There are several kinds of *Sage*; those used and cultivated by us are the *Tea-Sage*, or *Sage of Virtue*, the *Red Sage*, and the common or *Wormwood-Sage*.

The first, *salvia virtutis*, or *salvia hortenensis minor*, has the most agreeable flower; and on that score is cut when young and full of sap, dried, and kept for tea.—The Dutch dry and prepare their *Sage* like other teas, and carry it to the Indies as a very precious thing. They there find a good market for it; the Chinese preferring it to the best of their Indian teas; and for every pound of *Sage* tea, giving in exchange four pounds of theirs, which they sell again very dear in Europe. See TEA.

The common or wormwood *Sage*, *salvia hortenensis major*, is esteemed of the most efficacy in medicine, and is that alone used in the shops.—It makes an excellent gargarism, especially if sharpened with a little acid. Its decoction is very grateful and cooling, with the addition of a little lemon-juice. It is both detergent and absorbent, and as such, finds place in diet-drinks, and medicated ales, intended for sweeteners and cleansers of the blood.

The school of Salernum recommend *Sage* as a remedy in all diseases: hence the verse,

*Cur moriatur homo, cui salvia crescit in horto?*

*Sage*, when viewed with a microscope, appears covered all over with little spiders, which are seen to walk, &c. about.—It yields, by distillation, a very agreeable, aromatic oil, of some use in the shops.

**SAGITTA**, in astronomy, the arrow or dart, a constellation of the northern hemisphere near the eagle. See CONSTELLATION. The stars in the constellation *Sagitta*, in Tycho's catalogue, are five, and as many in Ptolemy's. In Mr. Flamsteed's catalogue they are twenty-three; the longitudes, latitudes, &c. whereof are as follow:

**SAGITTA**, in botany, signifies the top of any small twig, cyon, or graft of a tree. See **GRAFT**, &c.

**SAGITTA**, in geometry, is a term which some writers use for the abscissa of a curve. See **ABSCISSE**.

**SAGITTA**, in trigonometry, &c. is the same as the versed sine of any arch; and is so called by some writers, because it is like a dart, or arrow, standing on the chord of the arch. See **SINE**.

**SAGITTAL**, **SAGITTALIS**, **SUTURA**, in anatomy, the second of the genuine *Sutures* of the Cranium.—See *Tab. Anat. (Myol.) fig. 1. lit. f. fig. 2. lit. i.* See also **SUTURE**. It reaches the whole length of the head; and has its name from the Latin, *Sagitta*, as being straight, like an arrow.—Whence it is also called *Retta*, and sometimes also *Rhabdoides*. See **RHABDOIDES**.

**SAGITTARIUS**, in astronomy, the *archer*, one of the signs of the zodiac; the ninth in order. See **SIGN**. The stars in the constellation *Sagittarius*, in Ptolemy's catalogue are thirty-one; in Tycho's sixteen; in the British catalogue fifty. The longitudes, latitudes, magnitudes, &c. whereof are as follow:

**SAGO**, a medicinal simple brought from the East-Indies; of considerable use in diet, as a nourishment, and restorative. *Sago* is a sort of bread procured from a tree called *Landan*, growing in the Molucco's.

When a tree is felled they cleave it into two in the middle, and dig out the pith, which is even eatable when it comes fresh out of the tree. They pound it very small in a mortar, till such time as it is reduced into a kind of powder somewhat like meal. This done, they put it in a sieve made of the bark of the same tree, and place the sieve over a cistern made of its leaves, pouring water upon it, and by this means separating the pure part of the powder from the veins of wood wherewith the pith abounds.

The flour thus filtrated, they call *Sagu*: they make it into paste, and bake it in earthen furnaces; and this they do with so much expedition, that in three or four hours a man makes as much bread as will feed an hundred persons a day.

From the same tree they also draw a liquor, as agreeable to drink as our wines.

The leaves, when they are young, are covered with a kind of cotton, whereof they make their cloth; and as they grow older they serve them to tile their houses. The larger veins of these leaves serve them for stakes in building; and of the smaller they make a kind of hemp, wherewith they make very good ropes.

**SAGUM**, in antiquity, a military garment wore by the Greeks, Romans and Gauls, in manner of a cloak or cal-sock; covering the shoulders and back, as low as the hips; where it was fastened to the cuirass.

It was made of coarse wool, and square.—They had one for the winter, and another lighter for summer.

**SAICK**, or **SAIQUE**, a Turkish vessel, very proper for the carriage of merchandizes. See **VESSEL**.

It has square sails on the middle-mast; without either mizzen, top-gallant, or shrouds: only a main-mast, with a main top-mast, both very high; with a bolt-sprit, and a little mizzen-mast.

The height of the main-mast makes the *Saicks* visible at a great distance: their make renders it impossible for them to go with a side-wind; but when they have the wind behind them, nothing can out-go them.—The generality of them carry no guns.

**SAIGNER**, in fortification, a French term, signifying to bleed or drain.

Hence *saigner la fosse*, is to empty or drain the water out of the moat, by conveyances under ground; that it may be passed over the more easily; by laying hurdles or rushes on the mud remaining. See **DITCH**.

**SAIL**, in navigation, an assemblage of several breadths of canvas, or strong hempen cloth, sewed together by the lifts, and edged around with a cord; fastened to the yards and stays of a vessel, to make it drive before the wind which bears thereupon. See **SHIP**.

There are two kinds of *Sails*; the one square, generally used in high-bottomed vessels.—This has various names, according to the various masts it is fastened to; as the *Main-sail*, *Fore-sail*, the *Mizzen-sail*, the *Sprit-sail*, &c. See **MAST**, &c.

The others are triangular, called *Smack-sails*, and by some *Latin-sails*, because chiefly used in Italy, and in flat-bottomed vessels; though they are also used on the mizzen-masts and stays of other vessels.—They need but few ropes, and little wind; but are dangerous, and not to be used in foul weather.

There are ordinarily ten *Sails* in large vessels; which number is increased at bottom by the addition of bonnets, and at the sides by *Cape-sails*.—See *Tab. Ship. fig. 1. n. 2, 17, 20, 44, 65, 67, 86, 107, 109, 126, 138*.—See also the articles **BONNET**, &c.

A vessel is said to *set sail*, to go with full *sail*, to make all her *sail*, that is, to open all her *Sails*. To be under *sail*, is to be ready to *set sail*, &c.

**SAILS**, also denote the vanes of windmills; or the arms or flights, whereby the wind has its effect on windmills.—These are either horizontal or perpendicular. See **WIND-MILL**.

**SAILS**, in falconry, denote the wings of an hawk. See **HAWK**, **WING**, &c.

**SAILING**, in a general sense, is used for the art, or act of navigating; or of determining all the cases of a ship's motion, by means of sea-charts. See **NAVIGATION**.

Of this there are three kinds, *plain*, *Mercator's*, and *circular*.

**Plain SAILING**, is that performed by means of rhumbs drawn on a plain chart. See **Plain CHART**, and **RHUMB**.

**Mercator's SAILING**, is that performed by rhumbs drawn on a *Mercator's* chart. See **MERCATOR'S CHART**.

**Circular SAILING**, is that performed by the arch of a great circle; which, of all others, where practicable, is the shortest. See **CIRCULAR** and **GLOBULAR CHART**.

**Doctrine of plain and Mercator's SAILING**.—I. The longitude and latitude of two places given; to find the departure, or miles of longitude.

In *plain Sailing*. 1°. If both places be more easterly than the first meridian, subtract the less longitude from the greater, the remainder is the difference of meridians. If one of the places be more easterly, and the other more westerly than the first meridian, add the longitude of the more easterly to the complement of the longitude of the more westerly to a whole circle; the sum is the difference of meridians. 2°. Divide the difference of meridians into so many parts as there are degrees in the difference of latitude: or, if the difference of latitude be greater than that of the meridians, into so many fewer. 3°. Reduce the minutes of longitude answering to one part, into miles of the several parallels, in the former case; or into miles of the parallel, which is an arithmetically mean proportional between the two, in the latter case. 4°. The aggregates of these parts collected into one sum, exhibit the departure, or miles of longitude.

E. gr. Suppose the longitude of the one place 35°, and that of the other 47°. the difference of meridians is 12°, Suppose

pose the latitude of the first  $4^{\circ}$ . and that of the latter  $8^{\circ}$ . the difference will be  $4^{\circ}$ . consequently we have sailed from the 4th to the 8th parallel. Therefore divide 12 by 4, and reduce the quotient  $3^{\circ}$ . into miles in the several parallels 4, 5, 6, and 7. (see DEGREE) the several quotients will be  $43^{\circ} 71'$ .  $43^{\circ} 68'$ .  $43^{\circ} 65'$ .  $43^{\circ} 59'$ . the sum of which is 174, the departure or miles of longitude required.

*In Mercator's Sailing.* The reduction is much more commodiously performed in Mercator's charts; wherein the arch intercepted between the two meridians, is applied to an arch of the meridian intercepted between the two parallels; and the distance it there measures, gives the departure, or miles of longitude required. See DEPARTURE and LONGITUDE.

II. *The longitude and latitude of two places, to and from which, a ship is to sail, being given; to find the rhumb to be sailed on, and the distance to be run.*

*In plain Sailing.* 1. Find the departure by the last case. 2. From the departure, and difference of latitudes, find the loxodromic angle or rhumb-line; which is done by this proportion: as the difference of latitude is to the departure, so is the whole sine to the tangent of the angle of the rhumb-line. The distance then, to be run on this rhumb, is to the departure, as the whole sine to the sine of the angle of the rhumb. See RHUMB.

*In Mercator's Sailing.* 1. Apply the center of the mariner's compass on the place sailed from, on the Mercator's chart, as  $a$ , (Tab. Navigation, fig. 7.) and so as that the north and south line thereof be parallel to some of the meridians. 2. Mark the rhumb of the compass, wherein the place sailed to, as  $b$ , is placed. For this is the rhumb to be sailed on. 3. The same rhumb is likewise found by drawing a right line from  $a$  to  $b$ ; and with a protractor, finding the angle the rhumb makes with any meridian it cuts. 4. The quantity or distance  $ab$  is found by applying the part  $a$  1 to  $IK$ , 1 2 to  $kl$ , 2  $b$  to  $lm$ .

Note, the rhumb and distance may also be found after the same manner on a plain chart.

The same may likewise be found by loxodromic tables; thus, 1. Choose a rhumb at pleasure, and under the same, in the tables, find the longitudes corresponding to the given latitudes. The difference whereof, if it coincide with the difference of the given longitudes, the rhumb is well chosen; otherwise another must be pitched on, either more or less oblique, till the tabular difference agree with the given difference. 2. The rhumb thus found, the distances answering to the given latitudes, must be taken from the tables, and the less subtracted from the greater; the remainder is the distance sought.

III. *The rhumb at distance sailed being given; to find the longitude and latitude of the place arrived at.*

*In plain Sailing.* 1. From the data, find the difference of latitude of the two places: (by the proportion delivered under the article RHUMB-line.) This difference added to the latitude of the place sailed from, or subtracted from the same, the sum, or the remainder, leaves the latitude of the place sailed to. 2. From the same, find the departure; and thence the latitudes of the place sailed to (as directed under RHUMB-line.)

*In Mercator's Sailing.* 1. Place the mariner's compass on the chart, with the center over the place  $a$ ; and the meridian, and north or south line, parallel to the meridian thereof. 2. From the point  $a$ , draw a right line, as  $ab$ , for the ship's course. Take the distance by parts, in parts of the meridian  $IK$ ,  $KI$ , &c. and set it off upon the right line  $ab$ ; *e. gr.* from  $a$  to  $c$ ; then will  $c$  be the place the ship is arrived at; the longitude and latitude whereof are given by the chart. See CHART.

*By the loxodromic tables.* 1. Under the given rhumb, seek the distance answering to the latitude of the place sailed from; and either add it to, or subtract it from the given distance; as the latitude of the place sailed to is greater, or less than that sailed from. 2. Under the same rhumb, ascend or descend further, till you meet with the distance corrected. 3. The latitude answering thereto in the first column, is the latitude of the place sailed to. 4. From the second column of the table take the longitudes corresponding to the latitudes of the places sailed to and from. Their difference is the difference of longitude of the places sailed to and from.

IV. *The latitudes of the places sailed to and from, together with the rhumb sailed in, being given; to find the distance and difference of longitudes.*

*In plain Sailing.* From the difference of latitude and the rhumb given, find the distance; and from the same data, the departure. See RHUMB. This converted into degrees of a great circle (see DEGREE) exhibits the difference of longitudes sought.

*In Mercator's Sailing.* 1. Place the compass on the chart, as in the preceding case. From the place sailed from,  $a$ , draw the rhumb-line  $ab$ , sailed in; till it cut the parallel of the given latitude. 2. The point of intersection will be the

place arrived in. 3. Hence its longitude is easily found; and the distances. See RHUMB.

*By the tables.* Take both the longitudes and the distances answering to the latitudes of the given places, out of the tables; then subtract both the longitudes and the distances from each other. The first remainder is the difference of longitude, the latter the distance of the places.

V. *The latitudes of the places sailed from, and to, with the distance given; to find the rhumb and the difference of longitude.*

*In plain Sailing.* From the difference of latitude, and the distance, find the rhumb, and from the same data find the departure; which may be also determined from the rhumb now found, and the difference of latitude, or from the rhumb and the distance run. Lastly, from the departure find the difference of longitude. See RHUMB.

*In Mercator's Sailing.* On the map draw the parallel the ship arrives at,  $CD$ . Reduce the distance run into parts proportional to the degrees of the map. The distance reduced, being  $a$  2; from  $a$  describe an arch touching the parallel  $CD$  in 2: then will 2 be the place in the map; whose longitude accordingly is easily found.

*By the tables.* Subtract the given latitudes from each other; and in the tables seek the rhumb; under which, the distance run answers to the given difference of latitude. Subtract the longitude under the rhumb, answering to the latitude of the place sailed to; and that under the same rhumb against the latitude of the term sailed to, from each other; the remainder is the difference of longitude sought.

VI. *The difference of longitudes of the places sailed to, and from, with the latitude of one of the places, and the distance run, being given; to find the rhumb, and the latitude of the other.*

*In plain Sailing.* Convert the difference of longitudes into miles of longitude for the departure; from the given departure and distance run, seek the rhumb: and from the same, and the rhumb, seek the difference of latitude; which, and the latitude of one place being had, the latitude of the other readily follows. See RHUMB.

*In Mercator's Sailing.* Through the given place  $a$  in the map, draw a right line  $EF$  parallel to the meridian  $IH$ ; and make  $FL$  equal to the difference of longitudes. From  $F$  draw  $LM$  parallel to  $EF$ , which will be the meridian the ship is arrived at. Then from  $a$ , with the interval of the distance run,  $ac$ , describe an arch intersecting the meridian  $ML$ ; the place sought will be in  $c$ . If then a compass be placed on the map, as before directed, the rhumb-line will fall in with  $ac$ ; and consequently the rhumb will be known. Lastly, if through  $c$  be drawn  $NO$ , parallel to  $AB$ ;  $NA$  will be the latitude of the place required.

*By the tables.* Take a rhumb at pleasure, and under the same in the tables, find the longitude, and the distance answering to the given latitude. Add the given distance to the distance found in the tables, if the vessel sailed from the equator; or subtract it therefrom, if it sailed towards the same. With the same sum, or the difference, enter the tables; and the longitude found against it, subtract or add from that just found. If the remainder be found the given difference of longitudes, the rhumb is well taken. Otherwise, it must be changed for a more or less oblique one, till the same operation being repeated, the remainder be found the difference of longitudes; then the latitude in the first column, corresponding to the distance, will be the latitude of the other place.

VII. *The difference of longitude, and the latitude of one of the places, being given, together with the rhumb; to find the distance run, and the latitude of the other place.*

*In plain Sailing.* Reduce the difference of longitude into miles of longitude, or departure, as under the first case. From the departure and the rhumb, find the distance run. (See RHUMB.) And from these, or from the rhumb, and the distance run, find the difference of latitude. This done, as the latitude of the one is already had, that of the other is so too.

*In Mercator's Sailing.* Place the compass on the chart as before; and by the given rhumb, draw the rhumb-line,  $ab$ . Draw a meridian  $EF$  through the given place  $a$ ; and with the interval of the difference of longitude  $FL$ , draw another,  $LM$ , for that the vessel is arrived at. Where this intersects the rhumb-line, is the place  $c$  that the vessel is arrived at. Wherefore, if through  $c$  be drawn  $NO$  parallel to  $AB$ ;  $NA$  will be the latitude of the place. The distance run  $ac$  is easily reduced into miles by the scale.

*By the tables.* Under the given rhumb, seek the distance run, and the difference of longitude answering to the given latitude. If the vessel had sailed towards the pole, the difference of longitude is to be added to the given difference of longitude; if towards the equator, it is to be subtracted from the same. In the former case, descend in the table, and in the latter, ascend; till in the first, the aggregate, in the latter, the difference be seen in the column of longitude. The latitude answering hereto in the first column,

lumn, is that sought. And from the distance answering to this latitude in the first case, the tabular distance is to be subtracted; or in the latter case, that distance to be subtracted from the tabular distance. What remains, is the distance run.

From the solution of these cases in *Sailing*, it is evident, some are more easily performed by the charts than the tables; and that the Mercator's charts are preferable to the plain ones; since in the latter, the distance is not reduced by the map, but by a particular scale for that purpose.

**Doctrine of circular SAILING.**—I. *The latitude and longitude of the places sailed to, and from, being given; to find the angle M (fig. 8.) which a ship's way M O proceeding in a circular course, includes with the meridian P M of the place sailed from.*

Since in the triangle P M N, we have P M and P N, the complements of the given latitudes H M, and I N, together with the angle M P N, measured by the arch H T, the difference of the given longitudes H and T; the angle P M N is found by spherical trigonometry. See TRIANGLE.

II. *The latitude H M, and the longitude H, of the place sailed from, M, with the distance run, and the latitude of the place L S the ship in a circular voyage arrives at, being given; to find the longitude of the place L, and the angle P L M comprehended between the ship's way M L, and the meridian P S.*

In the triangle P M L, we have given P M the complement of the latitude H M, and P L the complement of the latitude L S. Wherefore, if the ship's way M L be turned into degrees of the equator; we shall find the angle M P L, which is equivalent to the difference of longitudes H S; and likewise the angle P L M by spherical trigonometry. See SPHERICAL TRIANGLE.

After the like manner may other problems be solved; but as it is easier and better *Sailing* by rhumbs, than by circles, and as this latter way is but very little in use; we chuse to pass them over. See GLOBULAR Chart.

**SAILING**, in a more confined sense, is the art of conducting a vessel from place to place, by the working or handling of her sails and rudder: though, what is done by means of this latter, is more properly called *Steering*. See STEERING.

To bring *Sailing* to certain rules, M. Renau computes the force of the water, against the ship's rudder, stem, and side; and that of the wind against her sails.—In order to this, he 1<sup>o</sup>. considers all fluid bodies, as the air, water, &c. as composed of little particles, which, when they act upon, or move against any surface, do all move parallel to one another, or strike against the surface after the same manner.

2<sup>o</sup>. That the motion of any body, with regard to a surface on which it is to strike, must be either perpendicular, parallel, or oblique. In the first case, the body strikes with all its force, which will be greater or less, according as the body moves swifter or slower. In the second case, the line of motion *a b*, (Tab. Navigation, fig. 3.) will not affect the surface at all, because it is no way opposed to it; nor can the moving body strike upon it, or touch it. In the third, if the line of motion, A D, be oblique to the surface D C, so that the angle of incidence be A D C, then the motion of the body in the line A D may be resolved into two directions, viz. into A E, or B D, and into A B. But the direction or line of motion A E being parallel to the surface D C, cannot affect it at all; so that the whole motion of the body A in that oblique manner of striking on the surface, will be expounded by the perpendicular line, A B. And if D A be made the radius of a circle, whose center is at D, B A will be the sine of the angle of incidence, A D C.

Hence it is deduced, that the force of a particle of air or water, as A, striking against the surface D C, which may represent, either a sail or the rudder of a ship, in the oblique direction A D, will be to the perpendicular force thereof, as B A is to D A: that is, as the sine of the angle of incidence is to the radius.

And since what is thus true of one particle, singly considered, will be true of all the particles of any fluid body collectively; it will follow, that the force of the air or water striking perpendicularly upon a sail or rudder, to the force of the same, in any oblique impingency, will be, as the square of the radius, to the square of the sine of the angle of incidence: and consequently, that all oblique forces of the wind against the sails, or of the water against the rudder, will be to one another, as the squares of the sines of the angles of incidence.

If the different degrees of velocities be considered, it will be found, that the forces will then be as the squares of the velocities of the moving air or water; that is, a wind that blows thrice as strong, or moves thrice as swift as another, will have nine times the force upon the sail.—And it being also indifferent, whether you consider the motion of a solid in a fluid whose particles are at rest; or of those particles moving all parallel against a solid that is at rest; the reciprocal impressions being always the same; if a solid be moved with different velocities in the same fluid matter (as suppose water) the different resistances which it will receive from

that water, will be in the same proportion, as the squares of the velocities of that body.

Let H M (fig. 4.) represent a ship, C D the position of the sail, and A B the course of the wind blowing towards B. Draw B G perpendicularly to the sail, and G K perpendicular to the line of the keel produced H M K. By what is said above, the sail C D, will be driven by the wind A B, according to the direction of the line B G. So that if she could divide the water every way with the same facility, as she doth with her head, the ship would go directly to the point G, along the line B G. And if H K represent her direct course, she would have got forward the length B K, and sideways she would have gone the quantity G K. But as her length is much greater than her breadth, so she will divide the water, or make her way in it with more difficulty with her side, than with her head or stern; on which account, she will not run sideways so far as K G, but fall short of it in proportion to the said difficulty of dividing the water with her side, that is, if the resistance she finds in her passing through the water sideways, be to that of passing lengthways, suppose, as ten to one, then will not the ship get sideways above a tenth part of the line G K.

Wherefore, if K G be found to G L, in the ratio of the resistance of the side to that of the stern, and the line B L be drawn; the ship will go to the point L, along the line, B L, in the same time as it would have gone to G, if it could have divided the water every way equally.—This part, K L, is called the *drift*, or *lee-way* of a ship, and the angle K B L is her degrees of lee-way; as the angle A B K, expresses how near the wind she lies.

After this, the author proceeds to demonstrate, that the best position or situation of a ship, so as she may make the best lee-way, but go to wind-ward as much as possible, is this: that, let the sail have what situation it will, the ship be always in a line bisecting the complement of the wind's angle of incidence upon the sail; that is, supposing the sail in the position B C (fig. 5.) the wind blowing from A to B, and consequently, the angle of the wind's incidence on the sail A B C, and its complement C B E; then must the ship be put into the position B K, or move in the line B K, bisecting the angle C B E.

He shews farther, that the angle which the sail ought to make with the wind, i. e. the angle A B C, ought to be but 24 degrees; that being the most advantageous situation to go to wind-ward, the most that is possible. And in order to bring this to bear in practice, he directs to put marks to the sheets, braces, and bow-lines of the lower sails, to know when they are in their best situation; and then, even in the night, when the marks of a brace or of a sheet shall come to the cleat, one may be pretty well assured, that the sail trims well.

To this might be added, many curious things from Borelli *de Vi Percussionis* concerning the different direction given to a vessel from the rudder, when sailing with a wind, or floating without sails in a current; in the former case, the head of the ship always coming to the rudder, and in the latter always flying off from it.

**SAILORS**, the elder seamen, who are employed in working or managing the sails, the tackle, steering, &c.

**SAINTS, SANCTI**, in the Romish church, holy persons deceased, and since their decease, canonized by the pope; after several informations and ceremonies. See CANONIZATION.

