TARTALIC ACID. [CHEMISTRY, *S.* 2.]

TARVER, JOHN CHARLES, was born of English parents at Dieppe, Normandy, March 27th, 1790. At the breaking out of the war in 1793, his family, in common with all other English residents at Dieppe, were thrown into prison. At that time the little boy was staying at the country-house of a friend of his mother (M. Féral, de la Carperie, ingénieur en chef des ponts et chaussées dn Departement de la Seine Inférieure), and when his family, through the interest of friends, had the means of escape given them, he was left behind in France until an opportunity should offer to send him to England. This never occurred. But M. Féral, faithful to his trust, brought the child np as his own son, educated him partly himself and partly at the government school at Pont-Andemer, and at the age of fifteen took him into his own employment in the several works he was snperintending under the government. In the year 1808 M. Féral got the youth an appointment in the Administration de la Marine, in which service he remained, first as secretary to the admiral of the fleet at Toulon, and afterwards in different ports, as Leghorn, La Spezzia, Genoa, and Brest, till at the cessation of the war in 1814 he was enabled to renew his intercourse with his family. In March 1815 he obtained a short leave of absence, and hastened to England, where he found his mother, brother, and sister living. He returned to Paris at the expiration of his leave in April, where he found that Bonaparte had escaped from Elba, and had put himself at the head of his army, and that the king, Louis XVIII., had fled. Such being the uncertain state of affairs, and his own desire to return to his family being very strong, Mr. Tarver gave up his situation, and in less than a week rejoined his mother. He soon sought and obtained employment as a French master; first at the grammar-school at Macclesfield in Cheshire, where he remained three years. In 1818 he went to live at Windsor, and in 1826 he was appointed French master to Eton school, which situation he held till his death April 15th, 1851, aged sixty-one.

Besides having written several elementary works, now used at Eton and some other public schools, he published while at Macclesfield a 'Dictionary of French Verbs, showing their Government and Peculiarities.' During his residence at Windsor he wrote his translation of the 'Inferno' of Dante in French prose, with a volume of notes; and snbsequently 'Lectures on French History,' 'Paris, Ancient and Modern,' and some minor works. He also revised the grammars of Wanostrocht and Levizac, and Nugent's 'Pocket French and English Dictionary.' For the last ten years of his life he was engaged on his 'Phraseological French and English Dictionary,' an original work of immense labour, and which has given to its author a high place amongst those who have most distinguished themselves in philological studies.

TASMANIA. A full description of this colony, formerly more generally known as *Van Diemen's Land*, will be found in vol. xxiv. The following gives the material alterations that have taken place.

The population in December 1847 had increased to 70,164, of whom 47,828 were males and 22,336 females. Of this total 33,173 were either free emigrants, or were born in the colony; the rest were then or had been convicts. Emigration to Victoria colony has combined with other causes to prevent any material increase of the population of Tasmania. On Dec. 31, 1855, it was only 69,962, of whom 7740 were convicts, although 10,887 emigrants had arrived dnring the year. The greater part merely made it the place of transit, bnt many of the old settlers must also have left.

Notwithstanding this drawback the colony is highly prosperous, and its trade and commerce have been continually expanding. The efforts of the local government are rapidly extending improvements over the island. Among the greatest works is a bridge over the Derwent, on the high road from Hobart Town to Lannceston; it is of wood, and has 20 bays, or arches, of 32 feet span each.

The exports to Great Britain in 1853 included 5,514,756 lbs. of wool (the average quantity for four years, 1849-52, had been upwards of 5,000,000 lbs.); 9599 hides (the average nnmber for the previous four years had been about 300,000); 778 cwt. tallow; 4762 cwt. bark; and 405 tuns spermaceti-oil. The declared valne of the imports of British produce and manufactures from Great Britain in 1853 was 1,408,927*l.*, the average for the preceding fonr years being only abont 420,000*l.* Of foreign and colonial prodnce, chiefly spirits, wine, and tobacco, imported from Great Britain, the declared valne for 1853 was 694,790*l.* The number of sailing vessels entered as belonging to Van Diemen's Land on December 31st, 1854, was, Hobart Town, 219, tonnage 21,473; Launceston 62, tonnage 6389. Of steam-vessels 6, of 510 tons aggregate burden, were entered at Hobart Town, and 2 of 356 tons at Launceston. In 1854 the valne of the imports was 2,604,680*l.*, of which 1,776,694*l.* was from Great Britain; the exports amonnted to 1,433,021*l.*, consisting chiefly of wool, oil, timber, cattle, flour, and grain. The extent of land under cultivation was 127,732 acres, of which 49,920 were of wheat, and 35,320 of oats; while the sheep numbered 1,631,308, the horned cattle 103,752, the horses 17,384, and the swine 22,598. The land revenue had amounted to 112,225*l.*

Hobart Town, the capital of the colony, is built upon an nndulating surface, on the left bank of the river Derwent. The streets are of good width, and laid ont on a regular plan, and contain many good dwelling-honses and shops. Some improvements have been made of late years, particularly in the construction of a new market-place in the town, and of docks and wharves at the river-side. Several of the pnblic buildings are handsome. A small rivulet which runs through the town, affords a supply of fresh-water. The population on December 31st, 1847, was 21,467, of whom 38 were aborigines.

Launceston, the second town of the colony, is situated at the confluence of the North Esk and South Esk, which there form the Tamar, 45 miles from its outfall in Bass's Strait. It is 124 miles N. by W. from Hobart Town. Launceston contains a government house, a court house, jail, barracks, and other public buildings, and several places of worship. Convenient wharfs have been constructed. The population in 1847 was 10,100. The shipping trade is important. A good highway extends from Hobart Town to Launceston, and there are inns along it at short distances from each other.

Richmond is situated on the Coal River, about 12 miles N.E. from Hobart Town, and contains a population of 8300. *Longford* has a population of 3690. *Avoca* is a small town in the rural deanery of Longford, with a population of 963.

Tasmania is divided into 19 police districts, and each of the districts generally contains a town or village of the same name. Lincoln, Perth, and George Town at Port Dalrymple, are places of some importance. They are seated on the Tamar, or the Macquarrie, as it is called in the upper part of its course.

Government.—Tasmania is administered, under the 13 & 14 Vict., cap. 59, by a Lieutenant-Governor, who is assisted by an Executive Council and a Legislative Council, of whom two-thirds are elected and one-third nominated. The judicature consists of a supreme court, courts of quarter sessions, and courts of requests.

A bishop of Tasmania was appointed in 1842, whose diocese includes the whole island and its dependencies, and is divided into the archdeaconry of Hobart Town, containing 34 places of worship, and the rural deanery of Longford, containing 19 places of worship. There are also 13 places of worship of the Church of Scotland, 3 for Roman Catholics, 21 for Wesleyan Methodists, 15 for Independents, 3 for Baptists, and 2 for Jews. Of these bodies all except the Independents and Jews receive government aid. There are numerous private schools in Hobart Town and Launceston, besides schools supported by the Government.

TAYLOR, GENERAL ZACHARY, late President of the United States of North America, was born Sept. 24, 1784, in Orange County, Virginia. He was the third son of Col. Richard Taylor, who had distinguished himself in the war of the Revolution, and who in 1785 removed with his family to Kentucky, where the settlers were then very few. Col. Taylor obtained from President Jefferson, May 3, 1808, a commission for his son Zachary as first-lieutenant in the 7th regiment of the United States Infantry. In 1810 Zachary Taylor married. On the breaking out of the war in 1812, having then become Captain Taylor, he was placed in command of Fort Harrison, a stockade on the river Wabash, for his defence of which against the attacks of the hostile Indians he received the brevet rank of major. He distinguished himself on several other occasions during the war, but when it terminated he was reduced from his brevet rank of major to his previous rank of captain, a step backward which he refused to consent to, and resigned his commission. He was, however, in the course of the year reinstated in his rank of major by President Madison. In 1816 he was placed in command of the post at Green Bay, on Lake Michigan, and on the 20th of April, 1819, received his commission as lieutenant-colonel. In 1832 he received his commission as colonel from President Jackson, and in that year served under General Scott in the Black Hawk war. He subsequently held the command of Fort Crawford at Prairie du Chien, where he remained till 1836, when the Seminole war in Florida called for his services. The manner in which he there performed his harassing duties acquired for him great reputation among his countrymen, and the battle of Okeechobee, fought Dec. 25, 1837, gained him the rank of brigadier-general by brevet. In 1838 he was appointed to the command of all the troops in Florida, where he remained till 1840, when the command of the south-western division of the army was assigned to him.

In 1845, on the annexation of Texas, General Taylor was ordered to place his troops in a suitable position for defending that country against a threatened invasion from Mexico, and in August he concentrated his troops at Corpus Christi. There he remained till March 11, 1846, when he broke up his cantonments, and moved westward with a small army of occupation of about 4000 regular troops. He reached the Rio Colorado on the 20th of March, crossed it without opposition, and on the 29th of March arrived at the Rio Grande, opposite Matamoras. On the 8th of May he gained the victory of Palo Alto, and on the 9th of May that of Resaco de la Palma. On the 21st, 22nd, and 23rd of September, he attacked and captured the city of Monterey, which was strongly fortified, and defended by a superior force. On the 22nd and 23rd of February he gained the victory of Buena Vista, in which the Mexican army of 20,000 men under General Santa Anna, was defeated with very great loss by the American army of about 6000 men. This victory led to negotiations for peace, and the treaty was ratified in February, 1848. Meantime General Taylor had returned to his residence at Baton Rouge, in Louisiana, where he had purchased an estate, and on the 1st of June, 1848, the Whig Convention in Philadelphia put him in nomination for the presidency. On the 7th of November, 1848, he was elected President of the United States of America, and on the 4th of March, 1849, he was inaugurated, and entered upon his term of office. He died July 9, 1850, at Washington, and was forthwith succeeded as President by Millard Fillmore, the Vice-President. He left a widow, one son, and two daughters.

TCHAD, LAKE. [AFRICA, *S.* 2.]

TCHADDA. [QUORRA; AFRICA, *S.* 2.]

TEETHING. [DENTITION.]

TEGNÉR, ESAIAS, universally acknowledged by the Swedes as the greatest poet of Sweden, was born on the 13th of November, 1782, at Kyrkerud in Wermland. His father, also named Esaias, the son of a peasant, Lucas Esaison, of Tegnaby, in the diocese of Wexio, had a turn for learning, became a student at the University of Lund, took orders, and was the first of the family to assume the dignity of a surname. He took that of Tegnér, from his birthplace of Tegnaby, a village which is part of the estates of the diocese of Wexio. As a parish-priest he was highly respected for diligence and piety. His wife, whose maiden name was Seidelius, was noted for her force of character and her talents, which she sometimes exercised in writing verses. The poet grew up till his tenth year at Millesvik, on the Lake Wener, where his father had been appointed pastor, and which it may be noticed is in a remarkably ugly part of the country. It is in particular destitute of trees. "King Olof, the tree-feller, a name well known in Swedish history, took his pleasure there," it has been remarked, "with axe and fire, and the trees have not grown again for a thousand years." In February, 1792, when Esaias was in his tenth year, his father died, leaving a widow and six children, four sons and two daughters, in whose circumstances this event produced a great change. The four sons were all remarkable in their way. Lars Gustaf, the eldest, was of a mild and earnest character, strongly tinged with mysticism; Elof, the second, was full of wit and acuteness; the third, Johannes, was silly from childhood, but had such powers of memory that when he was desired to attend to what was going on in church, he could on his return repeat every word he had heard in it, without being able to draw any distinction between the lessons, the banns of marriage, and the sermon. Esaias, the youngest, was of a remarkably flexible character, and at different times of his life exhibited a striking resemblance to each of his brothers in their prominent characteristics.

At the time of his father's death, the two elder brothers, who were intended for the church, were already students at Lund; the expenses of their education quite absorbed the resources of the family when deprived of a head, and the widow was grateful to a friend of her husband, Jakob Branting, a Kronofogde, or sort of tax-collector, for offering to take the youngest off her hands, and make use of him to assist him in his business. Esaias soon made himself a most useful assistant, and was to the end of his life remarkable for his quickness with figures. He found among Branting's books, 'Bjorners Kampadater,' a folio volume of the 17th century, containing a number of Icelandic sagas, with, in the same page, the Swedish translation: and almost his first attempt at composition seems to have been a poem called 'Atle,' founded on one of these sagas. The poem of 'Frithiof,' the great achievement of his riper years, was founded on another. His only recorded attempt at poetry previous to 'Atle' seems to have been when a child at Millesvik, an epitaph on a goose, a worthy companion to Dr. Johnson's famous epitaph on a duck. Branting, who noticed his young assistant's love of books and aptitude for learning, was smitten with the thought that he was degrading him out of his proper sphere; and one starry night, when, as he was driving home with him from a tax-collecting expedition, he turned the conversation on the heavenly bodies, and the boy, then aged thirteen, who had just been reading Bastholm's 'Philosophy for the Unlearned,' discoursed with fluency of things which Branting had never heard of, this feeling became too strong to be kept under. Lars Gustaf, the elder brother, was then acting as private tutor in the family of Captain Löwenhjelm, an officer with nine children. Branting wrote off to the captain in March, 1796, to say that he felt it a sin to keep such a boy as Esaias from study, and to propose that he should be admitted to share, with the captain's boys, the instructions of his elder brother. Löwenhjelm at once consented, and the whole course of the young poet's life was changed. "I now began," he says in an autobiographical notice, written in after-life, "to study Latin; the method adopted was the old and sound, and, in my opinion, the only right one, which may indeed seem tedious and tiresome, but in the end, by the greater certainty it gives, spares time instead of wasting it." He stated that he began French and English at the same time—French in Telemachus and English in Ossian's Poems; but his memory deceived him: a letter written by him in 1793, which was afterwards found, showed that at the age of ten he was already studying Latin and French at Millesvik. Ossian's Poems delighted him to such a degree that he learned English without any assistance. A door is still shown at Malwa, the residence of Captain Löwenhjelm, which bears the marks of the iron rod with which Tegnér used to thrust at it, when enthusiastically shouting out in English one of his favourite passages from Ossian—"The spear of Connell is keen!" In the next year the services of Lars were transferred to the family of Christopher Myrhman, an iron-master at Rämen, near Filipstad, who made some of the best iron in Sweden, and was a man of learning as well as a man of business. Lars made a stipulation that his brother should accompany him, and they both soon became almost members of the family. Myrhman had eight sons and four daughters: Lars was tutor of the four eldest sons; Esaias became at the age of fifteen tutor of three of the others, and the lover of one of the daughters, whom he married some years later.

At Rämen they found an excellent library in the classical languages, and a good collection of Swedish, French, and English books, but not a single German book; it was at the period before the introduction of German literature into Sweden. Of Shakspere, however, there was only 'Hamlet,' "which, strange to say," remarks Tegnér, "interested me very little. It requires, however, a riper age than I had then reached." He threw himself with vehemence on Homer. According to his own recollections afterwards, he in seven months after commencing the study of Greek, had read the 'Iliad' three times through and the 'Odyssey' twice, besides going through Virgil, Horace, and Ovid in Latin. "It seemed to those around him," says Böttiger, in his biography, "as if he had been born with the foreign languages in his brain, and it only needed a gentle shake to wake the slumberers into life." He made himself at the same time a proficient in chess and skittles. Often when the girl came to light his fire in the morning she found him still with his clothes on continuing the studies he had pursued all night. In 1799, when he went with his three pupils to the University of Lund, he passed such an examination to matriculate that it was said it would have sufficed for a degree. His want of means became however at this time so pressing, though he was supported by contributions from Branting and Myrhman, that he resolved to relinquish a learned career; but a life of Anacreon which he wrote in classical Latin, led Professor Norberg to advise him and apparently to assist him to continue the struggle. For some time he studied eighteen or twenty hours a day; he made proficiency in mathematics, as well as in other studies, but unfortunately at the same time that he became remarkable for learning, he became remarkable for the awkwardness, reserve, and rusticity of his manners. A post as under librarian, and afterwards that of assistant-teacher of æsthetics, increased his income, and finally, in 1806, he was enabled to marry, and Anna Myrhman became his partner for life. Then a change took place, which was extraordinary, strange, and sudden. Immediately after his marriage he became all at once as fond of company as he had been averse to it, lively, open, and full of spirits to an extreme, which seems on many occasions to have led him to objectionable levity. The wit of the Greek professor at Lund was often censured as passing the bounds of decorum. This professorship was conferred on him almost as a right when, in 1812, a separate professorship of Greek was first established at Lund. Together with the professorship he received the living of Stäfje, which obliged him to take holy orders, and for the next twelve years of his life he passed his time happily in the duties of his professorship, and in the cultivation of poetry, which he had commenced some time before, but which he prosecuted during this time with such success that he was finally hailed by common consent the first poet of Sweden living or dead.

His first public appearance in verse which attracted any attention, was on a melancholy occasion—the loss of his brother Lars Gustaf, who died in 1802. His elegy on that event was inserted in the 'Transactions' of the Literary Society of Gottenburg, from whom it received some sort of prize. It was in 1808 however when there was an alarm of invasion that he suddenly burst forth as a poet of the first order, by his 'War-Song of the Scanian Land-Defenders,' or 'Local Militia.' "This warlike dithyrambic," says Böttiger, "sounded like a tocsin in every patriotic ear. Tones at once so grand and beautiful had never before been heard from the Swedish lyre. The electric lines ran like wildfire through the kingdom, bearing testimony that the North now owned a Tyrtæus fully equal to him who sang in Sparta." In 1811 another patriotic poem entitled 'Svea,' won the prize of the Swedish Academy; it was a spirited outburst of indignation at the degeneracy of the modern Swedes, compared with their ancestors, whose swords weighed so heavily in the balance of Europe. Tegnér, who visited Stockholm to receive the prize, became acquainted with many of its literary men, at a time of transition when the Phosphorists, headed by Palmblad [PALMBLAD, S. 2], the introducers of German Literature into their country, were contending against the old French school of classicality and elegance, whose chief literary representative was Leopold. Tegnér, who was thought by his youth and his genius, naturally to belong to the anti-classical party, excited some surprise by his undertaking the defence of Leopold, which he afterwards followed up by dedicating to him his poem of 'Axel.' His consecration as a priest in 1812 gave occasion to a poem on that subject, which was afterwards surpassed by a poem of the same kind, his 'Nattvardsbarnen;' or children of the Lord's Supper, a sort of religious idyl, in 1820. In the same year, 1820, some cantos of his 'Frithiofs Saga,' a romantic tale of ancient Scandinavia, appeared in the 'Iduna,' a periodical published by the Gothic Society, of which Geijer [GEIJER, S. 2] was the leading member, with whom Tegnér had become personally acquainted in the country before either of them emerged into fame. His reputation was enhanced in 1821 by the publication of 'Axel,' a brief poetic romance, still thought by many the finest of his poems. It attained its culminating point in 1825, by the completion of 'Frithiofs Saga,' which became at once the most popular poem that has ever appeared in Sweden. From the period of the publication of 'Axel,' if not before, the name of Tegnér was recognised as that of the undisputed head of Swedish poetry.

This period of Tegnér's life was brought to a close by an unexpected, and at least at the outset, an unwelcome event. In 1824 he received the intelligence that the clergy of the diocese of Wexio had presented his name to the king as one of the three whom they nominated for the vacant bishopric, and that the king had been pleased to select him for that office. As a clergyman he had not been remarkable for gravity of demeanour, and the general impression was that an excellent Greek professor and an unequalled poet would now be turned into a very indifferent bishop. These expectations were disappointed. From the time of his appointment Tegnér's life took a different course. He ceased to appear as a poet, and gave himself up to the business of his diocese, and in particular to the management of its revenues, in which his early experience with Branting was said to be found of use. Almost the only unepiscopal episode we hear of for some years is on that memorable day in 1829 when he presented the poetical crown to Oehlenschläger [OEHLENSCHLÄGER, S. 2]. He gave himself up to theological studies, and was found in his study "walled up with fathers of the church and biblical commentators." Thirty-one new churches were built in his diocese during his episcopate. At the diets which he attended he was distinguished for his conservative principles and his opposition to what he called 'Radicalism,' at the time when his old friend Geijer, who had at one time been tending the same way, suddenly broke with the conservative party, on account of its propensity to carry reaction too far. His old liveliness was still to be found in his private letters. In the Diet of 1834 financial affairs were the chief subject; he complained to a friend of his being bilious and unwell, so unwell, he said, that he was as little able to comprehend financial affairs as a member of the Bank committee. "As for biliousness," he added, "it is unnecessary to carry that with one to the Diet, it can easily be got there, and in fact belongs to the order of the day." Tegnér was still looked upon with such favour by his order, that in 1839 he was one of the three candidates proposed for the archbishopric of Upsal. Next year, alas! he was the inmate of a lunatic asylum. "God preserve my understanding," he had written shortly before in a letter to one of his friends; "there runs a vein of madness in my family. With me it has hitherto broken out in poetry, which is a milder kind of madness, but who can give me the assurance, that it will always take that way?" A seclusion of some months in an institution for the insane at Schleswig enabled him to return in 1841 to his family, and partially to his duties, and he was even able to preach so lately as June, 1845, but after that he sank gradually. He was confined chiefly to his house and his room. He lay on the sofa, in cheerful spirits, and passed his time in reading. "About him," says Böttiger, "was generally seen a pile of books of different sorts and sizes, from the old Greek folio to the last fashionable novel, but some volumes of Ariosto and Walter Scott were never wanting." After a stroke of paralysis and still weakened health, he died without pain on the 2nd of November 1846, shortly before midnight and during a beautiful appearance of the northern lights. His wife survived him, and he left six children, one of whom, a daughter, is married to Professor Böttiger of Upsal. Böttiger is himself a poet, and one of his best-known pieces is a description of a little incident which occurred to him in the Bay of Naples, where having been interested by witnessing the emotions which a stranger evinced over a book he was reading, and afterwards finding the book lying where the stranger had left it, he took it up and found it was 'Frithiofs Saga.' Tegnér, as we have seen, had lost his father in 1792; his mother survived till 1836, when she died at the age of ninety. In 1822, when the king of Sweden, Bernadotte, was returning from a visit to Norway, he heard that Tegnér's mother lived in a village he was passing through, expressed a desire for an interview, and told her that she had given birth to a son of whom she and Sweden might be proud. The mother of such a son however had passed most of her life in anxiously tending on another son, the poor idiot Johannes, who at last in an unguarded moment walked into a river and was drowned.

The works of Tegnér were collected and published in six volumes by his son-in-law Professor Böttiger (Stockholm, 1847-48). Nearly three of the volumes are occupied by his smaller poems, two by prose works, chiefly speeches, and extracts from letters, and a volume and a half by the larger poems, on which the reputation of Tegnér is chiefly founded, and by a biography of the poet, from which we have taken most of our details. The smaller poems are many of them occasional verses on subjects of slight importance, but some are vigorous and interesting. One of his earliest is on 'Pitt and Nelson,' both of whom are objects of strong condemnation, Nelson being called 'the Tamerlane of the Sea;' another, remarkably well written, is a dialogue between England and France, vituperating each other, in which England has decidedly the worst of the fray. The sympathies of Tegnér seem to have been extremely limited, his contempt for Germans and Germany is repeatedly expressed, and it would be difficult to find in his writings praise of any country but his own, which, except on a tour for health to Carlsbad in 1833, was the only one he had ever seen, or apparently ever wished to see. In one of his letters he even declares his aversion to Stockholm as that hateful object a "large small town." His speeches are in great reputation both in Sweden and Germany for their lucidity and eloquence. They were chiefly delivered at anniversaries of grammar-schools and on similar occasions, and are of much the same character as those delivered in England and America at mechanics institutes, &c., and bearing on the same class of subjects—the benefits of education, the utility of particular studies, &c. Of the larger poems, 'Frithiof,' 'Axel,' and the 'Children of the Lord's Supper,' the English reader has an opportunity of forming almost as good a judgment as the Swedish. No foreign poet has been so fortunate as Tegnér in his English translators. Of 'Frithiof' there are at least five versions, more in number than we have of any other foreign poem of this century, and several of them are good. The first, by the Rev. William Strong, published in 1833, is undoubtedly the worst, but is still the work of a man of learning, and of an enthusiast for his original; an anonymous one, by several hands, which appeared in Paris in 1835, is apparently in part by Frye, who deserves more notice than he has met with; a third, by R. G. Latham, in 1838, though not equal to Latham's 'Axel,' is a fair representation of the original; a fourth, by G. Stephens, now Professor of English at the University of Copenhagen, was issued at Stockholm in 1841, and accompanied by a letter from Tegnér to say that he thought it the best English translation of himself he had seen; a fifth, by Oscar Baker, in 1841, possesses considerable merit. It is possible that the English reader, on the perusal of some of these, may arrive at the opinion that the 'Frithiofs Saga' has been considerably overrated. The same conviction has been arrived at by several English readers, among others the writer of this article, on the perusal of the original. The poem of 'Frithiof' has no deep pathos, no vivid eloquence. Its general character is that of neatness and prettiness rather than anything superior. It sinks often into tameness, and never rises to sublimity. The story, which follows too closely the original saga, is that of a young Northern warrior who is enamoured of the sister of two young kings, who is denied her hand by her brothers, who, in his indignant proceedings thereupon, accidentally burns the sacred grove of Balder, leaves the country on a warlike expedition, on his return finds his beloved married to an old king, who generously puts an end to his existence when he discovers he is in the lovers' way, and finally obtains the hand of the lady after having humbly expiated the sacrilege against Balder of which he has been guilty. This story is told in four-and-twenty cantos, of which some are as short as ballads, and each one is in a different measure, one in blank verse, another in hexameters, &c. That an epic poem would be improved by a variety of metre, was a proposition laid down long ago by Dr. Watts, if not before him; but this mechanical variety of four-and-twenty different metres, not one repeated, has somewhat of a childish appearance. Tegnér's poem of 'Axel' is in what may be called the Byronic metre, and in tone and structure strongly reminds the reader of Byron's 'Mazeppa,' on which it was doubtless modelled. The story is slight and commonplace—a maiden who follows her lover to the wars in male attire, and whose death in combat drives her lover distracted—but the spirit with which it is told atones for every deficiency. Those who are fond of 'Mazeppa' are sure to like this poem, either in the original, or its excellent English translation by R. G. Latham. There are two others, one by Oscar Baker, who has also translated 'Svea,' and another in 'Blackwood's Magazine.' The 'Children of the Lord's Supper' has been admirably translated by Professor Longfellow, who has also rendered various passages from 'Frithiof' and 'Axel.'

TEIDÆ, a family of Saurian Reptiles. [SAURIANS]. The following is a synopsis of the genera:—

I. Throat with two cross-folds, with larger 6-sided scales between.

A. Ventral shields small, long, smooth. Tongue contractile.

1. *Teius.*—Toes 5-5. Femoral pores distinct. Two species.
2. *Callopistes.*—Femoral pores none. Toes 5-5. One species.

B. Ventral shields broad, smooth.

* Tongue elongate, sheathed at the base. Teeth compressed.

3. *Ameiva.*—Toes 5-5. Teeth 3-lobed. Six species.

** Tongue not sheathed, free at the base.

4. *Cnemidophorus.*—Teeth compressed longitudinally, 3 lobed. Toes 5-5. Six species.

5. *Dicrodon.*—Teeth compressed transversely, bifid. Toes 5-5. One species.
6. *Acrantus.*—Teeth compressed transversely, bifid. Toes 5-4. One species.

II. Throat with a collar of large shields.

a. Collar and ventral shields keeled. Tail round.

7. *Acanthopyga.*—Scales of back large, of sides granular. One species.
8. *Centropyx.*—Scales of back and sides moderate, in many series. One species.

b. Collar and ventral shields smooth, elongate. Tail round.

9. *Emminia.*—Scales of back rhombic, keeled, equal. One species.

c. Collar and ventral shields smooth, elongate. Tail compressed.

10. *Crocodilurus.*—Scales of back equal, similar. One species.
11. *Custa.*—Scales of back unequal. Throat with a collar of large scales. One species.
12. *Ada.*—Scales of back unequal. Throat with two plaits. One species.

This family is well-illustrated by the *Teius Teguixin* of the British Museum Catalogue. It is the *Lacerta Teguixin*, Linn.; *Tejus Teguixin*, Schinz.; Le Grand Sauvegarde d'Amérique, Cuv.; Variegated Lizard, Shaw; Great American Safeguard, Griffith's Cuvier.

The warm countries of America are the native places of the *Teidæ*, which arrive at a considerable size, often measuring as much as 4 or 5 feet in length. Messrs. Duméril and Bibron state that they ordinarily inhabit the fields and the borders of woods, although they never climb trees; but they also appear to frequent sandy, and consequently arid tracts, where they are said to excavate burrows, in which they lay themselves up for the winter. When, in their flight to avoid pursuit, they come upon a lake, pond, or river, they plunge in, according to D'Azara, to escape from the danger which menaces them, and do not leave the water till all fear of danger is past. These Lizards, observe Messrs. Duméril and Bibron, have not, indeed, webbed feet; but their long and slightly compressed tail becomes, without doubt, under such circumstances, a sort of oar, of which they well avail themselves. D'Azara states that they feed on fruits and insects, and that they also eat serpents, toads, young chicks, and eggs. He also relates that they are fond of honey; and that in order to procure it without fear of the bees, they come forward at intervals, and, as they run away each time, give the hive a blow with their tail, till by repeated attacks they weary out the industrious insects, and drive them from their home. For figure of the Variegated Lizard, see SAUVEGARDE.

TENANT AND LANDLORD. The provisions of the statutes 4 Geo. II., c. 28, and 11 Geo. II., c. 19, and 57 Geo. III., c. 52, have been superseded by those of the Common Law Procedure Act, 1852; the landlord's remedy remains, however, the same, the procedure alone is altered. [EJECTMENT, *S.* 2]. Besides the remedy given to landlords in certain cases by the statute 1 & 2 Vict., c. 74, another equally summary method of recovering possession of premises when they are held over by a tenant, is afforded by the action of ejectment in the County Court. This tribunal may be applied to whenever the rent or value of the premises does not exceed 50*l.*, and no fine has been paid. [COUNTY COURTS, *S.* 2].

TENNANT, WILLIAM, was born in 1785 at the little fishing-town of Easter Anstruther, in the County of Fife, Scotland, and was educated in the town-school, where he had for a fellow-student the afterwards celebrated Dr. Chalmers. In 1799 he was sent to the University of St. Andrews, and acquired some knowledge of and a taste for the classical languages from the instruction and lectures of Dr. Hill and Dr. Hunter, but circumstances prevented his continuance for more than two sessions. At an early period of life he had lost the use of his feet, and could only move by the assistance of crutches. He was thus precluded from most active employments, and in 1801 he became clerk to his brother, who carried on the business of a corn-factor at Glasgow, whence he subsequently removed to Anstruther. Whilst in this situation he most zealously prosecuted his studies. He made himself acquainted with the best classics in verse and prose; with Ariosto, Camoens, and Wieland, in modern languages; and with Hebrew; nearly all of which was accomplished by his own unaided efforts. While residing in his father's house at Anstruther, and painfully aware of approaching commercial embarrassments, he wrote, and published anonymously in 1812, in his own little town his chief poem, 'Anster Fair.' It is a humorous fairy tale, adopting Maggie Lauder for its heroine, describing the scenery, the customs, and characters to be found and observed at Anstruther Fair and in the neighbouring towns and villages, written with a slight sprinkling of the Scottish dialect, in the ottava rima, which had fallen into disuse, though soon afterwards adopted by Lord Byron, whose example was quickly followed by others. The poem made but little way with the public at first, indeed it was hardly made known; but it attracted the attention and praise of A. F. Tytler, Lord Woodhouselee, and in 1814 a highly favourable review of it appeared in the 'Edinburgh Review' from the pen of Mr. Jeffrey. In his own narrow circle, however, it had made an impression in his favour, and probably assisted in procuring him the appointment in the autumn of 1813, of parish schoolmaster of Dunino, a rural upland district between Anstruther and St. Andrews, of which the income was about 40*l.* a year. While residing here, with the assistance of books from the library of the neighbouring university, he made himself master of the Arabic, Syriac, and Persian languages. In 1816 he was removed to a school at Lasswade, a pleasant village near Edinburgh, with a larger salary, affording him also an opportunity of becoming known to the most eminent literary men of that capital. He continued to prosecute his studies, and in 1819 was elected teacher of the classical and oriental languages in the institution founded under the will of Mr. M'Nab for promoting education at Dollar in Clackmannanshire. Here he continued till the beginning of 1835, when he succeeded the Rev. Archibald Baird in the professorship of Oriental languages at St. Mary's College, St. Andrews. At St. Andrews, where the university session extends from early in November to the end of May, he henceforward passed his winters, while the summers were spent at a little villa called Devon Grove, near Dollar. His leisure was employed in compiling grammars of the Syriac and Chaldee languages, published in 1840. His other works were—'The Thane of Fife,' 1822; 'Cardinal Beaton,' a tragedy, 1823, and 'John Balliol,' a drama, 1825, both pieces, though not ranking high as dramas, displaying much poetical power, with considerable originality; 'The Dinging Down of the Cathedral' [of St. Andrews], a descriptive poem in the Scottish dialect; 'Hebrew Dramas founded on Bible History,' 1845; and a 'Life of Allan Ramsay, with Remarks on his Writings,' prefixed to an edition of the 'Gentle Shepherd,' not published till 1852 at New York. Another little production deserves to be mentioned, as showing the cheerfulness with which he bore the calamity of his lameness. 'The Anster Concert,' a small pamphlet of 12 pages, published at Cupar, in Jan. 1811, purports to be by W. Crookleg, and preceded by some months the publication of his 'Anster Fair.' It is in the Scottish dialect, with mottoes on the title-page in Hebrew, Greek, Latin, and English, and pleasantly alludes to the peculiarities of the inhabitants of Anstruther, as well as to his own condition. He also wrote some miscellaneous poems, including translations from the Persian, Greek, and German, of more than average merit. He died on the 15th of February, 1848, at his house near Dollar.

TERBIUM. [CHEMISTRY, *S.* 1.]

TEROPIAMMON. [CHEMISTRY, *S.* 2.]

TERRICOLA. [ANNELIDA.]

TESTUDINARIA, a genus of Dictyogenous Plants, belonging to the natural order *Dioscoreaceæ*.

T. Elephantipes, the Elephant's-Foot Plant, is well known in our collections of plants from its curious truncate rootstock, looking like an elephant's foot. It is covered with a soft corky bark, which is split so as to give it a rough character. From the top of this thick mass a climbing stem is sent, which bears the leaves and flowers. Like the rest of Dictyogens this stem has not the regular division of the parts of the stem seen in most Exogenous Plants.

TETRAONYX. [TORTOISES.]

TEXAS, one of the United States of North America, lies between 26° and 36° 30′ N. lat., 93° 30′ and 106° W. long. It is bounded E. by the state of Louisiana; N.E. by that of Arkansas; N. by the Indian Territory; W. by the Territory of New Mexico; S.W. by the Republic of Mexico; and S. by the Gulf of Mexico. Its greatest length from north to south is 700 miles; its greatest width from east to west, 800 miles. The area is 274,356 square miles. The population in 1850 was 212,592 (of whom 58,161 were slaves), or 0·65 to the square mile. This however does not include the Indians, chiefly occupying the hill country, who were in 1853 estimated by the Commissioner of Indian Affairs at 29,000. The federal representative population according to the Census of 1850 was 189,327, in which number three-fifths of the slaves are included. This, according to the present ratio of representation, entitles the state to send two representatives to Congress. To the Senate, like each of the other United States, Texas sends two members.

Surface, Hydrography, &c.—The surface of so vast a country is of course greatly varied, but it may be broadly described as comprising a low and level region, an undulating or prairie tract, and a hilly or mountainous district, answering generally to what have been called Southern and Eastern, Middle, and Western Texas.

The level region occupies the entire coast, and reaches 60 or 80 miles into the interior. For 10 or 12 miles inland the country is subject to inundation, but behind this swampy tract it rises imperceptibly for some miles, and then stretches out in a wide plain with a nearly level surface. This plain is from 10 to 30 feet above the water-courses, and with the exception of the low bottoms along the banks of the rivers, it is not subject to inundation. The tide, though it varies only from two to three feet, ascends the rivers to the distance of 45 or 50 miles from the sea in a straight line. The whole of the plain is wooded, with the exception of the highest tracts of land between the rivers, which are destitute of trees, and exhibit fine prairies. The forests consist of different kinds of oak, hickory, iron-wood, sugar-maple, and other useful trees, which are found in the southern states of the American Union. The whole of this tract is in process of conversion into an immense field, producing cotton, maize, wheat, tobacco, and every kind of plants and fruit-trees which grow in the temperate zone and on the borders of the tropics; the sugar-cane flourishes here, but is not much cultivated.

The undulating country at the back of this plain, though naturally less fertile, has a more genial and healthy climate, and with moderate culture appears capable of producing almost unlimited supplies of corn, cotton, and tobacco, while the uplands afford vast and excellent grazing-grounds, being covered with grass, which maintains its verdure during many months. This is the most populous and productive portion of the state. The country between the river-bottoms generally rises from them with a gentle acclivity to an elevation of 200 to 400 feet, and presents for the most part an undulating surface, on which isolated hills of moderate elevation are dispersed. By far the greatest part of this tract is destitute of trees, which occur only in isolated clumps about the bases and declivities of the hills, and at considerable distances from one another.

Western Texas, the hilly and mountainous district, includes the southern portion of the Sierra Sagramento, and a nearly parallel range on the east called the Guadalupe Mountains. This region is little known, being as yet left to the Indian tribes, chiefly Cumanches, to the wild animals, and to the hunter. Many of the mountains are believed to rise more than 2000 feet above their bases. Most of the rivers of Texas have their origin in the mountain region, and American writers speculate freely on what it may become when the 'water-power' is fairly turned to account.

Texas owes much of its great capability for agricultural purposes to its numerous rivers and the regularity of their course. Nearly all the rivers, even those which run only 50 miles, are navigable for small craft in the greatest part of their course. The most remarkable of these rivers from west to east are—the *Rio Grande*, noticed under MEXICO, between which country and Texas it forms the boundary; the *Rio Nueces*, which flows about 250 miles with a general south-eastern course; the *San Antonio;* the *Rio Guadalupe*, which falls into a lagune forming the harbour of Espiritu Santo; the *Colorado*, or *Red River of Texas*, which traverses in its upper course the mountain tract of San Saba, flows upwards of 400 miles, and falls into the lagune constituting the harbour of Matagorda; the *Rio Brazos* or *Brazos de Dios*, whose origin is near to that of the Red River, and which, flowing chiefly in a south-south-easterly direction, intersects nearly the centre of Texas and the most fertile districts, and enters the sea after a course of more than 400 miles; and the *Rio Trinidad*, which, after a course of more than 300 miles in a south-south-easterly direction through a very fertile tract, falls into Galveston Bay. Red River and Sabine River, which separate Texas from the Indian territory and Louisiana, are noticed under LOUISIANA. The *Sabine* has a length of 350 miles, and is navigable for 150 miles, and much higher, by keel boats. Before reaching the gulf it expands into a lake 30 miles long and 8 miles wide. The bar at its mouth has 4 feet of water over it at low tide.

There are several good harbours along the coast. The low coast is skirted by a number of long flat islands, separated from the main by narrow straits; but these are much deeper than those farther south, and afford in several places good anchorage for vessels of moderate burden. The bars at the mouths of the rivers have tolerably deep water on them, and there is no part of the extensive Gulf of Mexico which has more or better harbours, bays, and inlets than those of Texas. There are no lakes of any importance in the state; and no canals have yet been constructed.

A southern Pacific railway is to cross Texas from east to west, and several other railways are projected, but none have as yet been carried into execution. The ordinary roads are many of them well laid out, and in good condition.

Geology, Mineralogy, &c.—The geological features of Texas have been but cursorily examined. The mountainous country consists chiefly of igneous and metamorphic rocks. In the eastern portion of this district a considerable belt of Lower Silurian strata has been observed. North of this, along the Saba River, carboniferous strata occur. Much of the centre and north of the state appears to belong to the cretaceous system of rocks; while the whole of the level region, and the low districts bordering the Gulf of Mexico, consist of tertiary and recent deposits.