One of the points wherein the Roman Catholics and Protestants differ, is, that the former address, invoke, supplicate saints, &c. to intercede for them; whereas the latter hold it sufficient to propose their good examples for our imitation. See LATRIA.

The number of *Saints*, allowed as such, in the Romish church, is prodigious: Father Papebroche reckons seventeen or eighteen hundred to have died on the first of June, only. Indeed, the crowd of *Saints* wherewith their martyrologies are stocked, is scandalous, even to the more sober of their own communion. Father Mabillon, in an express dissertation on the worship of unknown *Saints*, observes, that honours are given to *Saints*, who, perhaps, were not Christians; and whose names were never known. Hence, being under a necessity of giving them names, they are therefore called *Baptized Saints*. He adds, that they every day beseech *Saints* to intercede for them with God; when, it is much doubted, whether they themselves be in heaven. See RELICK, MARTYR, &c.

Father Papebroche and his associates have been a long time employed in writing the lives and acts of the *Saints*: they range them each on the day of the year wherein they died: for the first six months they have published twenty-four volumes in folio; and since Papebroche's death, in 1714, his successors have published two more. See ACT, and BOL- LANDIST.

**SAKER**, a small sort of cannon; whereof there are three species: *extraordinary*, *ordinary*, and *least sized*.

**SAKER Extraordinary**, is about four inches diameter at the bore, 1200 pound weight, 10 foot long; its load 5 pounds, shot 3 inches and half diameter, and something more than 7 pound

pound and a quarter weight; its level range is 163 paces.

**SAKER Ordinary**, is a size less, 3 inches 3 quarters bore, 9 foot long, 1500 weight; its charge, 4 pounds of powder; bullets diameter 3 inches and a half, weight 6 pounds, its level range 160 paces.

**SAKER of the least Size**, is 3 inches and a half diameter at the bore, 1400 pound weight, 8 foot long, its load near 3 pounds and a half; shot 4 pounds 3 quarters weight, and 3 inches and a quarter diameter. See **CANNON**, and **ORDNANCE**.

SAL, in chymistry, &c.	} See	SALT.
SAL Armoniac, or Ammoniac,		ARMONIAC.
SAL Petreæ, or Nitri,		SALT-PETRE, & NITRE.
SAL Prunellæ,		PRUNELLÆ.
SAL Tartari,		TARTAR.
SAL Polychrestum,		POLYCHREST.
SAL Gemmæ,		GEMMA.

**SAL Volatile Oleosum**, is the name of an aromatic volatile salt, first prepared by Sylvius de la Boe, and found a very notable medicine, chiefly as a cephalic, and cordial.

It is made thus: to an ounce of volatile salt of sal ammoniac, distilled with salt of tartar, and dulcified with spirit of wine, put a dram and half of some aromatic oil, or essence, drawn from some generous aromatic vegetable, as cinnamon, cloves, rosemary, balm, &c. And when the spirit and oil are well stirred and incorporated together, draw off the volatile salt and spirit in a cucurbit. Some, instead of this, mix all the ingredients together at first, viz. the sal ammoniac, sal tartari, spirit of wine and powder of cinnamon or cloves, &c. and distill off the volatile spirit and salt at once; but the former way is preferred. See **VOLATILE**.

**SALADINE**, a tax, imposed in England and France, in the year 1188, to raise a fund for the crusade undertaken by Richard I. of England, and Philip Augustus of France, against Saladin sultan of Egypt, then going to besiege Jerusalem.

The *Saladine-tax* was thus laid: that every person who did not enter himself a croise, was obliged to pay a tenth of his yearly revenue, and of the value of all his moveables, except his wearing apparel, books and arms.

The Carthusians, Bernardines, and some other religious, were exempted from the *Saladine*.

**SALAMANDER'S BLOOD**, a term which chymists give to the red vapours, which in distilling spirit of nitre, rise towards the latter end, and fill the receiver with red clouds.

They are the most fixed, and strongest part of the spirit; and nothing but nitre yields a red vapour in distillation. See **NITRE**.

**SALARY**, **SALARIIUM**, a stipend, or wages allowed any person in consideration of his pains, industry, or service in another man's business.

**SALET**\*, **SALLET**, or **SALADE**, in war, a light covering, or armour for the head, anciently wore by the light horse; only differing from the cask, in that it had no crest, and was little more than a bare cap. See **CASK**.

\* Nicod derives the word from *Sila*, which had the same signification among the Latins: others from *Saladinus*, alleging, that it was borrowed from the orientals; others from the Italian *Celata*, as if the head were hid hereby. Others from the Spanish *Celada*, a little cask, &c.

**SALIENT**\*, in fortification, denotes *projecting*.

\* The word is formed from the French *Saillant*, which signifies the same thing; of *sailler*, to project, advance outwards, and that, of the Latin *salire*, to leap.

There are two kinds of angles; the one *Salient*, which are those that present their points outwards.—The other *Re-entering*, which have their points inwards. Instances of both kinds, we have in tenailles, and star-works. See **ANGLE**.

**SALIENT**, **SALIENT**, or **SAILLANT**, in heraldry, is applied to a lion, or other beast, when its fore-legs are raised in a leaping posture.

A lion *Saliant* is that which is erected bend-ways: standing so as that his right fore-foot is in the dexter chief point, and his hinder left-foot, in the sinister base point of the escutcheon.—By which it is distinguished from rampant. See **RAMPANT**.

**SALIC**\*, or **SALIQUE Law**, *Lex SALICA*, an ancient and fundamental law of the kingdom of France, usually supposed to have been made by Pharamond, or at least by Clovis; in virtue whereof males only are to inherit. See **SUCCESSION**.

\* Some, as Postellus, would have it to have been called *Salic*, *q. d. Gallic*, because peculiar to the Gauls. Cenal takes the reason to be, that the law was only ordained for the royal *salles*, or palaces: Claud. Seissel says, it was thus called, because of the *salt* and the prudence it abounds withal: Fer. Montanus insists, it was because Pharamond was at first called *Salicus*. Others, with the abbot Uperg, derive its name from *Salogast*, Pharamond's principal minister; and others from the frequent repetition of the words *Si aliqua*, at the beginning of the articles. Genebrard says, it was called *Salic* for *Salomonic*, by reason Solomon set the first example of it. Davison derives it from the German words, *Salts* and *Lick*, *q. d. like to salt*.—The most probable opi-

VOL. II. N. CXXXVI.

nion is, that which derives the word from the ancient Franks, who were called *Sali*, *Salici*, and *Salingi*, on account of the river Sala, a river of ancient Germany: this is the sentiment of Rhenanus and Æmilus, who are followed by several others; among the rest, Menage, Pasquier, Borel, and Juncker. Bouteroue gives another plausible origin of the word: he says, it comes from the word *Salich*, which, in the old Teutonic language, signified *salutary*; and that the French in this law imitated the policy of the ancient Romans, who made salutary laws, which the magistrates were to have before them when they administered Justice. This he confirms from a curious figure taken out of the *Notitia Imperii*, where the book is represented covered with gold, with this Inscription, *Leges Salutaris*.

Du Haillan, after a critical examination of the *Salic Law*, declares it to have been an expedient of Philip the Long, in 1316, for the exclusion of the daughter of Louis Hutin, from inheriting the crown. Father Daniel, on the other hand, maintains, that it is quoted by authors more ancient than Philip the Long; and that Clovis is the real author of it. The style, which is scarce intelligible, and which is in a latinized dialect, is a mark of its antiquity.

This law has not any particular regard to the crown of France: it only imports in the general, that in *Salic land*, no part of the inheritance shall fall to any female; but the whole to the male sex. *De terra Salica nulla portio hereditatis mulieri veniat; sed ad virilem sexum tota terra hereditas perveniat*.—So that it is a popular error to suppose, that the *Salic Law* was established purely on account of the succession to the crown: since it extends to private persons as much as to those of the royal family.

Part of it seems to have been borrowed by our Henry I. in compiling his laws, *cap. 89. Qui hoc fecerit secundum legem Salicam moriatur*.

By *Salic lands* or inheritances were anciently denoted all lands, by whatever tenure held, whether noble or base, from the succession whereto, women were excluded by the *Salic Law*; and admitted to inherit nothing but moveables, and purchases; whenever there were any males.—Indeed M. Fenelon observes, that there were originally *Salic lands*, distinguished from all others, and destined for the military people of the nation; and to these, it is supposed, the law was originally intended to be confined.

M. Eccard, a Hanoverian, is said to have recovered an ancient MS. of this famous law, containing a third part thereof, much more amply than any yet discovered, with a very curious chronology of the same law, hitherto unknown.

**SALII**, in antiquity, priests of Mars, whereof there were twelve, instituted by Numa; wearing painted, parti-coloured garments, and high bonnets, with a steel cuirass on the breast.

They had their name *Salii* from *saltare*, to dance; because, after assisting at sacrifices, they went dancing about the streets with ancylia, or bucklers in the left-hand, and a rod in the right, striking musically on one another's bucklers with their rods, and singing hymns in honour of the gods. See **ANCYLE**, &c.

There were two companies or colleges of *Salii*: The ancient established by Numa, called *Palatini*; the latter by Tullius Hostilius, called *Collini*, and *Agonales*. Though Servius tells us, there were two kinds instituted by Numa, the *Collini* and *Quirinales*; and two others by Tullus, the *Palatini* and *Palatini*.

In singing, they used a peculiar ancient song, called *Saliare Carmen*; and after the ceremony, were entertained with a feast: whence *Saliare Epulæ*, and *Saliare Dupes*, passed into a proverb for good eating.

Their chief, called *Præful*, and *Magister Saliorum*, was one of their number: it was he led the band, and begun the dance; the rest imitating all his steps and motions.—The whole company was called *Collegium Saliorum*.

Sext. Pompeius makes mention of *Salian Maids*, *Virgines Saliares*, hired for the purpose, and joined with the *Salii*, wearing a kind of military garb, called *Paludamentum*, with high round bonnets like the *Salii*, and, like them, performing sacrifices with the pontifices in the palaces of kings.

M. Patin takes it, there is a figure of one of the *Salii* on a medal of the Saquinian family; who, besides the buckler in one hand, holds the caduceus in the other.—But his look appears too grave, and sedate: and besides, the buckler he holds, does not seem to be an ancyle, as being quite round, and not indented any where. And again, why should a priest of Mars, the god of war, be represented with a caduceus, the emblem of peace? It is probable therefore, this is no figure of any *Salus*, as Patin imagines.

**SALIVA**, *spittle*, a thin, pellucid humour, separated from the arterial blood by the glands about the mouth and fauces; and conveyed by proper salival ducts into the mouth, for several uses. See **SALIVAL DUCTS**.

It consists of a great deal of water or phlegm, and a volatile salt; some add, a sulphurous spirit.

The *Saliva*, Boerhaave observes, is void both of taste and smell; does not harden by heat; is more copious, fluid, sharp, penetrating, and detergent, as a person has fasted longer; and is separated from the pure arterial blood.

The glands wherein the *Saliva* is separated from the blood, are the parotides; the maxillary glands; the sublinguales, or those under the tongue; the amygdalæ, or almonds of the ears, and the palatinæ, or glands of the palate. See each under its proper article, PAROTIDES, &c.

The great use of the *Saliva*, is in masticating and diluting the food, and making the first digestion thereof. The other uses are to moisten the tongue, to render its motion more quick and easy; to lubricate the throat and oesophagus, in order to facilitate deglutition; to prevent thirst; and to assist in the sensation of tastes, by dissolving the salts. See MASTICATION, DEGLUTITION, DIGESTION, &c.

Some imagine it to do the office of a menstruum, by mixing the oily and aqueous parts of the food more intimately, dissolving the saline parts, and procuring a fermentation in the stomach. But Dr. Drake will not allow it fit for that purpose. Were the *Saliva*, says he, acrimonious enough for this, it would be impossible but it must offend the stomach; especially, considering the quantities of it that many swallow, even upon an empty stomach. See MENSTRUUM, FERMENTATION, &c.

M. Gastaldy, in a thesis on the *Saliva*, observes, that it takes its name from the salt it contains; which salt he will have to be partly a volatile acid, and partly alcalious. He adds, that it contains some oleaginous parts, and a little earth. By being compounded of so many different kinds of parts, it becomes a dissolvent proper for all the different kinds of foods whereof we live.—Its natural and laudable state, is to be a little more viscid than common water, and much less so than milk. It is preserved in this state by the application of the spirits, and of the particles of air which insinuate into it.

According to all appearance, the *Saliva* is derived from the blood of the arteries: part of the arterial blood brought to the salival glands, serves to feed them; another part is returned into the veins, and continues the circulation; and a third part, which is the serum, receiving a sub-acid quality from them, is converted into *Saliva*.

Some authors have imagined, that the nervous juice contributed to the composition of the *Saliva*; the rather because larger and more numerous twigs of nerves are communicated to these glands, than to most other parts, which yet have a more exquisite feeling than these. But Dr. Nuck has refuted this opinion by several experiments.

Too great an excretion of *Saliva*, Boerhaave observes, disorders the first digestion; and hence causes thirst, driness, a black bile, consumption, atrophy.—On the contrary, if no *Saliva* be discharged into the mouth, or less than ordinary, it spoils both the manducation of the food, and its taste, swallowing, and digestion; and withal, occasions thirst. See THIRST, &c.

**SALIVAL, or SALIVARY DUCTS**, in anatomy, certain little lymphatic canals lately discovered; whereby the saliva falls into the mouth. See SALIVA and DUCT.

The *Lower Salival Duct* comes from the maxillary glands, situate under the lower jaw, and terminated behind the dentes incisores.—It was first described by our Dr. Wharton, in his treatise of the glands, in 1656.

The *Upper Salival Duct* was discovered by Nicolas Steno, in 1660.—It comes from the parotid glands; whence perforating the buccinator, it terminates near the third upper grinder.

Casp. Bartholine, in 1682, discovered another *Salival Duct*, coming from the glands situate on the side of the tongue; though Rivinus, a physician of Leipzig, had mentioned it before, in a dissertation printed in 1679.

Ant. Nuck, professor at Leyden, discovered a fourth *Salival Duct*, arising from a gland situate in the orbit of the eye, between the musculus abductor, and the upper part of the os jugale.

These ducts are all double, there being one of each kind on either side.—But it is pretended, the two last are only found in some brutes, and not in man.

As the demand of saliva is greatest in mastication, deglutition, talking, &c. the disposition of the *Salival Ducts*, to favour the discharge on those occasions, is very remarkable: thus the ducts of the parotides pass close over the musculus masseteres, and through the buccinatores: the *Salival Ducts* of the maxillary glands pass close under the mylohyoideus, where the sublingual glands are placed; by means whereof, the intumescence of the masseters, in chewing, accelerates the spittle in the parotid *Salival Ducts*: as the mylohyoideus does in the action of deglutition, by drawing the hyoides upwards.—The agitation of the cheeks and lips, is sufficient to promote the discharge from the glands of the lips, &c.

**SALIVATION, SALIVATIO**, in medicine, a promoting of the flux of saliva, by means of medicines; chiefly mercury. See MERCURIALS.

The chief use of *Salivation* is in diseases belonging to the glands, and the membrana adiposa; principally in the cure of the venereal disease. Though it is sometimes also used in epidemic diseases.

The body is prepared for *Salivation* by a copious and continued use of attenuating, diluting, softening decoctions; as

of scabious, pellitory, china, sarsaparilla, lassafra, and fantal. *Salivation* is either *partial* or *universal*. By the first, only, the humours of some part of the body are to be discharged; as in catarrhs, tooth-ach, &c.—By the second, the whole mass of blood is to be purged.

The first is raised either by a slow continued chewing of some tenacious matter, as mastich, wax, myrrh; especially if other sharp things be mixed with them, as pyrethrum, ginger, or pepper: or by drawing in sharp irritating vapours, as those of tobacco, rosemary, thyme, marjoram, &c.

The latter is effected by the action of such medicines as create some slight but constant nausea; as stibium not quite fixed, nor yet quite emetic; a little common vitriol, &c.—But chiefly by such as dissolve all the parts of the mass of blood, turn them into lymph, and thus cause a pyalism: such are crude quicksilver, cinnabar, a solution of quicksilver in aqua-fortis, white and red precipitate, turbit mineral, sweet sublimate of mercury, &c. See APOPHLEGMATIZANT.

**Mercurial SALIVATION**, is now a very usual method of cure; especially in venereal, scrophulous, and hypochondriac cases. In effect, it proves the surest remedy yet discovered for the Gallic lues; though the discovery hereof, as that of most other remedies, is owing to chance. Jac. Carpi, a physician of Bologna, having read in Avicenna, and Meise, two Arab authors, that mercury applied externally, was proper for the lepra, and some kinds of pustules, particularly the scabies or itch; had a mind to try it in a pocky itch: a *Salivation* was hereupon unexpectedly raised, and the patient was cured not only of his itch, but of his pox.—The same method he afterwards used for the pox itself; and meeting with great success therein, others were induced to follow him; and thus did it arrive at its present height. See VENEREAL.

There are two manners of applying mercury to raise a *Salivation*: the one external, or in the way of unction; by mixing it up with some unguent, plaister, or perfume, and then rubbing it on the joints, &c.—The other internal, where it is taken at the mouth.

In each case, the mercury insinuates itself into the mass of blood, and mixing with the venereal poison, the two bodies thus locked together, are drawn, with the serosity, into the salival glands, where they are separated and discharged, as finding the pores of the glands proportioned to their figures, and proper to receive them.—But for the manner wherein the mercury acts to raise the *Salivation*, see further under MERCURIALS.

Dr. Quincy will have the internal to be much the safer and better method: the mineral globules, he thinks, being intimately combined with salts, in the preparations given inwardly, will, by the irritation thereof, be easily and fully thrown off by the secretory organs, till the blood is quite discharged of its load.—Whereas, in mercurial frictions, it is possible, some of the heavy particles may be left lodged in the interstices of the fibres, or cells of the bones. Add to this, that by computing the proportion of mercury in all the doses necessary to promote a spitting, internally; and the weight of the same mineral used when it is done by unction; the quantity used in the latter case, far exceeds that in the former; consequently, the ill effects apprehended from that dangerous medicine, should be more sensible in the one case than the other.

The external application, therefore, is only to be allowed of, where either the case will bear the violence of such a management; or outward ulcers and tumours require a particular cure by liniments. Thus Quincy.

But a learned French Physician, M. Chicoineau, chancellor of the university of Montpellier, has lately done some discredit to the practice of salivating in any manner; and that, in a little treatise lately published, where he endeavours to prove, that the *Salivation* itself contributes nothing to the cure, but is rather prejudicial thereto: that the salutary effects of the mercury are independent of any evacuation at all; and that it acts purely as a specific. It is without reason, therefore, he urges, that venereal patients are put to the torture of a *Salivation*, since the full effect of the medicine may be had without carrying matters to that extremity. The *Salivation* is only an accident to the cure; which is effectually obtained by a mercurial unguent rubbed on the joints in such quantities, and at such intervals, as not to raise any *Salivation*. He supports the whole by the experience of forty or fifty cures wrought in one year, by the new method. The same method, it seems, has been lately, too, tried in England, and with success; as appears from a translation of Chicoineau's piece lately published with notes, by an English physician.

**SALLET**\*, or **SALLAD**, a dish of eatable herbs ordinarily accompanying roast-meat, composed chiefly of crude, fresh herbage, seasoned with salt, oil, and vinegar.

\* Menage derives the word from the Latin, *Salata*, of *Sal* salt; others from *Salcedo*: Du Cange from *Salgama*, which is used in Ausonius, and Columella in the same sense.

Some add mustard, hard eggs, and sugar; others, pepper, and other spices, with orange-peel, saffron, &c.

Some define *Sallet* more generally, a composition of plants and roots, of several kinds, to be eaten either raw or green, blanched or candied, by themselves, or mixed with others; and even, occasionally, boiled, pickled, or otherwise prepared and disguised, to render them more grateful to the palate.—But this definition includes pot-herbs, &c. which the generality of authors deny to be any proper *Salleting*.

The principal *SALLET-herbs*, and those which ordinarily make the basis of our English *Sallets*, are lettuce, sellery, endive, cresses, radish, and rape, &c. Along with which, by way of furniture, or additional, are used purslane, spinach, sorrel, tarragon, burnet, corn-fallet, and chervil.

The different tastes of mankind will not allow any certain mixture of these to be prescribed as most agreeable; but, still, in mixing them, the relish of the several herbs is to be considered: those, for instance, which are most hot and biting; as cresses, mustard, sellery, tarragon, chervil, &c. with those that are more cool and insipid to the taste; as turnips, rape, spinach, lettuce, corn-fallet, purslane, &c. by this means the herbs may be so judiciously mixed, that the too strong taste of one kind may not over-power all the rest; and the insipid kinds be discreetly used to moderate and qualify the heat and pungency of the others, as the season of the year is more hot or cold; so as every *Sallet* may not only be agreeable to the taste, but also physic to the body.

The gardeners call *small herbs*, in *Sallets*, those which should always be cut while in the seed leaf; as cresses, mustard, radish, turnip, spinach, and lettuce; all which are raised from seeds sown in drills or lines, from mid-February to the end of March, under glasses or frames, and thence to the middle of May, upon natural beds, warmly exposed; and during the summer-heats, in more shady places; and afterwards, in September, &c. as in March, &c. and lastly, in the rigour of the winter, in hot beds. If they chance to be frozen in very frosty weather, putting them in spring-water two hours, ere they be used, recovers them.

In gathering small-herbs, the best way is to pull them up by the roots from the hot beds. If the roots be left, and a second crop of *Salleting* sown on the same bed, it will not prosper.—In sowing second crops, it is also to be observed, that seeds of the same kind be not sown in the same place; but the ground is to be eased by varying its burden, putting hot seeds where cold ones grew before, &c. Another rule is, that no plant be placed in the same spot where the same kinds have grown before.

Winter-*Sallets* are greatly improved by blanched sellery, which is a hot herb, of a very rich flavour; raised from seed sown in March, and April, in a well-exposed place, and transplanted, six weeks after its first appearance, into beds, where it remains till the middle of June, and then planted in trenches eight or ten inches wide, and as many deep, first pruning off the tops and roots. As they grow large, they are earthed up within four or five inches of the top, which is repeated several times, till they be fit for use.—Endive blanched is much used in winter *Sallets*, though it have neither taste nor flavour; it is cultivated much after the same manner as sellery.—Of lettuce there are various kinds, the best are the Roman, Dutch brown, Imperial, and Silesia-kinds, all which cabbage well. They are all commonly sown with other crops in March, for summer *Sallets*; and in August, to be transplanted; or September, to stand the winter; either to be cut for winter *Sallets*, or to cabbage early next spring for seeds. See SEEDS.

For the additional, or secondary *SALLET-herbs*: Burnet is a cool perennial herb, whose tender leaves, mixed with other herbs in winter, give the agreeable flavour of a cucumber: It is propagated by seed sown in March. Corn-fallet, raised at the same time, and in the same manner, makes a good winter-*Sallet* furniture; purslane, an insipid, yet cooling herb, is admired by some in summer-*Sallets*: it is raised by seeds sown in March in a warm place.—Sorrel is chiefly used in the spring, when the young leaves are very agreeable. It is raised from seeds sown in March, usually in rows or drills. Spinage is a necessary ingredient in raw *Sallets*, to be cut in the ear-leaf; but it is better for boiled *Sallets* in the winter and spring. It is sown in March, April, and May; and again in August, in a place well exposed to the sun, that the leaves may be large enough for boiling in the winter.—Tarragon, of all others, should never be wanting; it is a cordial herb, though not the most agreeable tasted: yet a few leaves, or three or four of the tender tops, give a *Sallet* a good relish. It is propagated from slips, taken from the root, and planted in March.—Note, in the spring dandelion blanched, which is gathered in almost every ploughed field, makes an excellent *Sallet* mixed with other herbs. Some likewise gather violet flowers, cowslips, and blossoms of burrage, as a part of the *Sallet* furniture; others, fennel, and parsley.

*Dressing of SALLETs*.—The sellery and endive are to have their hollow, green stem, or stalk, stripped of all its outside leaves, and sliced in the blanched part, cutting the root into four parts. The other ingredient herbs being exquisitely culled and cleansed, of all faulty leaves, &c. are washed rather by sprinkling, than sobbing them in spring-water;

laid to drain of all superfluous moisture, then shook and squeezed together gently, in a coarse cloth, to dispose them to receive the seasonings, viz. the salt, vinegar, oil, &c. The oil not to be yellow, or high-coloured, but of a pale olive green, without either taste or smell. See OIL. The vinegar perfectly clear, neither sour nor palled. See VINEGAR. The salt to be the best ordinary bay-salt, clean, bright, and dry. See SALT.

Some indeed recommend the essential salts and spirits of vegetables, or those of the alcalizate and fixed kind, extracted from the calcination of balm, rosemary, wormwood, &c. and affirm, that, without eating the gross *sallet-herbs* themselves, we might have healing, cooling, generous *sallets*, wholly out of the salt-seller.

Note, in the proportion of the salt, pepper, and vinegar, regard is to be had to the season, constitution, &c. the two first being best for cold, the second for hot stomachs and seasons.—For a moderate oxaline, or *sallet-vehicle*, to three parts of oil, put one of vinegar, or lemon, or orange-juice, and in the mixture, steep slices of horse-radish with a little salt; occasionally, add a little Guinea pepper, and mustard, with the yolks of two eggs boiled, squeezed, and bruised into a mash therein. Pour the whole on the herbs, stirring and mingling them till they be thoroughly imbibed.

*SALLY*, in architecture, from the French *Saillie*, is what we more usually call *Projecture*. See PROJECTURE.

*SALLY*, in the military art, the issuing out of the besieged from their town or fort, and falling upon the besiegers to cut them off, nail their cannon, hinder the progress of their approaches, destroy their works, &c.

We say, to make a Sally, to repulse a Sally, &c.

To cut off a Sally, is to get between those who made it and the town.

*SALON*, or *SALOON*, in architecture, a grand, lofty, spacious sort of hall, vaulted at top, and usually comprehending two stories, with two ranges of windows.

The *salon* is a grand room in the middle of a building, or at the head of a gallery, &c. Its faces, or sides, are all to have a symmetry with each other; and as it usually takes up the height of two stories, its ceiling, Daviler observes, should be with a moderate sweep.

The *salon* is a state-room: it is much used in the palaces in Italy; and from thence the mode came to us. Embassadors, and other great visitors, are usually received in the *salon*.

It is sometimes built square, sometimes round or oval, sometimes octagonal, as at Marly, and sometimes in other forms.

*SALT*, *SAL*, in chymistry, a simple, acid substance, which enters the composition of all bodies, and is held one of the five principles, or elements thereof; only to be extracted by fire. See PRINCIPLE.

*Salt*, M. Homberg observes, is an ingredient in all animal, vegetable, and mineral bodies, excepting perhaps some metals, and stones. In vegetables and mineral bodies, that have undergone a fermentation, the *salt* rises first in the alembic, then the phlegm: if the mixt have undergone a fermentation, the *salt* rises after the phlegm. See ANALYSIS.

*Salts* are distinguished, with regard to the manner of extracting them, &c. into *volatile*, *fixed*, and *essential*.

*Volatile SALTS*, are those light, subtle ones, which rise easily upon distillation, or are even exhaled by the nose, and rendered sensible to the smell. See VOLATILE.

*Fixed SALTS*, are such as, being more gross and material, resist and sustain the fire; and are not raised by it, but remain, after calcination, or distillation, in the earthy part, at the bottom.

—For the manner of extracting them, &c. See FIXT salt.

*Essential SALTS*, are those drawn from vegetables, without the use of fire; as by crystallization, and other easy, natural means. See ESSENTIAL salts.

*Volatile salts* become distinguishable to the nose, tongue, and brain, by their tenuity and briskness: *fixed salts* by their bitterness, and heat in the mouth. To these may be added an intermediate kind of *salt*, under the title of

*Mixed SALTS*, which are those resulting from a mixture of a *volatile* with a *fixed salt*.

*SALTS* again are of different kinds, according to the different matters wherewith they are found mixed: some are mixed bodies themselves, and their mixture separable by fire, and lixivation.—Such are all essential *salts* of plants, and all fossil *salts*, &c. but these are no proper chymical principles.

There are others which we are sensible are mixed, and whose mixture we know pretty nearly, though we are not yet able to decompose them: it is these make the chymical principle *salt*; for our analyses will not render them more simple, which is the character of a principle.—And in this sense, *salt* is defined, a matter dissoluble by water, and unchangeable by fire; to which some add, of a pungent taste. There are three kinds, or classes, of *salts*, which come under this definition; two whereof are *volatile*, and the third *fixed*.—The *volatile* ones, are acid *salts*, and urinous *salts*: the *fixed*, are those drawn by a lixivium after calcination, and called *Lixivious salts*. Nature produces none of these *salts* simple and unmixed; but we easily extract them by art, from the mixt wherein she has placed them.

The principal natural *salts* may be reduced to *Salt-petre*, *Sea-*

*Sea-Salt*, and *Vitriol*. Each whereof has its different kinds; of the various combination whereof, with different oily matters, all the natural *Salts*, we know of, are compounded. These *Salts* are found, by chymical analyses, to consist of aqueous, earthy, oily, sulphurous, and acid particles.—The acid matter is the pure *Salt*, or *Saline* principle, and is the base of all the rest. This M. Homberg observes, is pretty uniform, and nearly the same in all *Salts*, before the particular admixture of the sulphur, &c. See ACID.

*Salt-petre*, *Sea-Salt*, and the rest, therefore are not principles; but the acid *Salts* distilled from them are: and the water wherein these *Salts* swim, and the earth, or fixed *Salt* remaining in the retort after distillation, are other chymical principles. See PHLEGM, and EARTH.

The principle *Salt* is held a mean between the active and passive principles. The pure acid, though accompanied with its sulphurous determining matter, never becomes sensible but when lodged either in some earthy matter, or artificially in some simple aqueous matter. In the first case, it appears, under the form of a crystallized *Salt*, as *Salt-petre*, &c. In the second case, it appears in the form of an acid spirit, which, according to the determination of the sulphur that accompanies it, is either spirit of nitre, or spirit of common *Salt*, or spirit of vitriol.—And what we have here observed of the three simple, or fossile *Salts*, may be applied to all other more compound *Salts* of plants, animals, &c. with this difference, that when in form of a concrete *Salt*, these last always have a greater quantity of earthy matter, and when in form of an acid spirit, a greater quantity of aqueous matter, than the simple ones. Whence it follows, that the acid spirits of compound *Salts* are always weaker, lighter, and less penetrating than those of fossile *Salts*; and after distillation leave a greater quantity of earthy matter behind them. See SPIRIT.

We do not know precisely what figures the three *Salt*-principles, acid, urinous, and lixivial, must have: But to judge by their effects, one would conclude, the acids to be pointed, only the points sheathed in some sulphurous matter; the urinous *Salts* to be sponges, containing some of the acid, and some of the foetid oil of the animal or plant: and the lixivious *Salts* to be sponges only containing the remainder of the acid, which the calcining fire could not expel. See LIXIVIOUS and URINOUS.

Acid spirits may be conceived as pure, and without any mixture; in which case all acids will be found of the same nature: but if we consider them as distillation gives them, we shall always find them accompanied with some sulphurous matter, which we cannot separate from them, and which gives the degree of activity to the acid spirits. It is this sulphurous matter which characterizes them, and makes all the difference we find between acid spirits. M. Homberg ranges all the kinds of acid spirits under three different classes, according to the different sulphurous matters which accompany them.—The first class is of those which contain animal or vegetable sulphur; under which come all acids, distilled from plants, fruits, woods, &c. as also spirit of nitre.

It is easy to conceive, that the acids of plants may have retained a part of the oil of the plant, which is their sulphur; since in reducing these acids into *Salts*, we always find a little oil therein; which can be nothing else but that of the plants themselves. And for *Salt-petre*, as this is always drawn from earths moistened with the excrements of animals, or from old walls, plaster, &c. full of the sulphurous matters of the animals that lived within them, the foot, &c. it is thence, doubtless, *Salt-petre* borrows its sulphur. See SALT-PETRE.

The second class is of those which contain a bituminous sulphur: under which come the acids of vitriol, common sulphur, and alum. For those are all usually drawn from the same mineral stone, wherein the bituminous matter, which makes one of the principal parts of common sulphur, predominates. See SULPHUR.

The third class is of those which contain a more fixed mineral, sulphurous matter; approaching nearer the properties of a metaline sulphur: under which class come the acids drawn from several kinds of *Sea-Salts*, *Rock-Salts*, &c. For the *Rock-Salt*, or *Sal-Genmæ*, is always found in places near metallic mines; and *Sea-Salt*, in all appearance, is nothing but *Rock-Salt*, the quarries whereof have been penetrated by the sea-water, which has extracted all the saltiness therefrom. See *Sea-SALT*.

The sulphurous matters of the first class of acids being very light, and taking up a deal of space, must augment the bulk of the points of the acids to which they are joined. And hence these acids become disabled from penetrating very compact bodies; but their surface being increased from the same cause, the flame will have the greater hold to impel them: And hence the acids of this class act more swiftly than any of the rest.

The bituminous sulphur is the least active of all the sulphurs we know, as being loaden with a great quantity of earthy matter, which serves it as a matrix. Hence it unites more

difficultly with saline matters than any of the other sulphurs; so that a less quantity of it may be conceived to adhere to the acids of this, than of either of the other classes.—Accordingly we find, that the acids of this class, used alone, scarce dissolve any metals; but mixed with the others, partake of their sulphur, and thereby become enabled to dissolve all metals.

The metalick-sulphur is of all others the most fixed; that is, its parts are the smallest, and most compact. See FIXITY. Hence the points of this class of acids will not be much swelled by it, and of consequence will be able to insinuate themselves into the most compact bodies, or those whose pores are the smallest. And for the same reason they will not give much hold to the flame that agitates them, and will therefore act with less violence than those of the first class of *Salts*.

Acids joined to fixed *Salts*, compose mixed *Salts*: thus spirit of nitre, with *Salt* of tartar, make *Salt-petre*; and spirit of *Salt*, with salt of tartar, make a true common *Salt*; and spirit of vitriol, with *Salt* of tartar, a true vitriol.

However, the two ingredient *Salts* still remain, the one fixed, the other volatile: acids joined with urinous *Salts*, compose another kind of *Salts*, called *Sales Ammoniaci*, which are always volatile. See ARMONIAC.

Lixivial and urinous *Salts* are called *Alcalies*; the first a fixed alkali, the second a volatile alkali. See ALKALY.

These alkalies are usually esteemed antagonists to the acid *Salts*, because their mixtures always occasion a sudden ebullition. But it is more probable this ebullition is not the effect of a combat, but rather a proper junction and union of two matters which had been naturally united together, and only separated by the fire, and now re-place themselves in the same parts whence the flame had tore them off. Hence, the one are compared to sheaths, and the other to points, fit to be sheathed therein. Now, the precipitation where-with the points of the acids enter the pores of the alkalies, tears asunder their contexture, and reduces them into minute parts invisible to the eye; and thus is the business of dissolution accounted for. See DISSOLUTION.

Thus far will the mere doctrine of alkali and acid go towards accounting for some of the great phenomena of nature. But the theory is made vastly more compleat and adequate, by Sir Isaac Newton's principle of attraction, for which we refer the reader to the articles ACID, MENSTRUUM, &c. where the operation of *Salts*, or acid spirits, are perhaps more satisfactorily accounted for.

The principal chymical *Salts* of use in medicine are; *Salt* of urine, of lavender, of viper, of human blood, of wormwood, of guaiac, of quinquina, of tobacco, of rhubarb, of rosemary, of sage, of juniper, of vitriol, of amber, of saturn, &c. most of which, with many others, are explained under the articles of the respective drugs, &c. whence they are drawn: to which the reader may have recourse.

SALT, in its popular sense, denotes a kind of saline crystallization; or a sharp, purgent, detergent and astringent substance, used to season flesh, fish, butter, hides, and other things that are to be kept; as also to give a relish to meats, &c.

This we usually call *Common Salt*, in contra-distinction to the chymical *Salt*.

M. Guglielmini, in an express dissertation *de Salibus*, lays it down as a fundamental, that the first principles of common *Salt*, *Salt-petre*, vitriol, &c. had their figures unalterably fixed at their first creation, and are indivisible as to any created force. That of common *Salt* he maintains to be a little cube; that of *Salt* of vitriol, a parallelepiped; that of *Salt-petre* a prism whose base is an equilateral triangle, &c.

Common *Salt* is of three kinds, viz. *Sea-Salt*, *Fossile* or *Rock-Salt*, and *Salt* drawn from briny springs, and wells. For *Sea-Salt*, the greatest and best part is made in France; little in England.—*Fossile*, or *Rock-Salts*, are chiefly found in Poland, Hungary, and Catalonia.—For *Salt* springs, they are considerable in Cheshire, Worcestershire, Hampshire, Northumberland, Franche Comte, Lorrain, Tirol, and some other places.

The great property of SALT is, that it is incapable of corruption, and that it even preserves meats, &c. seasoned therewith, or steeped in solutions thereof. It endures the fire, and even comes purer out of it, as being thereby freed of its humidity. In very hot fires it fuses, and is converted into corrosive waters.

It gives fertility to lands, and promotes the fusion of all metals; yet, we read of princes, who, as a mark of their indignation, sowed grounds with *Salt* to render them barren. Plutarch observes, that the Egyptians believed *Salt* to be the spittle, or foam of the giant Typhon, the great enemy of their gods: and hence, adds he, they held it in the greatest horror.

*Salt* is found to have two opposite qualities: by its subtle, penetrating acidity, it breaks and dissolves the hardest and most compact minerals and metals; and by a contrary property, it coagulates liquid bodies, as milk, blood, &c. Some of its spirits, mixed in a certain proportion with water,

produce an excessive heat; yet, when mixed in a less quantity augment its coldness: as *Salt-petre* in snow, &c. Though all *Salts* dissolve by moisture, yet water only dissolves, &c. a certain quantity. However, when impregnated with any *Salt*, as much as it can bear, it will still dissolve a quantity of another *Salt*, whose particles are of different figures, proper to insinuate into the remaining vacuities of the water: thus, after *Common Salt* will no longer dissolve in it, alum will, and after alum, *Salt-petre*, then *Sal-Armoniac*, &c.

The use of *Salt* is so universal, and the traffic thereof so very important in the places where nature has produced the different *Salts*, and so necessary for those which have not that advantage; that a detail of the preparation, commerce, &c. of the several kinds, cannot fail of being acceptable.

*Sea-SALT* is made of sea-water, thickened by frequent evaporations, and at length crystallized.—Of *Sea-Salt* there are two kinds: that which requires the sun's rays to give it its consistence, called, from its own brown colour, *Bay-Salt*; and that which receives its consistence from the heat of a fire, called *White-Salt*.

They use either this or that manner of preparation, according to the disposition of the coasts, where it is made: if the coasts rise in downs or hills of sand, the *Salt* is made by fire, in copper or leaden vessels.—If the coasts be flat, and low; especially, if the bottom be a little clayey, the *Salt* is crystallized wholly by the action of the sun.

We have nothing very considerable of either kind in England: some indeed we have of the latter, at Shields in Northumberland; and of the former in the isle of May. France is the principal place for these *Salts*; more being made there than in all Europe, perhaps in all the world beside; and it is hence that we are chiefly furnished therewith. We shall therefore deliver the method of making it, as it is practised there.

The chief coasts for *Bay-Salt* are those of Bretagne, Saintonge, and the Pays d'Aunis. The chief *Salt*-works, in the two latter places, are Brouage, Maran, and the isle of Rhe. Those in Bretagne are in the bay of Borneuf, Guerand, and Croisil: for *White-Salt*, it is chiefly made on the coasts of Normandy. In the bay of Borneuf alone, are computed above twenty thousand considerable *Salt*-works.

*Manner of making Bay-SALT*.—Low marshy-grounds, disposed by nature for the reception of the sea-waters when the tide swells, and provided with banks and sluices to retain the same, are called a *Salt-marsh*.

These *Salt*-marshes, the bottoms whereof they ram with a deal of care, are divided into several square pits or basons, some greater, others less, separated by little dikes 12 or 14 inches broad: and into these basons, when the season is at hand, they let in the sea-water.

The *Salt* season is from the middle of May to the end of August; in which time the days being long, and the sun's rays strongest, the *Salt* is raised and crystallized better than in any other season. Ere they let in the water, they take care the basons be well cleared of what had been left in them during the winter to keep them in order. The water is admitted to the height of about six inches, after having first let it rest, and warm two or three days in huge reservoirs, without the works, that it may come in luke-warm. The water admitted, the sluices are shut, and the rest of the work left to the wind and the sun.

The surface of the water being struck, and agitated by the direct rays of the luminary, thickens, at first, imperceptibly, and becomes, at length, covered over with a slight crust, which hardening by the continuance of the heat, is wholly converted into *Salt*. The water, in this condition, is so hot, that the hand cannot be put into it without scalding it. When the *Salt* has received its full coction, they break it with a pole, upon which it sinks to the bottom, whence being dragged out again, they leave it sometime in little heaps, about the edge of the pit, to compleat the drying; and at length in greater heaps, containing several thousand muids, which they cover over with straw, or rushes, to secure them from the rain.

Eight, ten, or at most fifteen days, having thus perfected the crystallization of the *Salt*, they open the sluices, when the tide is rising, for a fresh flock of water; and thus they continue alternately, taking in water, and gathering the *Salt*, till the season be over. Rainy weather is very pernicious to the work; for rain-water, mixing in any quantity with the sea-water, renders it useless, so that new water must be called in.

The *Salt* is brown when taken out of the pits, and is usually thus sold, without farther preparation: indeed in some places they make it into *White-Salt* by refining. They refine it by boiling it in large flat caldrons, which not only takes away its acrimony, but is found to increase the quantity.

*Method of making White Sea-SALT*.—The *White-Salt* of Normandy is not made by refining the *Bay-Salt*, but has this colour naturally when taken out of the pits.—To make it, they gather a muddy sand on the flats of the shoar, which the rising tide has covered and impregnated with its waters for seven or eight days. The sand being removed into pits

• VOL. II. N°. CXXXVI.

for the purpose, discharges itself by degrees of all its water, which filtrates through some straw wherewith the bottom of the pit is filled, and trickles into vessels set on purpose to receive it. Of this water it is that they make their *Salt*.

Their furnaces are of earth, and their boilers of lead: each furnace boils four leads. When the water wherewith they have filled the leads begins to boil, they take off the skim, which arises in abundance, and in proportion as it diminishes, throw in fresh water, which they continue to skim, as before. When it thickens, they keep it continually stirring, with a crooked stick, or ladle; and when the grain is formed, take it off the fire to purify it.

The purifying is performed by letting it stand in large osier baskets; where it drains itself of certain humidities that remained. When dry, it is laid in heaps, and thence carried into the magazines.

The commerce of *White-Salt* brings an immense profit to France, though more to the king than to the makers and sellers: the duty is one fourth part of the price the *Salt* is sold at. The English and Dutch, and (when they are at war with France) the Swedes and Danes, take off most of the *Salts* of the Comte Nantois; paying for it, *communibus annis*, from 20 to 35 livres the load. That of Guerande is preferred, by the English and Irish, to all the rest, as the best and whitest. Yet that of Borneuf, though browner and heavier, is most used in France, as also throughout the Baltic; particularly in Poland, where, besides the ordinary uses, it serves in tilling the ground; being found to warm it, and to prevent little vermin from gnawing the grain.

The English and Dutch have oft strove hard, in times of war, to do without the French *Salts*; and to that end, have endeavoured to take *Salts* from the Spanish and Portuguese; but there is a disagreeable sharpness and serosity natural to them, which renders them very unfit for the salting of flesh, fish, &c.—To remove this, they boil them with sea-water, and a little French *Salt*, which they procure by means of neutral nations; which not only softens them, but increases their quantity by one third. But it should seem their refining does not succeed to their wish, by the eagerness wherewith they return to the *Salts* of Bretagne, &c. as soon as any treaty has opened the commerce.

*Fossile, or Rock-SALT*, is called also *SAL-Gemma*, from a certain brightness it has, which gives it some resemblance to gems. Indeed, it should have something of the gem in its nature; if there be nothing exaggerated in the account Dr. Ed. Brown, (who went down into the *Salt*-mines in Hungary) gives us thereof in his travels.

This *Salt* was intirely unknown to the ancients: Pliny, however, gives some curious things about *Salts* in Nat. Hist. lib. 30. c. 7. which we should have transcribed hither, could we believe them as true as they are pretty. We shall here content ourselves with what well-warranted relations we could get of the *Salt*-mines of Wilisca in Poland; those in the Upper Hungary, and those in the mountains of Catalonia, which make a very considerable article of commerce in those three states; *Salt* being transported hence to the several neighbouring nations, who cannot be conveniently supplied with *Sea-Salt*.

*SALT-MINES of Poland, &c.*—The Polish-mines, in the village Wilisca, five leagues from Cracow, were first discovered in 1251. Their depth and capacity are surprizing. Within them is found a kind of subterraneous republick, which has its polity, laws, families, &c. and even publick roads, and carriages; horses, &c. being kept here to draw the *Salt* to the mouth of the quarry, where it is taken up by engines. These horses, when once they are down, never see the light again; but the men take frequent occasions of breathing the village air. When a traveller is arrived at the bottom of this strange abyss, where so many people are interred alive, and where so many are even born and have never stirred out, he is surprized with a long series of lofty vaults, sustained by huge pilasters cut with the chissel, and which, being themselves *Rock-Salt*, appear, by the light of flambeaux which are incessantly burning, as so many crystals, or precious stones of various colours, casting a lustre, which the eye has much ado to bear.

The rocks of *Salt* are hewn in form of huge cylinders; the workmen using hammers, pick-axes, and chissels, much as in our stone quarries, to separate the several banks of stone. As soon as the massive pieces are got out of the quarry, they break them into fragments fit to be thrown into the mill, where they are ground, and reduced into a coarse farina or flour, which serves all the uses of *Sea-Salt*.

In the *Salt*-mines of Wilisca, there are two kinds of *Sal-Gemma*; the one harder and more transparent, and the crystallization whereof appears more perfect than that of the other: This is the real *Sal-Gemma* of the Druggists and Dyers. It cuts like crystal, and is frequently used for toys, chaplets, little vases, &c. the other is less compact, and only fit for kitchen uses. One of the chief wonders of the place is, that through these mountains of *Salt*, and along the middle of the mine, there runs a rivulet of fresh water sufficient to supply the inhabitants.

The *SALT-Mines in the Upper Hungary* are every whit as extra-

extraordinary. They are found in the mountains, two miles from Eperies, a city in the county of Sarax, on the river Tarhiz. The depth is 180 fathoms. The mineral runs in huge veins, so that pieces are sometimes dug not less than an hundred thousand weight; which however, are afterwards reduced into square pieces two foot long, and a foot thick, for the convenience of drawing them out of the mine. When out, they are broke farther, and put to the mill to be ground. The colour of the stone is a little brownish, and yet, when ground, becomes as white as if it had been refined. Some of the stones are found as hard and transparent as crystal; some white, yellow, blue, &c. fit for various works, whereon they engrave as on precious stones. The mine is cold and moist, whence there arises some difficulty in reducing the *Salt* into powder. Of the water drawn out of it and boiled, is made a blackish *Salt*, which fattens cattle.