In minerals the state is believed to be very rich. Gold has been found along several of the smaller streams of the western portion of the mountain district. Silver also occurs in the hill country, and the silver mine of Saba is said to have been one of the richest in America during the Spanish occupation. Iron ore appears to be very widely diffused. Lead and copper have also been found in several places. Coal occurs on the Trinidad and Brazos rivers. Alum is obtained in two or three places. Salt occurs very extensively in salt springs and lagunes; large quantities are annually taken from a salt lake near the Rio Grande. Potash and soda are also obtained in dry seasons near the salt lagunes. Asphaltum is obtained on the coast. From the limestone of the prairie country abundance of lime is obtained. Red and white sandstone, or freestone, may be quarried through a large portion of the state. A soft white stone, which becomes quite hard on exposure to the atmosphere, and is very useful for building purposes, is found in several places along the eastern side of the hill country. Agate, chalcedony, and jasper, are found. Saline, white and blue sulphur, and other mineral springs, said to possess considerable curative properties, are very numerous.

Climate, Productions, &c. — The temperature varies according to the locality, from tropical to temperate; yet, except along parts of the coast and the rivers where subject to inundations, the climate is said to be generally pleasant and salubrious—in some places eminently so. The summer heat is modified by refreshing breezes, which blow almost uninterruptedly from the south. In winter, ice is seldom seen, except in the northern part of the state. Texas has periodical winds: from March to November they are from the south, and little rain falls; the rest of the year northerly winds prevail, and in December and January they are strong and keen.

The characteristics of the soil and productions have been noticed in speaking of the surface of the country. Cotton has now become the staple of Texas: it generally grows well and of good quality; that grown along the coast is said to be little inferior to the celebrated Georgian Sea Island cotton. Tobacco also thrives well, and is becoming an important product of the state. The sugar-cane flourishes, but, as already noticed, engages very little attention from the Texan farmer. All the cereals produce abundant crops. Maize is the chief grain staple: two crops of it are frequently obtained annually. Wheat and oats are the next in importance among the cereals, and both are grown extensively. Buckwheat, rye, and millet are also grown. Rice is somewhat largely cultivated, and its culture could be very greatly extended. Both common and sweet potatoes are largely raised. Indigo, vanilla, and the chili, or cayenne pepper, are indigenous almost throughout the state.

All kinds of fruit ripen well. The vine grows luxuriantly, and it appears probable that Texas will become a wine-growing country. The orange, lemon, fig, peach, nectarine, pine-apple, olive, paw-paw, plum, apple, gooseberry, and many other fruits of both sonthern and northern climes ripen here side by side; while indigenous fruits are very numerous. Garden vegetables of almost every kind thrive remarkably here. Among the indigenous plants are the yanpan, or Texan tea-tree, the leaves of which yield an infusion which serves as an agreeable and cheap substitute for the tea of China; and the nopal, which is a favourite food of the cochineal insect, while cattle and horses feed on its fruit and leaves, and its wood is used for making fences, and for fuel. The native wild flowers inclnde many of the choicest favourites of the European garden and conservatory; among others are the dahlia, stellaria of every variety, geraniums, passion-flowers, trumpet flowers, perpetual roses, mimosas, and an endless variety more of the most brilliant hnes.

The forests of live oak and cedar surpass those of any other state in the Union. The entire coast, the river bottoms, and the chief part of the eastern section of the state, are heavily timbered with pine, oak, ash, hickory, walnut, cedar, cypress, and other forest trees, often of noble dimensions; and forest islands occnr all over the prairie country.

Horses and cattle form an important portion of the wealth of Texas, the rich prairies affording unlimited pasture-grounds. Swine are also raised in vast numbers. The wild animals, once so numerous, are rapidly diminishing in numbers. Buffaloes however yet roam the wilds in herds of many thousands; as do also deer. Wolves and foxes are still numerous, and the black bear abounds among the cane-brakes of the coast. The peccari and the wild-hog are numerous in the woods. Mustangs are found in droves in the west and north; when domesticated, they are much prized for their fleetness. Moose-deer, antelopes, mountain-goats, racoons, opossums, rabbits, squirrels, and numerous smaller animals abound in the forests and abont the hills. Wild-fowl, in almost interminable numbers and of the most various kinds, afford ample snpplies of game to the sportsman; and there are numerous singing-birds, paroquets, mocking-birds, &c. All the rivers abound in fish, both of the ordinary kinds, as cod, mullet, pike, &c., and of species not usually met with, as the red-fish (which gives its name to Red-Fish River, where it abounds), a fish of delicious flavour and large size, sometimes weighing 50lbs.; the gar-fish, remarkable for the length of its snont; the alligator-gar, which is said to measure several yards in length, and to resemble the alligator in shape, &c. The common alligator is met with of very large dimensions, in the lagunes and the lower course of several rivers. Oysters, lobsters, crabs, and other shell-fish are taken all along the coast. Turtles abound in the bays and harbours.

Manufactures, Commerce, &c.—The manufacturing industry is chiefly that incidental to an agricultural state, the bulk of the capital being invested in grist and saw-mills, tanneries, implement-manufactories, &c. There are somewhat considerable iron-works, machine-shops, and carriage and harness factories.

The direct foreign commerce, though steadily increasing, is not very great, most of the exports being made coastwise to New York, New Orleans, &c. The exports during the year ending June 30, 1853, amounted to 1,029,681 dollars, of which 569,918 dollars were of domestic produce. The imports during the same period amounted to 281,459 dollars, of which 156,144 dollars were carried in American and 125,315 dollars in foreign vessels. The total shipping owned in the state in 1850 was 3897 tons, of which 3309 tons belonged to the district of Galveston.

Divisions, Towns, &c.—Texas is divided into 77 counties. Austin City is the political capital, bnt Galveston is the chief commercial emporium, and the most populous town in the state. The following are the more important towns: the population is that of 1850:—

Austin City, the capital, is situated on the left bank of the Rio Colorado, in 30° 28′ N. lat., 97° 45′ W. long.: population 629. It is merely a village, but it contains the state buildings, and supports two weekly newspapers.

Galveston, a city and port of entry, and the capital of Galveston county, is situated near the east end of Galveston Island, abont 200 miles S.E. from Austin: population, 4177. The harbour of Galveston is the best in Texas, and six-sevenths of the shipping of the state belong to this port. The trade of Galveston is very considerable, and is steadily increasing. A regular line of communication by steam-ships is maintained with New Orleans. There are a few good pnblic buildings in the city, and numerous warehouses, hotels, &c. Galveston Island, on which the city stands, is 32 miles long and about 2 miles wide. It was once a favourite lurking place for pirates, but is now thoronghly cultivated, and the residence of several wealthy farmers. During summer it is much resorted to by invalids.

Houston stands at the head of steam-navigation on Buffalo bayou, 160 miles E.S.E. from Austin City: population, 2396. Next to Galveston, Houston is the chief business town in the state, being the centre of a rich cotton district. There are several public buildings, churches, and schools. A wharf 500 feet long, with a cotton press at each end, extends along the front of the city.

San Antonio, near the source of the river of the same name, 75 miles S.E. by S. from Austin City, population 3488, is the oldest town in Texas, and one of the oldest in North America. It contains several ecclesiastical edifices erected during the Spanish occupation, a large ruinous fortress, and other vestiges of its former possessors; also a United States arsenal and some modern structures.

History, Government, &c.—Until 1836 Texas formed a part of Mexico. For some years prior to that date the American colonists, an active, numerons, and united body, had been making every possible effort to prepare the way for a revolt against the Mexican authority. In 1835 hostilities commenced in earnest. The Mexican government was unable to suppress the rising; and eventually the Mexican army, under General Santa Anna, the president of Mexico, was defeated at Jacinto by the Texans, under the American general Houston. Santa Anna was made prisoner, and, as a condition of his release, agreed to sign a treaty acknowledging the independence of Texas. The Mexican senate disavowed the authority of Santa Anna to make such a treaty, but no steps were taken towards effecting a re-conquest of Texas; and in 1845 the United States of North America formally admitted Texas into the Union as a sovereign state. This led at once to war between Mexico and the United States; but the former country was in too disorganised a condition to hope for snccess in such a contest, and, after suffering a series of humiliating defeats, was constrained to accept peace on terms of acknowledging the independence of Texas, and ceding to the United States a large portion of territory, including the whole of the northern provinces.

The constitution was adopted in Angust, and ratified in October, 1845. By it the right of voting is vested in every free white male citizen who shall have resided in the state for one year. The legislature consists of a Senate of not less than 19 nor more than 33 (at present 21) members, who are elected for four years; and a House of Representatives, of not less than 45 nor more than 90 (at present 66) members, who are elected for two years. The governor is elected for two years. The state is entirely free from debt. The revenue for the year ending October 1857, was 1,544,694 dollars, and the expenditure the same. The state militia is composed of abont 18,500 men and 1248 commissioned officers. In 1850 there were in the state two colleges, having 7 teachers and 165 students; and 349 public schools, having 360 teachers and 7946 scholars.

(*Gazetteers of the United States; Official Reports relating to Texas, &c.; Seventh Census of the United States; American Almanac;* Maroon, Humboldt, &c.)

THALARCTOS. [BEAR.]

THALLOGENS, a class of Plants proposed by Lindley for those Flowerless Plants which are distinguished by the absence of an axial stem. It inclndes all the *Cryptogamia*, with the exception of Ferns and Mosses.

THEIN. [CHEMISTRY, *S.* 1.]

THENARD, LOUIS-JACQUES, BARON, a distinguished French chemist, was born at Nogent-sur-Seine on the 4th of May, 1777. He went to Paris early in life, and became a pupil of Vanquelin. He devoted himself with so much zeal and success to the study of chemistry that when he was only twenty years old he was appointed demonstrator of chemistry in the Polytechnic School of Paris. By his unwearied assiduity and great knowledge of his subject he was at last made professor of chemistry in the College of France and in the University. In 1824 he received the title of Baron on the occasion of the coronation of Charles X. In 1833 he was made a member of the Academy, and in the same year he was elevated to the dignity of a peer of France. In 1837 he resigned his professorship of chemistry in the Polytechnic School, and in 1840 he gave up his chair in the University of Paris. Baron Thenard was one of the most active chemists in the first half of the 19th century. His separate works however are uot numerous. One of the best known of his literary productions he published in conjunction with M. Gay Lussac; it is entitled 'Recherches physico-chimiques.' This work was pnblished after the discovery of the metallic nature of soda and potash by Sir Humphry Davy. Numerous experiments on the subject of the action of the galvanic pile are recorded, and methods of obtaining potassium and sodium independent of galvanism are indicated. Other snbjects of high scientific interest were discussed in this work, which served to give its anthors the first position amongst experimental chemists. In 1813 M. Thenard commenced the publication of his 'Traité de Chimie élémentaire, théorique et pratiqne.' This work is a valuable introduction to the science of chemistry, and has gone through several editious and been translated into German; the last edition was pnblished in France in five volumes in 1836. The great contributions of Thenard to the scieuce of chemistry are to be found in the scientific journals and transactions of scientific societies of his time. Of these there is a vast number, embracing the whole range of chemical science. There is indeed no branch of chemistry at which he did not labour, and there is no subject he has worked at ou which he has not thrown considerable light. He died in the month of Jnue 1857, and was buried publicly in Paris on the 23rd of that month. For many years before his death Baron Thenard had withdrawn from the active pursuit of chemical science. To the last however he took a deep interest in the development of the ednoational institutions of France. He was an administrator of the College of France and of the Faculty of Sciences, and vice-president for many years of the Superior Council of Public Instruction; and he has contribnted more largely than any other individual since the death of Cuvier to the development of the scientific institutions of France.

THERAPEUTICS. Under this head it is proposed to give an account alphabetically of some of the more important compounds that have been introduced into the list of the 'Materia Medica' since the publication of the first Supplement to the 'Penny Cyclopædia.'

Anamerta or Anamirta, the name of a genus of plants belonging to the natural order *Menispermaceæ*, to which the plant yielding the Cocculus Indicus of commerce is now referred. It has the following characters: flowers diœcious, calyx of 6 sepals in a double series with 2-close pressed bracteoles, corolla none; stamens on separate flowers united into a central column, dilated at the apex; anthers numerous, covering the whole globose apex of the column. The flowers with pistils are not known, but the fruit is a 1- to 3-celled drupe. The seed is globose, deeply excavated at the hilum, albumen fleshy, cotyledon very thin, diverging. The plant which yields the berries of commerce is the only species of this genus. It is a strong climbing shrub, and is met with on the coasts of Malabar and the Eastern Islands. It is called *Anamirta Cocculus*.

Anæsthetics, is the term applied to those agents, which, on being applied or administered to the human body produce either a local or general insensibility. Snch agents act more especially on certain parts of the nervons system, depriving it both of its power of communicating and perceiving impressions made upon its sensitive function. The state of anæsthesia comes on in various forms of paralytic disease, and as such has been known and described by medical writers. Anæsthesia can also be produced by artificial means, as in those states of the nervous system brought on by what is called animal magnetism. In this state of the system the anæsthesia is sometimes so perfect that surgical operations have been performed on persons whilst in it perfectly unconsciously. This was known previously to the general introdnction of anæsthetic agents during the performance of surgical operations generally. All narcotic medicines will produce conditions of anæsthesia, in which surgical operations may be performed without pain. During the action of alcohol on the nervous system in drunkenness, operations have been performed without the knowledge of the patient. Although these circumstances have been generally known, it was not till about the year 1847 that any attempt was made to introduce anæsthetic agents as a means of alleviating pain during the performance of surgical operations. About this time two gentlemen in America, Drs. Morton and Jackson, made experiments ou human beings with the nitrous oxide (laughing gas), and found that a state of insensibility could be produced by its agency, under which operations could be performed. The effects of this gas in prodncing excitement of the nervons system had been made known by the experiments of Sir Humphry Davy, and its peculiar action was often exhibited in the lecture-room of the chemist. It was also known that sulphuric ether produced similar effects on the human system. The merit, however, of the application of these remedies to the production of insensibility during the performance of surgical operations is dne to Drs. Morton and Jackson. Having discovered that ether was much preferable for this purpose to nitrous oxide, they made known the important fact, that under the influence of this agent an insensibility might be prodnced under which persons might undergo the most severe operations without pain, and might be restored from this condition without injury to their health. This announcement was speedily made known, and in the course of a few months the facts were realised in all parts of the world. In London the action of this agent was extensively tried, and realised the most sanguine expectations. The action of ether, and the best method of administering its vapour, was investigated by Dr. John Snow, who in September, 1849, published a work on the 'Inhalation of the Vapour of Ether.' After the success of the first experiments with ether it was found that other agents similarly constituted acted in the same way upon the human system. This subject was investigated with great success in Edinburgh, and led to the discovery by Dr. Simpson of that city, that chloroform, a terchloride of formyle, acted more speedily and efficaciously than even ether. From this time chloroform became more generally used, and is now the substance which is generally employed for the production of artificial anæsthesia. After this Dr. Snow found that amylene was capable of prodncing the same effects as chloroform. Whilst Dr. Richardson has shown from experiments on living animals that the dust of the common puff-ball, *Lycoperdon giganteum*, which had been used by Apiarians for stupifying bees, had also the property of producing insensibility.

These agents appear to act entirely through the nervous system, and according to the time employed in their administration will be their effect on the nervous centres. The first part of the nervons system which appears to be affected is the brain, and a kind of intoxication comes on in which the patient is excited, the intellectual powers are deranged, and the person acts as though drunk. This effect is produced much more quickly by the vapours of the above-mentioned substances than by drinking alcohol, it also passes off much more rapidly. It was to this action more especially that the effects of the nitrons oxide and ether were confined previous to the discovery of their anæsthetic properties. If, however, the use of the vapour is persevered in, the effect extends from the brain to the cerebellum, and this organ loses the power of regulating the movements of the body. This effect on the body is also produced by the drinking of alcohol. As the vapour continues to act on the system, the next nervous centre affected is the spinal cord, and the functions of sensation and motion more immediately under the control of this part of the nervous system, are more or less affected. It is in this stage that consciousness and the powers of motion and sensation are entirely lost, and the individual is pronounced in a state of anæsthesia. In this condition animal life is held in abeyance, and the body is insensible to all external agents. There is still, however, a sufficient amount of nervous power left to maintain the functions of organic life. The heart beats, the lungs perform their functions, and other actions essential to life are carried ou. These functions are, however, under the influence of these anæsthetic agents, and should too large a dose of them be administered, they cease, and death ensues. This is one of the accidents to which the employment of these remedies is exposed, and against which the greatest precaution should be employed.

Dr. Snow, who has practically studied the agency of these remedies more extensively than any other writer, divides the action of ether into five stages. "In the *first degree* the person experiences various changes of feeling, but still retains a correct consciousness of where he is, and what is occurring around him, and a capacity to direct his voluntary movements. In this stage the patient's feelings are generally agreeable, often highly so. In this stage it is not practicable to perform operations without a certain amount of pain. When, however, persons have experienced the more intense degrees of the anæsthetic agent, they return to this stage, and are free from the pain of an operation, whilst their consciousness has sufficiently returned to enable them to know what is going on. In the *second degree* the mental functions may be exercised and voluntary actions performed, but in a disordered manner. In this stage persons are often seized with a tendency to laugh, sob, or scream. They throw themselves about, their actions are instinctive, and not under the direction of their intelligence. In this stage it is not advisable to perform operations, and many operators not carrying the action of the anæsthetic further than this stage have regarded it as useless. The patient may return to this stage from a further one, but it is most desirable that operations should not be performed in it. In the *third degree* there is no evidence of any mental function being exercised, consequently no voluntary motions occur, but muscular contractions in addition to those concerned in respiration may occur. There is sometimes great rigidity of the muscles, but more frequently this is not present. There is a tendency to moan but not to utter any articulate sounds. "If this degree is well established, and if the patient has been detained in it at the same point, by inhaling at intervals, or by inhaling dilute vapour, an operation may usually be performed without producing any other effect than a distortion of the features expressive of pain, and perhaps a slight moaning and an increased frequency of respiration, and in some instances a general rigidity of the muscular system." There is never any recollection of operations in this degree, even when symptoms of pain have been exhibited.

'In the *fourth degree* no movements are seen, except those of respiration, and they are incapable of being influenced by external impressions. All the muscles are relaxed, and the limbs hang down, or rest in any position in which they are supported. The breathing is deep, regular, and automatic, and there is much snoring. In this degree the patient always remains perfectly passive under every kind of operation. It lasts seldom more than two or three minutes after the inhalation is discontinued. The integrity of the functions of respiration and circulation is not impaired. The pulse is distinct, and however much deranged in previous stages, is little disturbed in this; the sensibility of the glottis and pharynx is maintained, and the patient swallows without difficulty. In the *fifth degree* the movements of respiration and circulation become impaired, and every care should be taken to prevent the action of the vapour from arriving at this point, as death may shortly ensue.

With regard to the quantity of ether required, and the time necessary, Dr. Snow makes the following remarks: "If a middle-aged man, about the average size, is supplied with air mixed with vapour of ether in the proportion of 45 per cent. vapour to 55 per cent. air, and breathes it easily and without obstruction, he usually consumes about two drachms of ether per minute. It is not all absorbed, for a part is expired after passing no further than the trachea. At the end of the first minute he is usually in the first degree of etherisation; of the second minute in the second degree; of the third minute in the third degree; and at the end of four minutes, having inhaled an ounce of ether, in the fourth degree. If the inhalation is now discontinued, he commonly remains in this degree of etherisation for one or two minutes, passes gradually back into the third degree, which lasts for three or four minutes, at the end of which time he is in the second degree, which lasts about five minutes, to give place to a feeling of intoxication and exhilaration, which lasts for ten or fifteen minutes, or longer, before it entirely subsides."

The general effects of chloroform resemble closely those of ether. It is, however, a more potent remedy, and produces anæsthesia more rapidly and certainly than ether. Hence it has been employed more generally. This substance was originally discovered by Liebig and Soubeiran in 1831, and its chemical nature was investigated by Dumas. He first pointed out that the liquid which had been called chloric ether, and chloride of carbon, was composed as follows, $C_2\ H\ Cl_3$, and called it chloroform. Liebig subsequently pointed out that it was a terchloride or perchloride of the base formyle. This substance is prepared according to the Pharmacopœia of the London College of Physicians as follows:—Take of chlorinated lime iv. lb.; rectified spirit Oss; water Ox; chloride of calcium broken into pieces ʒj. Put the chlorinated lime first mixed with the water into a retort, and then add the spirit, so that the mixture may fill only a third part of the retort. It is then heated in a sand-bath, and as soon as ebullition begins the heat is withdrawn. The liquid is then distilled into a receiver. A quart of water is then added to the distilled liquid and well shaken. The heavier portion which subsides is then separated, and the chloride of calcium added to it, and frequently shaken for an hour. The liquid, which is the chloroform, is again distilled from a glass retort into a glass receiver. It is a transparent colourless liquid having a specific gravity of 1·48. It boils at 140° Fah., and the density of its vapour is 4·2. It has a fragrant ethereal apple-like odour, and a slightly acid sweet taste. It is soluble in alcohol and ether, but requires 2000 parts of water for its solution. It dissolves camphor, Indian-rubber, wax, and resins. It is not inflammable. This substance is sometimes given internally in doses of from five to ten minims, and acts as a stimulant sedative antispasmodic and anæsthetic.

Administered in the form of vapour as an anæsthetic, chloroform is much more powerful than ether. This effect seems to arise from its being much more sparingly soluble in the blood than ether. "The quantity of chloroform" says Dr. Snow, "required to induce insensibility is less than one tenth as much by measure as in the case of ether. Viewed in this manner, it is more than ten times as strong; but to ascertain their comparative physiological power, when inhaled in a similar manner, their volatility requires to be taken into account. In order to perceive the relative strength of these two medicines, we may suppose that the air which a patient breathes is saturated at 60°,—the ordinary temperature of a dwelling room,—with one or other of the vapours, and see how much air he would have to breathe in either case, in order to be narcotised to the third degree, —the extent of insensibility usually required in a surgical operation. Thirty-six minims is about the average quantity of chloroform required to produce this degree of narcotism in the adult, and this would saturate 257 cubic inches of air at 60°, making it expand to nearly 300 cubic inches, which would be breathed in 12 ordinary respirations of 25 cubic inches each. The quantity of ether usually required to produce the same amount of insensibility in the adult, is about 7½ fluid drachms; this would saturate 440 cubic inches of air at 60°, and increase its volume to rather more than 800 cubic inches, which would require 32 ordinary respirations to breathe it. We see, therefore, that 12 inspirations of air charged with vapour of chloroform are equal to 32 similar inspirations of air charged with vapour of ether, at the same temperature; and that, consequently, chloroform is nearly three times as strong as ether. In actual practice the difference in strength is generally greater than this, for ether abstracts much more caloric than chloroform during its evaporation, thereby reducing the temperature of the air passing over it, and the sponge or whatever contains it, and limiting its own evaporation, in a greater degree."—'Edinburgh Medical and Surgical Journal,' No. 180.

It is on account of its greater strength that a larger number of accidents have occurred with chloroform than with ether. At the same time, where great care is taken in its administration, there seems to be no reason why chloroform should not be employed for the production of anæsthesia. The usual method of administering this agent is to sprinkle a few drops upon a handkerchief and apply it to the mouth and nostrils of the patient in such a way that the patient may take air into the lungs, which is saturated with the vapour of chloroform. During this operation care should be taken that a larger quantity of the vapour is not inhaled than will produce the fourth stage of anæsthesia. By removing the handkerchief from time to time the patient may be kept in the third or fourth stage, according as it seems desirable. Although the administering of chloroform in the handkerchief is undoubtedly the most simple and convenient plan, it appears to be much safer to use an instrument called an inhaler by which the quantity administered can be regulated and controlled with certainty. Such an instrument was early introduced and employed by Dr. Snow, and the accidents which have occurred have certainly been fewer when this instrument has been employed than with the handkerchief. In the inhaler employed by Dr. Snow, the compartment containing the chloroform is surrounded with cold water, to limit the quantity taken up by the air, and the expiration valve of the face-piece is so adapted as to admit additional air to any extent to dilute the vapour still further. From an investigation of the fatal cases, and experiments upon animals, Dr. Snow has arrived at the following conclusions:—

1. Chloroform vapour, if it be inhaled in large proportion with atmospheric air, destroys life by paralysing the heart.

2. In smaller proportions, but long continued, it produces death apparently by the brain, and by interfering with the respiratory function. In such cases the heart is found to beat after the respiration has ceased.

3. Chloroform vapour, if it be blown upon the heart, paralyses it immediately.

4. Atmospheric air loaded with from 4 to 5, or even 6 per cent. of chloroform vapour may be safely administered, inasmuch as that mixture will not act directly upon the heart, but will give timely notice of its increasing effects in modifying the normal discharge of the functions of life. The average time occupied in producing insensibility is from three to four minutes.

5. The proportion of as much as from 8 to 10 per cent. of vapour of chloroform to atmospheric air is a dangerous mixture, as it suddenly charges the blood going into the heart with a poison capable of acting directly on that organ.

In cases where an over-dose of chloroform has been administered, the only remedy which appears to offer a chance of relief, is artificial respiration. Where the muscles of the tongue become relaxed, and this organ falls back over the glottis, it should be pulled forward till the patient revives. It might be desirable to open the jugular vein in order to relieve the distension of the right cavities of the heart.

The cases in which ether was first employed, and in which chloroform is to be recommended as an anæsthetic, are those in which operations producing pain are performed. There are no operations, from the extraction of a tooth to the capital operations of surgery, in which it may not be employed. At the same time it may always become a question whether it is worth while running the slight hazard of fatal effects for the sake of relieving a small amount of pain. Where chloroform is skilfully administered, there appears to be little or no hazard, but unfortunately it is not every one who is prepared to administer chloroform successfully. As a rule it may be stated, that it is not advisable for the surgeon who operates to administer the chloroform, and a competent assistant should always be employed to do this. Whatever may be the doubt in the minor operations of surgery, the beneficial effect of relieving pain upon the subsequent welfare of the patient in the capital operations of surgery, have led surgeons very generally to insist on its administration in these cases. It has now been shown, both by Dr. Simpson and Dr. Snow, that the fatal cases, after capital operations, more especially amputations, are fewer when chloroform has been administered, than when this or some other anæsthetic has not been employed. Looking to these results, it would appear that the life saved by the use of chloroform has been much greater than that sacrificed by its careless administration. When in addition to this it is recollected how great an amount of suffering is prevented, there can be little doubt about the propriety of its administration.

It has been supposed that certain states of the system are less favourable to the administration of chloroform than others, but Dr. Snow has pointed out that in these states of the system, the pain of an operation would be as likely to act as injuriously as the chloroform. At the same time, it would appear that a certain number of the fatal cases have occurred in persons with diseased heart, and perhaps in these caution should be employed.

Besides in operations with the knife, chloroform has been employed to facilitate the reduction of dislocations and of hernia. It has also been recommended in asthma, and as a means of procuring sleep in excessive watchfulness. It was first introduced by Dr. Simpson, of Edinburgh, as a means of alleviating the pain attendant upon child-birth, and although it has been much opposed in these cases, it is at the present day very largely administered by the obstetric practitioners of Great Britain. In some of the more difficult cases it becomes an important aid to the accoucheur, and in all cases it diminishes the suffering without in any way interfering with the natural actions attendant upon this condition. The injurious effects attributed to chloroform are at most problematical, and the benefits so decided as to lead to its use wherever circumstances will permit. At the same time here, as in other cases, it is not desirable that the operator should administer the chloroform, and as the services of an assistant, or person competent to administer cannot always be procured, it is not likely to come into general use throughout the country. But when assistants can be found, there is no doubt that it is an alleviation of suffering that ought not to be discountenanced.

From having experimented with various agents, Dr. Snow was induced to try the action of Amylene as an anæsthetic on the human system. This substance is a colourless mobile fluid, having a specific gravity of 0·659. It is very volatile, and boils at 102°. Its composition is $C^{10} H^{10}$. It is soluble in ten or eleven pints of water, and its odour is not disagreeable. The quantity of amylene required to produce anæsthesia is intermediate between that of chloroform and ether. The quantity of amylene consumed in Dr. Snow's inhaler was at the rate of rather more than a fluid drachm in a minute, and in this way insensibility was produced in about three minutes. Although Dr. Snow successfully administered this remedy in several cases, he met with one fatal case, and has since abandoned its use.

Other substances are capable of producing anæsthesia in the form of vapour, but none of these have been generally employed.

(Snow, *On the Inhalation of the Vapour of Ether*, 1847; *On Narcotism by the Inhalation of Vapours*, *Medical Gazette*, 1848 to 1851; *On Death from Chloroform*, *Lancet*, 1856. Richardson, *On the Anæsthetic Properties of Lycoperdon Proteus*, 1853. Pereira, *The Elements of Materia Medica and Therapeutics*, 1853.)

ARTANTHE ELONGATA, the plant which yields the medicinal agent known by the name of Matico. This plant belongs to the natural order *Piperaceæ*, and is the *Piper angustifolium* of Ruiz and Pavon, the *Piper elongatum* of Vahl, and the *Stephensia elongata* of Kunth. Although this plant has long been used by the natives of Peru as a remedy in various diseases, it was not known till recently that it produced the substance known as matico. The term matico is, however, applied in Peru to other substances, and Dr. Lindley states that the leaves of *Eupatorium glutinosum* were sent to him under that name.

Artanthe elongata, the true matico plant is a shrub about 12 feet high with jointed stem and branches. Its leaves are harsh, short-stalked, lanceolate, acuminate, pubescent beneath, tessellated or rough on the upper side on account of the sunken veins. The spikes are solitary, cylindrical, and opposite the leaves; the bracts lanceolate and the flowers hermaphrodite.

It is a native of Peru, and is found at Huanuco, Cucheco, Panao, Chaclea, and Muna. It flowers from July to September.

BEBEERINE, *Bibrina*, *Biberine*, *Beebeerina*, is a vegetable alkaloid, obtained from the *Nectandra Rodiæi* (Schomburgk), the Bibira, or Greenheart Tree. The properties of this tree were first noticed by Bancroft, in 1769. Dr. Roder in 1834 recommended it as a substitute for Cinchona Bark. He stated that it contained the alkaloid which he called Bebeerine. In 1843 Dr. Douglas Maclagan of Edinburgh confirmed Dr. Roder's discovery and investigated further the properties of the alkaloid. In 1844 Sir Robert Schomburgk brought specimens of the tree from British Guiana, where it is called Bibiru or Sipiri. This plant belongs to the genus Nectandra [NECTANDRA, *S.* 1], and to the order Lauraceæ. It is a large forest tree 60 feet or more in height, undivided by branches till near the top, and covered by an ash-gray smooth bark; the leaves are 5 or 6 inches long and 2 or 3 inches broad, nearly opposite, oblong, elliptical, shortly acuminate, coriaceous, smooth, shining, and obscurely netted on the upper side. Panicles few-flowered, flowers yellowish white; the anthers all thick, oblong, without glands. The fruit is somewhat obovate, globular, and slightly compressed, 6½ to 7½ inches in circumference; the seed in each fruit, about the size of a walnut.

The part used in medicine is the bark. It is derived from the trunk, and comes over in flat heavy pieces from 1 to 2 feet long, from 2 to 6 inches broad, and about 3 or 4 inches thick. The epidermis is brittle and of a grayish-brown colour. Internally the bark is of a cinnamon-brown colour. The fracture is rough and fibrous. The taste is bitter, astringent, and aromatic. The seeds also contain the bebeerine, on which the medicinal properties of the plant depends. The following is Dr. Maclagan's analysis of the two:—

	Bark.	Seed.
Bebeerine	2·56	2·20
Tannin and resinous matter	2·53	4·04
Soluble matter	4·34	9·40
Starch	...	53·51
Fibre and albumen	62·92	11·24
Ashes	7·13	0·31
Water	14·07	18·13
Loss	6·45	1·17
	100·00	100·00

The alkaloid bebeerine is obtained by decomposing commercial sulphate of bebeerine by ammonia; the precipitate is washed with cold water, triturated whilst still moist with moist hydrated oxide of lead, dried in a water-bath and exhausted rectified spirit; an alcoholic solution of bebeerine is thus obtained. The alcohol may then be distilled from the bebeerine. If this is heated with ether a part will be left undissolved. Dr. Maclagan thought this another alkaloid and called it sipeerine, but he now regards it as bebeerine in an oxidised condition.

When bebeerine is obtained from its etherial solution, it is a yellow, amorphous, resinous-looking substance, but in the form of powder it is white.

The effect of the Bibiru bark is the same as that of cinchona. It is bitter and tonic, and possesses antiperiodic or febrifugal virtues. The alkaloid possesses the same properties, and from experiments which have hitherto been made, although it is not so powerfully febrifugal as quinine, it does not produce the headache, feverishness, singing in the ears, and other symptoms which are sometimes found to follow the administration of quinine. In intermittent and remittent fevers, in neuralgia, and as a genuine tonic it has been recommended, and especially in those cases where quinine disagrees.

BERTHOLETIA. [BERTHOLLETIA].

CADMIUM, IODIDE OF. The preparations of iodine with the metals have many of them been found to be very efficacious in the treatment of disease both internally and externally. Dr. Garrod has recently recommended the Iodide of Cadmium for external application. "I had," he says, "previously felt the want of an agent containing iodine, and fitted for external application—those usually employed having many objections. The free iodine, or iodine combined with iodide of potassium, as occurs in unguentum iodinii compositum, P. L., is frequently too *irritant* in its nature, besides which its disagreeable odour, and the staining of the cuticle which it produces is often very objectionable.

"The simple iodide of potassium ointment, as ordinarily dispensed, is gritty in character, often to such an extent as to render its application to delicate skins impracticable, and it not unfrequently becomes brown from liberation of free iodine; now, although these inconveniences may be removed by proper management and care as to the purity of the drug, nevertheless I am disposed to look upon the salt, when mixed with fatty substances, as not very readily absorbed by the skin, and consequently not well adapted to produce the peculiar local effects of iodine which is often so advantageous to obtain; for it must be remembered that iodine is not always used simply for its rubefacient or counter-irritant action."

He adds, that the iodide of cadmium is not open to these objections. Mixed with eight parts of lard it forms a perfectly white and soft ointment, which produces but little local action upon the skin, and appears to be readily absorbed when properly applied with friction.

Dr. Garrod recommends this ointment in enlarged scrofulous glands, in joints affected by chronic inflammatory disease, in various cutaneous diseases, and chilblains.

The iodide of cadmium crystallises in white 6-sided nacreous tables, and is soluble in water and alcohol.

CHROMIC ACID has been recommended by Mr. Marshall as an escharotic. In warts and tumours where a powerful caustic is indicated, it appears to be a useful remedy. He recommends 100 grains of the crystallised acid in an ounce of distilled water. In the 'Record of Pharmacy and Therapeutics' the following account of the application of this solution is given:—

"The solution is best applied by aid of a pointed glass rod, or, where a large quantity is needed, by means of a small glass tube drawn to a point. Only so much should be applied as will saturate the diseased growth, avoiding the surrounding healthy mucous membrane; for although the solution is not sufficiently powerful as an escharotic to destroy or even vesicate the mucous membrane, it may give rise to an unnecessary amount of subsequent inflammatory action, which of course it is well to avoid, but from which no serious consequences have been found to ensue. Any superfluous acid may be removed by a piece of wet lint. The first effect of its application to the warts is to produce a slight smarting pain. If, however, any ulcerated surface be touched, the pain is of a burning character, more lasting, but not so acute and intolerable as that caused by the nitrate of silver, or by nitric acid, with or without arsenious acid. After a short time the pain passes off, but there is gradually established a certain aching and soreness, dependent on the excitement of more or less inflammation in the parts. This inflammatory action is accompanied by a purulent discharge, and under its influence the morbid growths rapidly waste, in some cases being thrown off altogether, and in others undergoing a partial though evident diminution in size. The best immediate dressing to the parts is dry lint, as that does not dilute the strength of the chromic acid solution, and is at the same time clean. Afterwards the lint should be changed twice daily, or, what appears to be better as a check to any inflammation, the parts may be washed with a solution of lead, and dressed with lint moistened in the same.

"In most cases of warts, one application suffices, the cure being completed in from four to eight days. The extreme period to which the inflammation set up by the chromic acid has been found to continue active is about four days. In severe cases, where the warts are large, repeated applications are necessary, each being followed by less inconvenience and less of the characteristic inflammatory action. In but one instance, so far as hitherto observed, have more than three applications been required, and in that there was great neglect as to proper cleanliness and dressing."

COD LIVER OIL is an oil obtained from the liver of the common cod, *Gadus Morrhua*, Linnæus. This, and other oils from fish, have been for a long time popular remedies amongst people living on the sea-shore, especially those engaged in fishing. In 1782 it was recommended by Dr. Percival as a remedy in chronic rheumatism, and in 1809 Dr. Bardsley stated it was a popular remedy in many parts of Lancashire. In 1841, Dr. Bennett, of Edinburgh, wrote a treatise on the 'Oleum Jecoris Aselli,' recommending it especially in scrofulous diseases.

Although this oil is named after the Cod, from the liver of which animal it is most frequently and abundantly obtained, other fish yield oil in their livers and adipose tissue with which this oil is frequently mixed. The oil sold in England usually comes from Newfoundland, where it is obtained by pressure from the livers of the innumerable codfish which are caught in the seas around that country. As it comes into the market it is usually of a chestnut-brown colour, and has a fishy smell. It is now, however, subjected to a preparation, by which its colour is almost entirely removed, and to a considerable extent its smell. Although more agreeable to the taste, it does not appear that its therapeutical properties are improved by this process. The following is Dr. De Jongh's analysis of the three kinds of oil which are to be found in the shops of London:—

Constituents.	Pale Oil.	Pale brown Oil.	Brown Oil.
Oleic acid (with Gadine and two other substances)	74·03300	71·75700	69.78500
Margaric acid	11·75700	15·42100	16·14500
Glycerine	10·17700	9 07300	9·71100
Butyric acid	0·07436	...	0·15875
Acetic acid	0·04571	...	0·12506
Fellinic and Cholic Acids with a small quantity of Margarine, oleine, and bilifulvin	0·04300	0·06200	0·29900
Bilifulvin, bilifellinic acid and two peculiar substances	0·26800	0·44500	0·87600
A peculiar substance, soluble in alcohol	0·00600	0·01300	0·03800
A peculiar substance, soluble in water, alcohol, and ether	0·00100	0·00200	0·00500
Iodine	0·03740	0·04060	0·02950
Chlorine and traces of bromine	0·14880	0·15880	0·08400
Phosphoric acid	0·09135	0·07890	0·05365
Sulphuric acid	0·07100	0·08595	0·01010
Phosphorus	0·02125	0·01136	0·00754
Lime	0·15150	0·16780	0·08170
Magnesia	0·00880	0·01230	0·00380
Soda	0·05540	0·06810	0·01790
Iron	...	...	a trace
Loss	3·00943	2·60319	2·56900
Cod Liver Oil	100·00000	100·00000	100·00000

Although this oil has been recommended in a variety of diseases, and has been administered in a most injudicious manner, in all kinds of disorders, the cases in which it has proved most successful are those of a gouty, and rheumatic, and scrofulous character. It has been found especially serviceable in the rickets of children, and in cases of phthisis. When first given it produces nausea, indigestion, and even vomiting; but, when persevered in, it is usually unattended with any unpleasant symptoms. In order to derive benefit from its use, it must be continued for several weeks, and even months. One of its most striking effects in cases where emaciation has set in, is its tendency to produce plumpness and to increase the nutritionary processes in the system. Cases are recorded in which persons have increased several pounds in weight in the course of a few weeks under the use of this remedy. Whilst this increase of weight is going on, there is increased tone and vigour in the system, and persons frequently gain considerable strength under its influence. In cases of phthisis many of the more urgent symptoms are relieved by its administration, and sometimes the progress of the disease has been entirely suspended.

The dose at the commencement should be half an ounce three times a day, which may be increased to one or even two ounces, should the stomach be able to bear it. It is given on coffee, milk, or peppermint-water. A small quantity of common salt taken before and after the oil will sometimes cause it to agree when other means have failed.