The *SALT-Mines of Catalonia* are found in the mountains of the dutchy of Cardonna, and belong to the grandees of that name. It is the opinion of the country people, that the *Salt* grows again, and is re-produced, after several years, in the same places whence it had been dug. But the naturalists will scarce allow of such a re-production. There is no doubt, however, but it vegetates, or grows sometimes: M. Tournefort, and the specimens he had of it in his cabinet, make it plain.

The *Salt* is of four kinds, white, bay, red, and brilliant: The first, is almost like our *Sea-Salt*, only that it is not granulated. The second, of an iron and slate colour, has most of the qualities of the white. The third, of a conserve rose colour, only differing from the rest by the mixture of some bole, or earth, which gives it this colour. The fourth is a brilliant *Salt*, yet transparent as crystal, which is the proper *Sal-Gemma* of the druggists.—Of this kind there is some blue, others green, orange, red, &c. but they all become white by grinding.

These four kinds of *Salts* are found over each other in distinct strata or beds: the commerce hereof is very considerable: The English, &c. when trade is prohibited with France, furnish themselves hence.

*Sal-Gemma* is to be chosen in large, bright, transparent pieces, easy to break, and dividing into little square grains. It grows red-hot in the fire, like iron, but dissolves easily in air: yet the druggists wash it, to give it the greater lustre, but they take care to wipe it dry again speedily.

*SALT drawn from briny springs*.—Our method in England is thus: near the spring, or place of the brine, is built a saltern, or boiling-house, with a convenience for the conveyance of the brine within it. The saltern is usually large enough to contain several huge flat pans, or boilers, each furnished with its grate and furnace.

At Shields, &c. on the eastern coast, where brine springs are wanting, they use sea-water in its place; which at spring-tides is let into their ponds called *sumps*, and from thence pumped into the pans.

The brine being in the pan, the fire is kindled; and after two hours time, the liquor begins to be ready to granulate: which is known by a thin skin rising at the top; this they skim off into brine tubs, that the brine that goes with it may not be lost: and whereas all brines contain, or yield sand, which is supposed to petrify in boiling; for that if the liquor have been strained before-hand through brown paper, yet upon boiling it, sand will arise; and the pan boiling violently in the middle, the sand is cast towards the corners, where it falls to the bottom of the pan, before the *Salt* precipitates; therefore, they rake it to one corner of the pan, with a broad rake, and then take it out with ladles, and put it into wooden vessels, open at one end, placed on stands.

The sand being removed, that the *Salt* floating in the liquor may precipitate, they shut up the vent-holes, and door, and let the fire go out; and in twelve hours time the *Salt* falls to the bottom, and grows hard; a liquor called the *bittern*, remaining at top, which being again boiled away, yields more *Salt*.—To make the *Salt* precipitate more readily, after the liquor is scummed, &c. they frequently use some beef-suet, and wine-lees, of each a like weight, melting and mixing them together; and putting an ounce of this mixture on the end of a slice, turn it round in the liquor till it be spent: then after two hours, at most, open the vent-holes and door, quicken the fire, and lade away the liquor in a good measure, and so is the *Salt* found lying at the bottom, fit to be removed.

It is now raked up to one side, taken out and put into cribs, or vessels, like hay-racks, with loose ribs on each side, so close to one another, that an half crown will scarce go between: here, after eight hours draining, it is found an hard granulated *Salt*, and may be taken away; but yet continues dripping three weeks, and afterwards, if not often moved, will become rocky: the liquor in the pan, called *bittern*, is to be all taken out, except a little to keep the pan from burning; drained from the *Salt*, and cast away, or reserved for *Salt-petre* makers; and the pan immediately filled with fresh brine, for another boiling.

A pan of brine, of moderate strength, in eight hours time

will be completely made into *Salt*, with the expence of about a bushel and half of coals, which will make a pan of *Salt* from two bushels and half to four bushels, or more, according as the liquor is in strength.

This *Salt* they sometimes mould into the form of sugar-loaves, in which state it will keep dry without fire, and that for a long time. At Nantwich, they bake the loaves twice or thrice, in an oven, and keep them in a stove, or the chimney-corner.

*SALT from brine raised by the sun*.—In some parts of England, as at Limington, Port-sea, &c. they use water raised by the sun, and then boiled, which they find preferable to the natural brines of springs; those being always found either too weak, or too strong.

To this end, they have several ponds, or cisterns, called *sun-ponds*, built with mud, and well-exposed to the sun, with little channels, to convey the brine from them all to a large shallow reservoir, called the *common-sun-pan*, not exceeding seven or eight inches in height. Here the liquor is left to mellow, from twelve to twenty-four hours, or till the liquor will bear a hen's egg new laid; and when it has attained a sufficient strength, it is from thence derived by channels into the cisterns, where the rain and sun breed red worms which cleanse and purify the liquor, which ripens by age, and is rendered fitter for boiling, which is performed after the same manner as is already described.

*SALTIER*, *SALTEER*, or *SALTIRE*, in heraldry, an ordinary in form of a St. Andrew's cross; anciently called the *Cross of Burgundy*. See *CROSS*.

The *Saltier* may be said to be composed of a bend dexter and sinister, crossing each other in the centre of the escutcheon. See *Tab. Herald. fig. 35*. See also the article *BEND*.

Its ordinary breadth, when alone, is one third of the escutcheon. It is sometimes bore alaisé, and sometimes in number, placed in different parts of the field: Sometimes charged, countercharged with the field, accompanied, raguled, engrailed, indented, quarterly-quartered, &c.

The *Saltier* was anciently a piece of the knight's harness; being fastened to the saddle, and serving him for a stirrup to mount upon; and it was hence it had its name *Saltier*, by the French *Sautoir*, from *Sauter*, to leap.—It was made of silk cord, or some other kind of cord, covered with some rich stuff.

Others will have it, that the original *Saltier* was a kind of palisade, serving to fence parks, woods, &c. where wild beasts were inclosed. Though Spelman says, it was an instrument for the taking them, thus called, *Quod fit in usu in Salu*. Lastly, others assure us, that *Saltier* was anciently the figure of an engine, which being full of pins, was used in the scaling of the walls of a besieged place: whence its origin from *Sauter*, as it helped the soldiers to leap over the wall.

*SALTNESS*, *SALSED*, the quality of something that is impregnated with salt; or that yields a saline taste. See *SALT* and *TASTE*.

The *Saltiness* of the sea, lakes, &c. is a thing that has long perplexed the philosophers to account for. Some take it to be the effect of the dry, adust, and even saline exhalations, which the sun raises from the earth, and the winds, and rains discharge into the sea: and hence, say they, it is, that the sea is found more brackish near the surface, than towards the bottom.—Others contend, that the sun being continually extracting the purest and subtlest parts from the water; the coarser parts remaining, being exalted and concocted by this heat, acquire by little and little, their degree of *Saltiness*.—Others, as father Bouhours, will have it, that the Creator gave the waters of the ocean their *Saltiness* at the beginning, not only to prevent their corruption, but also to enable them to bear greater burdens.—Bernier seems to be nearer the matter, when he ascribes the *Saltiness* of the ocean to the fessile or mineral salts brought into it by the rivers, and dissolved in the water.

The Count de Marfigli observes, that in Provence, the bottom of the sea is wholly stony, and nothing but a continuation of the mountains of the Cevennes; being even found to consist of several strata; among which, are salt, and pit-coal: and hence he derives the *Saltiness* and bitterness of the sea-water.

Dr. Halley, in an express discourse of the *Saltiness* of the ocean, in the Philosophical Transactions, observes, that all the lakes in the world are *saline*, some more, some less, than the ocean; which, in this case, may be esteemed a great lake itself; and that all the vapours exhaled by the sun from lakes, are perfectly fresh; so that all the saline particles brought in by the rivers remain behind, while the fresh evaporate. Hence it is evident, their *Saltiness* must be continually augmented.

Now if this be the true reason of the *Saltiness* of lakes, it is probable the *Saltiness* of the ocean itself arises from the same cause: and hence we are furnished with a method of estimating the age of the world, by observing the increase of *Saltiness* in the waters of lakes; and computing in how long time the ocean might, at that rate, arrive at its present *Saltiness*. See *LAKE*, &c.

**SALT-PETRE**, **SALPETRA**, *nitre*; a bitter, sulphurous or inflammable kind of salt; of great use in chymical preparations, the composition of gun-powder, dying, the glass-manufacture, making aqua-fortis, &c.

All the *Salt-petre* we now have, M. Homberg observes, is drawn either from earths moistened, and manured with the excrements of animals; or from old walls, and the plaister of ruined buildings, which have been filled with sulphurous matters as well from the animals which inhabited them, as the foot penetrating them, and the air incompassing them. See **SALT**.

However, we usually make a division of *Salt-petre* into *natural* and *factitious*.

Of *native SALT-PETRE* there are two kinds: the first formed by a natural crystallization of saline sulphurous juices distilling in caverns, or along old walls.—This is what they call *Salt-petre of the rocks*; the same with the *aphronitre* of the ancients. See **APHRONITRE**.

The second is furnished by the water of a dead lake in the territory of Terrana in Egypt, called the *Nitrian Waters*, exalted and concocted by the heat of the sun, much after the manner of our bay-salt.—This is the *natrum* or *anatron* of the ancients, which our druggists call *natron*; now little used but in the bleaching of linens. See **NATRON** and **ANATRON**.

*Artificial, or factitious SALT-PETRE*, is also of two kinds: the first, called, by some, *Mineral Salt-petre*, is procured in several places in the kingdom of Pegu, and about Agra, in villages anciently populous, but now desert: also, in some places along the banks of the Wolga, that famous river, which after watering a good part of Muscovy, empties itself into the Caspian sea.

The *Salt-petre* is here drawn from three different kinds of mineral earths, black, yellow, and white. The best is that procured from the black; as being freest from common-salt, and needing no purifying after it comes to us, to fit it for making of gun-powder; as the rest do. See **GUN-POWDER**. The method of working it is thus: two flat pits are dug; one of which they fill up with the mineral earth, turning water upon it for some time; and then tread it with their feet into the consistence of pap, letting it stand two days for the water to imbibe, and extract all the salt therein. They then pass the water into another pit, where standing some time, it shoots and crystallizes into *Salt-petre*. This they boil once, or twice, as they would have it more or less white and pure, scumming it continually, and filling it out into pots, holding 25 or 30 pounds each; and exposing these to the air in clear nights; by which means, if there be any impurity, it sinks to the bottom: they then break the pots, and dry the salt in the sun.

The second kind of artificial or factitious *Salt-petre*, is that prepared from nitrous matters collected in old buildings, dove-houses, the middle of ancient ruins, &c. by means of lixiviums, or lyes made of wood-ashes, and sometimes of those of herbs.

Of this there are great quantities made in France, particularly in the arsenal at Paris, where there is a corporation of *Salt-petre makers* appointed for the purpose.—The *Salt-petre* gained thus, they refine, by boiling it three or four times, and passing it successively through several lyes.

Some naturalists pretend, that the earths, which have already served for *Salt-petre*, may be re-animated, and made fit to serve again, by keeping them covered for twelve or fourteen years, and watering them with the scum, &c. of the *Salt-petre*, and even with brine.

Good common *Salt-petre* should be well cleansed, white, dry, and as free from common salt as possible: the best refined *Salt-petre*, is that whose crystals are the longest, largest, and finest.

Philosophers generally allow the air to be impregnated with a volatile nitre, or *Salt-petre*, which is thence communicated to plaister, mortar, &c. It is probable it may derive it from foot and smook, which are actually found to abound with volatile salt of a nitrous nature. Dew and rain are supposed to fertilize the ground principally by their bringing down this nitre. See **AIR**.

*Salt-petre* has a property of rarifying, or expanding itself to a prodigious degree. It is hence gun-powder derives its force, whereof *Salt-petre* is the principal ingredient. It is computed, that when inflamed, it takes up above ten thousand times the space it possessed before. See **GUN-POWDER**.

There are abundance of chymical preparations made with *Salt-petre*, as spirit of nitre, aqua-regalis, aqua-fortis, crystal-mineral, sal-polychrest, butter of nitre, &c. each of which see under its proper article, **AQUA-FORTIS**, &c.

**SALTS**, or **SAULTS**, in the manage, denote the leaps, or high airs and vaults of a horse: from the French *Saut*, of the Latin *Saltus*, a leap, dance, &c.

A *step and a Salt* is a high air, wherein the horse rising, makes a curvet between two *Salts*, or caprioles; so as to mount before, and fling back with his hind-feet.

Two *steps and a Salt* is a motion composed of two currets, ending with a capriole.

**SALTUARIUS**, in antiquity, an officer, or servant among

the Romans, who had the care and custody of a country-house, with lands and woods, and who was to look to the fruit, the fences, &c. See **FOREST**, &c.

In Nehemiah, chap. ii. 8. mention is made of an officer of this kind; *custos saltus regis*, which the English translators interpret, keeper of the king's forest; but he was more; having not only the keeping of a forest; but of a house with a forest; *Saltus* being here used as *hortus* for a house of pleasure; because gardens are the principal part.

In the laws of the Lombards, *Saltuarius* is an officer who has the guard of the frontiers.

**SALTUM**. *Ordination per SALTUM*. See **ORDINATION**.

**SALTUS**, in law books, a high, thick wood. See **WOOD**, and **BOSCAGE**.

**SALVAGE Money**, is a recompence allowed both by the statute and civil law, to such persons as have assisted in saving merchandizes, ships, &c. perishing in wrecks, or by pirates, or enemies.

This usually was a tenth part of the value of the things saved. See **WRECK**.

**SALVATELLA**, in anatomy, a famous branch of the axillary vein, passing over the back of the hand, between the ring finger and the little finger. See **AXILLARY**, and **VEIN**.

Several physicians, in imitation of the Arabs, recommend bleeding in the *Salvatella*, as proper in tertian and quartan agues, and most hypochondriac diseases.

**SALVE Regina**, among the Romanists, the name of a Latin prayer, or sequence addressed to the virgin, and sung after complines; as also upon the point of executing a criminal. Durandus says, it was composed by Peter bishop of Compostella.—The custom of singing the *Salve Regina*, at the close of the office, was begun by order of St. Dominic; and first, in the congregation of Dominicans at Bologna, about 1237. Gregory IX. first appointed it to be general. St. Bernard added the conclusion, *O dulcis! O pia*, &c.

**SALVER**, a flat dish, commonly of silver or other precious metal, used to set glasses on to serve wines, and other liquors.

The French call it *Sous-coupe*, under-cup.—The Italians use to present a *Salver*, with several kinds of wines, with this compliment, *Si non è buono, fatte lo*: If it be not good, make it so.

**SALUTATION**, the act or ceremony of saluting, greeting, or paying respect, or reverence to any one.

There is a great variety in the forms of *Salutation*: we salute God by adorations, prayers, &c. kings, by genuflexion, &c. In England, we salute one another by uncovering the head, inclining the body, &c. The orientals salute by uncovering their feet, laying their hands on the breast, &c. The pope makes no reverence to any mortal but the emperor of Germany, to whom he stoops a very little, when he admits him to kiss his mouth.

In the army, the officers salute by certain orderly, studied motions of the half-pike, &c.

It was believed by the ancients, that the statue of Memnon, in a temple of Egypt, saluted the sun every morning at his rising: the cheat consisted in this, that the statue being hollow, when the warmth of the morning began to rarify the included air, it was driven out through a narrow duct in the mouth: thus making a gentle murmur, which the priests interpreted a *Salutation*.

At sea, they salute by a discharge of cannon, which is greater or less, with ball or without, according to the degree of respect they would shew.

Ships always salute with an odd number of guns; galleys with an even one.—A vessel under the wind of another, is always obliged to salute first.

To salute with musquets, is to fire one, two or three volleys; which is a method of *Salutation* that sometimes precedes that of the cannon; and is chiefly used on occasion of feasts.

After the cannon, they sometimes also salute or hale with the voice, that is, a joint shout of all the ship's company three times; which *Salutation* also occasionally obtains where they carry no guns, or do not care to discharge any.

*Saluting with the flag*, is performed two ways; either by holding it close to the staff, so as it cannot flutter; or by striking it so as it cannot be seen at all, which is the most respectful *Salutation*.

*Saluting with the Sails*, is performed by hovering the top-sails half way of the masts.—Only those vessels which carry no guns, salute with the sails.

When there are several ships of war together, the commander alone salutes.

Father Fournier has an express treatise of *sea-salutes* and signals. See **SIGNAL**.

**Angelical SALUTATION**, is an address which the Romanists make to the virgin; containing the formula wherein the angel saluted her, when he acquainted her with the mystery of the incarnation. See **ANNUNCIATION** and **AVE MARIA**.

**SALZ**, **SULZ**, **SALTZ**, or **SULTZ**, a sort of brine or pickle made of salt, dissolved by the coldness, or moisture of a cellar.

**SAMARITANS**, an ancient sect among the Jews; still subsisting in some parts of the Levant, under the same name. See **JUDAISM**.

Its origin was in the time of Rehoboam; under whose reign, a division was made of the people of Israel into two distinct kingdoms. One of these kingdoms, called Judah, consisted of such as adhered to Rehoboam, and the house of David; the other retained the ancient name of Israelites, under the command of Jeroboam.—The capital of the state of these latter was Samaria; and hence it was they were denominated *Samaritans*.

Salmanazar, king of Assyria, having conquered Samaria, led the whole people captive into the remotest parts of his empire; and filled their place with colonies of Babylonians, Cutheans, and other idolaters. These finding themselves daily destroyed by wild beasts, desired an Israelitish priest to instruct them in the ancient laws and customs of the land they inhabited. This was granted them; and they thenceforth ceased to be incommoded with any beasts.—However, with the law of Moses, they still retained somewhat of their ancient idolatry. The Rabbins say, they adored the figure of a dove on mount Gerizim.

Be this as it will, it is certain, the modern *Samaritans* are far from idolatry: some of the most learned among the Jewish doctors own, that they observe the law of Moses more rigidly than the Jews themselves.—They have a Hebrew copy of the Pentateuch, differing in some respects from that of the Jews; and written in different characters, commonly called *Samaritan* characters; which Origen, Jerom, and other fathers and critics, ancient and modern, take to be the primitive character of the ancient Hebrews; though others maintain the contrary. The point of preference, as to purity, antiquity, &c. of the two Pentateuchs, is also disputed by the modern critics. See **HEBREW**, **PENTATEUCH**, **CHARACTER**, &c.

The *Samaritans* are now few in number; though it is not very long, since they pretended to have priests descended directly from Abraham. They were chiefly found at Gaza, Neapolis, (the ancient Sichem) Damascus, Cairo, &c. They had a temple, or chapel on mount Gerizim, where they performed their sacrifices.

Joseph Scaliger, being curious to know their usages, wrote to the *Samaritans* of Egypt, and to the high priest of the whole sect, who resided at Neapolis. They returned two answers to Scaliger, dated in the year 998 of the Hegira of Mahomet. These answers never came to the hands of Scaliger. They are now in the French king's library, and have been translated into Latin by father Morin, priest of the oratory; and printed in the collection of letters of that father in England, 1682, under the title of *Antiquitates Ecclesiae Orientalis*. M. Simon has inserted a French translation in the first edition, of *Ceremonies & Costumes des Juifs*, by way of supplement to Leo de Modena.

In the first of these answers, wrote in the name of the assembly of Israel in Egypt, they declare, that they celebrate the passover every year, on the fourteenth day of the first month, on mount Gerizim; and that he who then did the office of high priest, was called Eleazar, a descendant of Phineas, son of Aaron.—At present they have no high priest. In the second answer, which is in the name of the high priest Eleazar and the synagogue of Sichem, they declare, that they keep the Sabbath in all the rigour wherewith it is enjoined in the book of Exodus; none among them stirring out of doors, but to the synagogue. They add, that on that night they do not lie with their wives; that they begin the feast of the passover with the sacrifice appointed for that purpose in Exodus; that they sacrifice no where else but on mount Gerizim; that they observe the feasts of harvest, the expiation, the tabernacles, &c. They add further, that they never defer circumcision beyond the eighth day; never marry their nieces, as the Jews do; have but one wife; and, in fine, do nothing but what is commanded in the law: whereas the Jews frequently abandon the law to follow the inventions of their rabbins.

At the time when they wrote to Scaliger, they reckoned 122 high priests; affirmed that the Jews had no high priests of the race of Phineas; and, that the Jews belied them, in calling them Cutheans, whereas they are descended from the tribe of Joseph, by Ephraim.

The truth is, the Jews impose abundance of things on the *Samaritans*: they frequently confound them with the Sadduces, as if they were infected with their errors.—Rabbi Benjamin, who lived in the XIIth century, confirms the best part of what we have said of the *Samaritans*: he observes, they had priests of the tribe of Aaron, and who never married with any but those of the same tribe: that they sacrificed on mount Gerizim, where they had an altar of stone raised by the Israelites after passing over Jordan. He adds, that they are of the tribe of Ephraim; that they change their habit to go to the synagogue, and wash ere they put it on.

**SAMARITAN Characters, or Letters.** See **LETTER** and **HEBREW**.

**SAMARITAN Medals.**—In the cabinets of antiquaries we find some medals, usually called *Samaritan Medals*; the inscrip-

tions and legends whereof are Hebrew; but the character different from the Hebrew of our bibles, which is the square Hebrew, or Chaldee: and it is hence, viz. from the character, not from being struck by the *Samaritans*, that they are denominated *Samaritan*. See **MEDAL**.

These medals have been infinitely canvassed by the critics, both Jewish and Christian; particularly rabbi Alascher, rabbi Bartenora, rabbi Azarias, rabbi Moses, father Kircher, Villalpandus Waserus, Conringius, Hottinger, father Morin, Walton, Hardouin, Spanheim, &c.

The learned jesuit Souciet, in an express dissertation on the *Samaritan* medals, rejects all Hebrew medals, whose inscriptions are in Chaldee characters, as spurious; and allows of none to be genuine but the *Samaritan*.—Of these there are four kinds.

The first bear expressly the name of *Simon*, and the subject for which they were struck, viz. the deliverance of Jerusalem. The second kind have not the name *Simon*, but only the deliverance of Sion, or Jerusalem. The third kind have neither *Simon*, nor the deliverance of Sion; but only the epocha's, first year, second year, &c. The fourth class have neither any inscriptions, nor any thing whence one may judge of the time when they were struck.

The three first kinds were certainly struck after the return from the Babylonish captivity, and in the time of Simon Maccabeus, after Jerusalem had been freed from the yoke of the Greeks. But though struck after the captivity, father Souciet observes, their character shews itself to be that of the ancient Hebrew, which was used before the captivity, and the use whereof was lost by the people, during their sojourn in Babylon and Chaldea; but restored after their return, on the same footing as before. He adds, that the inscriptions are pure Hebrew, such as it was spoke before the captivity; that the character, therefore, is the true ancient Hebrew character: that it was the custom to write each language in its proper character: that if they had departed from this rule, they had doubtless used the new character they brought with them from Babylon: that there could be no other reason, but that of settling all things on the same foundation they were on before the destruction of Jerusalem, that could have induced them to use this character on their coins. And, lastly, that these medals were not struck by the *Samaritans*, but by the Jews, and in Jerusalem.

F. Souciet is very full on all these points, and, to the proofs drawn from medals, adds two others foreign thereto: the first drawn from the resemblance of the Greek letters, introduced by Cadmus the Phœnician, with this Hebrew character; which was the same with that of the Phœnicians, as the language of those people was the same with that of the Hebrews.—The second drawn from several various readings in the scriptures, which cannot be well accounted for otherwise, than by supposing, that the books wrote before the captivity, were in the same character with these medals, and which shew, that it is the conformity which certain letters have in that character, that has deceived the copists.

From the whole, he concludes, that this character of the medals is the true ancient Hebrew character; and, that to judge of the various readings of the Hebrew text, and the differences of the ancient Greek and Latin translations, either from themselves, or from the Hebrew text, recourse must be had to this character. See **HEBREW**.

**SAMARITAN Pentateuch.** See **PENTATEUCH**.

**SAMBUCUS**, an ancient musical instrument of the wind kind, resembling a kind of flute; probably thus called because made of elder, which the Latins call *Sambucus*.

**SAMBUCUS** was also the name of an ancient engine of war, used by Marcellus in besieging the city of Syracuse.

It was so big, that Plutarch, in the life of that general, observes, two ships were required to carry it.

**SAMIAN Earth, Terra SAMIA**, a kind of bole or astringent earth brought from the island of Samos, in the Ægean sea. See **EARTH**.

The best is called by Dioscorides, *Collyrium*, because used in the medicines of that name: it is white, very light, soft, friable, well-tasted, and a little glutinous on the tongue.

There is another kind, harder, fouler, and more glutinous, called *After-Samius*, in regard little shining straws are frequently found in it, disposed like little stars.

Each kind is esteemed very astringent, proper to dry, and draw wounds; having much the same qualities with the Armenian bole. See **ARMENIAN** and **BOLE**.

There is also a **SAMIAN Stone**, *λίθος Σαμίου*, taken out of the mines in the same island.—It is white, and sticks to the tongue when applied to it: it is held astringent, and cooling; and is also used by the goldsmiths to burnish their gold, and give it a greater lustre.

**SAMOSATENIAMS, SAMOSATENI**, a sect of ancient Antitrinitarians, thus called from their leader, Paulus \* Samosatenus, bishop of Antioch, under the emperors Aurelian and Probus.

\* They are also called by St. Augustin *Pauliani*, and by the fathers of the council of Nice, *Παυλιανισταις*.

He renewed the heresy of Artemonius, and had several sentiments in common with Sabellius, &c. though he differed from them in the manner of explaining them.—He owned, that

that the Father, Son, and Holy Ghost were but one God; but denied that the Son, and Holy Spirit had any real substance. According to him, they only subsisted in the Father, as the word of man subsists in his understanding.

St. Epiphanius will have the *Samosatarians* to be real Jews, without any thing more than the name of Christians; adding, that they use the same arguments against the mystery of the trinity that the Jews do; pleading against it, with them, on pretence of maintaining the unity of the godhead; though they do not observe the ceremonies of the law.

Their chieftain was condemned by a council held at Antioch, in 272, whereat assisted about seventy bishops; and was deposed from his bishoprick.

**SAMPSEANS, SAMPSEI**, ancient sectaries; the same, according to St. Epiphanius, with the *Elcesaites*. See *ELCESAITES*.

The *Sampseans* were not properly either Jews, Christians, or Gentiles; though they took their name from the Hebrew, *Semes*, sun; as if they adored the sun.

They acknowledged one only God; washed themselves often, and were attached, in almost every thing, to the religion of the Jews.—Many among them abstained from eating of flesh.

Scaliger, after Epiphanius, will have the *Sampseans* to be the same with the *Esseni*. In effect, the *Elcesaites*, *Sampseans*, *Maffalians*, and *Esseni*, appear to be no more than so many different names for the same sect; unless, perhaps, the first added something to the opinions of the last. See *ESSENI*.

**SAN BENITO**, or **SACO BENITO**, a kind of linen garment; born as a badge, by persons condemned by the inquisition. See *INQUISITION*, and *ACT of Faith*.

The *San Benito* is in form of a scapular; being a broad piece of cloth hanging down before, and behind; with two St. Andrew's crosses on it: it is of a yellow colour, and painted over with devils, and flames.

It is supposed to be an imitation of the ancient sackcloth, used by publick penitents in the primitive church. See *PENITENT*.

**SANCTIFICATION**, the act of *sanctifying*, or making a thing holy, and separate to God. See *HOLINESS* and *SACRED*.

The reformed divines define *Sanctification* an act of God's grace, whereby a man is renewed inwardly, his desires and affections alienated from the world, and the man put in a course of dying to sin, and living to righteousness.

The *sanctifying of the sabbath*, among the Jews, is of divine right, or institution.—By *sanctifying the sabbath*, is meant, the spending it in prayer, praise, &c. not in worldly concerns.

The first petition in the Lord's Prayer is, *Hallowed, i. e. sanctified, be thy name*: but which is meant, let thy name be ever accompanied with blessing, and praise.

**SANCTION**\*, **SANCTIO**, the authority given to a judicial act; or that, whereby it becomes legal, and authentic.

\* The word is formed from the Latin *sanctare*, to establish.

The royal assent gives the *sanction* of statutes, to all bills in parliament that have passed each house thrice. See *ASSENT*, and *PARLIAMENT*.

**Pragmatical SANCTION**. See *PRAGMATICAL*.

**SANCTI-VITI Chorea**. See *CHOREA Sancti-Viti*.

**SANCTUARY**, among the Jews, was the holiest and most retired part of the temple of Jerusalem; wherein was preserved the ark of the covenant; and into which nobody was allowed to enter but the high priest, and that only once a year, to intercede for the people.

The *sanctuary*, called also *sanctum sanctorum*, or *holy of holies*, is supposed to be a type, or figure of heaven, and of Jesus Christ the true high priest, who is ascended thither to make intercession for us.

Some will have it, that the whole temple was called the *sanctuary*; and that the *sanctum sanctorum*, where the ark was kept, was only a little chapel or oratory therein. See *TEMPLE*.

To try or examine a thing by the *weight of the SANCTUARY*, is to examine it by a just, and equal scale; in regard among the Jews, it was the custom for the priests to keep stone weights, to serve as standards for regulating all weights by; though these did not differ from the royal, or profane weights. See *STANDARD*, *WEIGHT*, *SHEKEL*, &c.

**SANCTUARY**, in our ancient customs, denotes an asylum, or place privileged by the prince, for the safeguard of mens lives, who are guilty of capital crimes. See *ASYLUM*.

In Scotland they call the *Sanctuary*, *Girtball*, or *Gyrthol*.

The Saxons also called it *Frodmortel* and *Fridstoll*.

Till Henry the VIIIth, all our churches and church-yards were *sanctuaries*; and protected traitors, murderers, &c. if within forty days they acknowledged their fault, and submitted themselves to banishment; and during that time, if any lay-man expelled them, he was excommunicated; if a clerk, he was made irregular: after forty days no man might relieve them. See *ABJURATION*.

St. John's of Beverly had an eminent *sanctuary*, called by the Saxons, *a seat of Peace*: so had St. Martin's le Grand, in London. Rippon had the like granted by Whitlase,

V O L. II. N<sup>o</sup>. CXXXVII.

king of the Mercians: so had St. Buriens in Cornwal, granted by king Athelstan, *Anno* 936; and Westminster the like, granted by Edward the Confessor. See *FRIDSTOLL*.

**SANCTUARY**, is also used in the Romish church for the chancel, or that part of the church wherein the altar is placed, incompassed with a rail or ballustrade. See *CHANCEL*.

**SANCTUM SANCTORUM**. See *SANCTUARY*.

**SAND**, a fine, hard, gravelly sort of earth, or rather stones, divided into small grains; of great use in building, and many other arts, and manufactures; as glass-making, plumbery, foundery, &c. See *EARTH*.

There are three kinds of *sands*, distinguished by the places whence they are drawn, viz. *pit-sand*, *river-sand*, and *sea-sand*.

The use of *sand* in building, is an ingredient in mortar: See *MORTAR*.—For this purpose, *pit-sand* is of all others the best; and of *pit-sand*, the whitest is always the worst. Of *river-sand*, that found in the falls of waters is best, because most purged. *Sea-sand* is the worst.

*Pit-sand*, as being fat and tough, is most used in walls and vaults.—*River-sand* serves for rough-casting.

All *sand* is good in its kind, if when squeezed and handled it crackles; and if being put on a white cloth, it neither stains nor makes it foul.—That *sand* is naught, which, mixed with water, makes it dirty and muddy, and which has been long in the air; for such will retain much earth and rotten humour.—Hence some masons wash their *sand* ere they use it.

The *sand* of Puzzuolo, de Lorme observes, is the best in the world; especially for maritime buildings. See *POZZOLANE*.

Some distinguish a *male sand*, which is of a deeper colour than another sort in the same bank or bed, called *female sand*.

The *sand* whereof glass is made, is white, and gritty, full of little sparkling grains. See *GLASS*.

The *sand* used by founders, is fossile: it is properly a yellow fat earth, whereof they make their moulds, for the casting of small work; whence it is they say, *Casting in sand*. See *FOUNDRY*.

The plumbers also use *sand* to mould several of their works, particularly large sheets.—To prepare the *sand* for these sheets, they wet it lightly, stir and work it with a stick, then beat and plain it. See *PLUMBERY*.

*Sands* may be divided into *sharp* and *soft*.

*Sharp*, or *rag-sand*, is that composed of small transparent pebbles naturally found in the mountains.

Of this, again, there is some *fine* and white, or grey, reddish or brown; others *coarse*, either of grielly, or brown colour.

*Soft* or *smooth sand*, is that mixed with flat particles from lime-stone, with micæ or glittering particles, either silver-like, as the *sea-sand* about the Scilly islands; or gold-like, as in Cleveland.

**SAND**, in agriculture, denotes one of the three usual kinds of soil; which are *sand*, *clay*, and *earth*, or *loam*. See *GROUND*, *CLAY*, *EARTH*, *LOAM*, &c.

M. de la Quintinie attributes all the difference we find in soils, to the different quality of the *sands* mixed in them.—*Soft sands*, according to him, make a soft, gentle earth: *uneven sands*, a stiff earth: *coarse sands*, a rough untractable earth, &c. See *SOIL*.

**SAND** is also applied to dry, crumbling earths, which, wanting any fatness to bind them together, the wind easily breaks into dust, and carries them away.

In this sense it is that travellers tell us, the caravans in Africa are frequently lost, and buried under clouds of *sand*, torn up by whirlwinds; and sometimes heaped into mountains.—The deserts of Lybia are mere *sands*; and hence their sterility. See *DESART*.

**SANDAL, SANDALIUM**, *Σανδαλιον*, in antiquity, a rich kind of slipper, or wear for the feet, made of gold, silk, or other precious stuff; used by the Roman and Greek ladies; consisting of a sole, with a hollow at one extreme to embrace the ankle; but leaving the upper-part of the foot bare.

Terence speaks of this *sandal*, *Utinam tibi committigari videam sandalio caput*: I wish she would break your head with her *sandal*.

Apollo was sometimes called *sandalarius*, *sandal-maker*; the reason of which appellation has given great perplexity to the critics: some derive it from a street called *sandalarius*, chiefly inhabited by *sandal-makers*, wherein that god had a temple: but others, with more probability, derive the name of the street from that of the god, and take Apollo to have been thus called from his effeminate dress, as if he wore women's *sandals*.

**SANDAL** is also used for the shoe or slipper wore by the pope, and other Romish prelates, &c. when they officiate; being such as is supposed to have been worn by St. Bartholomew. Akuin observes, that there was some difference between the *sandals* of bishops, priests, and deacons.—Monks were not allowed to wear *sandals*, except in travelling; as is observed by Du Cange, Salmasius, &c.

**SANDAL** is also the name of a sort of slipper still worn by several congregations of reformed monks.

It consists of no more than a mere leathern sole, fastened with latches or buckles, all the rest of the foot being left bare.

The Capuchins wear *sandals*, the Recollects, clogs: the former are of leather, the latter of wood.

**SANDARAC**, **SANDARACHA**, in natural history, &c. a preparation of orpiment, made by fusing it by a close fire into a red friable mass. See **ORPIMENT**.

*Sandaracha* is the same with what is otherwise called *Red Arsenic* and *Realgar*. See **ARSENIC** and **REALGAR**.

It is sometimes also called *Sandaracha Græcorum*, in opposition to the gum *Sandarach*. Some distinguish two sorts of Grecian *Sandarac*: the *natural* which is that above described; and the *fæctitious*, which is only cerus exalted by the fire, and burnt into a kind of minium. Both the one and the other is a poison. See **LEAD**, **CERUSS**, and **SANDYX**.

**Gum SANDARACH**, or **SANDARACHA Arabum**, a white gum oozing out of the trunk, and thick branches of the great juniper-tree, by incisions made in the heats of the summer.

The small or common juniper yields very little *Sandarach*: its fruit yields oils, waters, salts, spirits and extracts of some repute in medicine. See **JUNIPER**.

The *Gum Sandarach* is an ingredient in varnish. With this melted in oil of turpentine is made the fictitious varnish now used by painters and cabinet-makers. See **VARNISH**.—It is also reduced into an impalpable powder, and used to prevent paper from imbibing ink.

The best is in fine white tears, free of dust: the English, Swedes, &c. drive a considerable trade therewith. Some will have it, that the gum of the juniper is not the right *Sandarach*, but that of the *oxycedrus*, or lesser cedar.

**SAND-BAGS**, in fortification, are bags holding each about a cubic foot of earth, or sand; used for raising parapets in haste, or to repair what is beaten down. See **PARAPET**.

They are also of use when the ground is rocky, and affords not earth to carry on the approaches; because they can be easily brought on, and off at pleasure.

There are a lesser sort, which hold half what the former do, and are placed upon the upper talus of the parapet, to cover those who are behind, and who fire through the embrasures, or intervals, that are between them.

**SANDEVER**, or **SANDIVER**, the drops of glass; or the scum that arises from the ashes of the herb kali, used in the making of glass. See **GLASS**.

Some also use *sandever* for the kali, or glass-wort itself. See **KALI**.

**SAND-HEAT**, or **SAND-BATH**, denotes one of the chymists fires; consisting of hot sand, wherein herbs, flowers, &c. are infused in a cucurbit. See **BATH**.

The *sand-heat* is esteemed gentle, digestive, and alterative. See **HEAT** and **FIRE**.

**SANDIVER**. See the article **SANDEVER**.

**SANDYX**, a kind of minium, made of cerus, or rather lead, calcined and rubified; called also *fæctitious sandarach*. See **LEAD** and **SANDARAC**.

It is of little use in painting; the real minium, or vermilion, to which it is substituted, making a much better, brighter, and more durable colour. See **VERMILION** and **MINIUM**.

**SANGUIFICATION**, in the animal œconomy, the action whereby chyle is converted into blood. See **CHYLE** and **BLOOD**.

*Sanguification* succeeds chylification, and is followed by nutrition. See **CHYLIFICATION** and **NUTRITION**.

*Sanguification* is thus effected. The chyle having passed the lacteals of the several kinds, is delivered into the blood at the subclavian; whence the two humours pass together to the right ventricle of the heart, where being yet more intimately mixed, they circulate together through the whole body; till, after several circulations and depurations at the several collatures and strainers of the body, they become assimilated, or, as the chymists call it, *cobabated*, so as only to make one uniform compound mass, which appears to be nothing else but chyle altered by the artifice of nature, and exalted into blood.—In effect, it does not appear that any thing extraneous is mixed with the circulating liquor but chyle, excepting what was before separated from it for particular occasions; unless perhaps it should receive some portion of air in the lungs, which is a point long disputed, and yet scarce ascertained. See **AIR** and **BLOOD**.

Indeed, that there is a quantity of air mixed with the blood and circulating with it, is granted; but whether this be any more than what was at first contained in the bodies whereof the chyle was formed, is much doubted: the principal arguments for it, are, the necessity of respiration, and the florid colour the blood receives in the lungs, and first shews in the pulmonary vein.—But the first is satisfactorily accounted for another way. See **RESPIRATION**.

The latter is chiefly supported by this experiment, that blood drawn by venæsection, and suffered to coagulate, upon turn-

ing up the bottom, which before was blackish, being now exposed to the air, acquires a florid colour, like that we observe in the blood of the pulmonary vein.

The ancients were in great perplexity about the seat of *sanguification*, or the place where, and the instrument whereby it is effected: whether in the heart, or the liver, or the lungs? but, according to the doctrine of the moderns, the heart, liver, vessels, &c. contribute no otherwise to the changing of the chyle into blood, than the sun does to the changing of the must into wine. See **HEART**, **LIVER**, &c.

The ancients accounted for *sanguification* from a plastic power.—In the last century, when chymistry was introduced, *sanguification*, and almost every thing else, was to be effected by a ferment; and the physicians of those times, were very solicitous as to the particular officina where this ferment was prepared and kept. Some would have it the liver, others the spleen, &c. but the very notion is now exploded.

Of *sanguification* we may admit two degrees; the first amounting to no more than a confusion, or such an intimate mixture of parts, as suffices so to confound the different coloured liquors, as that the whiteness of the chyle shall be lost or drowned in the redness of the blood, so as never more to appear in its own shape and colour.—This we suppose may be effected by repeated circulations alone: how many circulations are necessary thereto, it is difficult to determine.

The second degree of *sanguification*, is, when the parts of the chyle are so exalted, or comminuted and subtilized, as to lose all tendency to a coagulatory separation, such as they have in chyle and milk.

To these two degrees may be added a third, wherein the fibres and filaments of the crude blood are so broken and blended with the serum, and not to be again separable from them.—This is a morbid *sanguification*, such as happens in fevers, &c. attended with a bloody sweat, purple spots, &c. All these degrees of *sanguification*, Dr. Drake makes no doubt, are procured by reiterated circulations, wherein as well the intestine, as the progressive motion, conspire to the mixing and comminuting of the adventitious parts. Doubtless they have their stated period, wherein they are in perfection; though where precisely to fix it, we do not know.

**SANGUINE**, *bloody*; or a thing abounding in blood. See **BLOOD**.

**SANGUINE Temperament**, or *Constitution*, is that where blood, and heat predominate. See **TEMPERAMENT**.

*Sanguine* constitutions require a frequent use of phlebotomy. *Sanguine* people are usually observed to be brisk, bold, daring, and even presumptuous.—Hence *sanguine* hopes, *i. e.* strong, assured, &c. hopes.

**SANGUINE**, in heraldry, the colour usually called *Murrey*; being made of red lake, tinged with a little *Saffron* brown. See **MURREY** and **PURPURE**.

It is represented in engraving, by transverse hatches like purple; and is mostly used in the coats of knights of the Bath.

When borne by nobles, it is rather called *Sardonyx*; and in the coats of sovereign princes *Dragon's Tail*.

**SANGUINE Stone**, *Lapis SANGUINALIS*, a kind of Jasper, brought from New-Spain, of a dark brown colour, marked with spots of a blood-red. See **JASPER**.

The Indians cut it in form of a heart, and use it in hæmorrhages, immoderate menses, and other fluxes of blood.—

The patient applies it by grasping it in his right-hand, having first dipt it in water. It is sometimes also hung on the part whence the blood flows. See **HÆMATITES**.

**SANGUINIS Periodus**. See the article **PERIODUS**.

**SANGUIS**, in medicine, &c. See **BLOOD**.

**SANGUIS**, in our ancient customs, denotes a right or power, which the chief lord of the fee anciently had to judge and determine cases where blood was shed.—*De murderia & raptu, de igne, de Sanguine*, &c. Monast.

**SANGUINEM Emere**, was an obligation which the inhabitants of some manors, as that of Grendon, were under, to buy and redeem their villain blood, or tenure, and make themselves freemen. See **VILLENAGE**.

**SANGUIS Caprinus**, or *Hircinus*, the blood of the he-goat, either wild or tame, which is prepared, with great precaution, to be used in medicine, and supposed by many to have very extraordinary qualities.

The principal precautions are these: the goat is not to exceed four or five years of age; it is to be fed a considerable time with aromatic herbs, and especially those of the saxifrage kind; to be drawn out of the throat, or the testicles, by cutting them; but neither what comes first, nor last, to be used, the former being too full of humidity, and the latter too thick; the operation to be only performed in July; and the blood put into earthen vessels, and dried either in the sun or the shade; and, lastly, bottled up to be used occasionally.

Among other specific virtues attributed to goat's blood, the two most considerable are, that it cures the pleurisy without bleeding; and that it dissolves the stone in the bladder, by taking it in vehicles proper for those diseases.—To be good, is to be extremely hard, and difficult to pulverize.

SAN-

**SANGUIS Draconis**, in pharmacy. See **DRAGON'S-BLOOD**.  
**SANHEDRIN\***, or **SANHEDRIM**, **SYNEDRIUM**, among the ancient Jews, the supreme council, or court of judicature of their republic; wherein were dispatched all the great affairs both of religion, and policy.

\* The word is derived from the Greek *Συνεδριον*, a council, assembly, or company of people sitting together; from *συν* con. together, and *ιδριον* seat.

Many of the learned agree, that it was instituted by Moses, Numbers ch. xi. and consisted at first of seventy persons, all inspired of the Holy Ghost, who judged finally of all causes and affairs; and that it subsisted, without intermission, from Moses to Esdra. — Others will have it, that the council of seventy elders, established by Moses, Numb. ch. xi. was temporary, and did not hold after his death; adding, that we find no sign of any such perpetual and infallible tribunal throughout the whole Old Testament.

The Jews, however, contend strenuously for the antiquity of their great *sanhedrin*: M. Simon backs and defends their proofs, and M. le Clerc attacks them. — Be the origin and establishment of the *sanhedrim* how it will, it is certain it was subsisting in the time of our Saviour; that it was held at Jerusalem; and that the decision of all the most important affairs belonged to it. — The president of this assembly was called *Nasi*.

There were several inferior *sanhedrim* in Palestine, all depending on the great *sanhedrin* at Jerusalem. The inferior *sanhedrim* consisted each of twenty-three persons; and there was one in each city and town. Some say, that to have a right to hold a *sanhedrin*, it was requisite there were one hundred and twenty inhabitants in the place. Where the inhabitants came short of the number of one hundred and twenty, they only established three judges.

Into the great as well as the inferior *sanhedrim* were admitted priests, levites, and laymen, of all the tribes, provided they were of noble extraction, rich, wise, without any blemish of body, and expert in magick; which last was esteemed a necessary qualification, to enable them to obviate and destroy it: very old people and eunuchs were excluded.

In each *sanhedrin* there were two scribes; the one to write down the suffrages of those who were for condemnation; the other to take down the suffrages of those who were for absolution.

Selden has a learned work on the subject of the Jewish *sanhedrim*, *de Synedriis*, printed at London in 1635, in three volumes, quarto.

**SANIES**, in medicine, a thin, limpid, serous matter; issuing out of wounds, and ulcers: by the Greeks called *ἰχμωρ*. See **ICHOR**.

Galen compares it to whey: it differs from *pus*, which is thicker and whiter. See **PUS**.

**SANTALUM**, **SAUNDERS**, a hard, heavy, odoriferous, medicinal wood, brought from the East-Indies, of some repute, as a drier, absorbent, and sweetener.

There are *santals* of three different colours; *citrine*, *white*, and *red*. The trees whence they are taken are all of the same kind; and it is supposed their different colours only arise from the difference of climates where they grow; some say from the different parts of the tree they are taken from.

They are all held to be a little astringent, to strengthen the heart and brain, and to stop vomiting; and are frequently used in diet-drinks, and medicated ales, against scorbutick complaints.

The tree is about the height of the European walnut-tree: its leaves resemble those of the lentiscus; its flowers blue, bordering on black; its fruit of the size of our cherry, green at first, but blackening as it ripens, and of a faint taste.

The *citrine-santal* is esteemed the best: it is brought from China, and Siam; is yellow, heavy, and of a good smell; used in medicine, as also by the perfumers.

The *white-santal* is less odoriferous; it is brought from the isle of Timor.

The *red* has the least smell of the three; but is the most astringent; it is brought from the island Tamassarin, and the coast of Coromondel.