The nature of the action of this oil has been much debated by medical practitioners. Whilst some are inclined to regard the small quantities of iodine and bromine it contains as the active agents, others attribute its effects to the oily acids, which it has in common with all other oils. It is well known that oil plays an important part in the development of the albuminous tissues, and is universally present in the eggs of the lower animals, and it is supposed that its introduction into the system in cases where the adipose tissue is manifestly deficient has an effect on the nutrition of the tissues generally. If this were the case, other oils ought to act in the same manner, and to a certain extent this is true, as it has been found that other animal oils, and even vegetable oils, exercise a similar effect. At the same time, it has been found that cod liver oil is more digestible and less liable to disagree with the stomach than other oils, and it is consequently used in preference to all others. An oleaginous diet has been found, however, a valuable adjunct to the use of the cod liver oil, and in young children who will not take the oil, cream has been substituted with advantage.

In cases of rheumatism and scrofulous swellings the external application of the oil has been attended with advantage.

The friction of the whole body in cases of phthisis and scrofulous diathesis has also been strongly recommended by Dr. Simpson of Edinburgh.

When other remedies are employed in conjunction with cod liver oil, they may be added to this substance, and many preparations of this kind are kept ready for use by the druggists. An objection has been urged against these compounds that if kept long the oil becomes rancid, and decomposition of the medicines take place. They are therefore best prepared extemporaneously.

DEODORISERS AND DISINFECTANTS. Although these terms are frequently used as synonymous, they yet have different meanings. Deodorisers are substances which deprive decomposing animal and vegetable substances of their disagreeable smell; whilst disinfectants are agents which have the power of destroying the infectious or contagious properties, more especially of animal poisons. Many substances which have the power of effecting the first object, do not attain the last; and it is important to know that frequently when a foul smell is removed, an animal poison may yet remain behind. In fact, many of the most powerful animal poisons are not attended with any smell at all, as those of the small pox, typhus and scarlet fever.

One of the most powerful deodorisers knows is *chlorine*. This arises from its affinity for hydrogen gas which enters into the composition of those gases which most powerfully affect the senses in a disagreeable manner, as sulphuretted, phosphuretted, and carburetted hydrogen. As these gases have an injurious effect of their own upon the system, and affect the senses disagreeably, they should always be got rid of as quickly as possible, and the various preparations of chlorine, more especially chlorine itself, and chlorinated lime and soda have been employed for this purpose. The chlorides of zinc, iron, and the metals may also be used for this purpose when added to liquid or solid bodies. One of the most effectual methods of evolving chlorine in the air has recently been proposed by M. Lambossy. It consists in obtaining chlorine from common salt by the following process. Take of common salt two table spoonfuls, red lead two tea spoonfuls, oil of vitriol half a wine glass full, water a quart. Mix the red lead with the salt, and add to it the water, stir the mixture well with a glass rod, and add very gradually the oil of vitriol, sulphate of lead is precipitated, and sulphate of soda and chlorine remain in solution. By exposure to the air the chlorine escapes very gradually and uniformly. When not wanted the bottle may be closed.

Oxygen is another powerful deodoriser. By the action of the oxygen of the atmosphere all animal and vegetable substances decomposing at length become purified. It is, however, desirable to supply oxygen faster than can be done from the atmosphere, and this can be effected by the manganic acid and permanganate of potassa. Manganic acid consists of one part of manganese and three of oxygen, whilst permanganate of potash consists of one part of potash and two of manganic acid.

These substances, more especially the permanganate of potash, give off readily their oxygen gas: and on being mixed with decaying animal and vegetable substances render them perfectly pure to the smell. Dr. Hoffman, in a report made to the Board of Health on these substances, in 1856, says:—

"The manganates and permanganates surpass in their deodorising and disinfecting powers most compounds which are usually employed for this purpose. Metallic salts, such as the compounds of lead, iron, and zinc, &c., act extremely well, if the odour to be removed arise from sulphuretted hydrogen and ammonia, or substances analogous to the latter; when a metallic sulphide and a salt of a metal ammonium is formed. But, frequently, the odour belongs to substances of a different class, which are fixed by neither of the constituents of the metallic salt. The odour of the water, which in my experiments yielded perfectly to the action of the manganates, was scarcely altered by the use of very considerable quantities of the usual metallic salts. Moreover, the offensive substances are not destroyed by metallic salts, but only fixed; they appear again — the sulphuretted hydrogen by the action of an acid, the ammonia-like compounds by that of a powerfully fixed alkali. The manganates and permanganates, on the other hand, destroy the smelling substances completely; containing, as they do, a large quantity of oxygen, the very agent which accomplishes all natural disinfection, they give rise to an actual process of combustion, in consequence of which the cause of the odour or putrefaction is permanently removed. They resemble, in this respect, the alkaline hypochlorites, such as hypochlorite of potash, soda, or lime (chloride of lime), the action of which is likewise permanent. The hypochlorites act with less energy and rapidity than the manganates, and are in this respect inferior; but they have an advantage over the latter by their evolving chlorine in the gaseous state, and destroying in this manner odorous and putrefactive substances which are diffused in the atmosphere. But as the chlorine evolved is frequently found objectionable by, and injurious to, patients, it would be important to ascertain whether the same effect could not be accomplished by exposing the contaminated air to the action of extended surfaces of solutions of the manganates and permanganates, either contained in shallow vessels, or diffused over sheets of wire gauze.

"The manganates and permanganates have, moreover, the advantage of possessing peculiar and strongly marked colours, whereby they are readily and safely distinguished from other compounds. In consequence of this marked coloration, accidents which have been frequently caused by the incautious and erroneous use of hypochlorites, or of metallic salts, are scarcely possible with the manganates and permanganates, which are, moreover, in themselves comparatively innoxious."

A solution of twenty grains of permanganate of potash in a pint of water has been of much service as an application to phagedænic ulcerations, and to sloughing sores in various parts of the body. It has also been found particularly beneficial as an application to cancerous sores, where the smell is sometimes very offensive.

Where clothes, bedding, and other materials have been in contact with poisonous effluvia, one of the most powerful *disinfectants* is *heat.* The application of heat to such articles may either be effected by subjecting them to the action of boiling water, or exposing them to heat in ovens or closed vessels constructed for the purpose.

(See *Minute of Information on Disinfection and Deodorisation*, published by General Board of Health, 1857).

DIPHTHERITE. [PHYSIC, PRACTICE OF, *S.* 2].

HYPOPHOSPHOROUS ACID is a compound of phosphorus and oxygen, in the proportion of one equivalent of each. It may be prepared by the decomposition of phosphide of barium, strontium, or calcium by water. It combines with the alkalies and oxides of the metals, forming hyposulphites. These substances have lately been introduced into medicine as a remedy for pulmonary consumption. In a paper presented to the Academy of Medicine, in Paris, Dr. Churchill has given an account of thirty-five cases of phthisis, which he had treated with these remedies. Out of this number he states that nine recovered; in eight the evidences of disease disappeared; in eleven, much improvement took place, and eleven died. Dr. Churchill believes that the immediate cause of tuberculosis is the decrease of phosphorus in the system.

"The specific remedy," he says, "of this complaint consists in the employment of a preparation of phosphorus which presents two characters—the first of being fit for immediate assimilation, and the second of being at the same time in the lowest possible state of oxidation. The hypophosphites of lime and soda are the salts which have hitherto presented these two characters in the most complete manner. Either of these salts, administered in doses varying from ten to forty-five grains per diem, may be used in the treatment of phthisis. The highest dose which I have given to adults has been fifteen grains per day.

"These preparations have a direct action on the tubercular diathesis, and dispel with a really wonderful rapidity all the symptoms which characterise the disease. When the morbid deposit which is the special result of the dyscrasia is recent, when the softening is only incipient, and does not take place too rapidly, the tubercles are removed by absorption, and disappear without leaving any trace. When the deposit is of older date, and the softening has reached a somewhat higher degree, the breaking down process may continue in spite of the treatment, and the issue of the case will depend on the pathological peculiarities of the lesion, on its extent, and especially on the presence or absence of complications. I have made numerous attempts to modify the local mischief by means of inhalations of several substances, but I have obtained no favourable results except such as were owing to the general treatment.

"The physiological effects which I have observed during the administration of the hypophosphites of soda, lime, potash, and ammonia, prove that these salts have a double action. On the one hand they immediately increase the principle (whatever it may be) which constitutes nervous power, and they present us, on the other hand, very efficient blood-generating agents, far superior to any hitherto known. These preparations possess in the highest degree all the therapeutical properties attributed by former observers to phosphorus, and are devoid of the dangers which have almost consigned this substance to oblivion. It cannot be doubted that hypophosphorous preparations will henceforth rank foremost in therapeutics."

The salts of hypophosphorous acid can be prepared by adding the bases to a solution of the acid in water.

Hypophosphite of Potash occurs in the form of a white opaque powder, readily soluble in water and in alcohol. It is very deliquescent, and ought to be kept in stoppered bottles.

Hypophosphite of Soda crystallises in nacreous rectangular plates. It is a less deliquescent salt than the last, and dissolves readily in alcohol and water.

Hypophosphite of Lime crystallises in rectangular or six-sided columns. It is not deliquescent, and possesses a bitter taste. It is perfectly soluble in water, and is the most convenient form for administering the hypophosphites.

Hypophosphite of Ammonia has a similar appearance to the lime-salt. It is, however, deliquescent in the air. When heated gently, it gives off ammonia, and leaves hydrated hypophosphorous acid.

IODOFORM, a compound of iodine, and the compound radical formyle. It was discovered by Serullas, and has recently been investigated physiologically and therapeutically by MM. Moretin and Humbot. It is a solid body occurring in pearly scales of a sulphur yellow colour, friable, soft to the touch, of a persistent aromatic odour, with a mild and uncorrosive taste. When this substance is administered to animals, they die from smaller doses than of iodine, and exhibit symptoms of great depression and exhaustion. The symptoms of depression are followed by convulsions, contractions, and other effects upon the nervous system. After death they exhibit no signs of any marked lesions of the stomach or intestines.

The authors above mentioned suggest that this remedy may be employed in all cases where iodine is indicated. It is more rapidly absorbed into the system than iodine, and produces none of the local irritations which have been observed to attend the action of iodine. They recommend it from its soothing properties in neuralgic disorders. They have also employed it with success in goitre, scrofula, rickets, and syphilis. The dose is from half a grain to eight grains in the course of the twenty-four hours.

KOSSO or KOUSSO, the Abyssinian name for the flowers of the *Brayera anthelmintica*, a plantbelonging to the natural order *Rosaceæ.* The Kosso has been recently introduced into European practice as a powerful remedy for worms. It has been known in Abyssinia upwards of two centuries, as an anthelmintic, and has been mentioned by several writers. The plant which yields it has been named after Dr. Brayer, a French physician who resided a considerable time at Constantinople, and having had opportunities of witnessing the anthelmintic properties of this plant, brought some of it to Paris in 1823. On being sent to Kunth, he found it to be a new genus of plants belonging to the order Rosaceæ.

The *Brayera* is an Abyssinian tree twenty feet in height, with round rusty tomentose-villose branches, marked by the annular cicatrices of the fallen leaves. The leaves are crowded, alternate, and sheathy at the base. The leaflets are oblong, or elliptical lanceolate, acute, serrate, villose at the margin and on the nerves of the under surface. Stipules adnate to the petiole. Flowers diœcious, small, and greenish, the calyx with the tube bibracteolate at the base and turbinate; throat constricted internally by a membranous ring; limb 10-partite; the segments in two series, the five outer ones much larger, oblong-lanceolate, obtuse, reticulately veined, stellately patent, the five inner ones alternate, smaller spathulate. Petals five, inserted in the throat of the calyx, small linear. Stamens from fifteen to twenty, inserted along the petals. Filaments free, unequal in length. Anthers bilocular, dehiscing longitudinally. Carpels, two placed at the bottom of the calyx, free, unilocular, containing one or two pendulous ovules. Styles terminal, exserted from the throat of the calyx, thickened upwards. Stigmas subpeltate-dilated, crenate-oblong.

This plant grows in Tyre, Agame, and Shoa, and is cultivated everywhere. Dr. Beke says it grows throughout the entire table-land of north-eastern Abyssinia, at an elevation of 6000 feet. He found it at the mouth of the Abai (Bruce's Nile) at an elevation of close upon 9000 feet. Bruce describes the flowers as being of a greenish colour, tinged with purple, and when fully blown of a deep red or purple. The petals, he says, are white. When prepared for medicinal use, the flowers are gathered before the seeds are ripe, and whilst some of the flowers are unopened. The bunches are suspended in the sun to dry, and afterwards packed in jars. When sent to this country it is packed in boxes, and the Kosso is contained in leather. It has a very powerful balsamic odour. The following is an analysis of Kosso by Wittstein:—

Fatty oil, Chlorophyle	1·44
Wax	2·02
Bitter acrid resin	6·25
Tasteless resin	0·77
Sugar	1·08
Gum	7·22
Tannin, striking a green colour with iron	8·94
Tannin, striking a blue colour with iron	15·46
Vegetable fibre	40·97
Ashes	15·71
Loss	0·14
	100·00

There is nothing in the botanical structure, or in the chemical composition, or physical character of this plant, that could have led to the conclusion that it would act as an anthelmintic. Yet there is no question on this point. The inhabitants of Abyssinia, from their habit of eating uncooked food, are very liable to the attacks of various forms of tapeworm, and the Kousso is universally employed amongst them as a remedy. Every traveller attests its efficacy. It has also now been employed in France, England, Germany, and Switzerland with the same success.

The mode of administering it in Abyssinia consists in taking a handful of the flowers and infusing them in hot water. In England, 240 grains or half an ounce is regarded as a full dose, children from 7 to 12 years of age may take 160 grains; from 3 to 7, 120 grains; and not exceeding 3 years of age, 80 grains. This dose should be taken in the morning fasting, the previous meal at night having been slight. The flowers are infused in from 6 to 10 ounces of luke-warm water for about a quarter of an hour. A little lemon-juice is then to be swallowed, and the infusion being stirred up, the whole is taken, liquid and powder at two or three draughts at short intervals, being washed down by cold water and lemon-juice. In three or four hours, if the remedy has not operated, a dose of castor oil should be taken.

The great barrier to the use of this remedy at first was its high price. When first brought to Paris it was sold as high as 1*l.* 15*s.* per ounce. It is now (1858), however, sold at a moderate price. The most recent notice of this remedy is in the first volume of Dr. Kuchenmeister's work on 'Animal Parasites,' translated for the Sydenham Society by Dr. Lankester (1857). The following is his account of Kousso:—

"This remedy, which is making a great noise at present, is adulterated in many ways. J. Clarus found Kousso obtained from Jobst to be adulterated with sawdust. I have already indicated that the sawdust might be probably the dust of a medicine for tape-worms, and, indeed, of the coarser stalks and twigs of the *Brayera*. It is still more probable, however, that these woody fibres or chips might come from the root of *Verbascum Ternacha*, which, as well as the leaves of *Jasminum floribundum* (*Herba Zelim*), is, as is well known, often added to Kousso, and is even administered alone, in doses of 70 grains, as a remedy against *Tæniæ*. In other respects, it acts as a pretty strong narcotic on lower animals, as, for example, when thrown into water it stupifies fishes. For these reasons I should in this case say, not so much that the agent is adulterated, as that it is often administered in combination with other Abyssinian remedies for tape-worm. According to my experiments, even the thick *T. crassicollis* of the cat died very soon in white of egg mixed with a decoction of Kousso flowers. The *Tæniæ* were dead within an hour. The dose of the powder of Kousso is ℥vj to ʒj. For my own part, I have always been more or less unlucky with this remedy, which, in the ordinary mode of administration, shares all the defects of the other remedies for tapeworms, and easily produces sickness and violent pains in the intestines. In my own experience, I have generally seen the worm expelled in innumerable fragments after the use of this remedy or its preparations. I have only seen larger or smaller portions of the worm, or, at the utmost, the worm up to the neck expelled by it; but have never found the head. In one case I certainly detected fragments of tapeworm in the evacuations for three months. Once I saw the worm passed up to the neck in the morning, but the head was expelled only after the patient had of his own accord at once taken a second dose of Kousso, and thus brought upon himself no slight pains in the bowels.

"Very recently Professor Martius, of Erlangen, and Professor von Raimann, of Vienna, have done particularly good service with regard to the mode of employing Kousso. According to Martius, the powder of Kousso always killed the worm, but in no case did the head pass away. He therefore endeavoured to isolate the active constituents of the resin. A red resin obtained from Kousso had no action. It was otherwise with a soft resin of the Kousso, of which ℈ij were obtained from ℥vj of Kousso, but in which there was certainly still some red resin and a waxy substance. This soft resin, or, more correctly, resinous mixture, was dissolved in alcohol at 36° R. (=113° F.), and filtered; the alcoholic solution was dropped upon sugar. As soon as the alcohol was evaporated, the solution was again poured upon the sugar, the whole was well dried, and reduced with sugar to the finest powder, sugar being added until with ℈ij of soft resin the whole quantity weighed ℥ss. This very finely divided resin was mixed with ℥j of honey, and the whole administered in a period of 12 to 16 hours, commencing at four o'clock in the afternoon. The next morning an aperient was given (castor oil or a salt). In this way, with this resin most kindly sent to me by Martius, I treated three patients in September, 1854; one of them being a very weakly boy of 14 years old. In all three cases the worm was expelled up to the neck, but in such a fragmentary condition that it was impossible to find the head. This will be the more easy to believe when I mention that the smallest of the expelled fragments towards the neck were scarcely two to three lines in length. One of the patients again passed segments of tapeworms at the end of December.

"Perhaps the more favorable result depends upon some small practical precaution, of which I am not yet aware; but although I must admit the efficacy of the remedy, and the more willingly from the ease with which Martius's resin is taken and endured—as I have never seen any bad secondary effects,—at the same time, the extremely fragmentary state in which the worm passes prevents me from giving the remedy a preference over turpentine and pomegranate root. Quite recently, Professor Raimann, of Vienna, has employed the following method:—℥vj of Kousso are macerated for 24 hours in cold water, and then boiled for half-an-hour. This infuso-decoction is then taken whilst fasting in two portions, without straining, and, therefore, with the flowers in it; and 2 hours afterwards, ℥j to ℥ij of castor oil. From the report in Hebra's 'Zeitschrift' for 1854, it appears that the remedy was very well borne, and acted with certainty.

NARTHEX ASSAFŒTIDA (Falconer), is the name of the plant which is now known to yield a portion of the assafœtida of commerce. This is the plant which was originally described by Kæmpfer as *Assafœtida disgunensis*, or Hingiseb. Dr. Falconer discovered this plant in Astore one hundred and fifty years after it had been described by Kæmpfer. The botanical characters of the genus Narthex are as follows:—

Umbels, compound; involucres, absent; calyx, obsolete; fruit, thin, compressed at the back with a dilated border;

ridges 3, only dorsal; vittæ, one to each dorsal furrow, and two to the laterals; albumen, thin flat.

N. Assafœtida, Falconer: Radical leaves 3-parted; segments, bipinnatifid with oblong-lanceolate, obtuse, decurrent lobes. The root is perennial, tapering, ponderous, increasing to the size of a man's arm or leg, covered with a blackish coloured bark beset near the top with many strong rigid fibres; its internal substance white, fleshy, abounding with a thick milky juice, which has an excessively strong fœtid alliaceous smell. Stem, two or three yards high or more, six or seven inches in circumference at the base, smooth, radical leaves nearly two feet long. The fruit is flat, thin, reddish brown, like that of a parsnip, only rather larger and darker.

"Narthex," says Dr. Falconer, in 'Royle's Materia Medica,' "both in the character of the flowers and fruit, and in its 'Pœony-leaved' habit, differs widely from any known species of Ferula, and appears to constitute a distinct and well-marked genus. In the Dardoh or Dangree language, (the Dardolus being the Daradi of Arrian), the plant is called 'sep' or 'snp.' The young roots of the stem in spring are prized as an excellent and delicate vegetable.

"The species would appear to occur in the greatest abundance in the provinces of Khorassan and Luar in Persia, and thence to extend on the one hand into the plains of Toorkestan on the Oxus, north of the Hindoo Khoosh Mountains, where it seems to have been met with by Sir Alexander Burnes, and on the other to stretch across from Beloochistan, through Candahar, and other provinces of Affghanistan, to the eastern side of the valley of the Indus, where it stops in Astore, and does not occur in great abundance. The whole of this region, which constitutes the head-quarters of the gum-bearing Umbelliferæ, possesses the common character of an excessively dry climate, indicated in 'Berghaus's Hygrometric Map' in 'Johnston's Physical Atlas,' by a belt of white.

"Besides the gum-resin, the fruit of Narthex Assafœtida is imported into India from Persia and Affghanistan, under the name of 'Anjoodan,' being extensively employed by the native physicians in India: 'Anjoodan' being the epithet applied to the seed of the 'Heengseh,' or 'Hulleet,' by Avicenna, also quoted by Kæmpfer, and used by the Indo-Persian and Arabic writers generally in describing the Assafœtida plant.

"Another Umbelliferous fruit is also imported with it, and sold under the name of 'Doogoo,' (a word evidently connected with [the δαυκος of the Greeks), being recommended as an excellent substitute for 'Anjoodan,' which it closely resembles in its general appearance. This I found to be the fruit of a species of true Ferula; it is one of the two Assafœtida-like fruits mentioned by Dr. Royle as occurring in the bazaars of Northern India. The species of Ferula yielding this fruit may furnish some one of the obscurely known gum-resins resembling Assafœtida produced in Persia. I have examined another kind of Umbelliferous fruit in the collection of Dr. Royle, labelled as 'the seed of the wild Assafœtida plant, collected and brought to England by Sir J. Macneill, from Persia,' which differs widely from the fruit both of Narthex and Ferula, and belongs to another tribe of the order."

PODOPHYLLIN, a resin obtained from the root of the *Podophyllum peltatum*. [PODOPHYLLÆ.] This substance was first obtained by Dr. Merrell of Cincinnati, who has administered it in various cases and recommends it in doses of two grains as a safe and active purgative.

"It has been found of great service, more especially in biliary fevers, determination of blood to the brain, and, indeed, in all cases in which the liver and stomach were primarily affected. It has also been found eminently useful as an alterative, as testified by Beach, Comfort, King, and other practitioners.

"The podophyllin when pure is quite insoluble in cold water, nor is it acted on by diluted nitric acid nor alkalies. It is not, therefore, an acid like tannin, nor an alkaloid, but a neutral proximate vegetable principle of a resinous character. It is insoluble in oil of turpentine, but readily soluble in alcohol and ether. In all respects, its chemical characteristics are like the resin of jalapa. It is very important in administering it that it should be finely pulverised." ('Record of Pharmacy and Therapeutics,' No. III).

QUINOIDINE. In the preparation of quinine from Cinchona bark, there is left in the mother liquor a substance which is called quinoidine. At one time this substance was regarded as amorphous quinine, and was sold under this name. The substance thus procured was found to possess more active antiperiodic and febrifugal properties than quinine itself. It has, however, been since found that the matters remaining after the crystallisation of the sulphate of quinine are of a complicated character, and probably consist of uninvestigated forms of alkaloids, similar to and more powerful in their action than sulphate of quinine. Whatever may be the nature of these substances, they are now sold under the name of sulphate of quinoidine.

"The most recent publications on the medicinal efficacy of quinoidine are a paper by Dr. Harting, in Smidt's *Jahrt*, 1853, and Dr. da Costa, in the *Philadelphia Medical Examiner* for May, 1855.

"Dr. Harting states that, from 12 years' experience in the treatment of agues, he finds it to be superior to the common sulphate of quinine. Dr. da Costa gives a summary of 53 cases of intermittent fever treated by quinoidine. In many of these the disease was of long standing. The rigors were arrested in 49 cases by the first administration of the medicine, only 4 requiring a repetition. The quantity given varied from 16 to 40 grains; the average was 20 grains. Six grains were given a short time before the expected accession of the paroxysm, the rest at intervals during the intermission. The quinoidine did not give rise to headache, singing or boring in the ears, nor to sickness, the ordinary effects of large doses of sulphate of quinine. The advantages of sulphate of quinoidine are, therefore, very considerable. Its superior medical efficacy depends, first, on its containing, associated with amorphous quinine, very energetic bases derived from the bark; second, its uncrystalline state, which renders it more readily assimilated. Drs. Pront and Daubeney have shown, on physiological grounds, that uncrystallised substances are more congenial to the animal economy than crystalline. Indeed, it is a fact, although little noticed, that sulphate of quinine often passes through the system undecomposed, and may be found in the urine; and this fact explains one cause of its frequent failure to arrest intermittent fevers." ('Record of Pharmacy and Therapeutics').

SANGUINARIA CANADENSIS, the Puccoon or Canadian Blood-root, so called from the red colour of its juice. This plant is a native of America, and has long been used by the Indians on account of its acrid narcotic properties. It has lately been introduced into European practice as a remedy for cancer.

The genus Sanguinaria has the following characters. Petals 8—12: stamens, 24; stigmas, 2; capsule oblong 2-valved, ventricose, acute at each end with deciduous valves, and 2 permanent placentæ.

S. Canadensis is an early spring flower, and grows in most parts of the United States and Canada in woods. It is a smooth plant with a creeping root-stock, which emits a bright orange juice when cut. The leaves are radical, solitary or long, channelled petioles reniform or heart-shaped, with large roundish lobes separated by obtuse sinuses. The underside strongly reticulated with veins paler than the upper, and at length glaucous. Peduncles solitary, axillary round, one-flowered, infolded by the young leaf. Sepals, 2; petals, 8; stamens numerous, with yellow anthers. Ovary, oblong; style, none; seeds numerous, of a dark shining red colour. In their report on Dr. Fell's method of curing cancer, the surgeons of the Middlesex Hospital thus speak of this remedy:—

"Whilst avowing our present judgment of the inefficacy of blood-root in the management of cancerous diathesis, we see no objection to further and much more extended observations of its effects in that disease. It is evidently a powerful remedy, and as an emmenagogue is, perhaps, equal to any drug now employed in England. But our hope of its usefulness in cancer is very small; and that becomes less still, when we remember that Dr. Fell himself never suggested that patients should continue the constitutional treatment after the extirpation of the local disease and the healing of the wound, and never advised the use of the sanguinaria pill in cases of internal cancer, or of those external malignant tumours which were rejected as unfit for local treatment."

It is probable that the use of this remedy in the cases alluded to, will lead to further trials of its properties, and it may yet be a valuable remedy in the list of Materia Medica.

THIERRY, JACQUES-NICHOLAS-AUGUSTIN, the distinguished historian, was born at Blois on May 19, 1795. In 1805 he commenced his studies in the college of his native town; in 1811 he entered the normal school; and in 1813 he became a teacher in a provincial school. In 1814 he went to Paris, enlisting himself as an adherent of the socialist principles of the Count St. Simon, of whom he became the friend and assistant; and in 1816 published 'Des Nations et de leurs Rapports mutuels.' He however shortly penetrated the fallacy and shallowness of his master's doctrines, abjured them, and became with Comte and Dunoyer the editor, in 1817, of the 'Censeur Européen,' a liberal political journal. It was at this time that he first formed the theory of the continued existence of two classes in England—the Norman masters and the Saxon servants,—whose successive struggles he traced down to the time of Charles I. in an essay in this paper, and which, with much perverted ingenuity, but with perfect honesty, and a rare and conscientious industry and perseverance in historical investigations which he then commenced, he has supported in all his subsequent works. On the suppression of the 'Censeur Européen' in 1820 he proposed to the editors of the 'Courrier Français' a series of letters on the history of France, for he says of himself that he had then found that history was his true vocation, and he was accepted as a contributor. With the second letter commenced the official attacks on his writings. Much was erased, still he pursued his course; but on receiving several other letters of disapproval, the editors wished him to vary his subjects. This he declined doing, and he ceased his contributions in January 1821. He then returned to his historical studies, which however he had to pursue under increased difficulties as approaching blindness rendered him unable to read, but he bore the deprivation with philosophical calmness. In 1825 he published his 'Histoire de la Conquête de l'Angleterre par les Normands,' a work which, despite his false theory of the ever-enduring difference of classification of the two races, is of a high merit, as displaying great power of acute discrimination, the result of vast labour digested by a well-regulated mind, with pleasing and animated descriptions grouping the peculiarities of the time, and an animated style. It has gone through many editions and has been translated into English and German. In 1827 he issued his letters from the 'Courrier Français' in an extended and collected form under the title of 'Lettres sur l'Histoire de France,' which have also been translated into English. In 1828 a nervous disorder, added to his now rapidly failing sight, occasioned his being sent by his medical adviser to Hyères, near Toulon, for the benefit of the sea-air of the Mediterranean. While residing here for nearly two years, he was elected a member of the Académie des Inscriptions et Belles-Lettres, and was created a member of the Legion of Honour, of which subsequently he was made an officer. The years 1831 to 1835 he passed partly at the warm baths of Luxeuil and partly at Vesoul in Haute-Saône, during which time, with the assistance of his brother, he composed his 'Dix Ans d'Études historiques,' a series of excellent essays, the product of his previous investigations, which was published in 1835. At this time, he was called to Paris by Guizot, who was then minister of public instruction, who confided to him the editing of a 'Recueil des Documents inédits de l'Histoire du Tiers-Etats,' which forms a part of the 'Collection des Documents inédits de l'Histoire de France.' In 1840 he published his 'Récits des Temps Mérovingiens, précédés des Considérations sur l'Histoire de France,' to which the Academy awarded their prize, and of which also there is an English translation. A collected edition of his works was published in 1853. He died May 21, 1856.

As an historian Thierry takes rank with Michelet and Guizot. Less profound in philosophical disquisition than Guizot, less eloquent and imaginative than Michelet, he excels both in the power of grouping large masses of detail, and of seeing and presenting every point of interest or importance; he combines picturesque effects with minute knowledge; and his style is earnest and lucid though not always elegant. He has also the merit of remaining consistently devoted to his vocation. While nearly every French writer of eminence looked forward to political influence or employment as his reward—and many contrived to attain them, too often by a sacrifice of their previous principles or opinions—Thierry held on his way undeviatingly. His consolation under various afflictions he has himself stated: "Blind and suffering, without hope and without intermission, I will give this testimony which from me no one will disbelieve: there is something in the world better than physical enjoyments, better than property, better even than health; it is a devoted attachment to a science."

JULIE THIERRY, whose maiden name was Quérangal, became the wife of Thierry in 1831, and was of essential service to him in his then state of total blindness. In 1836 she published 'Scènes de Mœurs aux 18me et 19me Siècles,' for which her husband wrote an introduction. She was also the author of a number of clever essays in the 'Revue des Deux Mondes.' She died on June 10, 1844.

THIOSINNAMINE. [CHEMISTRY, S. 2.]

THOM, JAMES, who acquired considerable temporary celebrity as a sculptor, was born in Ayrshire in 1799. He was brought up as a stone-mason, and taught himself the art of sculpture. Some small figures which he carved illustrative of the poetry of Burns secured him a local fame, and he was tempted to try his chisel on others of life-size. He accordingly produced in sandstone statues of Tam O'Shanter and Souter Johnnie, which had a surprising run of popularity. After being successfully exhibited in Scotland they were brought to London, where they proved equally attractive, and the self-taught sculptor found himself for a time 'a lion.' He was commissioned to carve more than one repetition of these figures, and small plaster models of them were produced in great numbers. There is undoubtedly a good deal of humour and spirit in the figures, but they are rude and inartistical in conception and execution, and their excessive popularity was of evil influence upon the sculptor himself. He afterwards executed a statue of 'Old Mortality,' and several other works; but he appeared to be falling into comparative obscurity when, about 1836, the misconduct of an agent whom he had employed to manage an itinerant exhibition of his 'Tam O'Shanter' and 'Old Mortality' in the United States, led Thom to proceed to America. Eventually he determined to remain in New York, where he found considerable professional employment. He also devoted some time to architecture; took a farm, on which he erected a house from his own designs, and became a tolerably prosperous man; but he seems to have gradually abandoned the use of his chisel. He died at New York on the 24th of April, 1850. The original figures of Tam O'Shanter and Souter Johnnie, are placed in a building attached to the Burns monument on the banks of the Doon; there are copies of them in England, and at Mr. Colt's, Paterson, New Jersey. His group of 'Old Mortality' stands at the chief entrance of the Laurel Hill Cemetery, near Philadelphia.

THOM, WILLIAM, the weaver-poet of Inverury, was born at Aberdeen in 1799. At ten years of age, with barely the elements of education, he was bound for four years apprentice to a weaver, and during this time, as he narrates himself, "picked up a little reading and writing," trying at the same time to acquire Latin, but being "defeated for want of time." At the end of his apprenticeship he was engaged at another factory, where he worked for seventeen years, learned to play the German flute, and to know "every Scotch song that is worth singing." He married about 1829, had a family, and after some other removals settled for a time at Newtyle, near Cupar-Angus in Forfarshire. He was there when the great commercial failures in America occurred, one consequence of which was the cessation of employment for the poor hand-loom weavers. With a wife and four children, without work, in a neighbourhood where nearly all were as poor as himself, and in a country where the poor-laws were not yet introduced, the sufferings of the family were extreme, and in a cold spring day of 1837 they resolved to set off to walk to Aberdeen, in hopes that there he might procure employment. Of this journey he has given a vivid and pathetic narrative. One child died on the way. To obtain the means of progressing he had recourse to his flute, which sometimes brought him a trifling gift, and he made his first attempt at song-making in an address to his flute. This he had printed, and by presenting a copy of it at the genteeler houses, procured sufficient to enable the family to reach Aberdeen. He obtained work, first in that town, and then at Inverury. In November 1840 his wife, whose health had been weakened by her late sufferings, died in childbed. His new affliction again drove him to poetry, realising Shelley's assertion, that poets "learn in suffering what they teach in song."

He sent one of his compositions, 'The Blind Boy's Pranks', to the 'Aberdeen Herald,' where it was inserted with much commendation. It attracted the notice of Mr. Gordon, of Knockespoch, a gentleman in the neighbourhood, who relieved and patronised him. He had other poems by him, which were produced and admired, and he was brought to London, feasted at a public dinner, and received that sort of patronage which had so injurious an influence in the case of Burns, a patronage that only enhances the bitterness of the fate to which its objects are almost inevitably consigned. Thom returned to Inverury, resolving, he said, not to be too much elated by the applause he had received, but it is difficult to withstand the seductions to which it leads. He published in 1841 at Aberdeen, a small volume of poems, 'Rhymes and Recollections of a Hand-Loom Weaver,' which had but a moderate success. His poetical powers were not great: the chief merit of his verses consists in the exact reproductions of feelings he had himself experienced, with a melody of versification and a correctness of taste remarkable in one of so extremely limited an education. He married a second wife, was often subjected to the extremest need, and at last died in great poverty in March 1850. His widow died in the July following, and a subscription was raised of about 250*l.* for his destitute children.

THOMPSON, WILLIAM, a celebrated Irish naturalist. His father was an Irish linen merchant at Belfast, and William, his eldest son, was born on the 2nd of November, 1805. As his father destined him for a commercial life, he received such an education as was supposed to fit him for that pursuit. In 1821 he was apprenticed to a firm in the linen-business at Belfast. Although at this time he had acquired no taste for natural history, he soon took an interest in this subject from making excursions with a fellow apprentice who possessed a copy of Bewick's 'British Birds,' and a passion for collecting and stuffing birds. For several years he was hardly more than an amateur; but in 1832 circumstances occurred which induced him to give up business, and from that time he devoted himself in earnest to natural history. Although birds were his favourite study, he took an interest in all kinds of animals and plants, and eventually there were few Irish minerals, plants, and animals, with which he was not cognisant. He first became known as a naturalist by his contributions to the 'Proceedings' of the Zoological Society of London, on the natural history of Ireland. The names of some of these early contributions indicate the direction of his mind: 'Catalogue of Birds new to the Irish Fauna;' 'On some Vertebrata new to the Irish Fauna;' 'On some rare Irish Birds;' 'On the Natural History of Ireland, with a description of a new Genus of Fishes;' 'On the Irish Hare.' He also prepared to lay before the meeting of the British Association for the Advancement of Science, held at Glasgow in 1840, a 'Report on the Fauna of Ireland, Division Vertebrata.' This was not a mere enumeration of the vertebrate animals of Ireland, or an account of their comparative scarcity and abundance, but an exposition of the number of species in Ireland, the most western land of Europe, compared with other British and European species. In 1841 Mr. Thompson accompanied the late Professor Edward Forbes on a voyage in the Ægean in H.M.S. Beacon, commanded by the late Captain Graves, R.N., during which he made a large number of observations on the natural history of the countries which he visited. Some of these he subsequently made use of in his works on the natural history of Ireland. From 1841 to 1843 he was a frequent contributor to the 'Annals of Natural History,' and also engaged in collecting materials for his further report to the British Association on the Invertebrate Fauna of Ireland. This report was read at the meeting of the association at Cork in 1843, and is remarkable for the large amount of minute information it contains on the natural history of Ireland. From this time his papers on Irish natural history became more numerous; a list of above seventy is given in the Ray Society's 'Bibliography,' and these were preparations for a great work which he had projected on the natural history of his native country. The first volume of this work appeared in 1849, the second in 1850, the third in 1851. These three were devoted to the birds. He did not live to complete his work. He had been mainly instrumental in inducing the British Association to meet in 1852 in Belfast. In promoting this object he came to London in the January of that year, when he was seized with paralysis, and died in the course of a few hours. The manuscript of another volume on the 'Natural History of Ireland' was found after his death in a sufficiently advanced state to be given to the public, and this was published with a short memoir of the author in 1856. He took an active interest in all the local institutions of his native town. He was president of the Natural History and Philosophical Society of Belfast, member of the Royal Irish Academy, and honorary fellow and member of several foreign scientific societies. William Thompson is a remarkable instance of a man who, by the devotion of average talents to one great object, succeeded in his work on the natural history of Ireland in achieving for himself a lasting reputation, and giving to science one of its most valuable monographs on the distribution of animals in Europe.

THOMSON, ANTHONY TODD, was born in Edinburgh on the 7th of January, 1778. His father, by birth a Scotchman, had settled in America, where he held two lucrative appointments under the British government, being Postmaster-General for the province of Georgia, and Collector of Customs for the town of Savannah. Having refused to take the oath of allegiance to the American government, on the breaking out of the Revolution he was compelled to relinquish his appointments, and returned to Edinburgh. Anthony Todd was born previous to this, whilst his mother was on a visit to Edinburgh. He received his education at the High School, Edinburgh. When a boy he formed an intimacy with Henry, afterwards Lord Cockburn, which lasted till his death. His father destined him for business, but having obtained a clerkship in the Post-office, he was enabled by the leisure it afforded him to gratify a wish he had always entertained to study medicine. He attended the lectures of Munro, Gregory, Black, and Dugald Stewart. In 1798 he became a member of the Speculative Society, and the companion of Jeffrey, Horner, Brougham, and Lord Lansdowne. In 1799 he became a member of the Royal Medical Society. Having graduated in 1799, he left Edinburgh, and established himself in London about the year 1800. He commenced the practice of his profession in Sloane-street, Chelsea, as a general practitioner. His progress was at first slow, but when once commenced it was never interrupted. In the midst of a large general practice, he found time to cultivate science and literature. He was mainly instrumental in procuring the enactment of the Apothecaries' Act in 1814. His first literary work was published in 1810, and entitled 'Conspectus Pharmacopiæ.' He sold the copyright of this book for twenty pounds. In 1833 it was bought by the Messrs. Longman for two hundred pounds. It has gone through fourteen editions. In 1811 he published the 'London Dispensatory,' which was a work of great labour. It contained a critical account of all the medicines and their compounds which were in use in Great Britain. It has been translated into several European languages, and ten editions have been published in England. During his researches into the materia medica he was impressed with the importance of the study of botany, and he was one of the first to give a course of lectures on this subject in London. In 1821 he published a first volume of his 'Lectures on Botany.' This work contained many very valuable observations on the structure and functions of plants which have since become a part of the science of botany. In his observations, he made extensive use of the microscope, and may fairly claim to be one of those who appreciated the value of this instrument when its use was generally neglected. In 1826 he became a member of the Royal College of Physicians of London, and commenced practice as a consulting physician. In 1828 he was elected professor of Materia Medica to the then London University, now University College. In this position he worked with great ardour at the subject of Therapeutics, and was one of the first to introduce the new substances discovered by the chemist into the practice of medicine. He formed here a very fine collection of specimens of materia medica, but the college had not the means of purchasing it after his death, and it has been lost to the country. In 1832 he was appointed professor of Medical Jurisprudence. The lectures delivered from this chair were published in the 'Lancet' in 1836-7. In 1832 Dr. Thomson published his 'Elements of Materia Medica,' a work of a more scientific character than his 'London Dispensatory,' and entering more fully into the subject of Therapeutics. Three editions of this work had been published at the time of his death. In 1839 he edited 'Bateman on Cutaneous Diseases,' and at the time of his death, he was engaged in preparing 'A practical Treatise on Diseases affecting the Skin,' which has since been completed and edited by Dr. Parkes. In 1848 his health first began to fail. He continued to give his lectures, with considerable interruptions, till the following summer, when he was obliged to retire into the country, and died of bronchitis at Ealing on the 3rd of July, 1849.