**SAP\***, in speaking of plants, denotes *juice*. See **JUICE**, **PLANT**, **VEGETATION**, &c.

\* The word is formed from the Saxon *Saþe*, which signifies the same; and that according to Mylius from the Greek *σαρξ*, *sarcis*, juice. — Whence also the Latin *Sapa*, used for an inspissated juice. See **ROS**.

**Circulation of the SAP**. See **CIRCULATION of the Sap**.

**Procurement of the SAP for æconomical uses**. See **TAPPING**.

**SAP**, or **SAPP**, in building. To *sap* a wall, &c. is to dig or open a hole in the ground at the foot of a wall, &c. to bring it down all at once for want of support.

To *sap*, according to Daviler, is to undermine a work with hammers, pickaxes, mattocks, &c. viz. a bank, or hillock, by propping it up, digging underneath it, and then burning the props, or stays; or a rock, by digging a mine underneath it.

To demolish the thick, firm walls of old castles, &c. *sapping* is much the readiest way.

**SAP**, in the military art, denotes a work carried on under ground, to gain the descent of a ditch, counterscarp, or the like.

It is performed by digging a deep trench, descending by steps from top to bottom, under a corridor; carrying it as far as the bottom of the ditch, when that is dry, or the surface of the water when wet.

When the covert-way is well defended by musketeers, the besiegers make their way down into it by *sapping*. *V. Tab. Fortif. fig. 21. n. 5*. When they are got near the foot of the glacis, the trench is carried on directly forwards; the workmen covering themselves with blinds, wool-packs, sand-bags, and mantelets upon wheels. They also make epaulements, or traverses, on each side, to lodge a good body of men.

The *sap* is usually made five or six fathom from the salient angle of the glacis, where the men are only covered sideways; for which reason they lay planks over-head with hurdles, and earth above them.

When they have forced the enemy to quit the covert-way, the pioneers immediately with sand-bags, wool-packs, or other fences, make a lodgment, and cover themselves as well as they can, from the fire of the opposite bastion.

**SAPATA**. See the article **ZOPATA**.

**SAPHENA**, in anatomy, a vein which arising over the maleolus internus, up along the leg, and the inner part of the thigh, discharges itself, near the groin, into the crural vein. See *Tab. Anat. Angiol. fig. 6. n. 44*.

It is this vein they usually open when they bleed in the foot, for suppression of the menses.

It has its name, probably, from *σαφης*, *manifestus*, as lying plain in sight.

**SAPHETA**, in architecture, is the board over the top of a window, placed parallel and opposite to the window-stool at the bottom.

**SAPIENTIAL**, **SAPIENTIALIS**, an epithet applied to certain books of scripture, calculated for our instruction and improvement in prudence, or moral wisdom; thus called, in contradistinction to the historical and prophetic books. See **BIBLE**, &c.

The *sapiential* books are Proverbs, Canticles, Ecclesiastes, the Psalms, and Job; though some reckon this last among the historical books. See **HAGIOGRAPHER**.

**SAPIENTIAE Dentes**, the two last or inmost of the dentes molares of the upper jaw, one on each side; thus called because they appear not till persons are grown. See **TOOTH**.

**SAPP**. See the article **SAP**.

**SAPPIC**, in poetry, a kind of verse much used by the Greeks, and Latins; denominated from the inventress *Sappho*.

The *Sapphic* verse consists of eleven syllables, or five feet; whereof the first, fourth, and fifth, are trochees, the second a spondee, and the third a dactyl, as in

*Integer vitæ scelerisq; purus,*

*Non eget Mauri jaculis nec arcu.*

**HOR.**

Three verses of this kind, closed with an Adonic verse, consisting of a dactyl and spondee, usually make a strophe. — Though we have some choruses in the ancient tragic poets, containing a much greater number of *Sapphicks* successively. — They generally run rough, unless they have the caesure after the second foot.

**SAPPHIRE**, or **SAPPHYR**, **SAPPHIRUS**, a precious stone of a beautiful azure, or sky-blue colour.

The *sapphire* is transparent, yet exceedingly hard, so as scarce to bear being engraven.

Different colours constitute different kinds thereof; the deepest blues being esteemed males, and the whitest females.

The *sapphires* of Pegu are the most esteemed. They are found in the same mines with the rubies. There are some also brought from the kingdom of Calcut, Cananor, and Ceylon; from which last place we should be furnished with abundance, if the king of the island did not prohibit all commerce thereof with foreigners.

The soft *water-sapphires* of Bohemia and Silesia are of some account, though far inferior to the oriental ones, both in the brightness of their blue, and the firmness of their texture.

Many people value the *sapphire* beyond the ruby; and give it the second place among precious stones, viz. that next the diamond: others give that place to the ruby.

Some authors affirm, that a *sapphire* being heated to a certain degree, between two crucibles luted together, loses all its colour, and becomes perfectly white; so as to deceive even the jewellers themselves, and make it pass for a diamond.

Our druggists sell two kinds of *sapphires* used in the confection of hyacinth; the one red, the other blackish. The last, by reason of the deep tincture they give that medicine, are very improperly used there: the former are little reddish stones, of the size of pins-heads, very hard, and difficult to pulverize.

Some rank the cat's eye, *oculus cati*, in the number of *sapphires*. This is a gem remarkable for a fine diversity of colours, as well as for its hardness, which bears a polish equal with that of the true *sapphires*.

The

The chymists make several preparations of *sapphire*; as a salt, a tincture, an essence, a water, an oil, &c. and there are few diseases but they pretend themselves able to cure by remedies composed thereof.

The superstitious attribute still more strange virtues to this stone; as, that it grows foul, and loses its beauty, when wore by a person that is lecherous, &c.

The rabins hold, that Moses's rod, and the tables he received on mount Sinai, were of *sapphire*.—The reason is, that in the Hebrew the finest things are all called *sapphires*; whence, in scripture, the throne of God is said to resemble a *sapphire*.

**SAPPHIRE-RUBIES**, are certain precious stones, between blue and red; which, in effect, are nothing but rubies, whose colour is not yet perfectly formed. See **RUBY**.

**SARABAITES**\*, **SARABAITE**, a name anciently given to vagabond and strolling monks. See **MONK**.

\* The word is derived from the Hebrew שָׂרָב *sarab*, to rebel. St. Benedict gives a frightful idea of these *Sarabaites* in the first chapter of his rule: Cassian does not speak a whit more favourably of them in his fourteenth conference; nor St. Jerom in his letter to Eustochium.

Cassian calls them, *Renuitæ*; *quia jugum regularis disciplinae renuunt*.

**SARABAND**, a musical composition in triple time; being, in reality, no more than a minute, whose motions are slow, and serious.

*Saraband* is also a dance to the same measure, usually terminating when the hand rises; whereby it is distinguished from the courant, which ends when the hand that beats time, falls.

The *saraband* is said to be derived originally from the Saracens, as well as the chacone: it had its name, according to some authors, from a comedian called *Sarabande*, who first danced it in France. Others derive the name from the Spanish *farao*, a ball: it is usually danced to the sound of the guitarre, or castanettes.

**SARCASM**, **SARCASMUS**, in rhetoric, a keen, bitter irony, whereby the orator scoffs, and insults his adversary. See **IRONY**.

Such was that of the Jews to our Saviour: *Thou who destroyest the temple, and raisest it in three days, save thyself, &c.* and again, *He saved others, himself he cannot save*. Or that of Turnus to a Trojan slain by him, in Virgil.

*En agros, & quam bello, Trojana, petisti  
Hesperiam metire jacens! Hæc præmia qui me  
Ferro ausi tentare ferunt: sic mœnia condunt!*

**SARCOCELE**\*, **Σαρκοcele**, in medicine, a fleshy, scirrhous excrescence, very hard, yet indolent; rising up by little and little about the testicles, or in the inner membrane of the scrotum.

\* The word is formed from the Greek σὰρξ, *caro*, flesh, and κελυ, *tumor*.

Sometimes indeed it is painful; in which case there is danger of its degenerating into a cancer.

It usually owes its origin to some external cause, as a blow, a bruise, or contusion. Such accidents occasion the nutritious juices to stop, and to be collected in great quantities in the relaxed or compressed pores of those parts, by which means is formed that kind of tumour called *sarcocele*, by some *hernia carnosæ*.

It is a very troublesome and obstinate disease, and is frequently incurable by any other means than castration, or cutting off the testicle. See **CASTRATION**.

**SARCOCOLLA**, **Σαρκοcolla**, a gum oozing out of a thorny tree, either with, or without incisions.

Neither authors, nor merchants are agreed as to the place where it grows: some say it is in Persia, others, in Arabia Deserta.—It comes either in grains, or in tears of different colours; sometimes white, sometimes yellow, and sometimes red, but all equally good, provided they be very dry. Their taste is bitter, accompanied with somewhat of a disagreeable sweetness.

It is esteemed warm, and drying; very good to consolidate and heal wounds; whence its name—from the Greek, σὰρξ, *flesh*, and κολλη, *glue*.

It is sometimes also used in collyria to stop defluxions, and take off specks in the eye.

**SARCOLOGY**, in anatomy, a discourse on the flesh, or the soft parts of the human body. See **FLESH**.

Anatomy is divided into two principal parts; *sarctology* and *sarcology*. The first whereof treats of the bones, and cartilages; the second of the flesh and soft parts. See **ANATOMY**.

**SARCOMA**, **Σαρκομα**, in medicine, a fleshy, fungous excrescence arising in the nostrils, or other parts; nearly resembling a polypus. See **FUNGUS**.

The *sarcoma* chiefly differs from the polypus, as the latter grows from the part by several roots; the former by one continued root, or without any roots at all. See **POLYPUS**.

Every polypus is a *sarcoma*; but not *vice versa*.—The *sarcoma* frequently degenerates into a polypus.

**SARCOMPHALUM**\*, **Σαρκομφαλον**, in medicine, &c. a fleshy excrescence of the navel.

\* The word is formed from the Greek σὰρξ, *flesh*, and ομφαλον, *navel*.

**SARCOPHAGUS**, **Σαρκοφαγος**, in antiquity, a sort of stone coffin, or grave, wherein the ancients laid those they had not a mind to burn.

The word, as derived from the Greek, literally signifies, *flesh-eater*; because at first, they used a sort of stones for the making of tombs, which quickly consumed the bodies.—

The quarries from whence they dug them were near a city of Troas, named *Assum*.—They had the faculty to waste away a body to nothing, save the teeth, in forty days.

This stone resembled a reddish pumice-stone, and had a saltish taste; they also made vessels of it to cure the gout, into which they put their feet, not suffering them to continue there too long.

**SARCOTICKS**\*, **Σαρκοτικα**, in medicine, remedies proper to fill up wounds and ulcers with new flesh; the same as incarnatives. Such are *sarcocolla*, dragon's blood, frankincense, &c. See **INCARNATIVE** and **EPULOTIC**.

\* The word is formed from the Greek σὰρξ, *flesh*.

**SARDIAN**, **SARDIOIN**, or *Lapis SARDIUS*, a precious stone of a blood colour, half transparent; the same with what we otherwise call a *Cornelian*. See **CORNELIAN**.

The most beautiful *Sardians*, are those brought from about Babylon: those of Sardinia, whence they take their name, are in the second class. There are others, and those no contemptible ones, found near St. Mauro in Albania; and other, very small ones, about the Rhine, in Bohemia, Silesia, &c.

To give them the greater lustre, it is usual in setting them, to lay silver-leaf underneath. The *Sardian* is most used for seals, as graving easily, yet taking a fine polish.

The author of the book falsely ascribed to Albertus Magnus, attributes several wonderful virtues to this stone. See **AGATE**, **GEM**, &c.

**SARDONIAN Laughter**. See **RISUS SARDONIUS**.

**SARDONYX**, **Σαρδονξ**, a kind of precious stone, partaking partly of the sardian, and partly of the onyx.

It is semi-transparent, and reddish bordering on white, somewhat like the nail of the hand: in some, the red inclines to a yellow. It is brought from the East-Indies, Arabia, and Bohemia. It was anciently much used for fine vessels. See **AGATE** and **SARDIAN**.

**SARPLAR**\* of *Wool*, **SARPLERA Lana**, otherwise called a *pocket*, is half a sack. See **SACK**.

\* In Scotland, it is called *Serplaitb*.

**SARRASIN**, or **SARRAZIN**, in fortification, a kind of portcullice, otherwise called an *herse*, which is hung with ropes over the gate of a town, or fortrefs, and let fall in case of a surprize. See **HERSE** and **PORTCULLICE**.

**SARSAPARILLA**, **SALSAPARILLA**, or **SARSA**, a medicinal plant, growing in New Spain, Peru, &c. chiefly used in decoctions, and potions for the venereal disease; being esteemed a great absorbent and sweetener; and, on that score, sometimes taken as a tea. See **ROOT**.

Its root, which is the part in use, divides itself into a great number of filaments, six or seven foot long; of the thickness of a quill: it is brownish without side, and white within, only marked with two red streaks. Its branches creep on the earth, or along the trunks of other trees, &c. as the ivy does.

To be good, it must be very dry, its filaments long, easy to cleave; and, in cleaving, must not yield any dust: when boiled in water, it must give it a red tincture.—Some physicians much doubt the medicinal virtue of this root; as it does not discover much, either in taste, smell or tincture.

There is another kind of *sarsa*, the filaments of whose root are thicker, growing in the island Marignan, on the coast of Brasil: this is not esteemed so good as the former.

There is a third kind brought from Muscovy, whose roots are still bigger, but good for nothing but to burn.

**SARTORIUS**, in anatomy, the *Taylor's muscle*; a muscle thus called, because serving to throw one leg across the other. See **MUSCLE**.

It is also called *Longus tibiæ*, and *Fascialis*; and is an antagonist to the popliteus. See *Tab. Anat. (Myol.) fig. 1. n. 49. fig. 2. n. 38*. See also the article **LONGUS**.

**SASSAFRAS**, a yellow, odoriferous wood, of a brisk, aromatic scent, somewhat resembling fennel; the produce of a tree whereof there are whole forests grown in Florida, Virginia, &c. See **WOOD**.

The natives call it *Pavama*, the Spaniards and French also *Cinnamon-Wood*; because, at the conquest of that country, under Ferdinand Soto, in 1558, they imagined this to have been the true cinnamon-tree.

The lignum *Sassafras*, chiefly its bark, wherein its principal virtue is supposed to reside, was formerly sold at an incredible price, to be used with *sarsaparilla* and *esquilina*, in the cure of the venereal disease. It is very drying and hot, though not quite so much as the guaiacum.

It is somewhat come into fashion in families, as a common tea, which the shavings of it make agreeable enough; but the scandal of being good in venereal cases, is a detriment to it, and prevents a deal of good being done by it.

It is esteemed in the gout, sciatica, and green-sickness. Chuse that covered with a thick bark, reddish, and rough, of a sharp taste, and a strong aromatic smell.

**SASSE**, in some of our statutes, denotes a kind of wear with flood-gates, commonly used in navigable rivers for the damming, and loosing the stream of water, as occasion requires, for the better passing of boats, and barges to, and from. See **WEAR**.

This, in the west of England, is called a *Lock*; in the river Lee, a *Turn-pike*, and in other places a *Sluice*. See **SLUICE**.

**SATELLITE**, **SATELLES**, *Guard*; a person attending on another, either for his safety, or to be ready to execute his pleasure. See **GUARD**, &c.

Among the eastern emperors, *Satellite* expressed the dignity or office of captain of the life-guard.

The term was afterwards applied to the vassals or lords; and afterwards, to such as held fees, called *Sergeanties*. See **SERGEANTY**.

**SATELLITES**, in astronomy, certain secondary planets, moving round the other planets, as the moon does round the earth; thus called, because always found attending them from rising to setting, and making the tour of the sun together with them. See **PLANET**.

The *Satellites* move round their primary planets, as their centres, by the same laws as those primary ones do round their centre, the sun.—For the physical cause of their motions, see **GRAVITY**: see also **SYSTEM**.

The words moon, and *Satellite*, are sometimes used indifferently; and thus we say, either Jupiter's moons, or Jupiter's *Satellites*: but ordinarily we distinguish; restraining the term *moon*, to the earth's *Satellite*; and *Satellite* to the little moons lately discovered about Jupiter and Saturn. See **MOON**.

The *Satellites* were unknown till our time; as needing the assistance of the telescope to render them visible. See **TELESCOPE**, and **ASTRONOMY**.

We do not know of any *Satellites*, besides those just mentioned; nor is there any great foundation to hope that more shall be discovered hereafter, as the longest, and the most exquisite telescopes have already been applied.

**SATELLITES of Jupiter**, are four little/secondary planets, performing their revolutions about Jupiter, as that planet does round about the sun. See **JUPITER**.

Simon Marius, mathematician of the elector of Brandenburg, about the end of November in 1609, observed three little stars moving round Jupiter's body, and proceeding along with him; and in January 1610, found a fourth.—In January 1610, Galileo observed the same in Italy; and the same year published his observations; from which time commenced the observation of the circumjovial *Satellites*.

Galileo, in honour of his patron, first called them *astra Medicea*, Medicean stars: Marius, the first discoverer, called that next Jupiter, *Mercurius Jovialis*, Jupiter's Mercury; the second, *Venus Jovialis*, Jupiter's Venus; the third *Jupiter Jovialis*, and the fourth *Saturnus Jovialis*, Jupiter's Saturn.

Indeed, Anthony Maria Schyræus de Rheita, a capuchin of Cologne, imagined, that, besides the four known *Satellites* of Jupiter, he had discovered five more, the 29th of December, anno 1642, and in honour of Urban VIII. the pope then reigning, denominated them *Sidera Urbano-Estiviana*.—But upon Nauda's communicating the observation to Gassendus, who had observed Jupiter on the same day, he soon perceived that the monk had mistaken five fixed stars, in the effusion of the water of Aquarius, marked in Tycho's catalogue 24, 25, 26, 27 and 28, for *Satellites* of Jupiter: whence it is no wonder they should appear to the discoverer to move a contrary way to that of the rest, viz. from west to east. See *Epist. Gassend. ad Gab. Naud. de novem stellis circa Jovem visis*.

**Phænomena and nature of Jupiter's SATELLITES**.—1°. They all disappear in a clear sky, when Jupiter interposes between them and the sun; that is, are eclipsed by him.

Hence it follows, that they are destitute of light, when the sun's rays, which are propagated in right lines, are intercepted by Jupiter: and hence it follows, that they are opaque bodies like our moon, and are illumined by the sun.—And hence, since Jupiter does not illumine his *Satellites* when placed behind him; he himself, in that side opposite to the sun, is destitute of all light.

2°. When the *Satellites* are interposed between Jupiter and the sun, a round macula or spot is observed in Jupiter's disk; which is sometimes found bigger even than the *Satellite* itself.

Hence, since the *Satellites* are opaque bodies, and are illumined by the sun, and must therefore project a shadow, opposite to the sun; the round spots seen in Jupiter, are the shadows of the *Satellites*.—Hence also, since the intersection of the shadow is a circle, the shadow itself is conical: and hence it follows, that the figure of the *Satellites*, at least, as to sense, is spherical.

3°. If when the earth is between Jupiter and the sun, any of the *Satellites* happen to be between the same, its light disappears, and is lost in Jupiter's light.—Thus M. Maraldi tells us, that on the 26th of March 1707, through a telescope of thirty-four foot, he observed the fourth of Jupiter's moons passing over his body, in form of a dark spot;

VOL. II. N°. CXXXVII.

but it had no sooner got off the disk, than it resumed its usual brightness. A like spot he observed on the 4th of April, from an immersion of the third *Satellite*; but, on the 11th of April, upon watching an immersion of the same *Satellite*, he found it appeared wholly, without leaving any spot at all.—The same phenomenon was also observed at other times by M. Cassini.

In effect, both Cassini and Maraldi have frequently observed very surprizing changes in the apparent magnitudes of the *Satellites*, when there was nothing in their distance, either from the earth, sun, or Jupiter, to occasion such variations.—E. gr. The fourth *Satellite*, which is frequently the least of all, sometimes appears the biggest: and the third, which is ordinarily the biggest, sometimes only appears equal, and sometimes less, than any of the rest.

Hence, since Jupiter's *Satellites* are illumined by the sun, even when immersed in the light of Jupiter, and yet, notwithstanding this, sometimes appear dark, and sometimes disappear; there must be some changes in their atmospheres, to prevent the equable reflection of the sun's rays, from the several parts of the atmosphere.—To the same cause it is owing that their shadows are sometimes seen bigger than themselves.

**Periodical times of Jupiter's SATELLITES**.—The periods, or revolutions of Jupiter's *Satellites* are found from their conjunctions with Jupiter, after the same manner as those of the primary planets are found from their oppositions to the sun. See **PERIOD**, &c.

By this method, Cassini found the periods of the several *Satellites* to be as follow.

First <i>Satellite</i>	1 Day 18 Hours 28 Min. 36 Seconds
Second <i>Satellite</i>	3 13 18 52
Third <i>Satellite</i>	7 3 59 40
Fourth <i>Satellite</i>	16 18 05 06

**Distance of Jupiter's SATELLITES from Jupiter**.—As in the primary planets, with regard to the sun, so in the *Satellites*, with regard to their primaries, the squares of the periodical times are in a triplicate ratio of their distances therefrom.—To determine the distance by observation, they measure them with a micrometer, in semi-diameters of Jupiter.—These distances, according to Cassini, are as follow.

The first <i>Satellite</i>	5 $\frac{1}{2}$ semi-diameters of Jupiter
The second <i>Satellite</i>	9 semi-diameters
The third <i>Satellite</i>	14
The fourth <i>Satellite</i>	25 and one 3d.

Hence, as the semi-diameter of Jupiter is equal to 27  $\frac{1}{2}$  semi-diameters of the earth, the distance of the first *Satellite* from the centre of Jupiter is 166 semi-diameters of the earth; that of the second 249 and a half; that of the third 388; and that of the fourth 884.

**Eclipses of Jupiter's SATELLITES**. See **ECLIPSE**.

**SATELLITES of Saturn**, are five little stars revolving about Saturn. See **SATURN**.

The first was discovered by M. Huygens, anno 1655, March the 25th, by means of a telescope twelve foot long: the other four, at different times, by M. Cassini, viz. those two next Saturn, in March 1684, by help of Campani's Glasses, of one hundred, and one hundred and thirty-six foot long: the third in December 1672, by a telescope of Campani's, of thirty-five foot; and the fifth (that of Huygens being the fourth) in October 1671, by a telescope of seventeen foot. Most, perhaps all, of the phenomena observed of Jupiter's *Satellites*, are also found exhibited by those of Saturn. Thus, they are found sometimes bigger, and sometimes less: the fifth is sometimes, also, found eclipsed, &c. And hence, there is no doubt, but they are of the same nature, &c. See **SATELLITES of Jupiter**.

**The periodical times of the SATELLITES of Saturn, according to M. Cassini, are as follow.**

First <i>Satellite</i>	1 Day 21 Hours 18 Min. 31 Seconds.
Second <i>Satellite</i>	2 17 41 47
Third <i>Satellite</i>	4 13 47 16
Fourth <i>Satellite</i>	15 22 41 11
Fifth <i>Satellite</i>	74 7 53 57

**The distances of Saturn's SATELLITES from his centre, according to the same M. Cassini, are as follow.**

First <i>Satellite</i>	4 $\frac{1}{2}$ Semi-	Diameter of Saturn's ring.
Second <i>Satellite</i>	5 $\frac{1}{2}$ diam.	
Third <i>Satellite</i>	8 of Sa-	
Fourth <i>Satellite</i>	18 turn,	
Fifth <i>Satellite</i>	54 or 10 $\frac{1}{2}$	

The great distance between the fourth and fifth *Satellite*, gave occasion to Huygens to suspect that there might be some intermediate one; or else, that the fifth might have some other *Satellite* moving round it, as its centre.