Dr. Thomson was a man of unwearied industry, and throughout his long career, pursued his labours with few or no interruptions. He was a man of varied attainments, cultivating literature as well as science, and was not an unfrequent contributor of literary articles to the Magazines and Reviews. He translated from the French, and edited, a work by Mons. Salvarte, entitled 'The Philosophy of Magic, Omens, and apparent Miracles.' His notes to this work are full of curious and interesting matter. He edited also an edition of Thomson's 'Seasons;' to which he appended a large number of notes, and a life of the author. He contributed many articles to the 'Cyclopædia of Practical Medicine.' He was for many years editor of the 'Medical Repository;' to which journal he also extensively contributed. One of his last works was entitled 'Domestic Management of the Sick-room,' of which several editions have been printed. A sketch of his life, from which the materials of this notice have been principally obtained, is published with his posthumous work on 'Diseases of the Skin.'

THOMSON, THOMAS, M.D., a celebrated chemist, was born April 12, 1773, at Crieff, Perthshire, and received his early education at the parish school of that place. He afterwards studied at St. Andrew's and Edinburgh, and was a pupil of the celebrated Dr. Black. In 1802 he delivered a course of lectures on chemistry, and continued to lecture on this science for nearly fifty years. He was one of the editors of the 'Encyclopædia Britannica,' from 1796 to 1800, and wrote the articles 'Chemistry,' 'Mineralogy,' &c. in that work. In 1802 he published his 'System of Chemistry.' He first suggested the use of symbols in chemistry, which have since become so generally employed. He was one of the first chemists who recognised the value of Dalton's atomic theory, and devoted himself to its elucidation. He also at this time conducted for the Board of Excise a series of investigations on brewing, which formed the basis of Scottish legislation on that subject. In 1813 Dr. Thomson came to London, and started the 'Annals of Philosophy,' a scientific journal, which he edited till the year 1822, when he resigned it to his friend Mr. Richard Phillips. In 1827 this journal became merged in the 'Philosophical Magazine.' In 1817 he was elected lecturer on chemistry in the University of Glasgow, and the following year received the title of professor. This chair he held till his death, assisted in his later years by his nephew and son-in-law Dr. R. D. Thomson. In 1835 he published a work, entitled 'Outlines of Mineralogy, Geology, and Mineral Analysis,' and in 1849 a work on 'Brewing and Distillation.' He died on the 2nd of July, 1852. His son, Dr. Thomas Thomson, is celebrated for his botanical knowledge; he has published an account of his travels in Thibet, and is now the superintendent of the East India Company's botanic gardens at Calcutta.

THREE RIVERS. [CANADA, S. 2.]

THRIFT, the common name of the *Statice Armeria*, Smith, now *Armeria maritima*. *Armeria* belongs to the natural order *Plumbaginaceæ*. It is distinguished by the flowers being in a head contained in an inverted cylindrical sheath, and the capsular fruit not bursting.

A. maritima, Thrift, is a common British plant, growing on muddy and rocky sea-shores and on the banks of salt-water æstuaries. It bears transportation to gardens, where it is a favourite in forming the borders of flower-beds. It may be easily distinguished from other species by its linear 1-nerved leaves. It has rose-coloured flowers. Several varieties are described.

THUREA. [BOSWELLIA.]

TICKS. [TRACHEAREA, S. 2.]

TIECK, CHRISTIAN FRIEDRICH, a celebrated sculptor, brother of Ludwig Tieck, was born in Berlin on the 14th of August, 1776. Having studied awhile under Schadow, he in 1798 proceeded to Paris, where he became a pupil of David. In 1801 he returned to Berlin, and afterwards went to Weimar, then a great centre of literary and artistic activity. Here he found Göthe a warm and most valuable friend and adviser, and whilst here he not only assisted in the execution of the sculptural decorations of the new palace, but executed busts of Göthe, Voss, and Wolff, besides many of members of princely and noble families. In 1805 he went with his brother Ludwig to Italy, and carefully studied the great works of art there, maintaining at the same time by his numerous busts, &c., his manual dexterity. Here he found friends and patrons in Madame de Staël, and the crown-prince, afterwards King Ludwig, of Bavaria. For the former he executed a rilievo for the family sepulchre at Coppet, and subsequently a life-size statue of Necker, and busts of herself, the Duc de Broglie, Augustus Schlegel, and M. Rocca. For Ludwig of Bavaria he executed at various times busts of Ludwig himself, Jacobi, Schelling, Ludwig Tieck, Lessing, Erasmus, Grotius, Herder, Wallenstein, and several others, chiefly for the Walhalla. On his second visit to Italy (1812) he became acquainted with Rauch, and the two great sculptors ever after remained fast friends. He returned in 1819 to Berlin, where he established his atelier, and was elected a member of the academy. During the remainder of his life he was employed upon many of the public works, and was a prominent actor in the artistic movements in the Prussian capital. Among his productions were the friezes, the sculptures in the pediment, and other external decorations of the Theatre Royal, the gates, and the statue of the angel in the porch of the Cathedral in Berlin; a series of fifteen seated marble statues of classical personages for the royal palace; a bronze equestrian statue of Frederick William at Ruppin, besides several monumental works and numerous busts and rilievi. He was also during many years extensively employed on the restoration of ancient works for the Royal Museum, in which institution he was director of the department of sculpture. He died at Berlin on the 14th of June, 1851. Tieck was not possessed of much imaginative power; he executed some good statues and rilievi, but his chief strength lay in his memorial busts, many of which display great elevation of style and admirable chiselling. In his studio several eminent sculptors have been formed, among whom perhaps the best known is Kiss, the sculptor of the Amazon. There are casts of some of Tieck's works in the Crystal Palace at Sydenham.

TIECK, LUDWIG, one of the most influential actors upon the modern literature of Germany, was born in Berlin, on May 31, 1773. At the universities of Halle, Göttingen, and Erlangen, he studied with great ardour; history and the poetical literature of both the ancients and the moderns being his favourite pursuits. His poetical powers developed themselves early, but they took a direction opposite to the usual classical models, and exercised themselves on the feelings and opinions of what may be termed the Christian chivalry or romance of the Middle Ages, although his first efforts, 'Almansur,' a prose idyll, in 1790, and 'Alla Moddin,' a prose play, in three acts, in 1790-1, assumed an eastern locality. Both displayed great poetical ability, but he did not attempt verse, except in a few short pieces introduced amid the prose. In 1792 he produced the tragedy of 'Der Abschied' (The Parting), also in prose, which, like most of his other dramatic pieces, is more fitted for the closet than the stage. He probably himself began to perceive that his true strength lay in narrative, and in the same year he produced 'Das grüne Band,' a mediæval tale of considerable pathos, with great truth of characterisation and much interest; and 'Abdallah,' an oriental tale, with little of oriental colouring, and of a ghastly terror-inspiring character. He had made much progress in the study of English literature, particularly the drama, and the result was, in 1793, a compressed translation, or rather paraphrase, of Ben Jonson's 'Volpone,' in three acts, in which it is remarkable how carefully he has omitted all the more poetical passages which ornament the original, and in which, for the scene where Volpone plays the mountebank, he substitutes a satirical one between an Englishman and a German author come to England for a few weeks to write volumes on the character of the country and its inhabitants. To the same period belongs also his novel of 'William Lovell,' of which the characters and scenery are intended to be English, but they have a very foreign air, and the tone of the whole is more gloomy than most of Tieck's productions.

The six years, from 1795 to 1800, both inclusive, was a period of incessant activity. During it he travelled; visited Jena, where he formed an intimate friendship with the two Schlegels, Novalis, and Schelling; Weimar, where he became acquainted with Herder; and Hamburg, where he married the daughter of a clergyman named Alberti. The intercourse with the above-named literary celebrities had much influence on his future course. While still adhering to the romantic school, his productions embraced a wider field. He continued to write tales, novels, tragedies, and comedies; but in embodying nursery tales, as in his 'Blaubart,' a play in five acts, 'Die Sieben Weiber des Blaubarts' (Seven Wives of Bluebeard), a tale, and the 'Leben und Tod des kleinen Rothkäppchen' (Life and Death of Little Red Riding Hood), a tragedy in three acts, he united much of the simplicity of the old traditions, with the added interest of poetical conception, a close adherence to the story, and occasional passages of pathos or of humour. Occasionally he took for his subject legends of a higher character, as in his 'Leben und Tod der heiligen Genoveva;' and in 1804, in 'Kaiser Octavianus,' a work which had been long expected, and which his countrymen consider as one of the most successful of his romantic productions. To this he has prefixed a long prologue, in which various characters are introduced to display the prosaic element, and a poet, to whom comes Romance, a female, who describes herself as infusing joy throughout the world, and says that her father is Faith, and Love her mother. In this prologue, and in the following play, which is partly in prose, is found the most favourable specimen of Tieck's versification. It is not of the most careful construction; and it is singular that though his conceptions were highly poetical, the best examples of them are found in his prose. This line was followed out in subsequent works, as in 'Fortunät,' which however embodies a considerable amount of good-humoured satire on the various conditions of the existing state of society. Another class comprises, what are styled by the Germans Art-Novels, to which belong 'Franz Sternbald's Wanderungen,' 'Phantasien über die Kunst,' and 'Herzensergiessungen eines Kunstliebenden Klosterbruders' (Heart-outpourings of an Art-loving Monk), written in conjunction with his friend Wackenroder, in all of which he displays a love and knowledge of the beautiful and elevated in art, a contempt for the self-complacency of affected connoisseurship, and a manifestation of Roman Catholic feeling, to which faith he for some time adhered about this period. Perhaps less distinctive as a class, as his previous tales had much of a similar character, were his 'Volksmährchen' (Popular Legends), such as the history of Heymon's Children, the Fair Magelone, Melusina, &c., legends which are European, and the 'Denkwürdige Geschichtschronik der Schildbürger' (Memorable History of the Simpletons), a sort of German version of our Men of Gotham; tales in prose, abounding in pleasant fancy, interspersed with picturesque descriptions or strokes of broad humour, and told with a simplicity and an apparent childish belief in the wonders related that give an indescribable charm to the whole. Upon yet another class he evidently bestowed more thought and labour. In the dramas, for they assume that form, 'Der gestiefelter Kater' (Puss in Boots); in 'Prinz Zerbino, oder die Reise nach dem guten Geschmacke' (Travels in search of Good Taste); 'Die verkehrte Welt' (The World turned upside down); and 'Leben und Thaten des Kleinen Thomas, genannt Däumchen' (Tom Thumb); in all of which he attacked with keen irony the low, material, anti-poetical notions of poetry advocated by learned pedants, and defended by implication, by example, and by occasional parodies on the classicists, the theory of the romantic school. A key to 'Zerbino,' by one thoroughly acquainted with the peculiarities of all the authors alluded to in that drama, would possess much interest for the English student. These pieces, independent of their critical merits, have an interest of their own from the wit and humour of the dialogue. Many of the productions of this period, including most of those above-mentioned, were subsequently published together, under the title of 'Phantasus,' in a frame-work of a conversational party, to whom or by whom they are related. An excellent translation of 'Don Quixote,' a very good one of Ben Jonson's 'Epicœne, or the Silent Woman,' and a remarkably successful one of Shakspere's 'Tempest,' also belong to this period.

In 1801-2, while residing in Dresden, he assisted F. Schlegel in bringing out the 'Musen-Almanach,' to which he contributed some of his tales. He then lived for a time at Berlin, and next at Ziebingen near Frankfurt-on-the-Oder, seeming to enjoy a poetical leisure, during which he produced nothing but 'Kaiser Octavianus' of which we have already spoken, in 1804; and in the same year he made a journey to Italy, returning from thence in 1806 to Munich, where he had the first attack of gout, from which he was ever after an extreme sufferer. This attack was so violent, that he produced little for several years. He occupied himself, when able, in revising and adding to his previous works, publishing the 'Phantasus' as above stated, and a collection of his poems; in studying and collecting the early poetry of his own country, of which in 1803 he had published 'Minnelieder aus dem Schwäbischen Zeitalter' (Love songs of the Swabian period), and in 1815 'Ulrich's von Lichtenstein Frauendienst' (Worth of Woman); and in extending his acquaintance with the English drama. In 1812 he published the 'Alt-Englisches Theater,' containing translations of the old King John, the Pindar of Wakefield, Pericles, Locrine, the Merry Devil of Edmonton, and the old Lear, all of which he contends are the genuine, though chiefly early, productions of Shakspere. In 1817 he published two volumes of specimens of the early German drama, and in the same year visited England for the purpose of acquainting himself with the literature connected with the drama which he could not procure in Germany. He laboured diligently; the treasures of the British Museum as well as those of many private collections were opened to him; and it is probable that no foreigner ever attained so wide and so exact an acquaintance as Tieck with the English literature of the great Elizabethan period, or so just an appreciation of Shakspere, although his enthusiasm has led him to the discovery of beauties hidden from Englishmen in the apocryphal or rejected works attributed to Shakspere, in the genuineness of nearly all of which he is a stedfast believer, but of which his countryman and follower Ulrici has formed a more sober judgment. On his return to Germany he settled at Dresden, and for some time his literary publications were chiefly novels and tales for the pocket-books and similar annuals. In 1823 he published the first volume of 'Shakspere's Vorschule' containing translations of Green's 'Friar Bacon,' 'Arden of Feversham,' of which he has doubts whether it is a production of Green's or an early work of Shakspere, and Heywood's 'Lancashire Witches;' this was followed by a second volume in 1829 containing 'Fair Em,' 'The second Maid's Tragedy,' by Mussingen, translated from one of the three manuscript plays saved from the fire by Warburton the herald, and 'The Birth of Merlin:' the first he considers to be more probably an early effort of Shakspere's than of any of the other names to which it has been assigned, grounding his opinion of this and other of the doubtful plays on the belief that Shakspere commenced writing for the stage many years earlier than had at that time been admitted; a belief which the investigations of Mr. C. Knight in his 'Pictorial Shakspere' has shown to be very probable, though not leading always to the conclusions at which Tieck has arrived regarding the particular plays. In 1828 he published his 'Dramaturgische Blätter,' chiefly written in 1817, a collection of reviews or criticisms of modern German plays, including notices of Schiller's 'Piccolomini,' and 'Wallenstein's Tod;' Göthe's 'Jery und Bätelei,' and 'Clavigo;' and Shakspere's 'Romeo and Juliet,' 'Lear,' 'Henry VIII.,' 'Macbeth,' and 'Hamlet;' all containing much genial criticism, with a delicate and true apprehension of their poetical feeling and harmony; with notices of the acting of Kemble and Kean; and Appendices on the German and English stage. About the same time he took an active part in the continuation and completion of the translation of Shakspere's acknowledged plays, which had been begun by Schlegel, and of which the first volume appeared in 1825. The merits of this translation, of which many were entirely from his own hands, and all were subjected to his revision, are universally acknowledged. Less literal, but more spirited and equally true to the sense of the author, than the previous translation by the Vosses, they are illustrated by a number of notes which display a vast amount of reading, and many ingenious conjectures as to various disputed readings, and they now form the recognised text of Shakspere's plays in Germany. The work was completed in 1829. But his labours were not confined to this work; he continued to write tales for periodical publications, and in 1828 he produced his novel of 'Dichtersleben,' (Life of a Poet) in which Shakspere and several of his contemporaries are introduced, and in which the death of Marlow is vividly described. In 1829 he published 'Der Tod des Dichters,' (the Poet's Death) in which the unhappy fate of Camoens is pathetically related. In 1826 he also produced one of his most picturesque narratives, 'Der Aufruhr in den Cevennes,' in which the insurrection in the Cevennes is graphically told, but unfortunately was left incomplete. While residing at Dresden his evening circles became celebrated, at which his readings and the relation of his tales formed a principal charm, and which were attended by all the literary celebrities who were in the vicinity and could gain admission. In 1836 and 1840 he published his two latest novels—'Der Tischlermeister' (The Cabinet-maker) and 'Victoria Accorombona,' both of which are very inferior to most of his previous works of a similar character. He also took an active part in the management of the Dresden theatres. In 1840, on the accession of Friedrich Wilhelm IV. to the throne of Prussia, Tieck was invited to Berlin, an invitation which he accepted. He was then created a privy-councillor, and passed the remainder of his life partly in Berlin and partly at Potsdam, occupied chiefly with some theatrical productions, and in revising and correcting his works, which were published in 20 volumes at Berlin between 1828 and 1846. At various times he also edited Novalis's 'Schriften,' in conjunction with Friedrich Schlegel, 1802; Heinrich von Kleist's 'Nachgelassenen Schriften' (Posthumous Works), 1826; Solger's 'Nachlass und Briefwechsel' (Remains and Correspondence) with Friedrich von Raumer, 1826; and Reinhard Lenz's 'Gesammelte Schriften,' (Collected Works) in 1828. After suffering for some years from continued illness, borne with wonderful patience and cheerfulness, he died at Berlin, April 28, 1853, leaving a name which may rank with the highest in his native country, and which Englishmen may reverence as that which in Germany is most connected with the popularising of the fame of the great dramatic poet of England.

TILLÆA, a genus of Plants belonging to the natural order *Crassulaceæ*. It has a 3- or 4-parted calyx; petals 3 or 4, oblong acuminated; scales none, or very small; carpels 3 or 4, somewhat constricted in the middle; 2-seeded. The species are small glabrous annual herbs, inhabitants of exposed subhumid places. The leaves are opposite. Flowers small, white, for the most part axillary.

T. muscosa is a native of Europe in many places, in dry, barren, sandy, and gravelly soil; plentiful in Britain on the most barren sandy heaths, and frequent in Norfolk and Suffolk. It has a stem branched and decumbent at the base; flowers axillary, sessile, and trifid. The plant is very minute, and of a reddish colour. The leaves are opposite, oblong, obtuse, concave above, connate; sepals ovate or lanceolate acute, bristle-pointed. Petals nearly subulate, white, tipped with red. There are several other species, natives of North and South America and Australia.

TINCAL. [Boracic Acid.]

TINEIDÆ, a family of small Moths, which are remarkable for depositing their eggs among animal substances, on which their larvæ afterwards feed. They are thus constantly found upon clothing made of hair or fur, and are called Clothes-Moths. The family is thus defined:—Antennæ moderate, slender, simple, pubescent beneath in the males; proboscis short; thorax rarely crested; body long and slender; wings entire, often narrow, mostly convoluted in repose. The caterpillars live in portable cases formed of various materials.

These moths are often ornamented with very brilliant colours, the upper wings having gold or silver spots. The caterpillars make their cases of the substances on which they feed. The *Adelæ* make their nests of bits of leaves. The true *Tineæ* clothe themselves with the hair of the skins of animals and bits of silk. When too small, they slit their cases and make them larger. Many of them burrow into skins, silk garments, &c., making cases as they proceed. The genera and species are very numerous.

(Westwood, *Entomologist's Textbook.*)

TIPTON. [Staffordshire.]

TIPULIDÆ, a family of Dipterous Insects belonging to the tribe *Nemocera*. They have the antennæ longer than the head, simple, not plumose, rarely pectinated; eyes entire, ocelli obsolete; front of head beaked; proboscis short, ending in two large fleshy lips; body elongated; wings long, nervures numerous; legs long.

The types of this family are the species of *Ctenophora*, *Pedicia*, and the species of *Tipulæ* which are usually known by the name of Daddy-Long-Legs.

Latreille divides this family into five smaller groups—Culiciformes, Gallicoles, Terricoles, Fungivores, and Florales.

The Culiciformes (*Chironomides*, Macquaart) include those forms the pupæ of which mostly dwell in the water, respiring by means of external tubes or filaments situated in front of the body. They have also the power of swimming. Many of them are transparent, and form exceedingly beautiful objects for the microscope. The larvæ of *Chironomus plumosus* are vermiform, and of a blood-red colour, whence they are called Blood-Worms. [Chironomus.]

The Gallicoles (*Cecidomyides*) include those species which form galls by depositing their eggs upon plants. [Cecidomyia.]

The Fungivores (*Mycetophilides*, Macquaart) embrace an extremely active group of these insects, which are capable of leaping by means of their hind legs. They are found in damp situations amongst various plants. They enter houses, and are found upon window-panes. They are also very partial to *Fungi*, hence their name; and they are generally found in the interior of *Boleti* and *Fungi*.

The Terricoles (*Tipulides*, Macquaart) are the true Crane-Flies. The species of the genus *Tipula* are found in damp meadows in great numbers, especially in the autumn. The larvæ are found in the soil, and feed upon the roots of grass, &c., and occasionally they do much harm. Mr. Westwood remarks that the male Daddy-Long-Legs is very quarrelsome, and often fights with his brethren of the same species.

The Florales (*Bibionides*, Macquaart) are distinguished by having the body and legs shorter and more robust than the other forms. The species are small, and their flight is slow and heavy.

(Westwood, *Families of Insects.*)

TODMORDEN. [Lancashire.]

TOLLENS, HENDRIK CORNELISZOON, long the most popular living poet of Holland, was born at Rotterdam on the 24th of September 1780. His father carried on a thriving business, founded by his grandfather, as a dealer in colours, and Hendrik was taken from school at the age of fourteen to assist behind the counter. The year after was that of the French entry into Holland, when many of the Dutch were disposed to look on them as deliverers, and young Tollens became the secretary of a "Vaderlandsche Bijeenkomst," or Patriotic Society, to whose purposes he soon contributed some songs, which had a run of success. His father, who had at first been pleased at his son's reputation, soon became alarmed lest poetry should lead him away from business, though that alarm might surely have been spared in Holland. When Tollens at the age of seventeen, made the acquaintance of two poets, one of them, Helmers, was a merchant, the other, Loots, a book-keeper in a counting-house, and Uylenbroek, a third, to whom they introduced him, was a respectable bookseller. Tollens had learned some French at school; by Uylenbroek's advice he now studied English and German, and thus enlarged his ideas; but he followed Uylenbroek's example in occupying himself with rendering French tragedies into Dutch verse. He afterwards ventured on original dramas, and his 'Lucretia,' written in 1805, had, at all events, sufficient spirit to be prohibited by the government. Another tragedy, 'De Hoekschen en Kabeljaauwschen' (The Hooks and the Codfish), had at least the merit of a national subject, being founded on the quarrels of the rival factions of these names, the Guelphs and Ghibelines of Dutch mediæval history, whose hostilities, which lasted a century and a half, are said to have arisen in 1350 from a jocose dispute between some nobles at a banquet as to whether the codfish could be said to take the hook, or the hook the codfish. Tollen's powers, however, did not lie in tragedy. In two contests with his friend Loots on subjects offered for prizes, one on the theme Hugo Grotius, and the other the death of Egmont and Hoorn, he won the second prize on the first occasion, and the first on the second; and in 1807 a short poem by him 'To a Fallen Girl,' attracted attention by its simple pathos. From that time his subjects were almost universally taken from national history and from domestic scenes, and though even his admirers did not place him on a level in point of genius with Bilderdijk, he became decidedly the most popular poet of his country, and had the honour of forming a school of poets—'the school of Rotterdam.' In 1817 the third edition of his poems had 10,000 subscribers; not long afterwards his fellow townsmen proposed to erect his bust in a public place, and it was only the reluctance of Tollens himself which prevented the intention from being carried out when the subscription was already full. This popularity increased as he grew more advanced in life. On his seventieth birthday, the 24th of September 1850, the minister of justice, Mr. Nedermeijer van Rosenthal, waited on him at his house at Rijswijk, to bring him the congratulations of the King of Holland, and present to him the insignia of commander of the order of the Dutch Lion, a very unusual honour for a literary man. A committee waited on him the same day to offer him a gold medal struck in his honour, with the inscription "Nederland zijnen geliefden Volksdichter' (Netherland to its beloved national poet), and to inform him that a subscription had been organised, without his knowledge, for the formation of a 'Tollens Fund,' to commemorate his name by a charitable institution, the nature of which was to be left to his own choice. He died in 1856, surrounded by universal respect.

The shorter poems of Tollens, lyrical and narrative, are his chief title to remembrance. One narrative poem, 'De Overwintering der Hollanders op Nova Zembla' (The Wintering of the Hollanders at Nova Zembla), commemorative of the celebrated voyage of Barends in 1596-97, is very popular and has often been reprinted, on one occasion in an illustrated edition. His 'Vierdaagsche Zeeslag,' or Four Days' Sea-Fight, commemorative of one of the desperate contests between the Dutch and English in the reign of Charles II., may be compared for spirit to his friend Loots's 'Overwinning bij Chattam' (Victory at Chatham), a favourite subject of allusion with the Dutch poets. Tollens is a fertile author of ballads on subjects of Dutch history, among which his 'Jan Van Schaffelaar,' 'Kenau Hasselaar,' &c., are conspicuous. His 'Wapenkreet' (Call to Arms), written on occasion of Napoleon's return from Elba, is one of his best productions. Tollens translated much from the German and English as well as the French, but often adapted the pieces he borrowed to Dutch subjects or history. An English reader would hardly suspect before reading it that his 'Jonker van 't Sticht' was taken from Scott's 'Young Lochinvar,' which has also been done into Dutch by Van Lennep, under the title of 'De Heer van Culemborg.' Tollen's works, of which a new edition is now publishing, are of some extent: his shorter poems alone occupy about ten 8vo. volumes, not very closely printed.

TOLUOLE. [CHEMISTRY, *S.* 2.]

TOOKE, THOMAS, one of the two sons of the Rev. William Tooke, was born in 1773. He published in 1838 'A History of Prices and of the State of the Circulation from 1793 to 1837, preceded by a brief sketch of the State of the Corn-Trade in the last two Centuries,' 2 vols. 8vo. The treatise comprised in these two volumes, though apparently an enlargement and continuation of one published about fifteen years previously under the title of 'Thoughts and Details on the High and Low Prices of the last Thirty Years,' embracing, as it does, the same line of argument and establishing the same conclusions, is yet essentially different both in its arrangement and details, and is, in fact, with slight exceptions, entirely new. It forms the first two volumes of the valuable work now well known to political economists as the 'History of Prices,' perhaps the first really scientific attempt to elucidate by inferences legitimately deduced from actual experience the complicated facts of this branch of political economy. The first two volumes were followed in 1840 by another volume in continuation of the two former, to which were added 'Remarks on the Corn Laws and on some of the Alterations proposed in our Banking System.' The fourth volume was entitled 'A History of Prices and the State of the Circulation from 1839 to 1847 inclusive; with a General Review of the Currency Question, and Remarks on the Operation of the Act 7 & 8 Vict., c. 32,' 8vo. 1848. Mr. Tooke afterwards published a tract, in which he was assisted by Mr. Newmarch, 'On the Bank-Charter of 1844, its Principles and Operation, with Suggestions for an Improved Administration of the Bank of England,' 8vo. The last two volumes of his great work are entitled 'A History of Prices and the State of the Circulation during the Nine Years 1848-1856, in Two Volumes, forming the Fifth and Sixth Volumes of the History of Prices from 1792 to the Present Time, by Thomas Tooke, F.R.S., Corresponding Member of the Institute of France, and William Newmarch,' 8vo., 1857. The 5th and 6th volumes, besides being a continuation and completion of the work, arranged under the heads Prices of Corn, Prices of Produce other than Corn, and the State of the Circulation, contains discussions on the connected topics of Railways and the Railway System, the origin and progress of the Free-Trade Movement, the State of Finance and Banking in France, and the New Discoveries of Gold. Mr. Tooke died in London, Feb. 26, 1858, being then within a few days of the completion of his 85th year. His younger brother, William Tooke, F.R.S., is still living.

TOOTH-TISSUE. [TISSUES, ORGANIC, *S.* 1.]

TOOTING. [SURREY.]

TORENO, DON JOSE MARIA QUEIPO DE LLANO, COUNT OF, a Spanish statesman and writer, was born at Oviedo on the 26th of November 1786, of one of the first families of the Asturias. In 1797 his parents, of whom he was the only son, fixed their residence at Madrid, where he received an excellent education of a character very uncommon at that time in Spain, as it included the study of English and even German, as well as French and Italian. After the national insurrection of the 2nd of May, 1808, in which he took a part, he returned to Oviedo, where, as Viscount of Matarrosa, he held an hereditary seat in the Junta, and when the city rose against Napoleon, he was selected, from his knowledge of English, to make his way to London to ask the assistance of England. In company with Don Angel de la Vega he got on board of a Jersey privateer, and was received at London with open arms by Canning. After spending some months in England, where he made the acquaintance of Wilberforce, Windham, and Sheridan, he returned to Spain in December, and, having lost his father in the interval, he succeeded to the title of Count of Toreno. He was sent to the Cortes as a member for the Asturias when a year too young to be able legally to take his seat, but by a vote of the Cortes on the 11th of February, 1811, he enjoyed the distinction of being specially exempted from the operation of the law. Young as he was he took a prominent part in the discussions on the constitution of 1812, and advocated with success two of the measures which most contributed to its subsequent downfall—one, that the Cortes should consist of a single chamber instead of two, and the other that the power of the king should be so restricted that all legislation should depend on the decision of the Cortes only. On the return of Ferdinand he was a marked man; when the celebrated decree of Valencia came forth, by which the Cortes was dissolved and many of its members thrown into prison, he was fortunately on his estates in the country, and had time to escape to Portugal. As he found there was no hope of resistance in Spain, he came to London, where he was the first emigrant from the tyranny of Ferdinand, as he had been the herald of resistance to Napoleon I. He received in London the intelligence that his estates had been confiscated and himself condemned to death. His brother-in-law, Porlier, who had married one of his four sisters, made an ineffectual attempt at insurrection, and was taken and executed. Toreno, who in 1816 was living in France, was thrown into prison for a time on suspicion, by the Decazes ministry, who interrogated him if he was not in habits of intercourse with the Duke of Wellington and General Álava, two persons whom it appears that the king of Spain then regarded as enemies. The Spanish revolution of 1820, recalled Toreno to Madrid, but he was now older and cooler than he had been, and saw with disapprobation many of the measures of the liberal party. His life was in consequence threatened in the Cortes, his house, in which his sister, the widow of Porlier, resided, was attacked, and, says Cueto, his biographer, "levelled to the ground." The king, on the other hand, pressed him to become prime-minister, and when he declined, named his friend, Martinez de la Rosa, whom Toreno had recommended. Finally, when the second French invasion had re-established the absolute king, Toreno found himself again a banished man, in favour with neither party, and this time his exile lasted nearly ten years. Most of it was passed in France and England, some in Germany and Switzerland, in the execution of a plan he had conceived of writing the history of the war of independence, for which he had begun collecting materials during his first emigration. He commenced the composition in 1827, at Paris, and finished the tenth book in the same city on the night of the 28th of July, 1830, in the midst of the insurrection which raged around.

The amnesty of 1832 restored him to Spain, but he was not permitted to reside in Madrid till after the death of King Ferdinand. In 1834, on the promulgation of the 'Estatuto Real,' by Queen Christina, on the recommendation of his friend, Martinez de la Rosa, he was named minister of finance. The measures he proposed for liquidating the foreign debt occupied his attention almost exclusively for some time, and prevented his sharing the unpopularity of his chief. so that, when in 1835 Martinez de la Rosa was compelled to retire, Toreno succeeded to his place as minister of foreign affairs and president of the council. Unfortunately for himself he admitted to his own post of minister of finance Mendizabal, who, with his dazzling schemes, soon threw him into the shade. Toreno, who was now decidedly a 'Moderado,' grew more and more unpopular; insurrections burst forth, which he wished to repress by forcible means, but his colleague thwarted him, and the country was not with him. In September 1835 he was driven to resign, and Mendizabal succeeded as head of the cabinet. On a dissolution of the Cortes, Mendizabal was returned by the electors of seven different places, and Toreno and Martinez de la Rosa were left without a seat. The disgraceful revolution of La Granja followed, the constitution of 1812 was proclaimed, and Toreno, now its declared opponent, found it expedient to resume his historical studies in Paris and London, where he brought his history to a conclusion, at the time that in Madrid he was sentenced to forfeit all his honours and estates. In a few months, however, he was again allowed to return to Spain, and in the Cortes of subsequent years he vindicated his character against an accusation of corruption brought against him by General Seoane. The revolution of Barcelona drove him into banishment yet another time, and it was the last. Toreno, after a tour in Germany and Italy, was in Paris, on his return, it is said, to Spain, when seized with a cerebral disease, which carried him off in a few days. He died at Paris on the 16th of September, 1843; but his remains were conveyed to his country, and deposited in the church of St. Isidro, at Madrid.

Toreno's 'History of the Insurrection, War, and Revolution of Spain' ('Historia del Levantamiento, Guerra, y Revolucion de España'), is the great Spanish work on that interesting subject. That it is a model of Spanish composition is affirmed by the best critics of that country. Its merits as a narrative are more liable to question, for there appears a languor and general want of spirit in its details, which surprise the reader who is aware that its author was not only an eye-witness of many of the events he describes, but also an actor in some of them. The editor of the edition of 1848, published after the author's death, speaks of the "carefulness and preciseness" of the history, "in which," he remarks, "the most insignificant French detachment is never mentioned without specifying the name of the chief who commanded it." A merit of more importance which Toreno's history possesses is that of a calm judicial tone, which favourably contrasts with the arrogant impetuosity of some English historians of that memorable contest. On the whole, it can only be considered like Southey's 'History of the Peninsular War,' as a temporary substitute and a collection of materials for the great work on the subject, with which it may be hoped that some future historian will enrich the literature of his country. The 'Historia del Levantamiento' has been translated into French and German, and a Spanish edition of it was printed by Baudry of Paris in his collection of the Spanish classics. The best edition of it is that published in four octavo volumes at Madrid in 1848, after the author's death, with his additions and corrections.

TORQUAY, Devonshire, a small sea-port and watering-place on the coast of the English Channel, in the parish of Tor-Moham, or Tor-Mohun, and hundred of Haytor, is situated in 50° 28′ N. lat., 3° 33′ W. long., distant about 30 miles S. from Exeter, 194 miles W.S.W. from London by road, and 219 miles by the Great Western and South Devon railways. The population of the town of Torquay in 1851 was 7903. The living is a perpetual curacy in the archdeaconry of Totnes and diocese of Exeter.

About fifty years ago Torquay consisted only of a few mean huts inhabited by fishermen. The mildness of the climate, and the favourable position and picturesque character of Torquay, induced many eminent physicians to recommend it as a winter residence for invalids. The abundance of building stone, which is found in the vicinity, presents great facilities for building. The town has consequently very much increased. Torquay lies in a small sheltered recess at the north-eastern extremity of Torbay. On all sides landward it is inclosed by lofty hills, on the sides of which the houses are built. The town is lighted with gas and paved, but the supply of water is insufficient. There are two chapels of the Establishment, a Free Episcopal church, chapels for Independents and Baptists, and National schools. Torquay contains assembly-rooms, a club-house, subscription and reading-rooms, a museum, and baths. The pier, which is used also as a promenade, incloses a small but convenient tidal harbour. The rise of tide at spring-tides is about 18 feet. The imports consist chiefly of American timber, coals and culm, Portland stone, corn, bricks, slates, and general goods: the exports include earthenware, cider, elm and oak timber, and yellow-ochre.

TRACHEARIA, a subdivision of the great class *Arachnida*. It includes those forms of this class which carry on their respiration by means of ramifying tracheal tubes. They have two or four eyes. This division includes the various forms of Mites, Ticks, Shepherd-Spiders, and Sea-Spiders. The following is a synopsis of the families of this sub-class from the 'Manual of Natural History,' by Messrs. Adams, Baikie, and Barron:—

Order I.—*Monomerosomata.*

Body without division, the head, trunk, and abdomen being united into a single mass; abdomen not annulated.

Sub-Order I.—*Errantia.*

Mouth with distinct mandibles; palpi always present; animals free.

Family 1. *Acaridæ.*—This includes the True Mites. [ACARIDÆ.]

Family 2. *Trombiidæ*, Garden-Mites.—Palpi jointed with a moveable appendage below the tip; feet formed for walking; eyes latero-anterior; chelicerae ending in a moveable claw.

Trombidium holosericeum is of a blood-red colour, and is very common in gardens during the spring.

Family 3. *Gamasidæ*, Spider-Mites.—Palpi filiform, incurved, short, free; mouth with two didactyle chelicerae; body depressed; skin soft or scaly; legs formed for walking; tarsi unguiculate. The Red Spider of our hot-houses belongs to this family.

Family 4. *Orbitidæ*, Wood-Mites.—Palpi fusiform, hid under the head, without hooks; mouth with didactyle chelicerae; eyes not distinct; body hairy or scaly, produced and rostrate in front; legs formed for walking.

Sub-Order II.—*Suctoria.*

Mouth in form of a sucker, with or without palpi; no apparent mandibles; animal attached.

Family 5. *Ixodidæ*, True Ticks.

Family 6. *Bdeilidæ*, Plant-Ticks.—Palpi antenniform; mandibles unguiculate or cheliform; eyes distinct; sucker in form of an elongated beak; body with a caselet; legs formed for walking.

Family 7. *Hydrachnidæ*, Water-Ticks.—Palpi with the last joint armed with points, the third and fouth joints larger than the others; body simple, oval, or rounded; eyes supero-anterior; legs ciliated, formed for swimming; parasitic in the young state; aquatic.

The species are found in fresh-waters. *Hydrachna* has the mouth composed of plates forming a projecting sucker.

Family 8. *Leptidæ*, Harvest-Ticks.—Palpi short; sucker porrected; body depressed, coriaceous, ovately rotund; legs six, two being undeveloped.

Leptus autumnalis is very common in autumn upon grass and other herbage. They crawl upon the human body, and insinuate themselves into the skin, producing great irritation. They are called Harvest Bugs.

Order II. *Adelarthrosomata.*

Body divided into three or four distinct segments; abdomen distinct, annulated; mouth with conspicuous didactyle pincers or chelicerae.

Family 1. *Solpugidæ*, False Scorpions.—Mandibles in the form of large compressed claws, with a moveable finger; palpi large, in the form of feet, or of cheliferous arms; body oblong, soft; abdomen hairy.

Family 2. *Cheliferidæ*, Book-Scorpions. — Mandibles short; didactyle at the end; palpi very large, awn-like, with a pincer at the end; body ovate, depressed, narrowed in front; legs of equal size, short, ending in two hooks. *Chelifer cancroides* is found in herbariums, old books, &c., where it feeds upon the minute insects which frequent such situations.

Family 3. *Phalangidæ*, Shepherd-Spiders.—Mandibles very conspicuous, composed of two or three pieces, free, ending in a didactyle pincer; palpi filiform, ending in a hook; body short, rounded; abdomen segmented; legs elongated. This family comprises the well-known forms called Harvest-Men.

Sub-Class III. *Aprobranchiata.*

This sub-class includes the genera *Nymphon* and *Pycnogonum*, which are the types of two families, *Nymphonidæ*, the Sea-Spiders, and *Pycnogonidæ*, Parasitic Sea-Spiders. These are often referred to the class *Crustacea*.

TRACHYPHONUS. [WOODPECKERS.]

TRACHYPTERUS, a genus of Fishes belonging to the riband-shaped forms of *Acanthopterygii*. The body is elongated and compressed; dorsal fin extending the whole length of the back, a few of the anterior rays sometimes elongated; ventral fins fragile, if not worn or broken, rather long; no anal fin; caudal fin-rays rising almost vertically from the horizontal line of the vertebral column; a row of small spines along the lateral line.

T. Bogmarus, the Vaagmaer, or Deal Fish, is described by Dr. Fleming in the 'Magazine of Natural History.' He was the first British naturalist who has made known its occurrence in Scotland. The species found in the north of Europe differ from those of the Mediterranean. One specimen only has been recently caught alive at Sanda in Orkney. It is thus described:—Length, three feet; body excessively compressed, particularly towards the back, where it does not exceed a table-knife in thickness; breadth nearly five inches, tapering to the tail; colour silvery, with minute scales, the dorsal fin of an orange colour, occupying the whole ridge from the head to the tail, with the rays of unequal size; head four inches and a half long, compressed like the body, with a groove on the top; eyes one inch and a quarter in diameter: both jaws armed with small teeth. Various specimens, probably to the number of twelve or more, appear to have been obtained on the island of Sanda between 1817 and 1829. The Vaagmaer is rare in Iceland. It differs from the two species found in the Mediterranean, *T. falx* and *T. iris*, and also from *T. leiopterus*.

TRADE, BOARD OF. The functions of this branch of the Privy Council have been of late years considerably extended, its duties being some of them of a ministerial, and others of a judicial character. It has the general superintendence of matters relating to merchant ships and seamen, and the carrying into execution the statutes in force relating to them. For that purpose it has to require and receive various kinds of returns as to trade and navigation, and originate and consider reports made to it by its inspectors and other officers. It has also a partial control over local marine boards, and may lay down rules as to the conduct of examinations, and as to the qualification of applicants for the posts of masters and mates of foreign-going as well as of home-trade passenger-ships. [SHIPS, *S.* 2.] It grants licences to persons to engage or supply seamen or apprentices for merchant ships in the United Kingdom, adjudicates on claims for wages, and investigates cases of alleged incompetency and misconduct (17 & 18 Vict. c. 104). The Board also appoints officers to report on the condition of steam-vessels and their machinery (14 & 15 Vict. c. 79).

The Board of Trade exercises a supervision over railways and railway companies, not only with respect to their original formation, but also as to their subsequent working. Railways were first placed under this control by the statute 3 & 4 Vict. c. 97. A few years afterwards the powers of the Board in this respect were transferred to a Board of Commissioners of Railways; but in 1851 all the powers of this latter board were transferred to the Board of Trade (14 & 15 Vict. c. 64). Notices of application for Railway Acts, accompanied by plans, must be deposited with the Board, before any bill can be introduced into Parliament; and before a line can be opened for traffic, notice must be given to the Board, and its permission obtained, on the report of an inspector, appointed by the Board for those and other general purposes. So, when accidents occur, notice must be given to the Board, and an inspector is generally sent to inquire into the circumstances, and on his report the Board may cause alterations to be made for the greater safety of the public.

The Board of Trade, through the medium of its registrar, is also charged with the registration of all Joint-Stock Companies (19 & 20 Vict. c. 47). By the statute giving a copyright in designs, their registration is effected by the Registrar of the Board of Trade (5 & 6 Vict. c. 100; 6 & 7 Vict. c. 65; 13 & 14 Vict. c. 104; 14 & 15 Vict. c. 8; 15 & 16 Vict. c. 6). The schools of design now established in almost all large towns are also under its immediate control, the appointments connected with them being made by the president. The Board also controls the proceedings of the Commissioners for regulating the employment of coal-whippers and the discharge of coal-laden vessels in the port of London (6 & 7 Vict. c. ci. (local and personal); 9 & 10 Vict. c. xxxvi.; 14 & 15 Vict. c. lxxviii.). Lastly, a department of the Board of Trade is charged with the collection and publication of tables, containing information with respect to the revenue, trade, commerce, wealth, population, and other statistics of the United Kingdom and its dependencies, as well as of foreign countries. The officers of another department collect and prepare the tables of the prices of corn, which formerly, and before the abolition of the corn-laws, regulated the amount of duty, and still govern the rent-charge in lieu of tithe under the Tithe Commutation Act. (Blackst. 'Comm.,' Mr. Kerr's edit. v. i. p. 268.)

TRADE, SHIPPING, AND CURRENCY. In the article GREAT BRITAIN [vol. xi. p. 417-18] we gave the official and declared value of the imports and exports, with the number of ships and amount of tonnage engaged in the trade of the country, down to the year 1836. The value of imported merchandise was only shown in the official valuation, which was very fallacious. The extent of our commerce has been constantly increasing, but without going through the details of each year, we shall give only summaries of 1854, 1855, and 1856, for which the materials are afforded in a report from the Board of Trade in a highly improved form; and for 1857, which is only a preliminary return, and somewhat less complete.

Trade. The real value of the total imports into the United Kingdom in 1854 was 152,389,053*l.*; in 1855 it was 143,542,850*l.*, and in 1856 it was 172,544,154*l.* These values are computed from the average prices fixed for the articles, which are chiefly entered by quantities at the Custom House. The value of the exports is obtained from the declared value set on the articles, except in the case of foreign and colonial produce, of which the price is computed in the same way as with the imports. In 1854 the total value of exports amounted to 115,821,092*l.*, of which 97,184,726*l.* were for the produce or manufacture of the United Kingdom, the remainder being for foreign or colonial produce. In 1855 the total value was 116,691,300*l.* of which 95,688,085*l.* were for the produce or manufactures of the United Kingdom; and in 1856 the total value amounted to 139,220,353*l.*, of which 115,826,948*l.* were for home productions; the official values of the exports show a singular contrast to the real values; they are for the three years respectively, 29,808,044*l.*, 31,494,391*l.*, and 33,423,724*l.* The official values of the imports for the three years show less discrepancy; they were 124,136,018*l.*, 117,284,881*l.*, and 131,937,763*l.*

Our largest importations in 1856 were from the United States of America; they amounted to 36,047,773*l.*; from Russia they were 11,561,924*l.*; from France, 10,386,522*l.*; from China, including Hong Kong, 9,421,648*l.*; from Turkey, including the Principalities, Syria, Egypt, and Tripoli, 8,960,900*l.*; from Holland, 7,433,442*l.*; from the Hanse Towns, 5,302,739*l.*; from Prussia, 4,534,815*l.*; from Spain, 3,645,083*l.*; from Belgium, 2,936,796*l.*; from Spanish West Indies, 2,654,580*l.*; from Denmark, 2,201,831*l.*; from Portugal, 2,164,090*l.*; from Sweden, 2,031,861*l.*; from various states of South America, Central America, and Mexico, 9,738,381*l.*; from the Western Coast of Africa, exclusive of British and French possessions, 1,657,375*l.* (this commerce has doubled itself within four years); from the Two Sicilies, 1,505,582*l.*; from Greece, 1,427,289*l.* The imports from other countries are each under a million. The total of imports from foreign countries was 129,517,568*l.* From British possessions the largest amount of importation was from the East Indies, 17,262,851*l.*; the other principal amounts were,—the North American Colonies, including Newfoundland, 6,535,770*l.*; the Australian Colonies, including New Zealand, 5,736,043*l.*;

the West Indies, 4,157,098*l.*; Mauritius, 2,427,007*l.*; Cape of Good Hope, 1,502,828*l.*; British Guiana, 1,418,264*l.*; Ceylon, 1,304,174; the other amounts make the total imports from British possessions of the value of 43,026,586*l.*

Of the exports, the total value taken by foreign countries in 1856 was, 82,526,509*l.*, and by British possessions, 33,300,439*l.* The United States (includiug California) was our largest customer, to the value of 21,918,105*l.*; then follow the Hanse Towns, 10,134,813*l.*; Turkey, including Syria and Egypt, 6,904,449*l.*; France, 6,432,650*l.*; Holland, 5,728,253*l.*; Brazil, 4,084,537*l.*; Spain, 1,734,483*l.*; Belgium, 1,689,975*l.*; Russia, 1,595,247*l.*; Portugal, 1,455,754*l.*; China (exclusive of Hong Kong), 1,415,478*l.*; Chili, 1,396,446*l.*; Cuba, 1,317,062*l.*; Two Sicilies, 1,202,183*l.*; Sardinia, 1,143,689*l.*; Sweden and Norway, 1,118,186*l.*; Denmark (including Holstein, &c.), 1,034,914*l.*; Peru, 1,046,010*l.*; Hanover, 1,021,485*l.*; and no other place above a million. Of the British possessions receiving exports, the largest amount was by the East Indies (including Ceylon and Singapore), 11,807,439*l.*; Australia (including New Zealand), 10,713,220*l.*; North American Colonies (including Newfoundland), 4,010,328*l.*; British West Indies (including Guiana), 1,873,397*l.*; Cape of Good Hope and South Africa, 1,344,338*l.*; these are the only places that exceed a million, but Gibraltar takes to the amount of 866,479*l.*; and Hong Kong to that of 800,645*l.*

The principal articles imported were—living animals (including horses) to the value of 1,488,691*l.*; bacon and hams, 1,078,908*l.*; butter, 2,635,182*l.*; cheese, 1,094,280*l.*; clocks and watches, 359,275*l.*; coffee, 1,498,108*l.*; copper and lead, 2,497,717*l.*; corn of all kinds, flour and meal, 23,039,422*l.*; cotton, raw and manufactured, 27,112,225*l.*; flax and tow, 3,633,194*l.*; fruit, including almonds, raisins, currants, &c., and oranges, apples, &c., 2,609,047*l.*; guano, 2,136,431*l.*; hemp, 1,984,907*l.*; hides, 2,814,743*l.*; indigo, 2,453,633*l.*; olive-oil, 1,124,755*l.*; palm-oil, 1,691,407*l.*; train and spermaceti-oil, 1,165,410*l.*; oil-seed cake, 716,001*l.*; rice, 2,031,647*l.*; flax and linseed, 3,195,634*l.*; silk, raw and mannfactnred, 11,467,603*l.*; skins and furs, 1,436,969*l.*; spices, 482,169*l.*; spirits, including brandy, rum, and geneva, 2,190,249*l.*; sugar and molasses, 12,504,218*l.*; tallow, 2,926,275*l.*; tea, 5,248,934*l.*; tobacco, raw and manufactured, 2,224,162*l.*; wine, 3,740,767*l.*: wood and timber of all kinds, 9,777,731*l.*; dyewoods, 504,260*l.*; ornamental woods—boxwood, cedar, mahogany, and rosewood, 487,612*l.*; wool, including sheep, lamb, alpaca, and llama, 8,664,420*l.*; woollen manufactures and yarn, 1,444,162*l.* No other article exceeded a million. The scale adopted for the estimated valne is published by the Board of Trade, and varies every year according to the actual rates in the market, and the sum stated is exclusive of duty. Thus, in 1855, tobacco from the United States was estimated at 8¾*d.* per lb.; in 1856, at 1*s.* 0¾*d.*; and from Cuba in 1855, at 2*s.* 2¾*d.*; in 1856, at 2*s.* 6¼*d.* The gross amount of Customs' duties received was 24,206,844*l.*

The chief articles exported, the prodnce or manufacture of the United Kingdom, were—apparel, old and new, including slops and negro clothing, to the value of 1,816,310*l.*; beer and ale, 1,455,043*l.*; coals, coke, and cinders, 2,826,582*l.*; copper, wrought and unwronght, 2,527,053*l.*; cotton manufactures, 30,204,166*l.*; cotton twist and yarn, 8,028,575*l.*; earthenware and porcelain, 1,334,118*l.*; haberdashery and millinery, 3,638,358*l.*; hardware and cutlery, 3,747,598*l.*; iron, pig, wrought, wire, hoops, nails, &c., 12,230,286*l.*; leather, wrought and unwrought, 1,756,451*l.*; linen yarn, 1,365,980*l.*; linen manufactures, 4,887,780*l.*; machinery, including steam-engines, 2,716,443*l.*; linseed-oil, 1,079,748*l.*; salt, 401,202*l.*; silk, thrown and manufactured, 2,962,056*l.*; British spirits, 998,445*l.*; stationery, 720,390*l.*; steel, unwrought, 735,823*l.*; sugar, refined, 806,445*l.*; tin, unwrought and in plates, 1,646,842*l.*; wool, 950,193*l.*; woollen manufactures, 9,500,428*l.*; woollen and worsted yarn, 5,331,870*l.* No other article amounted to a million. The foreign and colonial produce re-exported amounted to 22,393,405*l.*; the largest items being raw cotton to the amonnt of 3,345,770*l.*; indigo to 1,593,692*l.*; sugar and molasses to 1,250,446*l.*; wine to 959,135*l.*; and wool to 1,949,323*l.*

In 1857 the total declared value of articles of British produce and manufacture exported was 122,155,237*l.* Of foreign and colonial merchandise re-exported, the value is not given, only the quantities. Compared with 1856, there was less re-exported of coffee by 12,000,000 lbs.; less cocoa, guano, hides, seeds, spices, spirits, sugar, and wine; and more leather, metals, oils, quicksilver, rice, silk, tallow; and of tea, to the extent of 8,000,000 lbs.; and of wool, to 10,000,000 lbs. Tobacco was nearly the same, and in the other items the differences were not large. If we take the amount of re-exportations as the same as in 1856 it will give an increase of exports to the valne of 6,328,289*l.* for the year, and this in despite of the commercial crisis which, commencing in the United States in September, spread rapidly to Great Britain and every other civilised state, and in this country caused a falling-off in the month of December only to the amount of 2,174,922*l.* in articles of British production and manufactnre as compared with December 1856.

The importations for the year are likewise only given in qnantities. The differences are not large, but on the whole they were less, and the Customs' Duties, in which there had been additional dnties on tea, coffee, and sugar, prodnced only 22,956,371*l.*, or 1,250,473*l.* less than in 1856.

Shipping.—In the year 1855 there were 22,787 British ships entered inwards, of which the burthen was 5,270,792 tons; in 1856 the number entered was 26,029, with a burthen of 6,390,715 tons, an increase in the year of 3242 ships, and of 1,119,923 tons. In 1855 the number of foreign ships entered was 18,193, tonnage 3,680,447; in 1856 the number of ships was 19,371, tonnage 4,162,419, an increase of 1188 ships and 481,972 tons of burthen, considerably less than a half of the British increase. Of the total amonnts also in 1856 there were 7768 British ships with a tonnage of 1,304,453 entered in ballast; and 2027 of the foreign ships, with a tonnage of 1,007,017. In 1855 there were 20,816 British ships cleared outwards with cargoes, of 5,036,926 tons burthen, and 2279 ships, of 612,014 tons burthen in ballast; in 1856 the numbers were 23,970 ships, of 5,883,861 tons burthen with cargoes, and 2145 ships, of 671,195 tons burthen in ballast. The foreign ships cleared out in 1855 were 16,167 ships, of 3,311,[illegible] tons, with cargoes, and 3335 ships, of 577,553 tons burthen in ballast; and in 1856 there were 17,383 ships, of 3,777,[illegible] tons burthen with cargoes, and 3361 ships, of 703,386 tons burthen in ballast; all the items showing a great preponderance in the increase of the British trade in their own ports, notwithstanding the greater facilities offered to foreigners by the repeal of the old navigation laws. These returns inclnde both steam and sailing vessels. Of the foreign vessels with cargoes, the greatest number in 1856 was from Norway, 2259 ships, of 468,744 tons burthen: the next highest number was from Denmark, 2055 ships, but of only 194,686 tons burthen, or less than 200 tons for each ship. Prussia sent 1238 ships, and the Netherlands 1210, the united tonnage being only 465,460; the size of the ships being suited to the low shores of Holland and the shallows of the North Sea: bnt, crossing the Atlantic, the United States sends, it is true, only 1447 ships, but the tonnage is 1,378,631, approximating to a thousand tons for each vessel. The burthen of the whole number of 18,[illegible] British ships was 5,086,262 tons, an average of very nearly 280 tons for each. The total nnmber of registered British vessels, sailing and steam, was 36,012 on Dec. 31, 1856, of which the tonnage was 5,312,436, and the crews numbered 267,573 men, bnt this included the Channel Islands, and colonial possessions. In the British islands there were 6479 sailing vessels not exceeding 50 tons, and 12,027 above 50 tons; 529 steam vessels not exceeding 50 tons; and 743 above 50 tons. In the Home Trade (which signifies the coasts of the United Kingdom, or to ports between the limits of the river Elbe and Brest, but does not include river-steamers and transports), there were employed 9390 sailing vessels, of 719,[illegible] tons burthen, with 33,879 men, and 317 steam vessels, of 67,616 tons burthen, and 4786 men. Partly in the Home and partly in the Foreign Trade there were employed [illegible] sailing vessels, of 162,488 tons burthen, and 6483 men; and 42 steam vessels, of 16,102 tons burthen, and 965 men. In the Foreign Trade there were employed 8059 sailing vessels, of 2,942,674 tons burthen, and 110,718 men; and 492 steam vessels, of 247,337 tons burthen, and 17,[illegible] men. In 1856 there were built and registered 1150 ships in the United Kingdom, of which 921 were sailing vessels, and of these 33 were of iron, of an aggregate tonnage of 187,005; and 229 steam vessels, of which 175 were of iron, with an aggregate tonnage of 57,573. In the Channel Islands, Isle of Man, and in the colonies, 726 ships were built and registered, of which the tonnage was 179,016; and there were 57 foreign-built vessels, tonnage 11,65[illegible] registered at various ports of the United Kingdom. There were also 69 steamers and 6 sailing vessels built during the year for foreigners, the tonnage of which amounted to 34,061. There were 754 vessels wrecked during the year, 110 broken up, and 149 sold to foreigners, the tonnage of the whole, 249,459.

In the Coasting Trade in 1856 there were entered with cargoes (in ballast are omitted) 150,598 British vessels, tonnage 15,163,755, and 307 foreign vessels, tonnage 53,489; there were cleared, likewise with cargoes, in the same period, 155,006 British vessels, tonnage 15,248,329, and 370 foreign vessels, tonnage 65,355. For the United Kingdom there entered 127,739 sailing vessels, and 24,752 steamers; and there cleared 131,704 sailing vessels, and 24,735 steamers. The foreign sailing vessels entered numbered 288, the steamers 19; the number cleared was 315 sailing vessels, and 29 steamers.

In 1857 the number of British ships, including sailing vessels and steamers, entered inwards with cargoes, was 19,091, the tonnage 5,418,090; the foreign vessels, 13,602, tonnage 3,314,090. Cleared outwards, there were 24,834 British vessels, tonnage 6,204,198; the foreign vessels 19,570, tonnage 4,136,201. The number of ships in ballast is not stated. Of the ships entered inwards Norway and Denmark still have the greatest number, Norway 2080, and Denmark 2511, while the United States sent only 1250 ships, nearly 200 less than in 1856, and the tonnage declined to 1,214,464, a decrease of 164,167 tons. But though France only entered inwards 1122 ships, tonnage 90,038, she cleared out 4410 vessels, tonnage 473,859; Denmark cleared out 3141 ships, tonnage 316,625; Norway 1696 ships, tonnage 330,078; and the United States 1334 ships, tonnage 1,295,934. The number of ships employed in the Coasting Trade was 129,401 entered inwards, tonnage 12,979,066, of which 316 were foreign vessels, tonnage 48,619; cleared outwards, 144,955 vessels, tonnage 14,096,429, of which 247 were foreign vessels, tonnage 38,414.

Currency. At Michaelmas, 1837, the amount of Bank of England notes and post bills in circulation, was 17,086,610*l.*; the value of coin and bullion in hand was 3,856,000*l.* on October 17. At Michaelmas, 1837, the total amount of the notes of Private Banks and Joint Stock Banks of England and Wales was 10,142,049*l.*; of which 3,701,996*l.* were those of Private Banks, and 3,440,053*l.* those of Joint Stock Banks. In the year gold to the value of 1,253,088*l.*, silver to that of 76,111*l.*, and copper to that of 5096*l.*, had been coined. In July, 1844, Sir R. Peel's Bank Restriction Act (7 & 8 Vict. cap. 32) was passed for regulating the issue of paper money. By this act, the Banking Department of the Bank of England was separated from an Issue Department, then created. The Government debt of 14,000,000*l.* was to be taken by the Issue Department as security for a like amount of notes, and any further supply could only be obtained by a deposit of the value in bullion; and any withdrawal of bullion was to be followed by a return of notes to an equal amount. The bullion to be valued either in receipt or payment at 3*l.* 17*s.* 9*d.* per oz., at which rate all persons may demand notes for bullion of the Bank of England. Private Banks, not previously issuing notes, were restricted from commencing, and those which had done so, were prescribed as to the amount to be issued, and were required to furnish returns monthly. Bankers ceasing to issue were not allowed to resume, but the Bank of England, under certain regulations, were permitted to increase their issue beyond the fourteen millions by an amount not more than two-thirds of the private issue that had been discontinued. On January 4, 1845, the amount of notes issued to the Bank of England was 28,087,055*l.*, of which 8,418,125*l.* remained in its possession; and the bullion in both departments amounted to 14,801,621*l.* The notes of Private Banks in England amounted to 4,427,711*l.*, of Joint Stock Banks to 3,059,434*l.*; of the various banks of Scotland to 3,159,450*l.*; and of Ireland to 6,983,551*l.* In the autumn of 1847 a great monetary pressure was experienced, and on October 23, the temporary suspension of the Act was ordered by the First Lord of the Treasury and the Chancellor of the Exchequer (Lord John Russell and Sir C. Wood). The Bank rate of interest for discount had risen to 8 per cent., the suspension relieved the pressure, and the order was withdrawn on November 23. The act worked smoothly until the American failures, in the autumn of 1857, occasioned a pressure in the United Kingdom. The rate of discount was rapidly raised to 10 per cent., and on November 12 the restriction was again suspended. An issue of 2,000,000*l.* of notes, of which not more than a quarter were used, was sufficient to restore confidence, and by February, 1858, money had sunk to its ordinary value. We subjoin the following returns to show the contrast. On November 11 the notes issued to the Bank of England amounted to 21,141,065*l.*, and those in circulation to 20,183,354*l.*; so that there only remained 957,711*l.* in notes in its coffers; and the amount of bullion was reduced to 7,170,508*l.* In the return for November 18, the additional issue of the two millions was included; the notes issued amounted to 22,554,555*l.*, those in circulation to 21,406,410*l.*; the notes unemployed to 1,148,185*l.*; while the bullion had sunk to 6,484,096*l.* The note issue of the Private and Joint Stock Banks varied but little during this period. The two millions were returned by the Banking Department of the Bank of England to the Issue Department by December 30, and on February 17 the notes from the Issue Department amounted to 31,294,910*l.*; those in circulation to 19,453,515*l.*; those unemployed to 11,841,395*l.*; and the bullion to 17,623,251*l.*

The coinage, particularly that of gold, has been very large for several years. The following are the amounts of each description of metal for the respective years:—

	Gold.	Silver.	Copper.
1846	£4,334,697	£559,548	£6496
1847	5,158,440	125,730	4960
1848	2,451,998	35,454	2692
1849	1,977,955	119,636	1792
1850	1,491,836	129,245	448
1851	4,400 411	87,866	3584
1852	8,742,276	189,594	3882
1853	11,912,391	701,544	9073
1854	4,152,183	139,480	61,538
1855	9,008,663	189,511	63,928
1856	6,001,115	462,528	11,418

Commercial bills form a large part of the Currency of the kingdom; the average amount held under discount by the Bank of England is about 16,000,000*l.*; those discounted by other banks, by discount firms, and by private individuals, cannot be ascertained with any precision, but they must amount to an enormous sum. In the autumn of 1857 the commercial panic, beginning in America, caused the rate of discount to rise from 5¼ per cent. in July, by rapid steps to 10 per cent. in November. By February, 1858, the rate of discount had fallen to 3 per cent.

The value of the gold and silver bullion exported in 1857 was 33,566,968*l.*; of which 15,061,500*l.* was in gold, and 18,505,468*l.* in silver. Of the gross sum 10,863,818*l.* in gold was sent to France, and 17,295,432*l.* in silver to Egypt in transit to India and China. To no other country was so much as a million sent in both metals, except Brazil, to which was forwarded 958,014*l.* in gold, and 54,901*l.* in silver, a total of 1,012,915*l.* The Hanse Towns received a total of 935,886*l.*, the greater part in silver; and the United States, 859,110*l.*, all but 15,980*l.* in gold.

TRANSPORTATION. [SERVITUDE, PENAL, *S.* 2.]

TRAVNIK. [BOSNIA.]

TREE-FERN. [CYATHEA, *S.* 1.]

TRIÆNODON. [SQUALIDÆ.]

TRIAKIS. [SQUALIDÆ.]

TRIGLOCHIS. [SQUALIDÆ.]

TRILLIACEÆ, a small natural order of Plants belonging to the class Dictyogens. They are distinguished by their bisexual tripetaloideous flowers, half-consolidated carpels, and axile placentæ. Lindley gives the relations of this order with *Smilaceæ*, *Roxburghiaceæ*, *Commelynaceæ*, and *Melanthaceæ*. It contains 4 genera—*Paris*, *Demidovia*, *Trillium*, and *Medeola*. The species are found in thickets in the temperate parts of Europe, Asia, and North America.

TRIPTOLOMEA, a genus of Plants belonging to the natural order *Fabaceæ*, or *Leguminosæ*, and to the suborder *Papilionaceæ*. The species are natives of warm climates, and yield the Rose-Wood of commerce.

TRITHEN, FREDERICK HENRY, a distinguished Sanscrit and Slavonic scholar, was born in February 1820 in Switzerland, from whence he was removed when a few years old to Odessa, his father having accepted the situation of professor at a Russian college in that city. At Odessa he received an excellent education and had ample opportunities for making himself acquainted with the modern languages, of which French, English, and German were as familiar to him as Russian. At the university of Berlin, where he continued his studies, and took his degree of doctor of philosophy, he was distinguished for his knowledge of Greek, and he studied Sanscrit under Bopp. After passing some time in Poland, where he made himself master of Polish, he came to England, where, in 1841, he was teacher of modern languages at Rugby, under Dr. Tait, the present bishop of London. He then began to contribute articles, chiefly on subjects connected with Sanscrit literature, to the 'Penny Cyclopædia' and the 'Biographical Dictionary' of the Society for the Diffusion of Useful Knowledge.

In 1844 he was appointed one of the assistants in the Printed Book department in the British Museum, and was partly employed in cataloguing the Sanscrit and Arabic works, and those in the Slavonic languages, of which a large stock had then recently been added to the Museum library. In coming to the Museum he had indulged in expectations that his talents and acquirements would probably attract the notice of the Trustees with the effect of bringing encouragement and promotion, and he was deeply disappointed to find that such expectations were futile. He accepted in 1845 the post of private tutor in the family of Prince Chernichev, the Russian minister of war, and left London for St. Petersburg. He returned to England after an absence of about two years, part of which he had passed at Constantinople and Cairo, and in 1848 published at London an edition of the 'Maha Vira Charita,' or History of Rama, a Sanscrit drama, by Bhavabhuti. His friends suggested to him to offer himself as a candidate for the professorship of modern European languages in the Taylor Institution at Oxford, which was then on the point of being set in action. The professor, it was decided, was to be appointed at first for five years only, but with the capability of being re-elected; his post was to be one of influence and authority, the rest of the officials of the institution being placed under his directions, and his salary was to be 400*l.* a year. Dr. Trithen was elected to this post in 1848 in preference to some very able competitors, and contrary to his own expectations, and entered upon his duties with a lecture 'On the position occupied by the Slavonic dialects among the other languages of the Indo-European family,' which he afterwards printed as an essay in the 'Proceedings of the Philological Society of London,' of which he had been a member since 1843. The career of usefulness and honour which now seemed to lie before him was suddenly cut short about the middle of 1850 by an attack of mental aberration in so violent a form that his friends found it necessary to put him under restraint. It was reported at the time that the immediate cause of the disorder was, that a lady to whom he had paid his addresses had married a rival, but a tinge of eccentricity had on some previous occasions been remarked in his conduct. His father came to England, and in 1851 removed him to Odessa, where he remained in a hopeless state till April 1854, when the city was under apprehensions of bombardment from the English. Trithen was then removed to a village at a few miles distance, where an unexpected change in his disorder took place, and he recovered his mental powers as suddenly as he had lost them, but this was only a "lightning before death." After expressing a strong desire to return to England, it became evident that his bodily strength was failing, and he expired on the 27th of April 1854. He left behind him no adequate monument of the extent of the powers which his friends knew him to possess, but his contributions to biographical literature in the Cyclopædia and Dictionary are of a sound and solid character, and his scholarship was not only accurate but remarkably ready. The power which he possessed of conversing with ease in more than one of the Teutonic, the Romanic, and the Slavonic languages qualified him in an eminent degree for the professorship to which he was chosen.

TRIURIDACEÆ, *Tailworts*, a small natural order of Plants belonging to Lindley's class Dictyogens. They have the dictyogenous structure, unisexual flowers, a free perianth, and numerous 1-seeded carpels. There are only two genera, *Triuris* and *Peltophyllum*. The species of these plants were discovered by Mr. Miers and Mr. Gardner in the woods of Brazil, where they delight in moist shady places. Their relations are with *Smilaceæ*, *Menispermaceæ*, and *Trilliaceæ*.

TROWBRIDGE. [WILTSHIRE.]

TRUMPET-FISH. [CENTRISCUS.]

TRUMPET-FLOWER. [TECOMA, *S.* 1.]

TRURO, THOMAS WILDE, FIRST LORD, the son of a respectable solicitor in Warwick-square, London, and Saffron Walden, Essex, was born in 1782, and received his early education at St. Paul's School. He was articled as a clerk in his father's office, and having been admitted an attorney in 1805, practised for some years as partner in the firm of Wilde and Knight, in Castle-street, Falcon-square. In 1817 he was called to the bar, and went the Western Circuit. Good fortune attended him: he speedily rose to eminence as an advocate, and became leader of his circuit. In 1824 he was made a serjeant-at-law, and three years later a king's serjeant, and a vast accession of business was the consequence. Under Lords Denman and Brougham he was engaged as a junior in the defence of Queen Caroline, which tended materially to increase his professional reputation, though it retarded his advancement during the reign of George IV. In 1831 he was elected member for Newark, against the influence of the late Duke of Newcastle, and though thrown out in December 1832, he regained his seat in January 1835, and retained it, as colleague with Mr. W. E. Gladstone, until 1841, when he was elected for Worcester. In 1839 he succeeded Sir R. M. Rolfe, now Lord Cranworth, as solicitor-general, and became attorney-general in 1841. In 1846, on the return of the Liberal party to power under Lord John Russell, Sir Thomas Wilde was again nominated attorney-general, but within a week afterwards was raised to the bench as chief-justice of the Common Pleas on the death of Sir N. Tindal. In July 1850 he received the great seal, and was at the same time elevated to the peerage as Lord Truro. He resigned the chancellorship on the retirement of his party from office in February 1852. The most memorable causes in which he was professionally engaged before his elevation to the judicial bench were the trial of Queen Caroline, alluded to above, and the trial of the late Mr. O'Connell in 1844, to whom he gave his services without fee or retainer to obtain a reversal of the decision of the law courts of Dublin. In Parliament his name is most permanently connected with the great case of Stockdale *v.* Hansard, which involved the constitutional question as to whether the House of Commons had the right of publishing its reports without rendering its officers thereby liable to proceedings in the courts of law. On this question Sir Thomas Wilde took the affirmative side, and supported it by a speech of more than three hours' duration, which Dr. Lushington pronounced to be "the most consummate and masterly triumph of legal reasoning ever known." The matter at issue, as is well known, was eventually compromised by the introduction of a bill by Lord John Russell, formally conferring upon the House that power which it had hitherto claimed as a right. As a judge, the reputation of Sir Thomas Wilde stood high: he was patient, painstaking, and impartial in the highest degree. As lord chancellor, his judgments were regarded with respect; and though most of the cases brought before him were appeals from the vice-chancellors' courts, whose decisions he frequently reversed, yet of his own decisions as a judge only one was reversed on appeal. The chief fault laid to his charge as lord chancellor was an over-anxious and too elaborate dwelling on all the points in an argument, without due regard to their relative importance. Among other important public questions which were decided by him in this capacity was that of the Braintree Church-rates. Lord Truro was also eminent as a legal reformer. Whilst holding the chancellorship he appointed a commission to inquire into the jurisdiction, pleading, and practice of the court, the result of which was that a bill was introduced and carried for the abolition of the twelve masterships, a step which reduced the annual fees of the court by 20,000*l.* By another act also, mainly promoted by Lord Truro, some other offices were consolidated or abolished, and the practice of receiving fees by various individuals was suppressed to such an extent that the estimated saving to suitors is 60,000*l.* a-year. Among the other legal reforms effected by Lord Truro was the appointment of the lords-justices to relieve the chancellor of some of his judicial labours, and so to enable him to give his attention to his duties in the House of Lords, and as a member of the Cabinet without interruption to the law courts. To him also the legal profession owes the reform of the Common Law procedure, the professed object of which is to sweep away the antiquated technicalities upon which legal decisions were too frequently based, and to insure that they shall henceforth be given according to their own respective merits, "according to the very right and justice of each case," as is more fully explained in Finlason's 'Summary of the Common Law Procedure Act,' 1854. Lord Truro was twice married: his second wife, who survives him, was Mademoiselle Augusta Emma d'Este, daughter of H.R.H. the late Duke of Sussex. He died at his seat, Bowes Manor, Southgate, Middlesex, on the 11th of November 1855, and was buried by the side of the late Sir Augustus d'Este, in the Old Minster Church at Ramsgate.

TRUSTEES. Owing to the inadequacy of the existing law to meet the case of the defalcations and frauds of trustees, bankers, and other persons entrusted with the care and management of the property of others, a statute was passed in 1857 (20 & 21 Vict. c. 54) whereby the following offences were made a misdemeanour punishable with penal servitude for three years, or imprisonment, not exceeding two years, with or without hard labour:—

1. The appropriation or disposal, with intent to defraud, by a trustee of any property held for the benefit of some other person, or for any public or charitable purpose.

2. A banker, merchant, broker, attorney, or agent, selling, pledging, or in any manner appropriating, with intent to defraud, the property of any other person intrusted to him for safe custody.

3. Any person entrusted with a power of attorney for the sale or transfer of any property, fraudulently selling or transferring it.

4. A director, member, or public officer of any body corporate or public company, fraudulently taking or applying, for his own use, any of its money or other property.

5. Any director, public officer, or manager of any body corporate or public company, receiving or possessing himself of any of its money or other property, otherwise than in payment of a just debt or demand, and with intent to defraud, omitting to make, or to cause or direct to be made a full and true entry thereof in the books and accounts of such body corporate or public company.

6. Any director, manager, public officer, or member of any body corporate or public company, who, with intent to defraud, destroys, alters, mutilates, or falsifies any of the books, papers, writings, or securities belonging to it, or makes, or concurs in the making of any false entry or any material omission in any book of account or other document.

7. Any director, manager, or public officer of any body corporate or public company, who makes, circulates, or publishes, or concurs in making, circulating, or publishing any written statement or account which he knows to be false in any material particular, with intent to deceive or defraud any member, shareholder, or creditor of such body corporate or public company, or with intent to induce any person to become a shareholder or partner therein, or to intrust or advance any money or property to such body corporate or public company, or to enter into any security for the benefit thereof.

8. Any person knowingly receiving any chattel, money, or valuable security, which has been fraudulently disposed of, under any of the above provisions.

The statute further enacts that a bailee of any property fraudulently taking or converting it to his own use, or to the use of any other person than the owner thereof, although he shall not break bulk or otherwise determine the bailment, shall be guilty of larceny.

TRUSTS, CHARITABLE. The sovereign, as *parens patriæ*, has the general superintendence of all *charities*; which he exercises by the keeper of his conscience, the Chancellor; and, therefore, whenever it is necessary, the Attorney-General files *ex officio* an information in the Court of Chancery to have the charity properly established.

Until the passing of Sir Samuel Romilly's Act, in 1812, this was the only ordinary mode of redressing a breach of trust by the trustees of a charity. Sir Samuel Romilly's Act (52 Geo. III. c. 101) was passed, in order to provide a more summary and efficient remedy for such breaches of trust. For this purpose any two or more persons were enabled, with the permission of the Attorney or Solicitor-General, to present a petition in Chancery, praying such relief as the nature of the law might require; and it was directed that such petition should be heard in a summary way upon affidavit, or such other evidence as should be produced, the order thus made to be final, unless appealed against to the House of Lords within two years. This Act led to the appointment of Commissioners, who were to report upon cases of neglect, abuse, or breach of trust; and the reports of this body, which now extend to 38 volumes, form a valuable collection of information on the subject of existing charities. Additional powers were given by the statute 3 & 4 Vict. c. 77 to the Court of Chancery with respect to grammar schools, but the latest and most important piece of legislation on this subject is 'The Charitable Trusts Act, 1853,' of which the professed object is to secure the due administration of charitable trusts; and in certain cases a more beneficial application of charitable funds than that previously in operation. For these purposes a permanent board of commissioners is constituted, called 'The Charity Commissioners for England and Wales,' who are to inquire into all or any charities, their nature, objects, and administration, and the condition of the estates and funds belonging to them. This board is empowered to require all trustees of charities to render in writing to the board or its inspectors, accounts, explanations, and answers, to any inquiries, and to produce any documents in their custody.

When the income of any charity exceeds 30*l.*, and in the case of a London charity even when the income is below that sum, the Master of the Rolls and the Vice-Chancellors are to entertain any suit which may be brought for its administration. In the administration of charities where the income does not exceed 30*l.*, jurisdiction is given to the county court and court of bankruptcy of the district where the charity is situated. The decision of any district court of bankruptcy or county court may, however, be brought by the commissioners before a judge of the Court of Chancery, for re-consideration. [COUNTY COURTS, *S.* 2.] Application may be made to the Commissioners by the Attorney-General, by any one or more of the trustees or managers of the charity, by any one interested in it, or by any two or more inhabitants of the place where it is administered; and as the courts are prohibited from entertaining any legal proceedings (except *ex officio* informations by the Attorney-General) unless upon the certificate of the board, the first proceeding is, in almost all cases, to communicate with that body and obtain its sanction and advice. The powers which it possesses of extracting information on the subject of charities, enable it to afford the most efficient assistance to individual informants. The statute does not extend to Scotland or Ireland; and from its operation are excepted the Universities of Oxford and Cambridge, and certain other institutions. A report of the proceedings of the commissioners must be annually laid before Parliament. (Blackst. 'Comm.', Mr. Kerr's edition, v. iii., p. 483.)

TRYPHILINE. [MINERALOGY, *S.* 1.]

TUNSTALL. [STOKE-UPON-TRENT.]

TURKEY. The Turkish Empire is divided into Eyalets or general governments, each administered by a pasha, who is generally styled Vali, or vice-roy. The Eyalets are divided into Livas, governed by Kaimakans, or lieutenant-governors. The Livas are subdivided into Cazas, or districts, and these again into Nahiges, or communes, containing villages and hamlets.

Turkey in Europe contains 15 Eyalets, divided into 43 Livas, and 376 Cazas. Turkey in Asia is divided into 18 Eyalets, 78 Livas, and 858 Cazas; Turkey in Africa into 3 Eyalets, 17 Livas, and 86 Cazas. The following table gives the names of the Eyalets, with the chief town of each, extracted from M. Ubioini's recent work upon Turkey:—

TURKEY IN EUROPE.

Eyalets.	Capitals.
Tchirmen (Edirné)	Adrianople
Silistria	Silistria
Boghdan, or Moldavia	Jassy
Eslak, or Wallachia	Bucharest
Widdin	Widdin
Nisch (Nissa)	Nissa
Uskup	Uskup
Syrp (Servia)	Belgrade
Belgrade fortress	
Bosnia	Serajevo
Rumili	Monastir
Yania	Janina
Selanik	Saloniki
Jizair (islands)	Rhodes
Cryt or Crete	Candia

TURKEY IN ASIA.

Eyalets.	Capitals.
Kastamuni	Kastamuni
Quadavendiguiar	Brussa
Aydin	Smyrna
Karaman	Koniah
Adana	Adana
Bozoq	Angora
Sivas	Sivas
Tharabezun	Trebizond
Erz-rum	Erz-rum
Mosul	Mosul
Kurdistan	Van
Kharstrout	Kharput
Haleb	Aleppo
Saida	Beirout
Sham	Damascus
Baghdad	Baghdad
Habesh	Jidda
Haremi-Nahevi	Medina

TURKEY IN AFRICA.