Dr. Halley, in the Philosophical Transactions, gives us a correction of the theory of the motion of the fourth or Huygenian *Satellite*.—Its true period he makes 15 days, 22 hours, 41 minutes, 6 seconds; its diurnal motion, 22° 34' 38" 18"; its distance from the centre of Saturn, 4 diameters of the ring; and its orbit to be little or nothing distant from that of the ring, intersecting the orbit of Saturn under an angle of 23  $\frac{1}{2}$  degrees.

SATIR and SATIRE. See the article SATYR.

SATISFACIENDUM *capias ad.* See CAPIAS.

SATRAPA, or SATRAPES, in antiquity, the governor of a province among the ancient Persians.

King Darius usually walked attended by his principal lords, and *satrapæ*, Q. Curtius. The kingdom of Persia was divided into *satrapies*, or jurisdictions of *satrapæ*.

The word is originally Persian, signifying, strictly, admiral, or commander of a naval army; but was afterwards applied indifferently to all governors of provinces.—In which sense it was also borrowed by the Greeks, who used *σατραπης* in the same signification.

We also meet with the word in some ancient English charters of king Ethelred; where the lords, who sign next after the dukes, take the title of *satrapes* of the king.—Du Cange takes the word here to signify ministers of the king.

SATTIN \*, or SATIN, a kind of silken stuff, very smooth, and shining, the warp whereof is very fine, and stands out; the woof coarser, and hid underneath: on which depends that gloss, and beauty, which gives it its price.

\* The word comes from the French *Satin*, which Menage derives further from the Latin *Seta*, a bristle, or hair; others from the Hebrew *Sadin*; or from the old French *Sade* and *Sadinet*, handsome, genteel.

There are some *fattins* quite plain, others wrought, some flowered with gold or silk, others striped, &c.—All the varieties in the fabric of *fattins* are made by using new warps, or woofs. The finest *fattins* are those of Florence and Genoa; yet, the French will not allow those of Lyons any thing inferior thereto.—The *fattins* of Bruges have their warp of silk, and their woof of thread.

India *fattins*, or *fattins* of China, are silken stuffs, much like those manufactured in Europe.—Of these, some are plain, either white, or of other colours; others worked, either with gold, or silk, flowered, damasked, striped, &c. They are mostly valued because of their cleaning, and bleaching easily, without losing any thing of their lustre. In other respects they are inferior to those of Europe.

F. le Comte observes, that the Chinese prepare their *fattins* in oil, to give them the greater lustre; but this makes the stuff liable to hang to them.

SATTINET \*, or SATTINADE, a very slight, thin sort of fatin, chiefly used by the ladies for summer night-gowns, &c. and ordinarily striped.

\* The word is a diminutive of *Sattin*.

SATURANTIA, is sometimes used in the same sense as *Absorbents*. See ABSORBENT.

SATURDAY-STOP, a space of time, in which of old it was not lawful to take salmons, in the north, *viz.* from even-song on Saturday, till sun-rising on Monday.

SATURN, in astronomy, one of the primary planets; being that which is furthest from the earth, and the sun, and whose motion is the slowest: thus characterized, ♄. See PLANET.

*Saturn* shines but with a feeble light, by reason of its distance, on which account, though the biggest of all the planets, it appears the smallest. See PLANET.

The period of *Saturn*, or the space of time wherein he revolves round the sun, which makes his year, according to Kepler, is 29 years, 174 days, 4 hours, 58 minutes, 25 seconds, and 30 thirds; whence his diurnal motion must be 2 minutes, 0 seconds, 36 thirds. Though de la Hire makes his diurnal motion 2 minutes 1 second. See REVOLUTION.—

The inclination of his plane to that of the ecliptick, Kepler makes 2°. 32', de la Hire, 2°. 33'. See INCLINATION.—Its mean distance from the sun is 326925 semi-diameters of the earth; and from the earth 210000 of the same. See DISTANCE.—Its smallest diameter, according to Huygens, is 30 seconds: the proportion of its diameter to that of the earth, as 20 to 1; of its surface to that of the earth, as 400 to 1; of its solidity to that of the earth, as 1 to 8000. See DIAMETER and SEMI-DIAMETER.

Dr. Halley observes, in the preface to his catalogue of the southern stars, that he has found *Saturn* to have a slower motion than is assigned him in the tables: this irregularity, we may hope, is abundantly rectified in his own tables now in the press.

It is doubted whether or no *Saturn*, like the other planets, revolves on his axis: it does not appear from any astronomical observations that he does; and there is one circumstance that should seem to argue the contrary, *viz.* that whereas the earth, and other planets, which we know do revolve on their axis, have their equatorial diameter greater than their polar, nothing like this is observed in *Saturn*. See EARTH.

The distance of *Saturn* from the sun being ten times greater than that of the earth from the same, it is found, that the apparent diameter of the sun seen from him, will not exceed 3 minutes, which is but little more than twice the diameter of Venus.—The sun's disk, therefore, to an inhabitant of *Saturn*, will appear 100 times less than it does to us, and both its light and heat be diminished in the same proportion. See SUN.

The phases of *Saturn* are very various and extraordinary, and

long perplexed the astronomers, who could not divine the meaning of such irregularity: thus Hevelius observed him to be sometimes *monospherical*, sometimes *trispheerical*, *spherico-ansated*, *elliptico-ansated*, and *spherico-cuspidated*.—But Huygens plainly shews, that all these monstrous appearances are owing to the imperfection of the telescopes that author had used. Huygens, upon observing him very attentively with much better glasses, reduced all his phases to three principal ones, *viz.* *round*, *brachiated*, and *ansated*. See PHASES, ANSÆ, &c.

One thing *Saturn* has peculiar to himself, *viz.* a ring which surrounds his middle like an arch, or like the horizon of a globe, without touching him any where; the diameter thereof more than double that of the planet which it surrounds; the former containing 45 diameters of the earth, the latter only 20. When raised enough to be out of the shadow of the body of *Saturn*, it reflects the light of the sun very strongly. The thickness of the ring, Dr. Keill observes, takes up one half of the space between its outer or convex surface, and the surface of the planet.

This ring is found to be an opaque, solid, but smooth, and even body.—It was Galileo first discovered that the figure of *Saturn* was not round; but it was Huygens first found that its inequality was in form of a ring; the discovery of which he published in 1659, in his *Systema Saturnianum*.—It is doubted whether or no the ring revolves round the planet? its use and design are still a mystery.—For its phenomena, &c. See RING.

*Saturn* performs his course round the sun, attended with five satellites, or secondary planets; the periods, distances, &c. whereof, see under SATELLITES.

SATURN, in chymistry, signifies lead; in regard that metal is supposed to lie immediately under the influence of this planet. See LEAD.

SATURN, in heraldry, denotes the black colour in the coats of arms of sovereign princes; answering to diamond in the coats of noblemen; and sable in those of gentlemen. See SABLE, &c.

SATURNALIA, in antiquity, feasts celebrated among the Romans, in honour of the god Saturn. See FEAST.

The *Saturnalia* held three days; beginning on the 16th, others say, the 17th, and others the 18th day of December.

During the solemnity the slaves were reputed masters; they were allowed to say any thing; and in fine, were served at table by the masters themselves.—Every thing run into debauchery and dissoluteness, and nothing was heard or seen in the city of Rome, but the din, riot, and disorder of a people wholly abandoned to joy, and pleasure.

M. Dacier observes, that the *Saturnalia* were not only celebrated in honour of Saturn, but also to keep up the remembrance of the golden age, when all the world was on a level. It was a piece of religion not to begin any war, or execute any criminal during this feast.

The *Saturnalia* were not only observed at Rome, but also in Greece; and were, in reality, much older than Rome itself.—Some ascribe their institution to the Pelasgi, who were cast upon the island of Delos; others to Hercules, and others to Janus.—Goropius Becanus makes Noah the author of them. *Orig. lib. 4.* That patriarch, he tells us, in the ark, instituted a feast to be held in the tenth month, in memory of this, that in that month, the tops of the mountains began to appear above the water; and this he makes the origin of the *Saturnalia*: but it is very probable the year then begun in autumn, and of consequence December could not be the tenth month. Vossius goes still higher, and will have it, that the Saturn, in honour of whom this feast was instituted, was Adam.

SATURNILLIANS. See the article SATURNINIANS.

SATURNINE, or SATURNIAN, a term applied to persons of dark, fullen, melancholic complexions; as being supposed under the predominancy of Saturn, or at whose births Saturn was the ascendant.

SATURNINIANS, or SATURNILLIANS, a sect of ancient Gnosticks; thus called from their chief *Saturnillus*, or *Saturninus*, a disciple of Menander, the famous Gnostick. See GNOTICK.

*Saturnillus* taught the same errors with his master, in Syria. See MENANDRIANS.

SATYR \*, SATYRUS, ΣΑΤΥΡΟΣ, in the heathen theology, a fabulous kind of semi-god, who with the Fauns, and Syl-vans, presided over groves, and forests, under the direction of Pan. See GOD, HERO, &c.

\* The word is usually derived from *Satyr*, σατυρ, which, in the ancient Greek, signified the virile member; these deities being supposed much addicted to lasciviousness.

The *Satyrs* were painted half men, half goats: the upper part was human, excepting for horns on the head; the lower brutal, with the tail and legs of a goat; the whole covered with hair.

The poets usually confound the *Satyrs*, Silvens, Sileni, Fauns, and Panes. See SILENI and FAUNS.

Nonnus, in his *Dionysiaca*, makes the *Satyrs* the offspring of Mercury, and a Doric nymph, called Tiphima, and gives us the names of several, *viz.* Pæminius, Thyasus, Hypsi-chorus,

chorus, Oristas, Apæus, Phlegæus, Lycon, &c.—Memnon, in his book against the tyrants of Heraclea, derives the *Satyrs* from Bacchus, and a Naiad, called Nicæa. *Satyrs* made part of the dramatis personæ in the ancient Greek tragedies, which gave rise to a new species of poetry, called *satyrical*. See the article following.

**SATYR**\*, **SATYRA**, or **SATIRA**, in a literary sense, signifies all manner of discourse wherein any person is reprehended; but more particularly a poem, wherein mens follies, and vices are wittily exposed, in order to their reformation.

\* The origin of the word has been the occasion of a notable dispute among critics. The common opinion, supported by Scaliger, Heinsius and Vossius, deduces it from the Greek *Σατυρος*, *Satyrus*, a sort of Sylvan deities, by the Romans called *Fauni*, to whose petulance and wantonness this sort of composition is supposed to bear some resemblance.—On which footing *satyr* is considered as a poem of a wanton, and licentious nature, which like the *Satyrs*, turns things upside down to find occasion for censure, and ridicule.—Cafaubon, on the contrary, followed by Spanheim and Dacier, derives the Roman *satyr* not from the Grecian divinities called *Satyrs*, to which they assert it bears no relation, but from the Latin *satur*, used for *plenum* full, a thing to which nothing is wanting.—Thus it is, *satur color*\*, denotes wool which has sufficiently imbibed the colour, so that its dye cannot be further heightened: so *satur messis* denoted a plentiful harvest; and *satur gestus*, a various one.—From this *satur* came *satura*, which was also written *satira* with an *i*, as *maximus* for *maxumus*; and *optimus* for *optumus*. But *satura*, it is to be observed, is an adjective, referring to a substantive understood, which here is *lanx*; *satura lanx* being the name of a bason filled with all manner of fruits, which the Romans offered yearly to Ceres and Bacchus, as their first fruits. Thus the grammarian Diomedes: *Lanx referta variis multisque primitiis, sacris Ceres inferrebat, et a copia et saturitate rei, satura vocabatur*. Thence also the word *satura* was applied to other mixtures; particularly to a dish consisting of several sorts of meats: *Quoddam genus sarciminis multis rebus refertum saturum dicit Varro vocitari*†. And the same term was also translated to works of genius: thus, *leges satura* denoted laws consisting of many heads or titles, as in Festus: *satura est lex multis aliis legibus conferta*.—And the ancient Gloss. *satura* Νομ. & πολλα περισχων. Such, e. gr. is this, *Vultusne, jubetisne cum Jugurtha bellum componatur, et sedes feriatur: elephantos tradat, item omnes transfugas, &c.*—Hence also a thing was said *per saturam fieri*, when it was done hastily and confusedly: thus *per saturam legem ferre*, was to pass a law confusedly and in the lump, without collecting the votes.—Lastly, *satura* also became the title of several books, as of that of Pescennius Festus, who wrote *historias saturas*, or *per saturam*.—From the whole it is inferred, that the *satyrical* pieces of the poets were so called, as being various, and miscellaneous compositions; or as Porphyry expresses it, *quod multis et variis rebus hoc carmen refertum est*.—On this principle it is urged, the word should be written in Latin with an *u* or *i*, *satura* or *satira*, and in English only with an *i*. They who write it with a *y*, do it as supposing with Scaliger, and others, that the Sylvan *Satyri* gave name to this composition, and that from *Satyrus* came *satyra*, which Cafaubon labours hard to disprove, by showing, that from *satyrus* could never be formed *satyra*, but *satyrica*, and by explaining the great difference between the Greek *satyric* poems and the Roman *satire*.—Scaliger nevertheless defends the ancient etymon from the Greek *Σατυρ*, which he makes the origin of the Latin *satur*, *satura lanx*, &c. which according to him were appellations first used in the sacrifices and ceremonies of Bacchus, where *satyrs* were rehearsed: *Non a satura vel lege vel lance dicta est, ut frustra ac temere satagum grammatici; quin has a satyris dictas puto: cum lancibus enim prodibant, et eanistellis pomorum omni genere plenis, quibus nymphas allicerent*‡.—In effect, *satyrical* poetry, according to this critick, may be naturally enough deduced from the wantonness of the *Satyrs*: and what confirms it is, that *Σατυρικος* is rendered in ancient glosses by *ludus*; and *satyrical*, by *ludicrous*, *sportive*, &c. Thus Seneca's *satyr* is called *ludus*, and Horace and Persius use *ludere* for *scribere satyras*§.—V. Plin. *Hist. Nat.* l. 30. c. 10. § Sever. in *Ætina*. v. 12. § Manil. l. 5. v. 480. § Diomed. l. 3. § Scal. *Poet.* l. 1. c. 12. § V. Dan. Heinf. *de Satyr. Horatian.* l. 2. Lugd. 1628, 12° Fab. *Thef.* p. 2248.

*Satyr* bears a near affinity to raillery, ridicule, lampoon, libel, &c. and stands opposed to panegyric. See **LIBEL**, **PANEGYRIC**, &c.—The reason why *satyrs* generally please, and panegyrics tire the readers, seems to be, because the former are commonly true, and the latter false.—V. *Journ. des Sav.* T. 81 p. 294.

Horace calls his two books of *Satyrs*, indifferently either *Sermones*, or *Satyra*, two words which at first sight present very different ideas. See **SERMONES**.

The chief *satyrist*s among the ancients are, Horace, Juvenal and Persius; among the moderns, Regnier and Boileau in French; and Dryden, Oldham, Rochester, Buckingham, Pope, Young, &c. among the English.

A *satyr* ought to be lively, pleasant, moral, and full of variety, wherein Juvenal and Horace excelled, though their *satyrs* ought not to be read without caution.—Among the qualifications requisite in a *satyrist*, one of the most essential is good-nature: all the sentiments which are beautiful in this way of writing must proceed from that quality in the au-

thor. It is good-nature produces that disdain of all baseness, vice and folly, which prompts the poet to express himself with smartness against the errors of men, but without bitterness towards their persons. It is this quality keeps the mind in equanimity, and never lets an offence unseasonably throw a man out of his character. When Virgil said, he that did not hate Bavius might love Mævius, he was in perfect good humour, and was not so much moved at their absurdities, as passionately to call them fots, or blockheads in a direct invective, but laughed at them with a delicacy of scorn, without any mixture of anger.—The best good man with the worst-natured muse, was the character among us of a gentlemen as famous for his humanity, as his wit. In reality, the ordinary subjects for *satyr* are such as incite the greatest indignation in the best tempers, and consequently men of such a make are best qualified for speaking of them: such men can behold vice and folly, when they injure persons with whom they are wholly unacquainted, with the same severity as others resent the ills they feel themselves.—In all the writings of Horace and Juvenal, there is not one ill-natured expression; not one sentence of severity which does not apparently proceed from the contrary disposition.—V. *Tat.* N°. 242. T. 4. p. 219. *seq.*

*Satyr* may be divided with regard to the measure, and kind of verse, as well as the manner of the poem, and the character, into *narrative*, *dramatick*, *mixed*, &c.

*Narrative*, is a simple narration or recital of abuses in the poet's own person.—Such is the first of Juvenal.

*Dramatic*, is that wherein several persons discourse together; whether they be nameless, as in the first of Persius; or have names, as of Catius and Damasippus.

*Mixt*, is compounded of both the former; as that fine one of Horace, *Ibam forte via sacra*.

*Grave*, and animated, which inveigh with warmth and earnestness against corruption, and vice in every shape.—As those of Juvenal and Persius.

*Sportive*, and lighter, which seem to play with mens follies, but in playing omit no opportunity of making them feel the lash.—Such are those of Horace, hence said to be *sermoni propiora*.

The *grave* sort brandishes a naked sword; the *sportive* presents a thyrsus, like that of the ancient *Satyrs* surrounded with vine leaves, with which it stabs unawares.—The heat of the former sometimes degenerates into fury, and indignation; and the calmness of the latter sometimes sinks to mere raillery. But between the two extremes are a great number of intermediate species and degrees. The former, especially when dictated by passion, is much easiest: nothing is more difficult than to make people of taste laugh, even at the expence of others. The attaining of this must be the fruit of genius and talents, rather than rules: perhaps it may be unnecessary to explain either; since vanity, self-love, and even malice are masters more than sufficient for a poet who wants not wit, and judgment. Thus Juvenal: *Si natura negat, facit indignatio versum*; and Boileau: *La colere suffit et vaut un Apollon*.—V. Mourg. *Trait. de la poef. Franc.* c. 4. *Mem. de Trev.* Nov. 1723. p. 2150.

In perusing the writings of the two leaders of the two sorts of *satyr* last mentioned, it may not be unnecessary to consider, that they lived in very different times: Horace was intimate with a prince of the greatest goodness, and humanity; and his court was formed after his example: therefore the faults that poet falls upon were little inconsistencies in behaviour, false pretences to politeness, or impertinent affectations of what men were not fit for. Vices of a coarser sort could not come under his consideration, or enter the palace of Augustus.—Juvenal, on the other hand, lived under Domitian, in whose reign every thing great and noble was banished the habitations of the men in power. Therefore he attacks vice as it passes by in triumph, not as it breaks into conversation. The fall of empire, contempt of glory, and a general degeneracy of manners, are before his eyes in all his writings.—In the days of Augustus, to have talked like Juvenal had been madness, or in those of Domitian, like Horace. Morality and virtue are every where recommended in Horace, as became a man in a polite court, from the beauty, propriety, and convenience of pursuing them: vice and corruption are attacked by Juvenal in a style which denotes, he fears he shall not be heard unless he calls to them in their own language, with a bare-faced mention of the villanies and obscenities of his contemporaries.—V. *Tat.* T. 4. N°. 242. p. 219. *seqq.*

The Italians divide *satyr* into *serious*, as that in common use; and *jocose*, *giocosa*, which they also call *bernesca*, and *we burlesque*. See **BURLESQUE**.

Their chief *satyrist*s in the *serious* way are, Dante (whom they particularly call *Principe Satirico*) Ariosto, Aretine, Ercole Bentivoglio, Luigi Alamanni, Jacobo Soldani, Lorenzo Azzolino, Salvator Rosa, Lud. Adimari, and Benedetto Menzini.—Those who have excelled in the *jocose* kind are, Francesco Berni (the inventor of it) Mauro, Firenzuola, Casa, Coppetta Varchi Lasca, Caporali, &c.—V. Bianchin *della Satira Italiana*, P. I. p. 9. *Giorn. de Letter d'Ital.* T. 20. p. 306. § Id. *ibid.* P. II. p. 25. *Giorn. p.* 310. *seqq.*

*Satyr*

*Satyr* is divided into *general*, which is levelled at common abuses wherein numbers are equally interested: and *personal*, which points out and exposes particular characters.—Which last, as it affects mens reputation, on which their interest greatly depends, is scarce distinguishable from defamation, and scandal. See INFAMOUS and SCANDAL.

To this last class belong most of those which bear the title of *Anti*: as the *Anti-Baillet* of Menage, with which M. Baillet was so stung, that he composed a treatise expressive on *personal satyrs* which bear the title *Anti*; to shew the immorality, and unlawfulness of them, and their contrariety to the precepts of the gospel. See ANTI.

It is further objected to this kind of *satyr*, that a publick detection, far from producing the effect it is designed for, reformation, is apt to drive men to desperation, and harden them in their course. The excellent author of the treatise of the *Government of the Tongue*, speaking of uncharitable truths, says, a discovery of this kind serves not to reclaim, but enrage the offender, and precipitate him into farther degrees of ill. Modesty and fear of shame is one of those natural restraints which the wisdom of heaven has put on mankind: and he who once stumbles, may yet by a check of that bridle recover himself again. But when by a publick detection he is fallen under that infamy he feared, he will be then apt to discard all caution, and to think he owes himself the utmost pleasures of vice at the price of his reputation.—Nay, perhaps he advances farther, and sets up for a reversed sort of fame, by being eminently wicked: thus he who before was but a clandestine disciple, becomes a doctor of impiety.—Doubtless it was this sort of reasoning that induced our wise legislators lately to repeal the law which put the brand of infamy in the face of felons.—In effect, where crimes are enormous, the delinquent deserves little pity, yet the reporter may deserve less.—*V. Tat. N.º. 74. T. 2. p. 154. seq.* See also *N.º. 76. p. 166. seq.*

**Greek SATYR.**—Cafaubon makes a distinction between the *satyrical* poetry of the Greeks, and the *satyr* of the Romans, which he maintains was peculiar to themselves; in which also he seems to be justified by Quintilian. *Satyra quidem tota nostra est, in qua primus insignem laudem adeptus Lucilius* <sup>a</sup>. Which same Lucilius is also expressly said by Horace to have been the first *satyrical* poet <sup>b</sup>.

—*Est Lucilius ausus*

*Primus in hunc operis componere carmina morem.*

For a like reason Horace calls *satyr*, *Græcis intactum carmen*, a sort of poetry unknown to the Greeks. Spanheim in his fine preface to the *Cæsars* of the emperor Julian, has shown five or six essential differences between those two poems. The Greeks chiefly reprehended vice, &c. <sup>c</sup> in their drama's; though they had also a sort of narrative poems called *Silli*, like the Roman and our *satyrs*. These *Silli* were cutting, or sarcastick poems, as may be easily seen by the fragments of Timon's *Silli*; with this difference, that the Greek *Silli* were parodies from one end to the other, which cannot be said of the Roman *satyr*. Or if we find sometimes a parody, it is what the poet did not design, and consequently the parody does not make the essence of *satyr*, as it does that of the *Silli* <sup>d</sup>.—<sup>a</sup> V. Quint. *Inst. Orat. l. 10. c. 1.* <sup>b</sup> Hor. *Sat. l. 1. 2. v. 62.* <sup>c</sup> I. Cafaub. *de Satyrica Græcor. Poesi & Romanor. Satyra. l. 2. Par. 1605.*—<sup>d</sup> See Mascov. *Exerc. Prior. in Horat. Satyr. § 10.* Langheinrich *Diff. de Timon. Sillograph. Lipsf. 1720. & 1721.* Stoll. *Introd. ad Hist. Liter. P. I. c. 5. § 38.*

Scaliger, notwithstanding all this, followed by some of the latest and best critics, scruples not to derive the *satyrical* poetry of the Latins from that of the Greeks. According to these authors, *satyr* in its origin was a sort of interlude in tragedy, wherein goat-footed *Satyrs* were introduced to alleviate the distress, and with their jeers and humour diversify the solemnity of the tragick scene: much like the mimes in comedy, and the fescennines in the Attellan sports. See SATYRICAL.