Eyalets.	Capitals.
Missr, or Egypt	Cairo
Tarablousi Gharb, or African Tripoli	Tripoli
Tunis	Tunis

A general estimate of the population in 1844 made the inhabitants amount in round numbers to 35,350,000, distributed as follows among the great popular divisions of the empire :—

Turkey in Europe.		Turkey in Asia.	
Thrace	1,800,000	Asia Minor	10,700,000
Bulgaria	3,000,000	Syria, Mesopotamia, Kurdistan	4,450,000
Moldavia	1,400,000	Arabia	900,000
Wallachia	2,600,000	**Turkey in Africa.**	
Bosnia	1,100,000	Egypt	2,000,000
Rumili	2,700,000	Tripoli, Fez, Tunis	1,800,000
Albania	1,200,000		
Servia	1,000,000		
Islands	700,000		

The numbers of the different races of which the population is composed are given as follows :—

Races.	In Europe.	In Asia.	In Africa.	Total.
Ottomans	2,100,000	10 700,000	——	12,800 000
Greeks	1,000,000	1,000,000	——	2 000,000
Armenians	400,000	2,000,000	——	2,400,000
Jews	70,000	80,000	——	150 000
Slaves	6,200,000	——	——	6,200,000
Rumani	4,000,000	——	——	4,000,000
Albanians	1,500,000	——	——	1,500,000
Tartars	16,000	20,000	——	36,000
Arabs	——	900,000	3 800,000	4,700,000
Syrians	——	235,000	——	235,000
Druses	——	30,000	——	30,000
Kurds	——	1,000,000	——	1,000,000
Turkomans	——	85,000	——	85,000
Gipsies	214,000	——	——	214,000
Total	15,500,000	16,050,000	3,800,000	35,350,000

With regard to religion the classification is as follows :—

Religion.	In Europe.	In Asia.	In Africa.	Total.
Mussulmans	4,550,000	12,650,000	3,800,000	21,000,000
Greek Church	10,000,000	3,000,000	——	13,000,000
Catholics	640,000	260,000	——	900,000
Jews	70,000	80,000	——	150,000
Different Sects	——	——	——	300,000
Total	15,260,000	15,990,000	3,800,000	35,350,000

The total area of the Ottoman empire, inclnding the tributary provinces, is estimated at 1,220,000 square miles, of which about 300,000 are in Europe, 560,000 in Asia, and 360,000 are in Africa.

With regard to the administrative division of the empire it must be observed that neither the eyalets nor the sanjaks, or livas, have such invariable limits as provinces in Europe usually have: and with regard to the population, it is clear that, deducting the numbers placed opposite the tributary but almost independent states of Servia, Moldavia, Wallachia, Egypt, Tripoli, and Tunis, the inhabitants subject to the Porte do not much exceed 26 millions.

Abdn-l-Mejid, son of Mahmud II., ascended the throne of Osman in 1839, in his 16th year. The loss of the battle of Nezib, the treachery of the Capudan pasha, who deserted to Mehemet Ali with the whole of the Turkish fleet, and the advance of the victorious Ibráhím, seemed to foreshadow the immediate dissolution of the Turkish empire. This disaster was prevented however by the treaty of London (July 15, 1840), in fulfilment of which an Austro-English fleet bombarded and took Acre, Sidon, and several other towns on the coast of Syria, which Ibráhím Pasha was obliged to evacuate. Negotiations for peace soon followed, which terminated in the restoration of Syria to the Porte, and the recognition of Mehemet Ali as hereditary pasha of Egypt and its dependencies, npon payment of an annual tribute.

On the death of Mahmud II., the old Turkish party, opposed to all innovations, and especially to all imitations of the polity of Christian states, hoped that no more would be heard of reform. But their hopes were blasted by the appearance of the Hattisherif of Gulhané, dated Nov. 3, 1839, and countersigned by Reschid Pasha, which contained guarantees for the life, property, and honour of all the subjects of the Sultan, irrespective of person or religion, and promised the abolition of the arbitrary recruiting system, and the introduction of an impartial system of taxation. The issue of this charter threw the empire into commotion; the old Turks, headed by Risa Pasha in the capital (who was accused of being under the influence of Russia), made a formidable opposition to the execution of the decree; the Turkish subjects of the Sultan, brought np in principles of ascendancy and contempt for Christians, rose in insurrection to defend their privileges. The Christians of European Turkey, by far the most numerous class of the subjects of the Sultan in that part of the empire, long groaning under oppression, were accustomed (and taught) to look for protection and deliverance to Russia. France had to interpose frequently (but never offensively to the Porte) to protect the Christians of the east; and the English and Austrian ambassadors at the Sublime Porte embraced every opportunity of keeping up the influence of their several governments. Thus, not only did foreign nations interfere in the internal administration of the empire, but their ambassadors seemed to be a set of players with Turkey for a chessboard. The fair execution and firm establishment of the system mooted in the Hattisherif, would have put an end to this state of things, by giving the Christian subjects of the Porte the protection of law, and depriving them of all excuse and desire for seeking foreign protection. Russia could never coax a people to take shelter behind her shield who lived secure under the ægis of law. The Sultan's government, it is true, has given many indications of perseverance in reform, and has issued many orders in furtherance of the system (among others one in 1855 for the reception of Christian evidence in the courts of justice), but the fact is undeniable, that the central government is not able to enforce the tanzimat in the provinces.

A fine instance of the noble generosity that lies at the bottom of the Turkish character was exhibited to the world in the refusal of the Sultan Abdu-l-Mejid to surrender the Hungarian refugees to the imperious demands of Austria and Russia in 1849. Nevertheless the influence of Russia, however it might diminish at court, was rapidly extending among the Christian population of the Porte. Indeed, from the mere terms of the treaties of Kainarji, Adrianople, and Unkiar-Skelessi, it is clear that Russia was ever drawing the noose of political dependence closer and tighter round the neck of Turkey. The crisis seemed to arrive, when in 1853 the Czar Nicolas, through his minister Menzikoff, demanded openly the protectorate of the Christian subjects of the Sultan, and even the right to adjudicate in certain cases of dispute; and insolently occupied Moldavia and Wallachia, as a 'material guarantee' for compliance with his demands. In consequence of this, a Turkish army under Omar Pasha occupied the Balkan and the fortresses of the Danube; and French and English fleets cast anchor in Besika Bay. In October following the Porte declared war against Russia, and appealed to France and England for aid. In the campaign that followed in Little Wallachia the Russians were on every occasion defeated by the Turks, but in November the Russian fleet, issuing from the harbour of Sevastopol, attacked and utterly destroyed the Turkish fleet in the roads of Sinope. In the following March (1854) the Russians crossed the Danube, and seized the fortresses in the Dobrudscha; and about the same time England and France declared war, and the fleets entered the Black Sea. On the 15th of June the Russians, after great efforts and a vast loss of men, raised the siege of Silistria (French and English armies now appearing in Turkey, encamped at Varna), and retreated across the Danube. The Turks also crossed the Danube. The Russians were defeated at Giurgevo, and soon after evacuated the principalities, which, in accordance with the terms of a treaty with the Porte, were occupied by Austrian forces. Meanwhile the French and English fleets entered the Black Sea, bombarded Odessa, and forced the Russian fleet to take refuge in the harbour of Sevastopol. An Anglo-French army landed in the Crimea on September 14, 1854, under the command of Marshal St. Arnaud and Lord Raglan. The battle of Alma followed on the 20th, in which the Russians under Prince Menzikoff were utterly defeated by the allies, and the road was open to Sevastopol. To secure ready communication with their fleets, however, the allied army, by a flank march, seized upon the harbours of Balaklava and Kamiesch, and the southern side of Sevastopol was invested on the 26th of September, the Russians having, in the interim, by sinking seven men-of-war at the mouth of the harbour, blocked np the entrance by sea to this great naval and military arsenal. Here, on the dreary heights of Sevastopol, throughout the terrible winter of 1854-5, the allies maintained the hard struggle and obstinate siege against a skilful foe within and a countless Russian army without, humbling the name and prestige of Russia by the victories of Inkermann and Balaklava; and kept the eyes of the world fixed upon the spot where the whole interest of the war was now concentrated throughout the entire spring and summer of 1855, electric agency flashing to all parts of Europe tidings of losses and sufferings often, of defeat never, and of many a brilliant success (not least of which was the victory of Tchernaya, August 16, in which the Sardinians, then numbered among the allies, fought with great skill and courage); until at last, after a long bombardment, the French captured the Malakoff fortress on the 8th of September, and the allies occupied Sevastopol.

TURNER, JOSEPH MALLORD WILLIAM, was born at No. 26, Maiden-lane, Covent Garden, where his father carried on business as a hair dresser. The year, as well as the month of Turner's birth has been differently given: all that is certainly known respecting either is, that his baptism is entered on the register of the parish church of St. Paul's, Covent Garden, as having taken place on the 14th of May, 1775; and it is most probable that his baptism followed pretty close upon his birth. Of his boyhood and youth little is told. His father, a tradesman in a small way, did not attempt to make his son a scholar, and the great painter never advanced far beyond the rudiments of an ordinary English education. Of his primary training in art, or what led him to think of painting as a profession, we have no precise information. Probably his own strong inclination first stimulated him to overcome the initiatory difficulties of the study of drawing, and some casual occurrence or association aroused or directed his ambition. It does not appear that the elder Turner thwarted his son's inclination, though, perhaps from poverty, perhaps from indifference, he did not procure him the instruction which might have smoothed his early path.

Turner was essentially a self-made painter. It is said in a brief notice of him published in 1805—when, though only in his thirtieth year, he was already recognised as the first of living landscape painters—"Turner may be considered as a striking instance of how much may be gained by industry, if accompanied by perseverance, even without the assistance of a master. The way he acquired his professional powers was by borrowing when he could a drawing or picture to copy; or by making a sketch of any one in the Exhibition early in the morning, and finishing it up at home. By such practices, and by a patient perseverance, he has overcome all the difficulties of the art." (Dayes' 'Professional Sketches of Modern Artists,' Works, p. 352.) This passage was written by one eminent in his day as an instructor of young landscape painters, and the teacher and friend of Girtin, Turner's earliest and closest artistic associate, and it coincides with what other authorities, both written and traditionary, have always related of his career. But he was certainly still very young when he had opened to him the means of obtaining professional instruction, he having been admitted as a student in the Royal Academy in 1789, when consequently he was only fourteen years old. It is hardly probable, however, that he received much direct instruction in the Academy schools, or that he followed their prescribed course. If he studied in the antique, or later in the life-school, he certainly never acquired mastery over the human form, and no instruction was given the student in landscape drawing or painting. Still it is not likely that a young enthusiast, as he certainly was, would attend the schools and form acquaintance with professors and students, without acquiring from them much technical information, even if he received no systematic instruction. But his best academy, he was accustomed to say, was "the fields and Dr. Monro's parlour." Dr. Monro, who was a warm-hearted patron of young artists, had an excellent collection of water-colour drawings and engravings at his residence in the Adelphi, and he not only gave his two favourite protegés, Turner and Girtin, free access to his treasures, with permission to copy them, but directed their studies, and encouraged them to make coloured sketches of the scenery around London, which he readily purchased at prices satisfactory to the modest students. In these sketching rambles, Turner and Girtin were constant companions, and they formed for themselves a style of water-colour painting very different from that of any of their predecessors—unless indeed it be Cozens, a man of some genius and a friend of Dr. Monro, from whose drawings and conversation much was probably learned by the two young painters. Girtin was Turner's senior by a year or two, and as he was the more regularly educated artist, it is not unlikely that he was to some extent his companion's tutor; certain it is that their drawings were very similar in style—the chief difference being that Turner made out his details more carefully—and some have fancied that had Girtin lived he would have been as great a painter as his friend. He gave way, however, to intemperance, and died (Nov. 1802) at the early age of twenty-seven. Turner, with more self-control and perseverance, laboured steadily on, and rose in good time to the undisputed supremacy in his branch of art.

Two years before he entered the academy as a student, in 1787, when only twelve years of age (supposing his baptismal year was the year of his birth), Turner made his bow to the public as an exhibitor at the Royal Academy (under the name of W. Turner) of two drawings, 'Dover Castle' and 'Wanstead House;' his next appearance being in 1790, the year following his admission as a student, when he sent a 'View of the Archbishop's Palace, Lambeth.' From this time till his death—a period of sixty-years—he regularly contributed to every exhibition of the Royal Academy, with the exception of the years 1821, 1824, and 1848, sending in all 259 pictures, a very large proportion of them being paintings of considerable magnitude. But these alone would give a very inadequate notion of his remarkable facility and industry, as during that period he also sent to the British Institution some twenty oil paintings which had not been exhibited at the Academy, and painted a large number, and some of them his chief works, which were never exhibited at all, besides many hundreds of water-colour drawings and designs for engraving.

For some ten or twelve years he painted chiefly, if not exclusively, in water-colours, his pictures—with the exception of two or three fancy subjects, such as 'The Battle of the Nile,' 1799; 'The Fifth Plague of Egypt,' 1800—being confined to the representation of English and Welsh scenery. But already it was felt that there was a degree of brilliancy of execution united with close observation of nature which placed his works quite apart from those of any of his contemporaries, and justified the highest anticipations of his future success. The popular opinion received professional confirmation by his election in 1799 as an associate of the Royal Academy; in 1802 he became an academician. He now visited Scotland, France, Switzerland, and the Rhine; launched boldly into oil painting on canvasses of large size, and began to look into the Greek and Roman poets—or their substitute Lempriere—for subjects for his pencil. This year, 1802, the exhibition afforded a fair illustration of the wide and daring range his pencil was taking, his contributions being 'The Falls of the Clyde;' 'Kilchurn Castle;' 'Edinburgh from the Water of Leith;' 'Ben Lomond Mountains—the Traveller;' 'Jason;' 'The Tenth Plague of Egypt;' 'Fishermen upon a Lee-Shore in Squally Weather;' and 'Ships bearing up for Anchorage.' He evidently felt his strength; yet year after year, while showing himself sufficiently conscious that he knew his proper walk, he kept on putting forth strange experiments in subjects and methods: thus one year (1803) saw his 'Holy Family,' another (1807) 'A Country Blacksmith disputing upon the price charged to the Butcher for shoeing his Pony,' another (1808) 'The Unpaid Bill, or the Dentist reproving his Son's Prodigality,' and another (1809) 'The Gazetteer's Petition;' but even from these strange whims he seemed to gather new strength. At this time however he appears to have studied with most earnestness the stormy ocean, and never yet has the sea in its wildest fury been represented on canvas with such wondrous might and majesty as in his noble 'Shipwreck: Fishing-boats endeavouring to rescue the Crew,' now at Marlborough House; the 'Gale at Sea,' belonging to the Earl of Ellesmere; and the 'Wreck of the Minotaur,' the property of Lord Yarborough. But even alongside of these the poetic treatment of views of places, such as his 'Edinburgh from Calton Hill,' 1804; 'Fall of the Rhine at Schaffhausen,' 1805, and 'Sun Rising through Vapour,' 1806, not only enabled them to hold their place, but obtained for him perhaps even a wider popularity, while with the connoisseurs his 'Narcissus and Echo,' 1814, 'Mercury and Hersé,' and 'Apollo and Python,' 1811, his 'Dido and Æneas,' 'Apuleia,' and a long list of other mythological themes, won him fame as a poetic painter, though now, despite their pictorial richness and daring, they are generally felt to be in truth the least poetical of his works, and infinitely inferior to his other and more purely imaginative productions of this period, 'Snow-storm —Hannibal crossing the Alps,' and the like, in which he almost for the first time portrayed with some approach to the vastness and sublimity of nature the fierce encounter of the elements, the splendour of the rarer phenomena of the atmosphere, and the beauty and glory of the mountains.

In 1807 Turner was elected professor in perspective to the Royal Academy, and for several years he continued to give courses of lectures to the students, in which he spoke of the systems of pictorial composition adopted by the great landscape painters of earlier times, of their principles of effect and of colour, and compared them though sparingly with the teaching of nature; but the lectures were never printed, and as far as we know no record of them is left. Report has always spoken of them however as ill-arranged and ill-delivered, confused in style, and obscure in illustration. They never succeeded in securing the attention of the students, and for many years before he resigned his professorship he had ceased to deliver any lectures.

An important circumstance in the earlier career of Turner was the publication of his 'Liber Studiorum,' which was commenced in 1808. This now famous work was undertaken in rivalry of the book of sketches known as the 'Liber Veritatis' of Claude, in the possession of the Duke of Devonshire, of which a series of fac-simile aqua-tinta engravings was made by Earlom and others. Turner's series, engraved in a similar style, some of them by Turner himself, embraced examples of all the principal forms of landscape composition, and displayed a fertility of resource and an intimate observance of nature such as the publication of no previous landscape painter had approached. The work has long been extremely rare, and when brought to sale commands a very high price: two republications of it have been announced. From this time to his death Turner remained the most in request with publishers and engravers of any English landscape-painter, both for the landscape illustration of books and for series of engravings; and even where his 'eccentricities of colour,' as they are called, repel, his engraved designs are with few exceptions received with unmitigated delight. Among the most famous of these engraved works may be mentioned the 'Scenery of the Southern Coast,' 'England and Wales,' 'Rivers of England,' 'Rivers of France,' Rogers's 'Italy' and 'Poems,' of all his vignette engravings the most exquisite, the poems of Byron, Scott, &c. From his paintings likewise some very noble line-engravings of large size have been made by Pye, Willmore, Miller, Prior, &c.; while Turner's grand engraving of 'The Shipwreck' is one of the richest specimens of mezzotinto.

We cannot in a sketch like this trace the progress of the painter by the only really important events recorded of his life—the production of his chief pictures. He made three visits to Italy in 1819, 1829, and 1840, and after each his style underwent a remarkable change. The usual division of his style, and on the whole it is the most convenient one, does not however exactly coincide with his Italian visits. Turner's career, it is said, comprises three distinct periods; the first reaches to about his twenty-seventh year, when he was elected into the Academy, and during which he was chiefly noticeable as a water-colour painter diligently occupied in drawing from nature, and at the same time forming for himself a style, by carefully studying (and imitating) the methods of his English predecessors, Wilson, Loutherbourg, and, in a less degree, Gainsborough, the influence of whose works is very apparent in his earliest oil-paintings: the second period ranges from 1802 to 1830, in which he is seen at first a follower of Claude, and, in a less degree, of Gaspar Poussin, but rapidly disencumbering himself from the trammels of every kind of pupilage to great names, and striking out a style of landscape-painting entirely original and wholly unrivalled for brilliancy of colouring and effect: while the third period, dating from his second visit to Rome in 1830, is one in which everything else was sacrificed in the effort to attain the utmost splendour of light and colour—to make (in the strange language of his own 'MS. Fallacies of Hope')

> "the sun
> Exhale earth's humid bubbles, and, emulous of light,
> Reflect her forms each in prismatic guise."

But while such a division is convenient it must not be regarded as anything more. Like every great artist, his conceptions were always advancing and expanding, and in each period were painted pictures that would seem justly to belong to another. At which period he painted best it is difficult to say, and judges of art pronounce widely different opinions. It is quite certain that up to some ten or twelve years before his death, his knowledge of the phenomena of nature and of the resources of art continued to grow and expand, even when his hand failed to express faithfully his intentions, or his impatience prevented him setting them forth with due elaboration. Any one who has carefully studied Turner's works chronologically, and who has at the same time diligently studied nature, will sympathise if he cannot entirely concur in the strong statement of Turner's most ardent admirer, Ruskin:—"There has been marked and constant progress in his mind; he has not been, like some few artists, without childhood; his course of study has been as evidently as it has been swiftly progressive, and in different stages of the struggle, sometimes one order of truth, sometimes another, has been aimed at or omitted. . . . . As he advanced, the previous knowledge or attainment was absorbed in what succeeded, or abandoned only if incompatible, and never abandoned without a gain; and his latest works present the sum and perfection of his accumulated knowledge, delivered with the impatience and passion of one who feels too much and knows too much, and has too little time to say it in, to pause for expression, or to ponder over his syllables." ('Modern Painters,' i. 407.)

It would be easy to refer to examples illustrative of Turner's different periods, but so large a number of his best works—thanks to his munificence—are now public property, and through the care of Mr. Wornum have been so well arranged, dated, and catalogued, and rendered so easy of reference, that a special mention of any is needless. A cursory examination (with attention to the dates) of that collection, and of the other examples of Turner's pencil in the public galleries, will sufficiently illustrate what has been said of the progressive and, as it were, tentative character of his mind; and a studious consideration will convince the visitor that even in what seem Turner's wildest aberrations from the sobriety of nature, there is a foundation of truth for the idea he has endeavoured to work out, and that his failures, while they arise sometimes from wilfulness, arise more often from his attempting to represent unusual phenomena by materials utterly inadequate for the purpose. Turner in fact seems never to have understood the limits of his art, and in seeking to accomplish what is impracticable with such means as he possessed, and with such necessarily imperfect skill, he became extravagant and bizarre. Although eccentricity of colour and indefiniteness of form were at all times charged upon his paintings, the extreme development of this fault is chiefly urged against the works executed during the last twenty years of his life, and unquestionably with all there is of unfailing suggestiveness, to an artistic eye, in every one of them, it is upon these works that censure will eventually rest. Yet it is remarkable that to this period belongs the work in which, by general consent, his unrivalled powers as a landscape-painter are seen in their fullest developement, his 'Childe Harold, or Modern Italy,' (now at Marlborough House) which was painted in 1832; and to this period also belong some of his most poetic efforts, including 'The Fighting Temeraire tugged to her last Berth' (1839), and the 'Slaves throwing overboard the dead and dying—Typhon coming on' (1840).

Turner died on the 19th of December 1851, in humble lodgings, which he had taken in an assumed name, by the river-side at Chelsea. He was buried with some state in the crypt of St. Paul's Cathedral by the side of Reynolds, Wilkie, Fuseli, and others of our eminent painters. Turner was a man of unsocial and reserved manners, and many gossiping stories are related of his coarseness and love of money: but they bear on their face a coloured and exaggerated character. It is certain that he had hoarded his money for no selfish purpose. For many years he had refused to sell some of his best pictures, and when any such, painted and sold in his earlier years, were offered for sale, he if possible purchased them. On his death it was found that he had by his will bequeathed to the nation all the pictures and drawings then collected in his residence, No. 47, Queen Anne-street West, on condition that a suitable gallery was erected for them within ten years; and his funded property to found an asylum at Twickenham for decayed artists. Unfortunately the will was unskilfully drawn, and a suit in chancery ensued, but it was compromised by the engravings and the other property being transferred to the next of kin, who disputed the will, while the paintings and drawings were held by the nation. The oil paintings, one hundred in nnmber, include many of his finest works as well as examples of his pencil from the very outset to the termination of his career; they are for the present exhibited at Marlborough House. The finished drawings, which nnmber several hundreds, and the sketches, which amount to some thousands, have been (or are being) arranged, cleaned, and mounted with rare skill and patience by Mr. Ruskin, who volunteered his services to the government; and a choice selection of them is now hung on screens at Marlborough-House. Among those now exhibited are many admirable drawings in colours, and numerous sepia drawings made for the 'Liber Studiorum,' the Rivers, &c., some of which are of an exquisite heauty and brilliancy of effect, probably unequalled among drawings of that character. The nation also possesses in the collections presented by Mr. Vernon and Mr. Sheepshanks several other choice examples of Turner's pencil.

There is no need to add anything to what has been said respecting the rank which Turner holds among the landscape painters either of his own or an earlier time. But as his merits are still sometimes contemptuously denied—perhaps in part owing to the indiscriminate eulogy which has of late years been heaped upon him—and as it is sometimes said that, if he were the great painter so strongly affirmed, foreign artists and writers on art would not be slow to acknowledge his superiority—it may be well to quote the calm judgment of a German writer whose authority is admitted, and whose opinion is the result of a repeated consideration of his works. Dr. Waagen says—"In point of fact no landscape painter has yet appeared with such versatility of talent. His historical landscapes exhibit the most exquisite feeling for beauty of lines and effect of lighting: at the same time he has the power of making them express the most varied moods of nature—a lofty grandeur, a deep and gloomy melancholy, a sunny cheerfulness and peace, or an uproar of all the elements. Buildings he also treats with peculiar felicity; while the sea in its most varied aspect, is equally subservient to his magic brush. His views of certain cities and localities inspire the spectator with poetic feelings such as no other painter ever excited in the same degree, and which is principally attributable to the exceeding picturesqueness of the point of view chosen, and to the beauty of the lighting. Finally, he treats the most common little subjects, such as a group of trees, a meadow, a shaded stream, with such art as to impart to them the most picturesque charm. I shonld, therefore, not hesitate to recognise Turner as the greatest landscape-painter of all times, but for his deficiency in one indispensable element in every work of art, namely, a sound technical basis." — ('Treasures of Art in Great Britain,' 1854, vol. i., p. 383-4.)

TURNER, SHARON, was born in London on September 24, 1768. He was educated at Pentonville, at a school kept by the rector of St. James's, Clerkenwell, and at the age of fifteen he was articled to an attorney. On the death of his master, before his clerkship had expired, he succeeded him in his business. Even during his clerkship he had felt the promptings of a literary taste, and had occupied his leisure by studious reading and composition. While in business for himself he began to collect materials for his 'History of the Anglo-Saxons,' of which the first volume was published in 1799, and the third in 1805. It is on this work that his reputation chiefly rests. He was the first English author who had taken the pains, or had had sufficient knowledge, to investigate the valuable remains left to us in Anglo-Saxon records. He consulted the original manuscripts with great industry and intelligence, and the result has been that, thongh his views have been more than once assailed, they have heen generally sustained now that the study of Saxon literature has been more appreciated, and the authenticity of his materials more completely understood. The work soon took a permanent place in the historical literature of the country, and, encouraged by his success, he continued his history from the Norman conquest to the death of Elizabeth, publishing at different times the volumes of a distinct period; the three subdivisions being republished together under the title of 'The History of England from the earliest period to the Death of Elizabeth,' 6th ed., 2 vols. 8vo, 1839. This portion, though distinguished by a large amount of industry, and the discovery in consequence of a few hitherto unknown facts, was not equal to the previous portion. Where the field was less new he had no advantage over previous writers; his views had little originality, and his treatment of his subject had no superior merit. In 1829, after suffering from illness for some years, he retired to Winchmore-Hill, where he prepared and published in 1832 the first volume of his 'Sacred History of the World, as displayed in the Creation, and subsequent events to the Deluge. Attempted to be philosophically considered in a series of Letters to a Son.' Two other volumes completed it, the object being, from temporal history, to establish the principle of minnte providential agency or snpervision. In 1843 the death of his wife occasioned him much distress, and increased his illness. At length he was compelled to return to London, where, in his old residence in Red Lion-square, he died on February 13, 1847. Besides the works above-mentioned, he published a volume of essays and poems under the title of 'Sacred Meditations, by a Layman,' a 'Prolusion on the Greatness of Britain, and other Subjects;' 'Richard III., a Poem;' and he contributed two or three articles to the 'Quarterly Review.' Some letters which he addressed to the Royal Society of Literature, of which he was an associate, on the affinities of the various languages of the world, have been added to the last edition of his 'Anglo-Saxons.'

TURNER, THOMAS HUDSON, was born in London in 1815. His father was a printer in the employment of Mr. Bulmer in Pall-Mall, hut dying young and in difficulties, his family was assisted hy Mr. W. Nicol, the nephew and successor of Mr. Bulmer, who placed young Turner at school at Chelsea, where he early distinguished himself by a love for antiquarian research, and formed a friendship with the two sons of the late Allan Cunningham. With the younger, Peter, his friendship continned until his death. In 1831 he was taken into the printing-office of Mr. W. Nicol to learn the business. While here he employed all his leisure in pursuing his antiquarian and historical studies, and on seeing an advertisement for a young man at the Record Office in the Tower who conld read and translate records, he applied for and obtained the situation. He devoted himself with great diligence to the study of the records, and his knowledge increased rapidly. He projected many historical works, but his labours in acquiring constantly fresh information prevented his carrying his many plans into execution. From this employment he was taken by Mr. Tyrrell, the Remembrancer of the City of London, to assist him in collecting materials for a history of London, at which he most assiduously laboured, bnt the information thus collected remains yet in manuscript. When this was completed he edited with remarkable care a volume of 'Early Household Expenses,' to which he prefixed a valuable introdnction; the work being presented to the Roxburghe Cluh by Mr. Beriah Botfield. After the publication of this volume he was made secretary to the Archæological Institute. While he held this office his readiness in imparting information respecting antiquities was remarkable; he wrote some valuable papers for the 'Journal' of the Society, and communicated several records to the Society of Antiquaries at Newcastle, which are printed in the 'Archæologia Æliana.' On his retirement from this office, he continned his studies, but commenced his work, 'Some Account of Domestic Architecture in England, from the Conquest to the End of the Thirteenth Century, with nnmerous Illustrations,' which was published in 1851. This work, and his papers in the 'Archæological Journal' pnblished between 1846 and 1851, formed the groundwork of his fame. The papers only amount to five, and one of them is on the dining-customs of the Middle Ages, a subject similar to that of his book. His 'Domestic Architecture' is noticeable for the exactitude and wide extent of his knowledge, and is a valuable contribution for the student of English antiquities. It does not confine itself to the mere building, but inclndes a large amount of subsidiary information and illustration mainly collected from our national records, and comprises an account of the furniture; the implements used in the processes of cooking, brewing, baking, &c.; the state of horticulture at the time; with disquisitions on the manufactures connected with the household economy, such as glass, linen, cutlery, &c. Mr. Turner's severe and constant application to his studies had for many years greatly impaired his health, and on June 17, 1852, he died, having produced far less than from his great accomplishments could have been wished and might have been expected. His vast store of knowledge was freely scattered in conversation; he had constant applications for information, and few were sent away unsatisfied; but his ardour for accumulation prevented his application to composition, so that of his many projected works the one above-named was the only one he executed, and that was in a manner but a fragment: at any rate, Mr. Turner promised to carry down the subject to a more recent period, a promise he did not live to fulfil. A second volume has however been prepared and published by Mr. Parker of Oxford.

TURTONIA, a genus of Conchiferous *Mollusca*, named by Mr. Hanley after Dr. Turton. There is but one species, *T. minuta*, which has been separated from the genus *Kellia*. The shell is oblong, inequilateral, anterior side very short; ligament concealed between the valves; hinge-teeth 2—2. Animal with the mantle open in front; foot large, keeled; siphon, single, slender, elongated, protruded from the long end of the shell. It is found in Great Britain; also in Norway and Greenland. (Forbes and Hanley, *British Mollusca*.)

TUSCANY. The territory of Lucca fell to Tuscany in 1847. [LUCCA.] The Grand-Duchy is divided into compartimenti, or provinces, as in the following table:—

Provinces.	Area in Square Miles.	Population in 1854.
Florence	2,246	715,701
Lucca	510	265,304
Pisa	1,174	231,473
Siena	1,455	190,159
Arezzo	1,265	221,090
Grosseto	1,710	80,980
Livorno	38	89,420
Isle of Elba	96	21,559
Total	8,494	1,815,686

TWICKENHAM. [MIDDLESEX.]

TYPHUS FEVER, TYPHOID FEVER. [PHYSIC, PRACTICE OF (*Blood, Diseases of*), *S.* 2.]

TYTLER, PATRICK FRASER, was born at Edinburgh on the 30th of August, 1791, the fourth son of Alexander Fraser Tytler, Lord Woodhouselee. He was destined to increase the literary reputation of a family in which literary taste and talent seemed hereditary. After having been educated at the High School and the University of Edinburgh, he became a member of the Scottish Faculty of Advocates in 1813, but he soon abandoned practice for authorship. On the peace of 1814 he accompanied Mr. (now Sir Archibald) Alison and the present Lord-Justice Clerk of Scotland on a visit to the Continent. His first literary efforts were a[illegible] contributor to 'Blackwood's Magazine;' but in 181[illegible] published in Edinburgh an independent work entitled 'Life of James Crichton of Cluny, commonly called Admirable Crichton.' The work reached a second edition in 1823, when an 'Appendix of Original Papers' was added to it. In 1823 he published also at Edinburgh, 'An Account of the Life and Writings of Sir Thomas Craig of Riccarton; including biographical sketches of the most eminent legal characters from the institution of the Court of Session by James V. till the period of the Union of the Crowns;' and this was followed in 1826 by a 'Life of John Wicklyff,' published anonymously. It was about this time that, on the earnest suggestion of Sir Walter Scott, who had at one time thought of undertaking the task himself, he began his great work, 'The History of Scotland.' The first volume was published in 1828, and the work was completed in nine volumes in 1843. It has since then passed through several editions, and is recognised everywhere as the standard History of Scotland—the only work in which Scottish history is treated at full length on the basis of authentic materials, and in a calm and accurate as distinct from a merely popular manner. It commences with the accession of Alexander III. to the Scottish throne in the 13th century, and brings down the narrative to the union of the crowns in 1603. While writing this work, Mr. Tytler resided sometimes in Edinburgh, sometimes in London, collecting materials in both places. During the time that the work was in progress he threw off other smaller historical works, of which the following is a list:—'Lives of Scottish Worthies,' in 2 vols., 1831-33; 'Historical View of the Progress of Discovery on the more Northern Coasts of America,' published in Edinburgh in 1832, and recently re-edited in America; 'Life of Sir Walter Raleigh,' 1833; 'Life of Henry the Eighth,' 1837; and 'England under the Reigns of Edward VI. and Mary, illustrated in a series of original letters, with historical introductions and notes,' 1839. Mr. Tytler also wrote the article 'Scotland' for the seventh edition of the 'Encyclopædia Britannica,' and the article has since been re-published as a useful abridgment. In recognition of claims so well founded, Sir Robert Peel's government conferred on Mr. Tytler a pension of 200*l.* a year. In politics he was a Conservative. Though an Episcopalian, he took much interest in the Scottish Presbyterian movement of 1834-43. In private life he was much beloved for his social qualities. Towards the close of his life he suffered much from ill-health, and went abroad for a time. He returned to Edinburgh, and died on the 24th of December 1849. He was twice married, and left two sons and a daughter by his first wife.

U

UDORA, a genus of Plants belonging to the natural order *Hydrocharidaceæ*. A probable species of this genus has been recently introduced into England, and described by Babington under the name of *Anacharis alsinastrum*. The following is his description in the 'Manual of British Botany':—

It has its leaves 3 in a whorl, oval-oblong, obtuse, serrulate (the male flower is unknown), the female flower with a tubular bifid spathe, many times longer than the sessile germen: sepals, and petals, broad, nearly equal; stigmas reflexed. The stem is long, branching; whorls of leaves many and close together. Flowers subtended by a leaf-like bract placed within the whorl of leaves. Flowers very small. The sepals tinged with green and pink externally, incurved, hooded, with a narrow diaphanous margin. The petals are flat, diaphanous, recurved, and oblong. Filaments at first curved outwards, their points placed under the hood of the sepals, afterwards erect, linear, blunt, diaphanous; stigmas recurved, linear, or deeply bifid; sepals, petals, and stigmas, of about equal length; the style adnate on three sides to the tube.

This plant was first observed in Great Britain by the late Dr. Johnston of Berwick-upon-Tweed, in the river Whiteadder, in Berwickshire. It was afterwards discovered in a canal near Nottingham, and subsequently in many other places. Although at first not known, yet late inquiries have led to the conclusion that this plant is the *Udora Canadensis* of American botanists, and that it has been introduced into this country by means of the timber that is brought from the New World. Its power of retaining its vitality adapts it to bear so long a journey without destruction. The pistilliferous plants have alone been seen in Great Britain. Its power however of reproducing itself by buds is so great that it has already become a serious pest in the rivers, canals, lakes, and ponds, to which it has had access.

Anacharis alsinastrum is one of those plants in which a circulation can be seen, and has afforded to several observers the means of more closely watching these vegetable movements than any other plant which has yet been examined. It has been inferred by Dr. Branson and others, that the movements of the cell-contents of this plant are produced by cilia. Mr. Wenham however regards this movement as originating in the molecular activity of the proteinaceous endoplast.

(Babington, *Manual of Botany;* Marshall, *On the new Water-Weed;* Branson and Wenham, *On the Sap-Circulation of Anacharis alsinastrum*, in vol. iii. of the *Quarterly Journal of Microscopical Science.*)

ULSTER, NEW. [ZEALAND, NEW, *S.* 2.]

UMPIRE. [ARBITRATION, *S.* 2.]

UNITED STATES OF NORTH AMERICA, a Republic, formed by the federal union of States and Territories.

It occupies the middle portion of North America; and extends between 25° and 49° N. lat., 67° and 125° W. long.; from the Atlantic Ocean on the east to the Pacific Ocean on the west. It is bounded N. by British America, S.W. by the republic of Mexico, and S. by the Gulf of Mexico. The boundary line between the United States and British America is stated under UNITED STATES, *S.* 1. The greatest width of the United States from east to west is 2900 miles, the greatest length from north to south is 1730 miles. The entire area of the United States has been very differently estimated. As estimated by the United States authorities for the Census office in 1850, it amounted to 3,306,865 square miles. But a more elaborate and careful estimate made by the United States 'Topographical Bureau,' January 1854, reduces the area to 2,936,166 square miles, and if to this be added the additional territory of 27,500 square miles, ceded by Mexico by treaty in July 1854, the total area at the present time will be 2,963,666 square miles. The population in 1850 was 23,191,876, or 7·90 to a square mile: but this does not include the native Indians, who were estimated by the Indian Commissioner in 1853 at 400,764. The following table shows the States and Territories comprised in the Union, with the extent of each, the number and character of its population in 1850, and other particulars.

The areas of several of the States and Territories in this table are given from the new computations made by the United States 'Topographical Bureau,' and recently made public in the 'Statistical View of the United States,' drawn up and printed by order of Congress.

The physical geography of the United States has been given generally under AMERICA; and more particularly under

the heads of the several States and Territories; of the rivers COLUMBIA; MISSISSIPPI; MISSOURI, &c.; the ALLEGHANY, and ROCKY MOUNTAINS, &c.; the lakes ERIE; ONTARIO, &c. The total area of the United States, as already stated according to the revised calculations of Colonel Abert, of the United States Topographical Engineers, is 2,963,666 square miles, which he thus apportions:—Area of the Pacific Slope, or of the region watered by rivers falling into the Pacific, 793,702 square miles; the Mississippi Valley, 1,217,562 square miles; and the region whose waters fall into the Atlantic, 952,602 square miles, of which 514,416 square miles belong to the Atlantic slope proper, 112,649 square miles to the Northern Lake region, and 325,537 square miles to the region whose waters fall into the Gulf of Mexico, east and west of the Mississippi. The main shore line of the United States on the Atlantic coast amounts to 6861 statute miles, on the Pacific to 2281 miles, on the Gulf of Mexico to 3467 miles; the island shore on the Atlantic to 6328 miles, on the Pacific to 702 miles, and on the Gulf of Mexico to 2217 miles, giving a main shore line of 12,609 miles, and an island shore line of 9247 miles.

The following table taken, with a few slight changes to render it more readily understood by English readers, from the official 'Compendium to the Census,' will show at a glance the extent of the territorial acquisitions, and the occasions on which they were made:—

Territorial Increase of the United States.

TERRITORY.	Square Miles.
Area of the United States at the peace of 1783	820,680
Purchase of Louisiana from France, 1803	899,579
Cession of Florida by Spain, 1819	66,900
Admission of Texas [see TEXAS], 1844	318,000
Territory obtained by Oregon treaty with Great Britain, 1846	308,052
Territory ceded by Mexico [see MEXICO], 1848	522,955
„ additional, ceded by Mexico by a new treaty, 1854	27,500
Total	2,963,666

The following table shows the rate of increase of the various classes of the population at the several censuses of the Union, except the census of 1840, which is given under UNITED STATES.

Classes.	1790	1800	1810	1820	1830	1850
Whites . .	3,172,464	4,304,489	5,862,004	7,861,937	10,537,378	19,553,068
Free Coloured .	59,466	108,395	186,446	238,156	319,599	434,495
Slaves . . .	697,897	893,041	1,191,364	1,538,038	2,009,043	3,204,313
Total . .	3,929,827	5,305,925	7,239,814	9,638,131	12,866,020	23,191,876

The commerce of the United States has gone on rapidly extending, until next to that of Great Britain it is the largest in the world. In the year ending June 30, 1856, the total imports of the United States amounted to 314,639,942 dollars; the exports to 326,964,908 dollars; of which 310,586,330 dollars were of domestic produce, and 16,378,578 dollars of foreign produce. Of the foreign trade, considerably more than half is with Great Britain and its dependencies. The total amount of tonnage engaged in the foreign trade was 4,871,652. The total number of American vessels entered from foreign countries in 1856 was 10,307, of foreign vessels, 11,375; the clearances during the same year were, of American vessels 10,592, of foreign vessels 11,186. The registered tonnage of the commercial navy was 2,491,403. The crews of American vessels cleared out numbered 152,971 men and 1070 boys. There were in 1857 of canals 4798 miles; of railways 24,220 miles completed.