At first it was only in the tragedies exhibited in the feasts of Bacchus, that *Satyrs*, the supposed companions and priests of that god, were introduced: but afterwards they made a part in the solemnities of the other deities. So that *satyr*, in its first institution, was wholly dramatick.—V. Scalig. *Poet. l. 1. c. 11 & 12.* See also the article SATYRICAL.

**Roman SATYR.**—Dacier, after Cafaubon, traces the institution of the Roman *satyr* very minutely; and distinguishes three species or states of it: the first *dramatick*, the second *narrative*, the third that called the *Varronian* or *Menippean satyr*.

The ancient Romans had been without any scenical entertainments for almost four hundred years; till chance and merriment in one of their festivals gave rise to the saturnine and fescennine verses, which for some years supplied the place of theatrical performances. These verses were rude, and without any measure, being extemporary, and the productions of a savage people, who had no other instructors than the fumes of wine. Accordingly they were stuffed with gross railleries, and accompanied with gesticulations and dances. An idea of them may be formed by conceiving a knot of country fellows, dancing in a hobbling manner,

toffing about their home-spun jokes, and exposing each other's failings. Thus Horace, *Epist. l. 1. lib. 2.*

*Fescennina per hunc inventa licentia morem*

*Verfibus alternis opprobria rustica fudit.*

The ancient Roman *satyrs* then were a sort of innocent farces, where spectators and actors were indifferently rallied.—And thus they continued till the time of Livius Andronicus, who first attempted to write plays in imitation of the Greeks. This new entertainment appearing more noble and perfect, drew crowds of spectators, which occasioned the *satyrs* to be neglected for some time; but they were afterwards resumed, and tacked to the ends of comedies, much like the modern farces. They were annexed more peculiarly to the Atellane pieces, and on this occasion changed their name *Satyrs* for that of *Exodia*, which they ever after retained. See EXODIUM.

After Livius Andronicus, Ennius having observed the eagerness of the Romans for *satyr*, imagined that poems not accommodated to the theatre, but retaining the gall, raillery, and pleasantry of the theatrical *satyr*, would not fail of success. Accordingly, he wrote discourses under the title of *Satyrs*, in which he took the liberty of mixing several sorts of verse together, as hexameters with iambick trimeters, and trochaic tetrameters. In these pieces were found the same variety, raillery, allusions, fables, and even dialogue, in a word every thing that constituted the character and beauty of the first *satyrs*, except the dancing and musick. Pacuvius succeeded, who also writ *satyrs* in imitation of his uncle, or according to others, his grandfather Ennius. When Pacuvius was in his prime, Lucilius was born, who also composed *satyrs*, somewhat of a new turn, endeavouring to imitate the character of the ancient Greek comedy, of which the Romans had but an imperfect image in their own *satyrs*. This seems to be what Horace meant when he said, *Satyr. l. 1. lib. 2.*

—*Quid, cum est Lucilius ausus*

*Primus in hunc operis componere carmina morem.*

He could not mean, that the Romans had no *satyrs* before Lucilius, since that poet was preceded by Ennius and Pacuvius, whom he imitated. Horace's design was only to hint that Lucilius's manner and turn was new, that he had embellished this poem, inasmuch that he might be looked upon as its first author. But in fact, Lucilius only added to it a little more politeness and salt, without other alteration. And though like Ennius he did not mix together several sorts of verse in the same piece, yet he composed different poems, some of which were entirely hexameter, others iambic, and others trochaic, as appears from his fragments.

The third kind of *satyr* was the *Varronian* or *Menippean*, so called from its author *Varro*, the most learned of the Romans, and because in this he imitated the manner of Menippus the Gadarenian, a cynic philosopher.

This *satyr* was not only a miscellany of different sorts of verse, but was also interlarded with prose, and Greek, and Latin.—Seneca's poem on the death of Claudius, Petronius's *Satyricon*, Lucian's *Dialogues*, the *Golden Ass* of Apuleius, and the *Cæsars* of the emperor Julian, are so many *satyrs* in the *Varronian* taste. <sup>a</sup>—To the same head may also be referred the *Catholicon* of Spain, the *Moriæ Encomium* of Erasmus, the *Don Quixot* of Cervantes <sup>b</sup>, the *Advertisements* from Parnassus of Boccacini, the *Tale of a Tub* by Dr. S. &c.—<sup>a</sup> V. Dacier *Discours sur la Satire, in Mem. de Liter. de l'Acad. R. des Inscr. T. 3. p. 246. seqq.* And in the preface to his version of Horace's *Satyrs*. <sup>b</sup> V. Rapin *Reflex. sur la Poet. en Partic. § 28. Oeuv. Divers. T. 2. p. 205. seqq.*

**SATYRICAL**, something relating to, or that partakes of the nature of *satyr*. See SATYR.

We have *satyrical* poets; *satyrical* preachers, as South; *satyrical* historians, as Burnet and Mezeray; *satyrical* philosophers, as Apuleius and Montaigne.—In the heathen theology, we find a *satyrical* god, viz. Momus: Homer in his *Thersites* gives the character of a *satyrical* courtier. The Dutch have been charged with *satyrical* prints, and medals; which have sometimes cost them dear.

*Satyrical* poetry had its origin at Athens; though its perfection be owing to the Romans. According to father Mourgues, and Bianchini <sup>a</sup>, it was at first a sort of tragedy acted at the feasts of Bacchus, wherein *satyrs* were introduced conversing with heroes <sup>b</sup>. Burette rather takes it for a sort of pastoral farce tacked to the ends of tragedies <sup>c</sup>. One of the chief ornaments of it was a wild, grotesque sort of dance performed by *satyrs*, and called *Sicinnis* <sup>d</sup>. See DANCING.—<sup>a</sup> Mourg. *Trait. de la Poet. Franc. c. 4. Mem. de Trev. Nov. 1723. p. 2149.* <sup>b</sup> Bianchin. *Della Satira Italiana, P. I. p. 5. seqq. Giorn. de Letter d' Ital. T. 20. p. 203.* <sup>c</sup> Buret. *Mem. 2. sur la Danse, in Mem. Acad. R. Inscript. T. 2. p. 163.* <sup>d</sup> Buret. l. c. Averan. *Prælect. ap. Bibl. Chof. T. 22. p. 34.*

The *satyrical* shews of the Greeks were through masquerades: the actors herein were disguised variously, some in the habits of *Satyrs*, Sileni, Centaurs, Mænades, and other of Bacchus's crew; while others personated giants, cyclopes, monsters, and even beasts: the whole making a medley more romantick and extravagant than any thing on the modern stage,

stage, unless perhaps some of our late grotesque pantomime entertainments. The only piece of the kind now extant is the *ΚΥΚΛΩΣ* of Euripides. — V. Boind. *sur les Masq. & Habits de Theatr. des Anc.* in Mem. Acad. R. Inscr. T. 5. p. 176, & 188. — V. Fabric. *Bibl. Græc.* l. 2. c. 18. § 2. p. 645.

**SATYRIC Fountain.** See the article FOUNTAIN.

**SATYRION**, or **SATYRIUM**, a root called by this name, because of its fancied promotion of lust.

Dioscorides distinguisheth this from the orchis, but Mr. Dale ranks it under that tribe. It passes for a great cordial and restorer; but its shape, resembling the human testicles, seems to be the chief foundation of its virtues.

**SAVAGES**\*, or **SALVAGES**, wild, barbarous people, without any fixed habitation, religion, law or policy. See **BARBARIAN**.

\* The word is formed from the Italian *salvagio*, of *salvaticus*, *selvaticus*, or *silvaticus*, which we find used in the barbarous Latin for *silvestris*, belonging to the woods.

A great part of America is peopled with *savages*: many, some say most, of the *savages* are Anthropophagi. See **ANTHROPOPHAGI**.

**SAVANT.** See the article SCAVANT.

**SAUCE**—white SAUCE } See the articles } **WHITE**.  
**SAUCIDGE** } SAUSAGE.

**SAUCISSE**, **SAUSAGE**, in the military art, a long train of powder sewed up in a roll of pitched cloth, about two inches in diameter; serving to set fire to mines, or caissons. See **MINE**, &c.

The length of the *saucisse* is to extend from the chamber of the mine, to the place where the engineer stands to spring the mine. See **CHAMBER**.

There are usually two *saucisses* to every mine; that if the one should fail, the other may take effect.

**SAUCISSON**\*, in fortification, a kind of faggot made of thick branches of trees, or of the trunks of shrubs bound together: whose use is to cover the men, and to serve as epaulments. See **EPAULMENT**.

\* The word is French, and signifies literally, a big sausage. See **SAUSAGE**.

The *saucisson* differs from a *fascine*, which is only made of the small branches, and by its being bound at both ends, and in the middle. See **FASCINE**.

Anciently, they made the *saucisson* 46 foot long, and 15 foot thick; since, it is usually 23 foot long, and 12 thick; bound strongly together with three bands strengthened with iron.

**SAVE Appearances.** See the article APPEARANCE.

**SAVER DE FAULT**, in law, signifies to excuse a fault: as when a man having made default in court, comes afterwards, and alleges good cause why he did it; as imprisonment at the time, or the like. See **DEFAULT**.

**SAVIOUR.**—*Order of St. SAVIOUR*, is the name of a religious order founded by St. Bridget, about the Year 1344; thus called from an opinion, that Christ himself, the *Saviour* of the world, prescribed the rules and constitutions thereof. They are also called, from their foundress, *Bridgetins*, or *Brigittins*.

Their origin was thus: Wilpho prince of Nericia, to whom St. Bridget had been married, being dead at Arras, in his return from Galicia; the widow thought of nothing but devoting herself to a religious life; and accordingly soon after, built the monastery of Western in the diocese of Lincopen in Sweden, where she entered herself.

By the constitutions of this order, it is principally appointed for women, who are to pay a particular honour, and service to the virgin.—The monks are only to afford them the spiritual assistances they may need, to administer them the sacraments, &c.

The number of nuns is fixed to sixty in each monastery, and that of monks to thirteen, according to the number of apostles, whereof St. Paul makes the thirteenth. Four of them are to be deacons, to represent the four doctors of the church, and eight converts; the whole number making seventy-two, the number of the disciples of our *Saviour*.

Setting aside these circumstances, and the habit; this order is under the rule of St. Augustine.—It was approved of by Urban V. and several succeeding popes. In 1603, Clement VIII. made some alterations in it, on account of the double monasteries which then began to be built in Flanders, &c.

**SAULTS.** See the article SALT.

**SAUNDERS.** See the article SANTALUM.

**SAVOR**, or **SAVOUR**, **SAPOR**. See the article TASTE.

**SAUSAGE**\*, or **SAUCIDGE**, a term of some significancy in commerce; denoting a popular food prepared of some crude meat, usually either pork or veal shred small, seasoned and put up in a skin, in manner of a pudding.

\* The word comes immediately from the French *saucisse*, which signifies the same, formed of the Italian *salsiccia*, and that according to Salmasius from the Latin *salsicium* wrote for *salsum*, salted.

The most esteemed confection of this kind, is the Bologna *sausage*, which is much thicker than the common one, and is made with most success in some cities in Italy, particularly Bologna, Venice, &c. whence great quantities are exported to other places.

VOL. II. N°. CXXXVII.

It is made of raw pork, well beaten in a mortar, with a quantity of garlick, pepper in the grain, and other spices: the Italians are furnished with a great part of the skins or guts for their *sauzages* from England: the quantities of that commodity yearly exported, are greater than one would imagine.

**SAUSAGE**, in war. See the article SAUCISSE.

**SAUT**, in the menage. See the article SALTS.

**SAW**, **SERRA**, an instrument serving to divide into pieces, divers solid matters; as wood, stone, marble, ivory, &c. See **SAWING**.

The *saw* is one of the most useful machines, in the mechanic arts, ever invented: the fable, which is perhaps founded on some surer tradition, attributes the invention thereof to Icarus; who, vying with his father Dædalus, enriched the rising arts with several discoveries.—It is added, he took the first hint from the spine or backbone of a flat fish, such as the soal. The *saw* is made of steel, with teeth, but those differently filed, and turned, according to the use it is designed for.—There are also a kind of *saws* without teeth, used in the sawing of marbles and other stones.

The best *saws* are of tempered steel, ground bright and smooth; those of iron are only hammer-hardened: hence, the first, besides their being stiffer, are likewise found smoother than the last.—They are known to be well hammered by the stiff bending of the blade; and well or evenly ground, by bending equally into a bow.

The edge, wherein the teeth are, is always thicker than the back, in regard the back is to follow the edge.—The teeth are cut and sharpened by a triangular file; first fixing the blade of the *saw* in a whetting-block.

When filed, the teeth are to be *set*, that is, to be turned a-skew, or out of the right line, to make the wider kerf or fissure, that the back may follow the better. This is done by putting an instrument, called a *saw-wrist*, between every other two teeth, and giving it a little wrench, which turns one of the teeth a little towards you, and the other a little from you.—The teeth are always set ranker for coarse cheap stuff, than for hard and fine; in regard the ranker the tooth is set, the more stuff is lost in the kerf; and if the stuff be hard, the greater the labour of sawing it.

The workmen, who make the greatest use of the *saw*, are, the sawyers, carpenters, joiners, ebonists, stone-cutters, carvers, sculptors, &c. The lapidaries too have their *saw*, as well as the workers in mosaick; but these bear little resemblance to the common *saws*. See **LAPIDARY** and **MOAICK** work.

But of all mechanicks, there are none have so many *saws* as the joiners, nor of so many different kinds.—The chief are as follow.

*Pit-saw*, a large two-handed *saw*, used to saw timber in pits.—It is set rank for coarse stuff, so as to make a kerf or fissure of almost a quarter of an inch; but for finer stuff, finer.

*Whip-saw*, which is likewise two-handed, used to saw such large pieces of stuff as the *hand-saw* will not easily reach.

*Hand-saw*, is made for a single man's use: of which there are various kinds; as the

*Bow* or *frame-saw*, furnished with cheeks; by the twisted cord and tongue in the middle thereof, the upper ends are occasionally drawn close together, and the lower set the further apart.

*Tenon-saw*, which being very thin, has a back to keep it from bending.

*Compass-saw*, which is very small, and its teeth, usually, not set; its use is to cut a round, or any other compass-kerf: hence, the edge is made broad, and the back thin, that it may have a compass to turn in.

The chirurgeons likewise use a **SAW**, to cut off bones.—It is to be very small, and light, in order to be managed with the more ease and freedom: the blade exceedingly fine, and the teeth exquisitely sharpened; to make its way more gently, and yet with more expedition in amputations of legs, arms, &c.

The **SAW** is also a gardener's instrument, used in the pruning of trees, &c.—It is chiefly applied in the cutting of old, dry, and, consequently, hard woods, whether roots or branches, which might spoil the pruning-knife; and big branches, &c. which the knife could not well take off at one stroke.

Except on these occasions, Quintiney will have us always use the knife, rather than the *saw*. See **PRUNING**.

**SAWING**, the application of the saw, in the dividing of timber, &c. into boards, &c. See **SAW**.

There are wind-mills, and water-mills, which do the office of *sawing* wood, with infinitely more expedition, and ease than is performed by the hand. See **MILL**.—They consist of several parallel *saws*, which are made to rise and fall perpendicularly, by means of one of the grand principles of motion.—A very few hands are here needed, viz. only to push forward the pieces of timber, which are laid on rollers, or suspended by ropes; in proportion as the *sawing* advances. These mills are frequently found abroad; and were lately begun to be introduced in England; but the parliament, in consideration of this, that they would spoil the sawyers trade, and ruin great numbers of families, thought fit to suppress them.

M. Filibien mentions a kind of long saws, invented by one Miffon, inspector of the marble quarries in the Pyreneans; by means whereof stones are sawed even in the rock itself whence they are taken.—He adds, that some of them are twenty-three foot long: but does not describe either their form, or application: he only says, they are of iron, and without teeth.

**SAXIFRAGE\***, *SAXIFRAGA alba*, a medicinal plant, thus called from its supposed virtue in dissolving the stone in the bladder. See **LITHONTHRIPTIC**.

\* The word is compounded of the Latin *Saxum*, stone, and *frango*, I break.

Its leaves are almost round, indented, succulent and shining, like those of ivy: in the middle of the leaves rise stalks, about a foot high, which, at their extremities, bear little white flowers, consisting of five leaves, disposed in form of a rose. Its seed, which is very small, is inclosed in the capsule of a roundish pod. Its root divides itself into several fibres, at the bottom whereof are found little reddish tubercles, like coriander-seed.

It is these grains are commonly called the seed of the *saxifrage*, and are the part used in medicine.—The best manner of administration, is to take them infused in white-wine, or in a decoction in common water.

Some use the decoction of the root itself: it is held a great diuretick; though Dr. Quincy observes, its lithontriptic virtue is but little seen in practice. He adds, that the simple water thereof, sold in the shops, is good for nothing; the virtue of the plant, if it have any, consisting in something too gross to rise over the helm. See **STONE**.

**SAXON**, or the **SAXON Language**. See **ENGLISH**.

**SAY**, or **SAYE**, in commerce, a kind of serge; or a very light crossed stuff, all wool; much used abroad for linings, and by the religious for shirts; and with us, by the quakers, for aprons, for which purpose it is usually green.

There are very considerable manufactures hereof at Sudbury, near Colchester; also at Ypres, Houdscot, &c. in Flanders, &c.—Those made in England are chiefly exported to Portugal, and Leghorn.

**SCABELLUM**, in the antient architecture, a kind of pedestal, usually square, sometimes polygonous, very high and slender, commonly terminating in a kind of sheath or scabbard, or profiled in manner of a baluster. Its use is to support busto's, or other relievo's, &c. See **PEDESTAL**, **STATUE**, &c.

**SCABIES**, in medicine. See the article **ITCH**.

**SCABIOUS**, *SCABIOSA*, a medicinal plant, very common in the fields, which has a great character among dispensatory writers, though it seems to grow much out of use.

It passes for a great pectoral, and to do great things in asthma's and pleurifies; and Etmuller gives it the pre-eminence in inward abscesses. It has a place also among alexipharmicks. But hardly any thing is in better esteem for the itch, and other cutaneous foulnesses; whence it has its name, *viz.* from *scabies*, itch; and upon which account it is often met with in decoctions, and sometimes in a syrup, among such as are called sweeteners.

**SCAFFOLD\***, a timber-work, raised in manner of an amphitheatre, to place spectators upon for the commodious viewing of some shew, or ceremony.

\* Some derive the word from the German *scharwau*, which signifies the same, compounded of *scharwen*, to look, view, and *haus*, house. Guyet derives it from the Italian *catafalco*, which signifies the same thing. Du Cange, from *Eschafaudus*, a word in the corrupt Latin, signifying a tribunal, or pulpit: he adds, that it might come originally from *cata*, a wooden machine used to carry earth to fill up ditches, and carry over the soldiers to the attack; whence the Italians formed their *catafalco*, the old French their *eschafaut*, the Monks their *scaffaldus*, and the English their *scaffold*.

**SCAFFOLD**, is also used for a little stage, or theatre, raised in some publick place, to execute criminals upon, either by beheading or breaking upon the wheel.

**SCAFFOLD**, or **SCAFFOLDING**, is also used for an assemblage of planks and boards sustained by tressels, or by pieces of wood fixed in the wall; whereon masons, sculptors, painters, &c. stand to work in high places, wells, cielings, &c.

**SCALA**, in anatomy.—The cochlea, or inner cavity of the ear, is divided by a septum into two canals, called *scalæ*: whereof the one, looking towards the tympanum, is called the *scala tympani*; the other, having a communication with the vestibulum, is called the *scala vestibuli*. See **COCHLEA**, **EAR**, **TYMPANUM**, and **VESTIBULUM**.

**SCALA**, in the ancient architecture, denotes what in the modern we call a *stair-case*. See **STAIR-CASE**.

**SCALÆ Gemoniæ**. See the article **GEMONIÆ**.

**SCALADO**, or **SCALADE**, a furious assault made on the wall or rampart of a city, by means of ladders wherewith to mount without carrying on works in form to secure the men. Cities are now no longer taken by *scalade*, since the walls have been flanked. See **ESCALADE**.

**SCALE**, a mathematical instrument, consisting of one or more lines drawn on wood, metal or other matter, divided into equal or unequal parts, of great use in laying down distances in proportion, or in measuring distances already laid down.

There are *scales* of several kinds, accommodated to the several uses; the principal are, the *plain scale*, the *diagonal scale*, *Gunter's scale*, and the *plotting scale*.

**Plain SCALE**, or **SCALE of equal parts**, is made, by dividing a line, as *A B* (*Tab. Surveying fig. 37.*) into any number of equal parts, *e. gr.* 5 or 10, and then subdividing one of them, as *a b*, into 10 less parts.—This done, if one of the larger divisions represent 10 of any measure: *e. gr.* 10 miles, 10 chains, 10 poles, 10 feet or 10 inches; each of the lesser will represent one mile, or one chain, pole, foot or inch. See **PLAIN** and **LINE**.

The use of this *scale* is very obvious. *E. gr.* To lay down a distance by it of 32 miles, or 32 poles, &c. I take in my compasses the interval of three of the larger divisions, which contain 30, and two of the smaller, for the two odd ones: this distance drawn on paper, will contain 32 by the *scale*.—Again, were I required to measure any line by a given *scale*: taking the length of the line in my compasses, I apply one foot in one of the great divisions of the *scale*, so as the other may reach over among the lesser; then the number of great and small divisions intercepted between the points, give the number of miles, &c.—See the use hereof further illustrated under the article **PLOTTING scale**.

**Proportional SCALES**, called also *logarithmical*, are the artificial numbers, or logarithms, placed on lines; for the ease and advantage of multiplying, dividing, &c. by means of compasses, or of sliding-rules.—They are, in effect, only so many lines of numbers, as they are called by Gunter; but made single, double, triple, or quadruple; beyond which they seldom go. See **DECIMAL**, **GUNTER'S**, **PLOTTING**, **REDUCING scale**.

<i>Decimal SCALE,</i>	} See the articles	<b>DECIMAL.</b>
<i>Gunter's SCALE,</i>		<b>GUNTER, and LINE.</b>
<i>Plotting SCALE,</i>		<b>PLOTTING scale.</b>
<i>Proportional SCALE,</i>		<b>PROPORTIONAL.</b>
<i>Reducing SCALE,</i>		<b>REDUCING.</b>

**SCALE**, in geography and architecture, a line divided into equal parts, placed at the bottom of a map or draught, to serve as a common measure to all the parts of the building, or all the distances and places of the map. See **MAP**, &c. In maps of large tracts, as kingdoms and provinces, &c. the *scale* usually consists of miles; whence it becomes denominated *A scale of miles*.

In more particular maps, as those of manors, &c. the *scale* is usually of chains sub-divided into poles or links.

The *scales* used in draughts of buildings, usually consist of modules, feet, inches, palms, fathoms, or the like.

To find the distance between two towns, &c. in a map, the interval is taken in the compasses, and set off in the *scale*, and the number of divisions it includes, gives the distance.—The same method serves to find the height of a story in a design.

**Front SCALE**, in perspective, is a right line in the draught, parallel to the horizontal line; divided into equal parts, representing feet, inches, &c.

**Flying SCALE**, is a right line in the draught, tending to the point of view, and divided into unequal parts, representing feet, inches, &c.

**SCALE**, **SCALA**, in musick, is a denomination given to the arrangement of the six syllables invented by Guido Aretine, *ut re mi fa sol la*; called also *Gammut*. See **GAMMUT** and **NOTE**.