The naval and also the military forces will be found under MILITARY AND NAVAL FORCES, *S.* 2.

The revenue of the United States for the year ending June 30, 1857, was 68,631,513 dollars, of which 63,875,905 dollars were raised by customs duties. The expenditure for the same year was 70,822,724 dollars. Of this 5,943,896 dollars was for interest on and redemption of the public debt, which amounted to 30,963,909 dollars.

The following is a list of the Presidents, continued after those previously given (v. xxvi. p. 12):—

10.	John Tyler	1841 to 1845
11.	James Knox Polk . . .	1845 „ 1849
12.	Zachary Taylor (died in office) .	1849 „ 1850
13.	Millard Fillmore . . .	1850 „ 1853
14.	Franklin Pierce	1853 „ 1857
15.	James Buchanan . . .	1857

From the establishment of their position as an independent republic until the present time, the United States have been chiefly occupied in the development of their vast resources. Many questions of internal government and relationship have occurred and excited much interest, but it does not belong to us to notice more than will be found in AMERICA, *S.* 2; CALIFORNIA, *S.* 2; OREGON, *S.* 2; TEXAS, *S.* 2; UTAH, *S.* 2.

URANOGRAPHY (from οὐρανός, heaven, or the firmament, and γράφειν, to describe.) The article ASTRONOMY, in the 'Penny Cyclopædia,' after explaining generally the processes of observation and reasoning by which the science of physical astronomy has attained its present degree of perfection, gives a series of brief historical notices of the discoverers in astronomical science, and of the most important of their discoveries, brought down to the year 1830. The most important of the instruments by which the processes of astronomical observation are carried on are elaborately described, with the addition of figures accurately drawn, under the heads CIRCLE, ASTRONOMICAL; EQUATORIAL INSTRUMENT; REPEATING CIRCLE; and SEXTANT; and also under PENDULUM and TELESCOPE.

The collection of revolving bodies of which the sun is the centre, is described generally under the head SOLAR SYSTEM; and the Newtonian theory of that system under the head GRAVITATION. The sun and each of the large planets are described separately under their respective names, SUN, MERCURY, VENUS, &c. The earth and the earth's satellite are described separately, EARTH, MOON; and the smaller planets discovered previously to 1843, are described under the head VESTA, which includes also notices of *Juno, Ceres,* and *Pallas.* There is a general article on comets [COMET], and particular articles on ENCKE'S COMET and HALLEY'S COMET.

So far as to the Solar System. The starry heavens have a distinct article STAR, DOUBLE STAR, CLUSTER OF STARS, NEBULA; and there is also an article on the obscure masses of stars called the MILKY WAY.

The additions made to astronomical science since the completion of the 'Penny Cyclopædia' have been so numerous and important, that a detailed account of them would be scarcely possible except in a work wholly devoted to the subject. It may be sufficient here to indicate broadly some of the leading facts which have a general rather than a purely scientific interest, yet which will serve to illustrate the recent progress of astronomy.

First in rank we may place the determination of the motion, or movement of translation, as it has been termed, of the entire solar system in space. The possibility of such a movement was suggested by Bradley in 1748, and the question was discussed by subsequent astronomers; but the elder Herschel was the first who sought by actual observation to verify or disprove the notion. His observations, which extended over more than twenty years (1783-1806), led him to conclude that such a movement did really exist, and that our solar system is moving towards the constellation Hercules. It remained, however, long a mere hypothesis. [SOLAR SYSTEM, vol. xxii., p. 198.] The first important step towards its confirmation was made by Argelander, in a paper published in the 'Mémoires' of the Imperial Academy of St. Petersburg for 1837. By comparison of the proper motions of 390 stars given in his own catalogue of 560 stars observed at Abo, with those of Bradley as given in the 'Fundamenta' of Bessel, Argelander verified the fact of the motion, and found the point towards which the solar system is tending to be situated in the same constellation as Herschel supposed. Other astronomers pursued the enquiry with great zeal and industry, but the decisive step is ascribed to another Russian astronomer, Otto Struve, whose paper ('Bestimmung der Constante der Präcession mit Berücksichtigung der eigenen Bewegung der Sonnensystem'), printed in the St. Petersburg 'Transactions' for 1842, was regarded as having set the question at rest, and was, on account of its importance, awarded the gold medal of the Royal Astronomical Society of London, in 1850. The results of these researches of Argelander and Struve are thus summed up by the elder Struve in his 'Études d'Astronomie Stellaire' p. 105, (see also Grant's 'History of Physical Astronomy,' p. 557):—

"The motion of the solar system in space is directed to a point in the celestial sphere, situate on the right line which joins the two stars of the third magnitude, π and μ Herculis. The velocity of this motion is such, that the sun, with the whole cortége of bodies depending on him, advances annually in the direction indicated, through a space equal to 1·623 radii of the terrestrial orbit, or 154 millions of miles."

The observations which led to this great discovery were all made on stars of the northern hemisphere. It was most desirable therefore to ascertain whether the general movement of the stars of the southern hemisphere would indicate a motion of the solar system towards the same point as that shown by the northern stars. This laborious task was undertaken by Mr. Galloway. Employing the catalogue of 606 stars observed at St. Helena by Mr. Johnson, and the catalogue of 172 stars observed by Mr. Henderson at the Cape of Good Hope, with the older determinations of Bradley and Lacaille, he arrived at almost exactly the same conclusions as Argelander and Otto Struve; the reality of motion being proved, and the point of motion being nearly identical. For this work Mr. Galloway received the gold medal of the Astronomical Society. Finally, to remove all possibility of doubt, if any remained, Mr. Main contributed to the Astronomical Society, in 1852, a paper on the motions of 875 stars observed at Greenwich, in which the accuracy of the investigations of Argelander and Struve was fully established.

The fact of this rapid movement of the entire solar system in space is of great importance in practical astronomy; while in the higher theoretic branch of the science it has set astronomers on the consideration of the question whether there does not exist a general centre of gravity, to which is subjected not only our own solar system, but the whole stellar universe. Some eminent German astronomers have attempted to arrive at conclusions more or less definite on the subject, but as is well said by Sir John Herschel in noticing some of their theories: "In the present defective state of our knowledge respecting the proper motion of the smaller stars, we cannot but regard all attempts of the kind as to a certain extent premature, though by no means to be discouraged as forerunners of something more decisive."

A subject which has long been one of primary interest in astronomy, is that of the constitution of the central body of our solar system. The then actual condition of our knowledge was fully stated under Sun. Since that article was written, the spots on the sun have been carefully watched by many skilful observers. The observations and investigations of Dr. Bohm, Mr. Dawes, and others, have been particularly valuable. One of the chief points ascertained was that, by Mr. Dawes (in 1852), of the rotation of the sun's spots. The latest important contribution on this particular subject was that of M. Schwabe of Dessau, which obtained for him the award of the gold medal of the Royal Astronomical Society in 1857. The result of his investigations was thus stated by Dr. Lloyd in his address as president of the British Association, 1857 :—"According to the observations of Schwabe, which have been continued without intermission for more than thirty years, the magnitude of the solar surface obscured by spots increases and decreases *periodically*, the length of the period being 11 years and 40 days. This remarkable fact and the relation which it appears to have to certain phenomena of terrestrial magnetism, have attracted fresh interest to the study of the solar surface; and upon the suggestion of Sir John Herschel, a photoheliographic apparatus has lately been established at Kew for the purpose of depicting the actual macular state of the sun's surface from time to time." Of the constitution of the sun itself little additional knowledge has been acquired. "Towards the close of the last century," observed Dr. Lloyd in the presidential address just quoted, "many hypotheses were advanced regarding the nature and constitution of the sun, all of which agreed in considering it to be an opaque body, surrounded at some distance by a luminous envelope. But the only certain fact which has been added to science in this department is the proof given by Arago, that the light of the sun emanated (not from an incandescent solid, but) from a gaseous atmosphere, the light of incandescent solid bodies being *polarized by refraction*, while the light of the sun, and that emitted by gaseous bodies, is unpolarized."

Next to the sun, the earth's satellite the Moon has, among the heavenly bodies, always engaged the largest share of the attention of man. Observations of the moon's visible surface have from the earliest use of telescopes been diligently prosecuted; and while there has been no falling off of late years among astronomers in zeal, there has been a great increase of combination in research, and the instruments they have used have been of a very superior character. Their observations on the moon's surface have recently been directed specially to ascertain whether the old opinion of the existence of lunar seas and a lunar atmosphere is well founded or not. Increased telescopic power showed that the supposed ocean beds were full of inequalities, in fact, as described by Professor Phillips, "the so-called seas, under this more exact scrutiny, appear destitute of water, and the surface, under low angles of incident light, becomes roughened with little points and minute craters, or undulated by long winding ridges of very small elevation:" and though Arago suggested that some of these appearances were not inconsistent with uneven sea-bottoms covered with shallow water, as on our own planet the rocky ocean bed is plainly visible from great heights, he himself, from these and other optical phenomena, acquiesced in the belief, now general among astronomers, that water does not exist on the surface of the moon.

The appearance of the moon's surface, when examined through a powerful telescope, has, as is well known, been long represented in very carefully prepared maps, on which all the leading features—mountains, plains, ridges, "rills," and so-called seas—are not merely laid down, but have names attached, which the astronomers of Europe have agreed to assign them. Such a map will be found under the article Moon. The famous lunar map of Beer and Mädler has carried accuracy and beauty of execution as far as it probably can be carried. But the drawings for such a map must be made at the eye-piece of a telescope of great magnifying power, and it is hardly conceivable that, with the eye thus strained, and the mind almost necessarily somewhat excited, perfect accuracy can be attained—though by the comparison of many drawings a surprisingly near approach to it has been made. The most minute and perfect accuracy however is what astronomers always desire in the record of their observations; and hence the beautiful art of photography has been gladly called in to aid in securing a perfect delineation of the moon. Mr. Bond, the distinguished American astronomer, was the first who so applied it; but it has since been extensively used in this country. Many difficulties have presented themselves, but by that steady, patient, inventive application which is so characteristic of the astronomer, they have already been to a great extent surmounted. By various ingenious apparatus, including the addition of a clock-work motion to the telescope, and by the use of extremely sensitive collodion, lunar photographs of remarkable beauty have been obtained by Mr. De la Rue and some other gentlemen; and it is probable that the portrait drawn by the Moon herself will to a great degree supersede that drawn by man. We have already noticed that the Sun is keeping for the perusal of the astronomer a continuous record of the changeful progress of the spots upon his disc. We may add, that by the very refined means now in use, photographs and daguerreotypes are now obtained almost instantaneously, not only of the moon's surface, and of the spots on the sun, but even of Jupiter and his belts, and of numerous astronomical phenomena of a kind which, from their fugitive nature, could only be hitherto described in words or depicted from memory.

With respect to the lunar atmosphere, a negative opinion has likewise been arrived at; though whenever an instrument of increased power, or a stellar phenomenon, appears likely to afford a new or more precise test, it is carefully brought to bear upon the point. The most delicate test is the exact observation by a telescope of high magnifying power of the occultation of a planet. If the moon were enveloped in an atmosphere, there would be some change of form or brightness in the planet, owing to atmospheric absorption or refraction at the edge of the moon's disc at the moment of its immersion, or disappearance behind the moon, and at its emersion, or reappearance. None such has however been observed with the powerful instruments which have been employed for the purpose of late years. On the contrary, the immersion and emersion have been instantaneous, without the slightest deflection of the planet's light, and in precise accordance with calculation as to time.

Another question of great interest has also been solved: that of the production of heat by the light of the moon. Various experiments had at different times been made with a view to determining whether the lunar rays gave out any appreciable warmth, but without success. At length, in 1846, Signor Melloni, an eminent Italian astronomer, renewed the experiment on the cone of Mount Vesuvius, and succeeded, by means of a large lens of peculiar construction, in obtaining satisfactory indications of elevation of temperature. Some doubt however remained as to the accuracy of the experiment, but it was dissipated by still more distinct evidence of the radiation of heat from the moon being obtained by Professor Piazzi Smyth. To resolve this and some other astronomical, meteorological, and magnetical problems, Mr. Smyth established himself, during the summer of 1856, on the Peak of Teneriffe, at an elevation sufficient to place his instruments beyond the obstructing influence of the earth's grosser atmosphere. His upper station was 10,700 feet, his lower 8840 feet, above the level of the sea, and at the lower, as well as at the upper station, the warmth of the moon's light was distinctly ascertained.

A point of great interest to astronomers—what is known as the long inequality in the moon's epoch—has been satisfactorily elucidated by the labours of Professor Hansen of Gotha and of Mr. Airy, the Astronomer Royal (1846-49); the latter of whom has also discovered and explained a new lunar inequality depending upon the action of the planet Venus. The statement of the reasonings of Messrs. Airy and Hansen would be out of place in a non-mathematical notice like the present; it may be sufficient therefore to say, as indicative of the importance of these discoveries, (in the words of Mr. Grant, 'History of Physical Astronomy,') that they "completely account for the errors in the tables which had so long perplexed the astronomers and mathematicians of Europe. The lunar theory may therefore now be considered as divested of all serious embarrassment."

The discoveries, and the corrections of our previous knowledge, in the world of planets, have been equally grand and surprising. Passing over all that is of secondary consequence, and all that is mainly of interest to the astronomer and the man of science, we may commence with the extraordinary additions made to the group of small planets which revolve in the wide interval between Mars and Jupiter. The discovery of the first of these was made on the 1st of January 1801, so that our knowledge of the entire group belongs to the present century. By March 1807 four had been discovered. The discovery of this fourth minor planet was made by Olbers, the discoverer of the second of the group, not accidentally, but in the course of a laborious examination of that portion of the heavens, undertaken in the full expectation of finding such a body there. For, on the discovery of the second planet, Olbers conceived and published the idea that these two small planets might be fragments of a large planet which had been broken up by some great catastrophe; and if so, that these, and most likely other fragments, were describing round the sun elliptic orbits, the intersection of whose planes must fall nearly at the same point. Impressed with this idea, Olbers, after a search prolonged for nearly five years, discovered, as we have said, a fourth planet—a third had been meanwhile discovered accidentally—but the labours of no other astronomer met with a similar reward, and any systematic search was gradually abandoned. Nearly forty years elapsed before a fifth, Astræa, was added to the group of minor planets. A year and a half later another was discovered; and now, after the lapse of little more than ten years, no less than forty-seven more have been found—making in all fifty-three, of which forty-nine have been discovered from the 1st of July 1847—and all (at least all since the fifth of the series) as the result of a systematic exploration made with telescopes of great power.

Without further reference to the hypothesis of Olbers, that these minor planets are the fragments of a disrupted planet, we may notice the remarkable coincidence or complication of their orbits, respecting which D'Arrest says, (as quoted by Humboldt in his 'Cosmos,' Sabine's translation, vol. iii., p. 374,) "it appears to testify in favour of a real or inherent connection between all the members of the entire group of the small planets, that, if we figure to ourselves the natural dimensions of their orbits as forming actual material rings, these rings are all so interlinked, that by taking hold of any one, all the others would be lifted by, or found suspended on it." The whole of these minor planets are what are termed telescopic planets, being invisible to the naked eye. The diameter of the largest is indeed probably less than 500 miles, but it is scarcely necessary to add, that if the whole 53 at present known—and probably more will yet be found—are fragments of one shattered planet, it must have been a very large one.

The four minor planets which were first discovered are all noticed under Vesta; but we give a full list of them, arranged in the order in which they were discovered, with the names of the discoverers, and the date of their discovery.

1. Ceres	Piazzi	January 1, 1801.
2. Pallas	Olbers	March 28, 1802.
3. Juno	Harding	September 1, 1804.
4. Vesta	Olbers	March 29, 1807
5. Astræa	Hencke	December 8, 1845.
6. Hebe	Hencke	July 1, 1847.
7. Iris	Hind	August 13, 1847.
8. Flora	Hind	October 18, 1847.
9. Metis	Graham	April 26, 1848.
10. Hygeia	De Gasparis	April 24, 1849
11. Parthenope	De Gasparis	May 11, 1850.
12. Victoria	Hind	September 13, 1850.
13. Egeria	De Gasparis	November 2, 1850.
14. Irene.	Hind	May 19, 1851.
15. Eunomia	De Gasparis	July 29, 1851.
16. Psyche	De Gasparis	March 17, 1852.
17. Thetis	Luther	April 17, 1852.
18. Melpomene	Hind	June 24, 1852.
19. Fortuna	Hind	August 22, 1852.
20. Massalia	De Gasparis	September 19, 1852.
21. Lutetia	Goldschmidt	November 15, 1852.
22. Calliope	Hind	November 16, 1852.
23. Thalia	Hind	December 15, 1852.
24. Phocea	Chacornac	April 6, 1853.
25. Themis	De Gasparis	April 6, 1853.
26. Proserpine	Luther	May 5, 1853.
27. Euterpe	Hind	November 8, 1853.
28. Bellona	Luther	March 1, 1854.
29. Amphitrite	Marth	March 1, 1854.
30. Urania	Hind	July 22, 1854.
31. Euphrosyne	Ferguson	September 1, 1854.
32. Pomona	Goldschmidt	October 26, 1854.
33. Polymnia	Chacornac	October 28, 1854.
34. Circe	Chacornac	April 6, 1855.
35. Leucothea	Luther	April 19, 1855.
36. Atalanta	Goldschmidt	October 5, 1855.
37. Fides	Luther	October 5, 1855.
38. Leda	Chacornac	January 12, 1856.
39. Lætitia	Chacornac	February 8, 1856.
40. Harmonia	Goldschmidt	March 31, 1856.
41. Daphne	Goldschmidt	May 22, 1856.
42. Isis	Pogson	May 23, 1856.
43. Ariadne	Pogson	April 15, 1857.
44. Nysa	Goldschmidt	May 27, 1857.
45. Eugenia	Goldschmidt	June 28, 1857.
46. Hestia	Pogson	August 16, 1857.
47. Aglaia	Luther	September 15, 1857.
48. Doris	Goldschmidt	September 19, 1857.
49. Pales	Goldschmidt	September 19, 1857.
50. Virginia	Ferguson	October 4, 1857.
51. Nemausa	Laurent	January 22, 1858.
52.	Goldschmidt	February 5, 1858.
53. Calypso	Luther	April 4, 1858.

The planet Saturn, from the wonderful appendages connected with it, and the general beauty as well as scientific interest which it presents to the telescopic observer, has always been an object of careful examination and study; and it might well have been supposed that little additional information was attainable respecting its external character, did not every increase of telescopic power afford evidence that the field of astronomical discovery is practically inexhaustible. The first of the recent discoveries was made in 1848. During the autumn and winter of that year the ring or rings of Saturn disappeared, and astronomers seized the opportunity to observe the planet with unusual care, in order to obtain more minute and accurate admeasurement, with the view of ascertaining with greater precision the divergence, if any, of his diameter from a true ellipse. In the course of this examination Mr. Bond, of Cambridge, Massachusetts, U. S., and Mr. Lassell, of Liverpool, discovered almost simultaneously an eighth satellite of Saturn—but seventh in distance from the planet. This satellite, to which the name Hyperion has been given, was first seen by Mr. Bond on the 16th of September, 1848, but its true character was not recognised by him till the 19th. It was seen and recognised by Mr. Lassell on the 18th of September. The siderial revolution of this satellite round the planet is 21 days, 4 hours, 20 minutes, its mean distance in semi-diameters of Saturn is 25·02: the revolutions and mean distances of the other satellites are given under Saturn.

The other discovery—that of an inner dark, dusky, or diaphanous ring, lying between the bright ring and the body of the planet, but unattached to either—was made nearly two years later. On this occasion Mr. Bond was again one of the first discoverers, but several European astronomers detected it very nearly at the same time; and the actual priority is of the less consequence, as it is certain that the inner ring had been observed by Dr. Galle of Berlin in 1838, and described by Encke in the 'Nachrichten' of that year; though somewhat unaccountably it had been suffered to slip entirely out of notice. But the discovery of this inner ring led to a more searching scrutiny of the other rings, and to the detection by our countryman, Mr. Dawes, and by Mr. Bond, of a probable division of the external ring. Otto Struve again was led to the conclusion that the inner edge of the interior bright ring is gradually approaching the body of the planet, while the total breadth of both the bright rings is increasing. Mr. Main, however, having made a very large number of admeasurements of the rings with a double-image micrometer, during the years 1852-55, for the purpose of testing Struve's hypothesis, failed to detect any increase of width, and regards Struve as mistaken.

In the article Uranus, that planet was said to have six satellites, but of which only two had been seen, except by the discoverer of Uranus, Sir William Herschel. In 1847-48 two, perhaps three, of these satellites were again seen, by Otto Struve, and Mr. Lassell; and in October and November 1851 Mr. Lassell discovered two new satellites of Uranus, both apparently nearer to the planet than the first satellite of Sir William Herschel: the periods of revolution of the new satellites are respectively 4 days and 2½ days, while the first of Herschel's is about 5 days 21 hours. After what has been said, it is scarcely necessary to add that none of the satellites of Uranus can be seen except with first-rate telescopes.

But far more remarkable than either of these discoveries is the discovery of Neptune—as Encke expressed it, in a passage quoted by Humboldt, "the most brilliant of all planetary discoveries, because purely theoretical investigations caused the antecedent prediction of the existence and the place of the new and yet unknown planet." In the motion of the planet Uranus, certain irregularities had been for several years observed, which could not be explained by the action of the planets then known to exist. Several astronomers had directed their attention to this enigma, as Bessel termed it; but no real advance had been made towards solving the enigma, when two young men, Adams of Cambridge, and Le Verrier of Paris, devoted themselves, unknown to each other, to the task—one of enormous labour, and requiring great skill in the higher mathematics—of arriving by calculation at the source of the perturbation. Each arrived at the same conclusion, that the cause must be the existence of a new planet outside Uranus, and each succeeded in indicating nearly the same position as the spot near which it would be found. The steps in the discovery are so fairly indicated by Humboldt, that we borrow his summary as that of a judge, free from national or other bias. He says, ('Cosmos,' vol. iii., note 640), "Le Verrier at the instance of Arago, began in the summer of 1845, to work at the theory of Uranus. He laid the results of his investigation before the Institute, on the 10th of November 1845, the 1st of June, 31st of August, and 5th of October, 1846, and published them at once; but his greatest and most important work, which contained the solution of the whole problem, only appeared in the 'Connaissance des Temps pour l'an 1849.' Adams, without printing anything, laid the first results which he had obtained for the perturbing planet, before Professor Challis, in September 1845, and the same, with some modifications, in the following month, October 1845, before the Astronomer Royal,—still without publishing anything. The Astronomer Royal received from Adams his final results, with some fresh corrections relating to a diminution of the distance, in the beginning of September 1846. The young Cambridge geometrician," continues Humboldt, "has expressed himself with noble modesty and self-denial on the subject of this chronological succession of labours, which were all directed to the same great object:—'I mention these earlier dates merely to show that my results were arrived at independently, and previously to the publication of M. Le Verrier, and not with the intention of interfering with his just claims to the honour of the discovery; for there is no doubt that his researches were first published to the world, and led to the actual discovery of the planet by Dr. Galle: so that the facts stated above cannot detract in the slightest degree from the credit due to M. Le Verrier.'"

Le Verrier having communicated to Dr. Galle the results at which he had arrived, and begged him to seek for the predicted planet, Galle at once directed the great telescope of the Berlin Observatory to the spot indicated, and, on the 23rd of September 1846, had the exquisite delight—the greatest perhaps which an astronomer could experience—of discovering there the new planet for which he was looking. The name of Neptune has been given to the planet with the full consent of all parties. At first, several astronomers thought they could perceive the new planet to be surrounded by a ring, but there is little doubt that this was a mistake. On the 10th of October 1846, however, Mr. Lassell perceived what he believed to be a satellite of Neptune, but the planet was then rapidly approaching the end of its visibility for the season, and he was unable to determine the point. On the reappearance of the planet, he again directed to it his great 20-feet reflector, and on July 8-9, 1847, he recognised with certainty, the first of Neptune's satellites. In August 1850, Mr. Lassell believed that he saw a second satellite of Neptune, but the discovery has not been confirmed.

Neptune is the most distant planet of which the existence is known. Its mean distance from the sun is 2864 millions of miles, or above thirty times the mean distance of the earth; and more than 1000 millions of miles farther off than Uranus the next most distant planet (or, the mean distance of the earth being taken as =1, that of Uranus is 19·18263, and that of Neptune 30·03683). Its period of sidereal revolution is 60,126 days 17 hours five minutes, or 164 years and 226 days. Its diameter is 35,000 miles, yet so great is its distance, that it can only be discovered with a very powerful telescope. Its satellite revolves, in 5 days 21 hours 4 minutes, at a mean distance from Neptune of 236,000 miles—or about 2000 miles less than the mean distance of the moon from the earth.

Comets have during the last few years engaged no small share of the attention of astronomers, and not only have the comets, whose return was predicted, appeared at the anticipated periods, but every year some new comets — mostly telescopic—have become visible. But the most astonishing cometary phenomenon, and one wholly unanticipated — one of which the possibility even had never suggested itself to any one—was the separation into two parts of Biela's comet.

This comet, which has a period of revolution of 6¾ years, became visible in November, 1846, and remained visible for several months. On the 19th of December, Mr. Hind noticed a kind of protuberance in the comet; on the 29th, it was seen by astronomers in North America to have separated into two parts, each being in fact a distinct comet, with its own head, nucleus, and tail. The separation was not observed in Europe till January, 1847. The two comets, which were unequal in size but similar in form, moved in the same direction, with an interval between them of empty space, at first equal to about 3, but which afterwards increased to about 6 minutes. The separation continued as long as they were visible, sometimes one, and sometimes the other being the brighter. The smaller comet disappeared towards the end of March, the larger one continued visible till the 20th of April. The phenomenon, of course, excited great interest, and the next periodical appearance of the comet was anxiously looked for by observers, all being desirous to know whether it would re-appear as a single or a twin comet. It re-appeared at the calculated period, and as a twin comet. On the 25th of August, 1852, the first portion was seen at Rome by Signor Secchi; the other portion was first seen on the 15th of the following September. Since they were last seen, in the early part of 1846, the distance between the nuclei had much increased, while the same alternations of brilliancy occurred. So long as they continued visible they continued equally far apart; indeed, the severance of the two portions appears, from a comparison of the various observations, to be complete and permanent. The next appearance of the comet, which will be in April, 1859, will probably go far to settle the question.

The number of comets recorded as having been seen at various times and in different countries amounts, according to the reckoning of Mr. Hind, to 607. Dr. Michelson, in 1847, at a meeting of the Astronomical Society, remarked, that "there are 3 comets whose return is certain (Halley's, Encke's, and Biela's comets), 5 probably periodical, and 19 for which elliptical orbits have been calculated with some degree of probability, making the total number of periodical comets 27." The number of comets whose orbits have been calculated down to December 31, 1853, amounted to 4 periodic comets, and 197 comets the returns of which to the perihelion had not been established with absolute certainty, making altogether 201.

One of the grandest comets mentioned in history is that which made its appearance in the middle of the year 1264. A very brilliant comet which appeared in 1556 is supposed by Mr. Hind to be identical with the former. This comet has been calculated by Mr. Hind to re-appear between August, 1858, and August, 1860, there being an uncertainty of two years in the elements on which the return of the comet is calculated.

In the division of stellar astronomy, beyond the region of the solar system, great activity has been displayed by astronomers. Zones of stars, down to those of the ninth magnitude, double, and multiple, and variable stars, have been with untiring labour and perseverance observed and catalogued by Laland and Lacaille (whose catalogue, and another of great value, have been published by the British Association), Bessel, Argelander, Airy, Lamont, F. G. W. Struve, Chacornac, Rümker, Cooper, and many more men of profound attainments and indefatigable zeal. The value of star-catalogues can hardly be overrated. Of the curious results which their preparation brings to light, it may be sufficient to mention as an illustration, that the great catalogue of Mr. Cooper, made at his observatory, Markree, Ireland, and published by the aid of the parliamentary grant to the Royal Society, shows that "no fewer than 77 stars previously catalogued are now missing." On the other hand new stars have suddenly appeared, and whilst Sir John Herschel was at the Cape of Good Hope, he saw the star η Argus increase from the second to the first magnitude. Connected with the appearance of new and the disappearance of old stars, may be mentioned the hypothesis of F. G. W. Struve, that light in its passage through the boundless regions of space becomes successively weakened and eventually extinguished—a theory which, if it could be established, would open a wide field for reflection and investigation.

One of the most important recent additions to stellar astronomy is Sir John Herschel's 'Results of Astronomical

Observations made during 1834-38, at the Cape of Good Hope; being the completion of a Telescopic Survey of the Whole Surface of the Visible Heavens, commenced in 1825,' which was published in 1847. The first part of this survey was made in the northern hemisphere, as the continuance of his father's 'Sweeps of the Heavens,' which resulted in his famous catalogue. Sir John Herschel's four years' residence at the Cape of Good Hope, in the words of Humboldt ('Cosmos,' iii. 205), "constitutes an epoch in respect to the more exact topographical knowledge of the southern heavens; his perseverance enriched astronomy by upwards of 2100 double stars, which, with a few exceptions, had never been observed before." But double stars formed only one of several departments of astronomy which Sir John enriched by his observations and investigations. So vast, indeed, was the mass of observations made, that it took the author nearly nine years to digest them and prepare the results for publication in a regular form.

Passing to the nebulæ, we find the greatest advances due to the construction of the magnificent telescope which Lord Rosse set up on the lawn in front of his residence, Birr Castle, near Parsonstown, in King's County, Ireland. The lenses of this enormous instrument—which has 6 feet aperture and 54 feet focal length, and is by far the largest telescope hitherto made—were formed, and the whole of the instrument constructed, under his lordship's personal superintendence. As was expected, it was found to possess a far greater amount of space-penetrating power than any previous telescope. By means of it Lord Rosse has succeeded in resolving several nebulæ which had resisted all prior attempts. Besides showing that these hitherto unresolved nebulæ were wholly composed of stars, Lord Rosse's telescope disclosed many unexpected peculiarities of structure—as, for example, a very remarkable but well defined spiral arrangement—in several of the nebulæ which resisted all its powers of penetration. Some of the so-called nebulous stars have also been shown by it to have a central star-like point placed in a nebulous nucleus, beyond which, but distinct from it, is a nebulous ring.

It will perhaps be expected that we should allude, but an allusion will be sufficient, to what "in some measure" (borrowing Mr. Airy's words) "belongs to astronomy"—M. Foucault's "experiment on the rotation of the plane of a simple pendulum's vibration; it being an experiment which excited very great attention both in France and England, as visibly proving, if proof were necessary, the rotation of the earth."

We may perhaps not unaptly conclude this sketch by a brief reference to a few of the labours of Mr. Airy at the Royal Observatory, which may indeed almost be regarded as an epitome of recent astronomical progress. Under his administration the observatory at Greenwich has become second to none in the world. To render the observations made there worthy of the advanced state of the science, new methods and new instruments of greatly increased power, and of the most refined character, have been introduced. The yearly observations are published in a form and with a regularity never before attempted. He has also procured the reduction under his own superintendence of the Greenwich Lunar Observations from 1750 to 1830, and the uniform reduction of all the Observations of the Planets made at Greenwich during the same period—works of enormous labour, but of inestimable importance—the former of which was published in two large quarto volumes in 1848, the latter in a very thick quarto volume in 1846. He also introduced and perfected, in a series of elaborate experiments, the method, first practised in America, of determining the longitudes of distant places by means of the wires of the electric telegraph. By this means he successfully determined the longitudes of the principal observatories in the British Islands and on the Continent; and he in like manner connected the observatory with Deal, and with many other maritime and inland stations, so as to mark by the fall of a time-ball simultaneously with that of the observatory, the true Greenwich mean-time for maritime and other purposes.

We ought also perhaps to notice that, among other good works at the Paris Observatory, M. Le Verrier has completed and laid before the Academy of Sciences, Paris, his great work entitled 'Réduction des Observations faites aux Instrumens Méridiens de l'Observatoire de Paris, depuis 1800 jusqu'à 1829,' a work which he stated that he had performed unassisted by any of the staff of officers employed at the observatory.

URANOTANTALITE. [MINERALOGY, S. 1.]

URBAN, D'. [NATAL, S. 2.]

URCHIN. [HEDGEHOG.]

URE, ANDREW, M.D., a distinguished chemist, was born at Glasgow in the year 1778. He was educated in the university of his native town, and afterwards studied medicine at Edinburgh, and took his degree of M.D. at Glasgow in 1801. In the following year he was appointed professor of chemistry and natural philosophy in the Andersonian Institution in Glasgow. He also gave the lectures on materia medica in connection with the medical courses of this institution. In the year 1809 he took an active part in the establishment of an observatory in the city of Glasgow, and for this purpose visited London, where he made the acquaintance of many of the distinguished astronomers and chemists of the day. The observatory having been erected, he was appointed astronomer, and lived in the observatory, where he was visited by Sir William Herschel. In the year 1813 he published a 'Systematic Table of the Materia Medica,' with a dissertation on the action of medicines. In 1818 he read a memoir before the Royal Society, entitled 'New Experimental Researches on some of the leading doctrines of Caloric, particularly on the relation between the Elasticity, Temperature, and Latent Heat of Different Vapours, and on Thermometric Admeasurement and Capacity.' This memoir was printed in the 'Philosophical Transactions,' and has obtained for the author a lasting reputation as a natural philosopher. He subsequently wrote several papers on chemical subjects, all remarkable for the accuracy of the experiments on which his views were founded. Amongst these were papers on nitric acid, the constitution of muriatic acid, and on the construction of a new eudiometer. In 1821 he published a 'Dictionary of Chemistry,' which was remarkable for the extent and accuracy of its information on all subjects connected with the science of chemistry. The following year (1822) he published a paper 'On the Ultimate Analysis of Animal and Vegetable Substances,' in the 'Philosophical Transactions.' This paper was remarkable as being one of the first to initiate the brilliant period in the history of chemistry, connected with researches into the composition of organic bodies. In 1824 he published a translation of Berthollet on 'Dyeing.' In 1829 he published his 'System of Geology,' one of the last books on this subject advocating the influence of the Noachian deluge on the surface of the earth. In 1830 Dr. Ure removed to London, and in 1834 was appointed analytical chemist to the Board of Customs. It was in connection with this important office that he obtained materials for many of his subsequent works. In 1835 he produced a work on the 'Philosophy of Manufactures,' and in 1836, 'The Cotton Manufacture of Great Britain compared with that of other countries.' In 1839 he published a great work 'On the Arts and Manufactures.' A second edition of this work was published in 1853. It contains a great mass of useful information of the most accurate kind and conveyed in a most lucid style. He was elected a Fellow of the Royal Society of London in 1822, and was one of the original Fellows of the Geological Society, and a Fellow of the Astronomical and other scientific societies both in this country and abroad. He died at his residence in Gower-street, London, on the 2nd of January 1857.

UREDINACEÆ, a family of *Fungi*, belonging to the sub-order *Sporiferi*. It includes the various forms of *Fungi* which occur on diseased vegetable tissues, and which are hence called Blights. The spores are single, often partitioned on more or less distinct sporophores, flocci of the fruit obsolete or mere peduncles. [FUNGI.]

URUGUAY, REPUBLIC ORIENTAL DEL, formerly known as the BANDA ORIENTAL, South America, (under which head its geography has been described), comprehends the country lying between the southern limit of Brazil and the Rio de la Plata. It extends between 30° 20′ and 35° S. lat. 53° 30′ and 58° 50′ W. long.; and is bounded E. by the Atlantic Ocean, N. by the empire of Brazil, W. by the province of Entre Rios, from which it is separated by the river Uruguay, and S. by the Rio de la Plata, which divides Uruguay from Buenos Ayres. The area is about 100,000 square miles; the population has been estimated at 250,000, but, including a few native tribes, it probably does not much exceed half that number.

The only manufactures are of the rude articles required for domestic use. The commerce is comparatively inconsiderable; though, from the position of the country on the Atlantic and the great æstuary of the La Plata, with the excellent harbour of Montevideo and others of an exceedingly useful class, and with the facilities for internal communication afforded by the Uruguay, it is the natural entrepôt of the commerce of a vast region of the interior; while its own fertile soil and healthy climate would alone render it, in the hands of a peaceful and industrious people, a great exporting country. At present the trade is chiefly centred in MONTEVIDEO. The exports consist almost wholly of the produce of the herds, as hides, horn, hair, jerked and salted beef, tallow, &c., and do not now probably exceed 1,000,000*l.* sterling annually. The imports are chiefly of articles of British and colonial manufactures, &c.; and of North American and some continental produce. There is also a considerable but fluctuating trade between Uruguay and Brazil, the Argentine Provinces, &c. The exports of British goods in 1853 amounted to 529,883*l.* The exports to the United States in 1853 amounted to 302,980 dollars; the imports to 308,446 dollars.

Uruguay is a republic with an elective president, a senate, and a house of representatives; but the actual power is generally centred in the president, who is usually some successful general. The country is divided into nine departments—Montevideo, Maldonado, Canelones, San José, Colonia, Soriano, Paisandu, Durango, and Cerro Largo.

MONTEVIDEO is the political capital, the commercial metropolis, and much the largest and most populous city of the republic. Between it and Cape Santa Maria stands the town of *Maldonado*, with a fine harbour, good fortifications, and about 2000 inhabitants: it exports hides and copper. *Colonia del Santo Sacramento* is a small town, with a harbour, opposite Buenos Ayres. None of the other towns are of any importance.

The Banda Oriental was, during the Spanish supremacy, the name of that portion of the vice-royalty of Buenos Ayres which was situated to the east of the river Uruguay, and comprehended the present republic of Uruguay and the country called the Seven Missions. The continual civil wars by which the declaration of independence was followed in Buenos Ayres, induced the government of Brazil to take possession of the Banda Oriental in 1815. The republic of Buenos Ayres protested against this step, and, as no amicable settlement could be made, a war ensued between the two countries in 1825. Through the intervention of the English government a treaty of peace was concluded in 1828, by which the northern district known as the Seven Missions was ceded to Brazil, and the more exclusive southern district was declared an independent republic under the title of Republica del Uruguay Oriental. But instead of securing peace to the country its independence appears hitherto to have only entailed discord upon it. Internal hostilities broke out at a very early period, and this was soon followed by the incursion of troops from Buenos Ayres; the assistance of Rosas, the president of Buenos Ayres, having been invoked by Aribe, one of the unsuccessful aspirants to the rulership of Uruguay. After a long continuance of strife without any prospect of either party securing a manifest superiority, Brazil was induced by the appeals of Paraguay and other neighbouring powers to interfere. In order to show her good faith, Brazil sent ministers to the courts of England and France, with a view to obtain their assistance either as umpires or active agents in compelling the respective parties to come to terms. Those powers accordingly sent some ships of war to the Rio de la Plata in 1845. The English ships blockaded Montevideo till 1848 and the French till 1849, when both England and France made treaties with Rosas. On these powers withdrawing, Brazil commenced more active hostilities—the Argentine Provinces of Corrientes and Entre Rios uniting with her. The war was however prolonged till 1851, when Aribe was forced to capitulate in Uruguay, and Rosas was soon after deposed in Buenos Ayres. Treaties between the several parties gave peace to Uruguay as far as regarded hostilities with foreign powers, and secured the recognition of the republic by the neighbouring states. But internal discord in this as in so many other of the petty republics of South America appears to have been chronic. Brazil, which by assisting the government with money and men, had hoped to enable it to re-establish peace, order, and security in the country, failed for a time; but under the new president Pereira a treaty has been concluded by which the freedom of navigating the La Plata and the Paraguay has been secured. But the revenue of Uruguay has for some time been inadequate to meet the current expenses, and the interest on its heavy public debt has been long unpaid.

URYLE. [CHEMISTRY, *S.* 2.]

USES, CHARITABLE AND SUPERSTITIOUS. [TRUSTS.]

USURY. Although the legitimacy of interest upon moderate and conscientious terms has long been recognised amongst us, it has, until quite recently, been believed desirable to regulate by law the rate at which it should be taken, and interest beyond this allowed limit has long been stigmatised with the odious appellation of usury. [INTEREST, vol. xii., p. 506.] It has been reserved for our own time to carry out a principle which political economists have preached for above a century, that of permitting the rate of interest to regulate itself according to the exigencies of the time and the nature of things. The first statute by which some relaxation of the usury laws was made in favour of trade, was the 3 & 4 William IV. c. 98, which enacted, that no person taking more than the rate of legal interest for the loan of money on any bill or note not having more than three months to run, should be subject to any penalty or forfeiture. Shortly afterwards the statute 5 & 6 Will. IV. c. 41, enacted that bills or other securities should not be void because a higher rate of interest than was allowed by the statute of 12 Anne had been received thereon. The statute 1 Vict. c. 80, next enacted, that bills payable within 12 months, should not for a limited time be liable to the usury laws, and this statute was followed by six others, extending from time to time the application of the original act. The statute 2 & 3 Vict. c. 37, enacted that no bill or note, payable within twelve months after date, or not having more than twelve months to run, nor any contract for the loan of money above 10*l.*, should, by reason of interest taken thereon or secured thereby, or any agreement to buy or receive or allow interest in discounting, negotiating, or transferring any such bill or note, be void, nor any person so lending be liable to the penalties of the usury laws; but it was provided that this relaxation should not extend to the loan or forbearance of any money on the security of land. The public mind having thus slowly advanced in the direction of the policy advocated by Bacon above two centuries ago, at length became prepared for a still wider measure, and the statute 17 & 18 Vict. c. 90, after laconically reciting in the preamble, that "it is expedient to repeal the laws at present in force relating to usury," proceeds to repeal wholly, or in part, eleven English, five Scotch, and four Irish Acts, on which the whole penalties of usury previously rested: among these Acts are included those relating to annuity transactions. [ANNUITY.] The natural laws which regulate the terms on which money can be borrowed are therefore now left to operate freely, and borrowers and lenders are amenable to no other rules than those which govern contracts in general.

(Blackstone's 'Commentaries,' Mr. Kerr's edition, vol. ii. p. 475).

UTAH, a Territory of the United States of North America, lying between 37° and 42° N. lat., 106° and 120° W. long. It is bounded S. and S.E. by the Territory of New Mexico; E. by the Territories of Kansas and Nebraska; N. by that of Oregon; and W. and S.W. by the State of California. The area of Utah is estimated by the 'Topographical Bureau of the United States' at 269,170 square miles. The population in 1850 was 11,380 (of whom 24 were free coloured persons, and 26 slaves en route to California), or 0·04 to the square mile: but this does not include the native Indian population, who were estimated by the Commissioner of Indian Affairs in 1853 at 11,500.

Surface, Hydrography, &c.—The Territory of Utah occupies for the most part a vast broken depression, known as the Great Basin, which lies between the Rocky Mountains on the east and the Sierra Nevada [CALIFORNIA, *S.* 2] on the west; these lofty mountains rising in parts above the line of perpetual snow, while across them are only a few difficult passes. On the north of the Great Basin there is no continuous mountain chain, the watershed being formed by an elevated tract, which is sometimes a swamp. On the south-east the rocky barrier is broken through by the head streams of the Colorado, the only river which finds its way out of the Great Basin; all the others which flow into the basin from the slopes of the mountains being lost in the plains or in the lakes which occupy the bottoms of the larger valleys. The Great Basin is about 500 miles long, from east to west, and little less wide, and some 4000 feet above the level of the sea. Parallel to the main ranges of the Sierra Nevada and the Rocky Mountains are several inferior ranges, of which the Wahsatch Mountains on the east are the most important.

Some of these secondary chains attain an elevation of from 2000 to 3000 feet; and from these diverge cross ridges, which form lesser valleys. A large portion of the Great Basin consists of arid plains, on which artemesias and salicornias are almost the only plants, but in many parts these plains are so impregnated with salt as to be unfit to sustain vegetable life. The most remarkable features of this singular country are the great valleys. Of these by far the largest is the Great Salt Lake Valley, which is about 120 miles long and from 20 to 40 miles wide, the Great Salt Lake occupying the greater part of the northern portion of it. In the centre of this valley the surface is level, but it rises gently on both sides to the mountains. There are few or no trees visible. On the south and west of the Great Salt Lake the land is a soft sandy irreclaimable barren, on the north it is a swamp, on the east and south-east, where is the Great Mormon settlement, it is fertile and cultivated from the mountains to the shore. The climate of the valley is dry and mild; but rain seldom falls during the summer months, so that the agriculturist is to a great extent dependent on irrigation. The other valleys bear a general resemblance to Salt Lake Valley, but they are much smaller. The chief are—Utah Valley, about 60 miles long by 20 miles wide; Sand Pitch Valley, 45 miles long by 20 miles broad; Bear River Valley, South Valley, Ynab Valley, Cache Valley, and Sevier Valley. Of that portion of the territory which does not strictly belong to the Great Basin, the Valley of Green River with its tributaries, which occupies the eastern portion of the territory from the Sierra Madre to the Bear River Mountains, is the most extensive, being more than 150 miles long; but it is so elevated and so badly watered that it is thought not to contain a single spot available for agricultural purposes. The little valley of the Uintah River, a more southern tributary of the Colorado, is much warmer and more promising. But all this eastern part of the country is, with this exception, barren.

Utah possesses no great navigable rivers. The Colorado, as already mentioned, is the only river which flows out of the Great Basin, and it is a stream of little consequence till it has flowed some distance along the territory of New Mexico. There are indeed accumulated in the gorges of the mountains unfailing stores of snow, which furnish during the whole of the summer abundant and perennial streams, which in some instances possess a considerable volume of water; but many of these never reach the bases of the mountains, and the great majority are lost in the arid plains. A few find their way to the lakes, but from the lakes, except from one to another, there is no outlet. Some of the streams which connect the lakes are however of considerable value for irrigation, and may become of essential importance for manufacturing purposes. The most valuable of these rivers is the Jordan, a rapid stream which unites the Great Salt Lake with Lake Utah; it is on this river that Salt Lake City is built, and already several manufactories are established along its banks.

Of the numerous lakes which are in the territory the largest and most remarkable is the Great Salt Lake, which lies at the northern end of Great Salt Lake Valley. This lake is about 70 miles long, from 20 to 30 miles wide, and has a shore-line of of 291 miles. Its water is saturated with chloride of sodium (salt). Dr. Gale, who made an analysis of its water for the United States government, says that it contains full 20 per cent. of pure chloride of sodium, and not more than 2 per cent. of other salts, and is one of the purest and most concentrated brines in the world.. The specific gravity of the water is 1·170. Several picturesque islands rise to a great altitude above the surface of the lake. On the mountains on each side of the lake are several distinct terraces, exhibiting unmistakeable evidences of this valley having been at some time the bed of a great inland sea. The other lakes are much smaller than the Great Salt Lake; the water of Lake Utah, which is connected with the Great Salt Lake by the river Jordan, is said to be quite fresh. It receives several streams from the mountains. In the neighbourhood of the Great Salt Lake, and in other parts of the territory, are several hot and sulphureous springs.

Geology, &c.—Metamorphic, Silurian, and Carboniferous rocks prevail. In the neighbourhood of the Great Salt Lake rocks of granitic and sienitic character occur, with hornblende rocks, and talcose and mica-schists. The more elevated portions of the lake shore and mountain summits appear to consist of carboniferous limestone, which, in some localities, lose their granular character, and become sub-crystalline, or threaded with veins of calcareous spar. All the elevated ranges on the north, south, and west of the Great Salt Lake seem to be capped with the carboniferous limestone, which generally rests on a coarse granular sandstone. In some localities the sandstones are overlaid with a coarse conglomerate, which is sometimes partly altered so as to assume the character of a quartz rock. Cretaceous strata occur in several places; and along the valleys are tertiary clays, &c. Good building-stone is quarried in the vicinity of Salt Lake City. Of the mineral wealth of Utah little is really known.

Soil, Climate, Productions, &c.—A large proportion of the country is uninhabitable and unproductive, but that portion which is available for agricultural purposes, though limited in extent as compared with the intervening desert tracts, is much of it of extreme fertility; and according to Captain Stansbury, who made a careful survey of the territory for the government of the United States, fully sufficient for the support of a large though not dense population. These fertile and habitable tracts are for the most part confined to the narrow strips of alluvial land along the bases of the mountains and the bottoms of the warmer and more sheltered valleys. Along the western foot of the Wahsatch range occurs one of the richest of these tracts, a narrow slip only a mile or two wide, but stretching for more than 300 miles in length. In the valley of the Jordan it is much wider; and there are wider patches in several other of the valleys, as in those of the Tuilla, of the Timpongas and others of the Traverse Range. In fact the most available part of the Great Basin appears to consist of the valleys along its eastern border, sheltered by the Wahsatch range. The most productive of the cultivated soils consist of disintegrated feldspathic rocks, mixed with the débris of the limestones. There also occur in the valley bottoms very rich vegetable and marly loams. So productive are some of the soils that Captain Stansbury mentions an instance of a bushel of wheat producing on three acres and a half of land a yield of 180 bushels; and other authorities speak of 50 or 60 bushels of wheat to the acre as being by no means unusual, but there can, we think, be no doubt that such must be exceptional cases.

In the valleys the climate is milder and drier than in the same parallel of latitude on the Atlantic, and the winters are much more temperate; in the Salt Lake Valley the thermometer seldom descends to zero. But on the higher arid plains the heat is often oppressive. Over these plains the mirage is frequently observed in the warm season. The eastern section of the country is cold. Throughout the habitable portions of the territory rain seldom falls between May and October, and can never be relied on for agricultural purposes. Artificial irrigation is therefore requisite to agricultural success; but the character of the country happily admits of irrigation being effected with comparative ease in the more fertile valleys, although there are extensive tracts of land which will not admit of cultivation on account of their being beyond the application of irrigation.

The principal cereals grown are wheat, oats, maize, barley, and rye. Very little buckwheat is raised. The common potatoes grow luxuriantly; of sweet potatoes the crops are limited. All the vegetables peculiar to the middle and western states succeed here. The sugar-beet grows to a large size, and is being raised, though not largely, for making sugar. Cotton, the sugar-cane, and rice will, it is said, grow in some districts, but they are evidently not suited to the climate. Tobacco and flax are raised in small quantities. A portion of the territory is well adapted for grazing, though the bunch grass on the lower slopes of the mountains, which at present feeds vast herds of antelopes and deer, is burnt up during the summer months. Horses are the animals of which the inhabitants perhaps possess the largest proportionate number; but they have a considerable number of cattle, and there is a growing attention being paid to sheep, which are in great request for their wool.

The country in its natural state is almost destitute of trees. The only timber found is in the more sheltered ravines, on the banks of a few of the streams and occasionally on the bases of some of the mountains. Wild game abounds. The antelope, deer, bear, and panther are very numerous. The lake-islands are frequented by aquatic birds in astonishing quantities. The more common kinds are swans, geese, ducks, curlews, plovers, gulls, blue herons, cranes, pelicans, &c. Mosquitoes and sand-flies are very numerous and troublesome. But the greatest insect pest is a large kind of cricket, which at irregular periods appears in enormous numbers, and commits terrible ravages.

Utah from its insulated situation must be to a great extent hrown upon its own resources, if the peculiarities of its opulation did not cherish by every means their separate elf-dependent condition. Cut off by lofty and difficult nountains and vast deserts from all other settled states, with agricultural resources little more than sufficient for the upply of its own increasing requirements, and without any taple product or material required by the arts or luxuries of other communities, it is not likely to have any considerable mount of external trade or commerce; while there will proably be a sufficient stimulus to the growth of such manuactures as are required for ordinary domestic purposes. With California regular communication is maintained, but he cost of transit is too great for California to offer a market or the produce of Utah. On the other hand, from Salt Lake City to St. Louis, the nearest considerable market, is upwards of 1600 miles. Some modification would undoubtedly be wrought by the construction of the projected Great Pacific Railway, but in any case Utah must remain to a great extent a ountry separated geographically, politically, and commerially. The local government has done everything it could o encourage the establishment of factories, and there are lready several woollen-mills, potteries, hardware-works, &c., specially along the valley of the Jordan. Flour-mills are in peration very generally.

Divisions, Towns, &c.—Utah is divided into 12 counties. *Fillmore,* a little village, in the south-western part of the tate, is the political capital; but the chief city, indeed the nly one of any consequence, is Salt Lake City. There are everal other 'cities,' but they are merely collections of a ew adobe cottages.

Salt Lake City, or as it is officially designated, the *City of he Salt Lake,* is situated on the east side of the Jordan River, a strait which unites Utah Lake with the Great Salt Lake, in 40° 45′ N. lat., 112° 5′ W. long., and at an elevation of 4300 feet above the sea. The population in 1850 was over 5000; it has since largely increased, but we have only vague estimates of its numbers. The city was laid out in July 1847, under the direction of Brigham Young, the Mormon prophet, as the great central city of the Mormon people. The space marked out was four miles long and three miles broad, the same size as Nauvoo. The streets intersect at right ngles, and are 132 feet wide; and the houses are ordered to e set back 20 feet from the front line of the lot, and the ntermediate space to be planted with shrubs or trees. A plot of several acres is set apart for the site of the great emple, which is to be built on a scale of the greatest possible plendour, far surpassing the famous temple of Nauvoo. The ouses are mostly built of adobe, or sun-dried bricks, and ave a neat appearance; but large houses and public estabishments are now built of stone. There are several manuactories and mills in the vicinity of the city, and salt is argely made on the borders of the lake. Several schools ave been established, and a site has been set apart on one of the terraces of the Wahsatch mountain for the erection of university.

Government, History, &c.—The government of Utah teritory is exactly similar to that of New Mexico.

The Territory of Utah originally formed a part of the Mexican Province of Alta or Upper California, and, with the est of that province, was transferred to the United States by reaty in 1848. But the whole of the province had really assed out of the hands of Mexico for some years before the ormal transfer; and while the tract west of the Sierra Nevada, or what now forms the state of California, was lready in the possession of the citizens of the United States, he Great Basin, hitherto abandoned to the native Indians, ay open to any body of settlers strong enough to maintain hemselves within it. By such a body it, was occupied in 847. We shall not relate here the early history of that emarkable sect the Mormons, whose occupation of the terriory has invested Utah with so singular an interest. [Smith, oseph, *S.* 2.] It will be enough to remind the reader, hat the Mormons first settled as a community at Indeendence, and afterwards in Clay county, Missouri; and that n being expelled in succession from each of these places, hey left the state, and established themselves at Nauvoo in llinois. Here they speedily became a large and flourishing ody; and, besides various public edifices, erected a spacious emple at a cost of nearly a million dollars. Joseph Smith, heir prophet, governed them with absolute and almost unuestioned authority until his death in 1844, which was rought about in a very shocking manner. A newspaper established in Nauvoo by some opponents of the sect, having published certain scandalous statements respecting him, the town council directed its publication to be stopped and the office to be razed. The editors appealed to the mayor of Carthage, who issued a warrant for the arrest of Smith and his brother. Smith at first refused to obey, and placed the city in a state of defence; but he was induced to surrender in order to prevent a collision between his followers and the state authorities on receiving a pledge of protection from the populace. A mob was however permitted to break into the state jail and murder both Smith and his brother. The Mormons elected a new prophet, Brigham Young, as the successor of Smith, and affairs again became prosperous. But organised mobs several times attacked the city, and at length regularly invested it; and the leaders were forced to undertake that the whole body should entirely quit the state. The prophet and elders now formed the bold resolution to lead their followers across the vast western wilderness, to the far distant and nearly unknown country lying beyond the Rocky Mountains—there to seek some secluded retreat beyond the reach of their persecutors. They had been promised to be allowed till the spring to make their preparations for the departure of the first or pioneer party; but their enemies became clamorous, and they were obliged to set out in February 1846, while it was yet winter. The sufferings of this pioneer party were of the most terrible and trying kind; but they struggled on resolutely, planting crops, and otherwise preparing the way for those who were to follow them. It was not till July of the following year that the first section of the pioneers reached the promised land. The remainder were soon to follow; for although the authorities had engaged that the rest of the community should be allowed to stay in Nauvoo till apprised of the safe arrival of the first migration, their old opponents came down, and drove them all out of the city in September 1846.

On taking possession of the site of their new city by the Great Salt Lake, the elders at once set about organising a regular government, at the head of which they placed their prophet Brigham Young; and as soon as what they deemed a sufficient number of their followers had arrived, and their territory had become by cession from Mexico a part of the United States, they elected the usual state-officers, and applied to the federal government to be admitted into the Union as a sovereign state under the name of the State of Deseret. But Congress refused their application, and remanded the state back to a territorial condition, naming it Utah. Brigham Young was however appointed or continued as governor; and the community, though nominally under the laws of the Union, remained virtually independent, and governed by the maxims of the Mormon leaders. In 1855, however, Young was superseded by the President, who appointed a 'Gentile' governor, and the federal government assumed a more direct control. This led to disputes, and at length the federal judges were expelled, and the governor was forced to leave. This has produced a contest between the federal state and Utah. Forces have been sent against it to subdue it. Little impression has been made as yet; there has been no serious fighting; but supplies have been intercepted, and detachments cut off by the Mormons; but the state forces are gradually being strengthened and are approaching their city.

The religious opinions of the Mormons are stated under Smith, Joseph, *S.* 2. Here however, as Utah is their appointed Zion, and as they are almost its only inhabitants, we may just state that the Mormons profess to be a separate people, living under a patriarchal dispensation, with prophets, elders, and apostles, who have the rule in temporal as well as religious matters; their doctrines being embodied in the 'Book of Mormon' and the 'Book of Doctrine and Covenants,' revealed to their first prophet, Joseph Smith; that they look for a literal gathering of Israel in this western land; and that here Christ will reign personally for a millennium, when the earth will be restored to its paradisaical glory. The practice of polygamy, which has drawn upon them so much obloquy, was not at first officially admitted; but there is little doubt that it has been allowed, at least to their leaders, and some of their more ardent advocates defend it by reference to the practice of the ancient Jewish patriarchs. That such a system could possibly grow up into such magnitude in these times is sufficiently startling; but that it can long maintain itself if not subjected to persecution, is inconceivable.

As we did not notice *Nauvoo* under Illinois, we may add to what we have said of it above, that it stands on the Mississippi, 125 miles N.N.W. from Springfield; and that after the departure of the Mormons, Nanvoo became the seat of a colony of French communists, or Icarians, under the direction of M. Cabot, who were however far from successful. Of its present state we have no trustworthy particulars; its population has dwindled down to a very insignificant number. The great Mormon temple of Nauvoo was, in October 1848, set on fire by an incendiary and destroyed.

(Captain Howard Stansbury, Topographical Engineers, U. S. Army, *Expedition to the Valley of the Great Salt Lake of Utah;* Fremont, *Report of Expedition to the Rocky Mountains;* Lieut. J. W. Gunnison, *The Mormons, &c.; Statistical View of the United States; Seventh Census of the United States; Gazetteers of the United States, &c.*)

UVAROV, SERGY SEMENOVICH, or OUVAROFF, as the name is written in French, an eminent Russian statesman and author, was born about 1785 of a noble family, and received his Christian name from the Empress Catherine, to whom his father was aide-de-camp. He studied at Göttingen, and in the year 1810 made his first appearance as an author in a 'Project for an Asiatic Academy,' written in French and addressed to the Emperor Alexander, in which he proposed the foundation of a great institution for the study of the languages and literature of Asia. In the following year he was appointed, young as he was, to the curatorship of the university and educational establishments of the district of St. Petersburg, an important office which he discharged with great liberality of views. "The European Republic," he remarked in a Russian pamphlet, published at the conclusion of the great struggle in 1814, "is now preparing to emerge from chaos and to consolidate its foundations. A stupid tyranny will no longer oppose itself to the efforts of reason, and on the whole surface of the globe it will be permitted to think." When the Emperor Alexander's views became of a more retrograde character than they had been, Uvarov, after in vain offering the introduction of some new regulations relating to education, retired, in 1821, from his curatorship, but still retained the post of president of the Academy of Sciences which had been conferred on him in 1818. In the following year he became director of the department of manufactures and internal commerce, and he was subsequently for some years minister of finance. That his influence was not extinct was proved by his being able to establish in 1823 an institution for the instruction of young diplomatists in the Oriental languages, carrying out in some degree his early project. After the accession of the Emperor Nicolas he was appointed in 1832 Minister of Public Instruction, a step which excited some surprise, as the tendencies of the new government were certainly not in favour of permitting the liberty to think. From that time till 1848 Uvarov was indefatigably active in founding museums, botanical gardens, observatories, and educational institutions, and in providing for the better endowment of such establishments, and any deficiency in liberality in their management was attributed rather to the emperor than the minister. In 1848 he again retired from office on occasion of some restraints on education being imposed, of which he did not approve.

The principal writings of Uvarov are rather elegant than profound: they are collected in two volumes, one bearing the title of 'Studies of Philology and Criticism,' and the other 'Political and Literary Sketches' ('Études de Philologie et de Critique,' St. Petersburg, 1843, 2nd edition, Paris, 1845; 'Esquisses politiques et littéraires,' Paris, 1848). All of these essays are in French, except two on philological subjects, one 'On the poet Nonnus of Panopolis,' and the other 'On the Ante-Homeric Age,' which are in German. In the preface to the essay on Nonnus, addressed to Göthe, the author expresses an opinion that "it is now time for every author to choose for his instrument the language which is best suited to the circle of ideas he intends to treat." He seems however, in spite of the confidence of his tone, to have been for some time in doubt as to venturing to print in German, and before publication applied to Göthe for advice, who in a half jesting tone replied "Never confide to any German the grammatical revision of your manuscripts. Do not forfeit the immense advantage you enjoy in not knowing German grammar; I have been trying to forget it these thirty years." Among the few foreigners who have written in that language, Uvarov is admitted to have been one of the most successful. In French, which was in the time of his youth more familiar than Russian to educated Russians, his style is pronounced to be perfectly idiomatic by his French editor M. Léouzon Leduc, who in his amusing preface declares with apparent confidence in his own correctness that "everywhere our novels, our plays, our books, whether serious or frivolous, enjoy a monopoly of admiration." The subjects of Uvarov's essays 'Stein and Pozzo di Borgo,' 'The Prince de Ligne,' 'Venice,' Rome,' &c., are in themselves of interest and are treated in a light and graceful style which never fatigues the reader. Uvarov is reported to have written memoirs of his own time, which may probably form the best portion of his writings in the eyes of posterity.

UWINS, THOMAS, R. A., was born in Pentonville, London, in 1783. Apprenticed to Smith, an engraver of some repute in his day, he acquired, whilst learning the use of the burin, a certain familiarity with the general principles of design. But having fixed his heart on becoming a painter, he, on quitting Smith, entered as a student at the Royal Academy, at the same time availing himself of the lectures which Sir C. Bell was then delivering to students in art. For some years he was principally occupied in making designs for book engravings, in which he seems to have taken Stothard as his model, though maintaining considerable originality; many of his designs display very decided power as well as grace. He also made numerous copies of paintings for the use of engravers. At this time he practised almost exclusively in water-colours, and in 1811 he was elected a member (and subsequently secretary) of the Society of Painters in Water Colours. Failure of health having led to a temporary abandonment of his profession, he after a short interval commenced practice in Edinburgh as a portrait painter, having prepared himself by making a series of portraits for book illustrations. In 1826 he visited Italy, and the studies which he made during his stay led him to commence painting pictures illustrative of the cheerful outdoor life of the Italian and especially of the Neapolitan peasantry. These works painted with a light bright pencil, picturesque in costume, gay in colour, and cheerful in spirit, became at once very popular, and their popularity remained undiminished as long as he continued to produce them. As samples of these sunny Italian pictures may be mentioned, 'The Mandolin;' 'Dressing for the Festa;' 'Neapolitan Peasantry returning from a Festa;' 'The Fisherman's Song of Naples;' 'Interior of a Saint Manufactory at Naples;' 'Festa della Madonna del Arco;' 'Loggia of a Vine-dresser's cottage in the afternoon of a Saint-day;' 'Mountaineers returning from the Festa;' 'Bay of Naples on the 4th of June; "Teaching a Child the Tarantella;' 'Children asleep in a Vineyard;' 'Making a Nun.' He also painted some English peasant pieces, as 'The Top of the Stile,' 'The Pet of the Village,' &c., but with less success. Later he painted illustrations from popular authors, Sterne's Maria, the Dorothea, &c.; and still later he essayed a loftier class of subjects, as 'Lear and Cordelia in Prison;' 'Cupid and Psyche' (painted for Prince Albert); 'Psyche returning from the Infernal Regions with the Casket of Beauty;' 'The Reproof;' 'John the Baptist proclaiming the Messiah on the Morning after the Baptism;' 'Judas,' &c.; but these were scarcely adapted to his pencil. Mr. Uwins was elected a Royal Academician in 1836; and from 1844 to 1855 he held the office of librarian to the Royal Academy. He was appointed keeper of her Majesty's pictures in 1842, and keeper of the National Gallery in 1847, but he resigned the latter situation after two or three years. He died Aug. 25, 1857, at Staines, in Middlesex. In the Vernon collection are two pictures by Mr. Uwins, 'The Vintage in the Claret Vineyards, South of France,' and 'Le Chapeau de Brigand:' in the Sheepshanks' collection are four more characteristic examples of his pencil—'Italian Mother teaching her Child the Tarantella;' 'Neapolitan Boy decorating his Inamorata;' 'The favourite Shepherd;' and 'Suspicion.'

V

VALENTIA, HARBOUR OF. [KERRY.]

VALERYLE. [CHEMISTRY, S. 2.]

VALLEJO. [CALIFORNIA, S. 2.]

VALLEY, LILY OF THE, a common name for the *Convallaria majalis*. This plant is too well known to need description. The genus *Convallaria* has a bell-shaped 6-parted deciduous perianth; a 3-celled 2-ovalled ovary; a blunt trigonous stigma; berry with 1-seeded cells; flowers jointed to the pedicel.

C. majalis, the Lily of the Valley, is about a foot high, with two ovate-lanceolate radical leaves. The flowers are racemose, nodding, pure white, globose, bell-shaped, and fragrant.

VAN DIEMEN'S LAND. [TASMANIA, S. 2.]

VANCOUVER ISLAND (or *Quadra and Vancouver Island*) lies off the western coast of North America in the North Pacific. It is long and narrow, extending in a direction from south-east 48° 24′ to north-west 50° 3′ N. lat., and between 122° and 129° W. long., the length being about 250 miles, the average width 50 miles. It is overlapped at its southern end by the continental headland of Cape Flattery, and between is the Strait of Juan de Fuca, five leagues wide at its entrance, and running in an east-south-east direction for about 100 miles, widening in several parts, extending southward into Puget's Sound, and forming several bays on the continental shore, then, suddenly narrowing, turning northward through an archipelago of small islands, called the Arro Archipelago, thence widening into the Gulf of Georgia, and re-entering the ocean amidst another archipelago, through Johnstone's Strait into Queen Charlotte's Sound. Vancouver first discovered this passage in 1792. There are many bays and harbours all round the island. Three islands of the Arro group are separated from the coast of Vancouver Island by a passage called the Arro Canal, which is narrow at both extremities, but expands to a considerable width in the middle. At Wentnhuysen Inlet, which is at the north end of the Arro Canal, several extensive beds of coal have been discovered, the site of which has been named Newcastle. Coal exists also in the northern part of Vancouver Island. At the southern end the settlement of Victoria has been formed, on a harbour named Camosack, safe and easily accessible for vessels, but having the drawback of being scantily supplied with water. The other principal harbours are, Nootka Sound, Clayquot, Nitinat, all on the western coast. The shores of the island present an alternation of rocky cliffs and sandy beaches. At no great distance from the sea is a compact mass of rugged mountains, whose summits are covered with snow. The island contains a considerable quantity of fertile land, covered with good natural grass. There are numerous small tribes of Indians on the island, of whom some have been found of a friendly disposition.

The possession of Nootka Sound had nearly given rise to a war with Spain, who claimed it, and had expelled some English settlers from Nootka, but it was at length resigned to England, and has since continued in their hands. Vancouver Island was made over in 1846 to the Hudson's Bay Company by a charter, on condition that they should colonise it; the government reserving the right to reclaim possession of the island for Great Britain within a specified time.

North of Queen Charlotte's Sound lie *Queen Charlotte's Islands*, between 52° and 54° N. lat. The group consists of three islands extending about 150 miles in length, by about 60 miles in breadth. In these islands are several excellent harbours. At Mitchell Harbour, on the middle island, and at other spots, gold has been found, embedded in quartz rock. Traces of silver have been found in the rocks. The interior of the islands is hilly and well wooded, the climate is healthy, and the soil remarkably fertile. The islands contain some beds of coal, and several fine specimens of lead and copper have been obtained.

VARNA, a fortified town and sea-port of Turkey-in-Europe, in the province of Bulgaria, is situated at the head of a small bay on the west coast of the Black Sea, in 43° 12′ N. lat., 27° 53′ 58″ E. long., and has a population of 16,000 to 20,000. The bay or road of Varna is protected from the north and north-east winds, and has a good bottom, with a depth of 8 to 15 fathoms. The entrance of the bay is formed by two steep rocky capes (Galata and Hodrova, or Sughanlik), 4½ miles asunder. The shores sink gradually to the head of the bay, where in the neighbourhood of the city they are level. The Paravati River (the ancient Lyginos), which rises in the Balkan near Shumla, after traversing the two lakes of Devne, discharges itself by a broad stream into the Black Sea, along the foot of the southern walls of Varna. The distance between the eastern shore of the eastern Lake of Devne and the Black Sea is little more than half a mile. It has been in contemplation to deepen the channel of this river so as to admit ships to the lake, which would thus be converted into a harbour capable of affording shelter and accommodation to the largest fleets in all weathers. In the isthmus between the two lakes Alexander the Great defeated the Triballi. The isthmus is from a mile to a mile and a half broad.

Varna is a wretchedly built town, surrounded by old stone walls and a dry ditch. It is a place of considerable trade, the exports of corn, barley, tallow, eggs, and other Bulgarian produce, amount in value to about 600,000*l.* Austrian steamers between Constantinople and Galatz put in at Varna. Under the walls of Varna the Sultan Murad II. in 1444 defeated the Hungarians under King Ladislaus (who was killed) and John Huniades. The Russians took Varna in 1828. The Anglo-French army encamped in Varna and its environs in the summer of 1854, previous to its embarkation for the Crimea.

VAUQUELINITE. [CHROMIUM.]

VENIRE FACIAS. This writ, and also the other writs referred to under this head (vol. xxvi., p. 245), the *distringas* and *habeas corpora juratorum*, have been in effect abolished by the Common Law Procedure Act, 1852; which has supplied a much simpler jury process. (Blackstone's 'Commentaries,' Mr. Kerr's ed., vol. iii., p. 380.)

VENUS'S FLY-TRAP. [DIONÆA.]

VERNAL GRASS, SWEET. [ANTHOXANTHUM.]

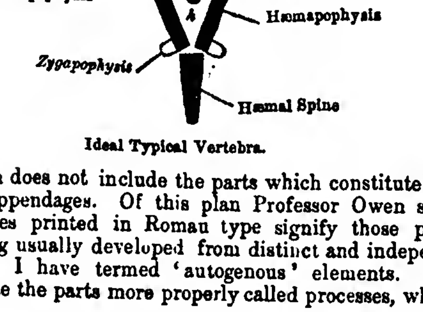
VERNON, ROBERT. Though possessing personally no title to an enduring name, yet as the founder of the National Gallery of British Art, Mr. Vernon claims an honourable place in this work. The so-called 'National Gallery' of paintings was founded in 1824 by the purchase by Lord Liverpool's government of the collection formed by Mr. Angerstein. This collection included nine pictures by British painters — the 'Marriage-à-la-Mode' of Hogarth; that painter's portrait; Lord Heathfield by Sir Joshua Reynolds; and Wilkie's 'Village Festival.' In the course of the next twenty-three years there were occasional bequests or presentations of English pictures, but not a single English picture was added to the national collection by purchase: the entire number of British pictures in the National Gallery in 1847 was only forty-one, and several of these were portraits of unknown or insignificant persons by second-rate artists, or works of little artistic excellence or general interest. In every other country the possession of worthy specimens of the pencils of the chief painters of that country had been deemed the essential feature of a national collection; here the National Gallery, according to the official estimate, was to be a gallery of the works of the 'Old Masters' of Italy and Holland.

It is to Mr. Vernon that the country is primarily indebted for what has been done towards placing matters on a more rational and satisfactory footing. Born in 1774, he by diligence, perseverance, and skill, during a long commercial career, raised himself from very humble into very affluent circumstances; earning at the same time a high character for liberality, and enlarged though unostentatious benevolence. Having a great fondness for pictures, he began, as soon as his means permitted, to indulge his inclination by purchasing some, and following his own taste he selected the works of English artists. In the course of years his collection grew till every room in his house was filled. He now conceived the design of presenting his pictures to the nation, in the hope that if kept together they might serve as the nucleus of a gallery of British art. With this view he sold such of his pictures as he deemed undeserving of such a destiny, and purchased or commissioned (in nearly every instance direct from the painter) fresh examples of the masters he most admired. Then—not waiting to make it a posthumous gift—he offered his collection to the government, requesting that all those pictures might be selected which were considered worthy of national acceptance: and that being done, he made them over by a deed of gift, dated December the 22nd, 1847, to the Trustees of the National Gallery. The collection so transferred comprised 157 pictures, all but two by British artists, and a large proportion by living artists. The pictures having been selected in the first instance for a private residence of moderate dimensions, are mostly of cabinet size, and to a considerable extent of homely subjects; but they include favourable specimens of a large proportion of the chief deceased and living English painters. Mr. Vernon lived long enough to see that his munificent gift was warmly appreciated by the great bulk of his countrymen; but not to see it provided with a fitting repository. He died May 22nd, 1849. Since his decease the Vernon collection has found a temporary resting place in Marlborough House. To it has been added the splendid bequest of Mr. Turner [TURNER, J. M. W., *S.* 2]; and Mr. Sheepshanks has also presented to the nation his noble collection of 233 paintings in oil by English artists: but his gift is clogged with stipulations as to the place where they are to be deposited, which prevent them from being—for the present at least—placed along with the Vernon and Turner pictures. It is however greatly to be desired that some arrangement may be made by which these collections may be brought together, and thus form the commencement of a National Gallery of British Art worthy of the nation.

A marble bust of Mr. Vernon, purchased by subscription, is placed in the hall at Marlborough House; where also are a marble group by Gibson of Hylas and the Nymphs, and about half a dozen marble busts, presented with his pictures by Mr. Vernon—the somewhat sorry commencement of a National Collection of the works of British Sculptors.

VERTEBRA is the name given to each of the separate bones of which the spinal column of the skeleton of the *Mammalia* is composed. [SKELETON.] Although in technical anatomy the term is thus restricted, it has recently received a much more extended signification. Professor Owen defines a vertebra as "one of those segments of the endo-skeleton which constitute the axis of the body and the protecting canals of the nervous and vascular trunk: such a segment may also support diverging appendages." According to this definition, the vertebra becomes the type or plan on which all the bones of the skeleton of vertebrate animals are constructed. It is not only a portion of the spinal column, but the elementary form to which all the parts of the skeleton may be reduced. The bones of the head, of the thorax, the pelvis, and the limbs, however complicated, are reducible to the plan of the typical vertebra. In the history of the development of this interesting branch of anatomical inquiry a variety of opinions have been expressed, as to what may be regarded as the true elements of a typical vertebra, since in no instance do we find all the parts of the vertebra developed in exactly the same manner.

The diagram exhibits a typical vertebra, according to the plan of Professor Owen.



Ideal Typical Vertebra.

This plan does not include the parts which constitute the diverging appendages. Of this plan Professor Owen says, "The names printed in Roman type signify those parts which, being usually developed from distinct and independent centres, I have termed 'autogenous' elements. The italics denote the parts more properly called processes, which shoot out as continuations from some of the preceding elements, and are termed 'exogenous;' e. g., the diapophyses, or upper transverse processes, and the zygapophyses, or the 'oblique' or 'articular processes' of human anatomy."

The autogenous processes generally circumscribe holes about the centrum, which in the chain of vertebræ form canals. The most constant and extensive canal is that formed by the neurapophyses for the lodgment of the trunk of the nervous system, and marked *n*, in the diagram. The second canal is formed by the hæmapophyses, and is below the centrum, and embraces the central circulating organ (*h*), the heart, and the large trunks of the vascular system. At the sides of the centrum, most commonly seen in the cervical region, rise two other canals, formed by the three lateral elements of the vertebra, and these often embrace an artery and a nerve. Thus a typical or perfect vertebra, with all its elements, presents four canals or perforations about a common centre; such a vertebra is seen in the thorax of man, and most of the higher forms of vertebrate animals, as in the neck of many birds. In the tails of most reptiles and *Mammalia* the hæmapophyses are articulated or anchylosed to the under part of the centrum, space being needed there only for the caudal artery and vein. But where the heart is to be lodged an expansion of the hæmal arch takes place, analogous to that which occurs in the neural arches when the nervous trunk assumes the form of a brain.

In the same manner that the parts of the thorax, spinal column, and skull, may be traced to the elements above referred to, the parts of the two pairs of locomotive organs with which all vertebrate animals are endowed may be traced to a common plan in the diverging appendages. These parts of all others are most subject to change,—now developed to an enormous extent, and again almost entirely disappearing, according to the necessity of adapting the animal to its special habits. With the exception of the posterior and anterior extremities, these organs are developed only to a limited degree. It is through the study of these appendages that the pectoral fins are seen to be the homologues of the anterior extremities in the Reptiles, of the wings in the Birds, of the fore legs in the majority of the *Mammalia*, the flippers of Seals and Whales, and of the arms in Man. In like manner the abdominal fins of Fishes are the homologues of the legs in Birds, and of the posterior extremities of the Reptiles and *Mammalia*, and the legs in Man. These homologues include not only the totality of these organs, but the individual parts, and the scapula, clavicle, coracoid process, humerus, radius, ulna, carpal and metacarpal bones, and phalanges, in the higher *Mammalia* and Man have their homologues in the lower form of vertebrate animals. So with the pelvic arch, with its ilium, ischium, pubis, femur, fibula, tibia, tarsal and metatarsal bones, and phalanges.

We have not space here to enter into the details of the application of this general plan to the structure of the skeleton of the various forms of vertebrate animals, but this has been done in a most masterly manner by Professor Owen, in his 'Report on the Homologies of the Vertebrate Skeleton,' published in the 'Transactions of the British Association' for 1846, and also subsequently in an independent volume devoted to the same subject. This department of anatomical inquiry is no longer a matter of ingenious hypothesis and verbal speculation, but has been placed by this inquirer, through the unerring principles of comparative anatomy and development, upon the firmest basis, and may be regarded as an essential part of scientific truth.

VICO, FRANCESCO DE, one of the most distinguished astronomers of modern Italy, the son of Count Ascanio de Vico-Ubaldini and the Countess Amalia Archinto, was born at Macerata on the 19th of May 1805. He was educated partly at the Collegio dei Nobili in Urbino, partly in the school of the well-known congregation of the Scolopi at Siena, and entered the Jesuit Society as a novice in 1823. After passing with much distinction through the usual stages, both as a scholar and as a master, in the Roman College of that Society, he was appointed (in 1835) assistant of Father Stephen Dumouchel, who was at that time in charge of the observatory; and it was a sort of presage of the history of his after-career, that one of the first duties assigned to him was to calculate the time of the appearance of the then expected Halley's comet, both according to the elements of Damoiseau and to those of Pontécoulant. The young astronomer had the satisfaction of being the first to observe the comet, on the 5th of August 1835. Soon afterwards, De Vico, in consequence of the great age of F. Dumouchel, becoming the principal astronomer of the Roman observatory, undertook a long series of observations for the purpose of ascertaining the suspected error in the latitude of Rome, as determined by his illustrious predecessors, Boscovich, Calandrelli, Conti, and Reichenbach. These observations, which amounted to nearly 8000 in number, were eminently successful, and the result was a correction of an error of two seconds in the received latitude. He engaged at the same time on a similar series of observations for the longitude, in concert with the astronomers of Paris and Naples. Soon afterwards, Father De Vico, at the instance of Schumacher of Altona, undertook a course of observations of the planet Venus, for which the clearness of the Roman atmosphere was peculiarly adapted, with a view to the determination of the time of its rotation upon its own axis. The success of this undertaking contributed more than all his previous labours to establish his reputation among the astronomers of Europe; and his subsequent observations of the satellites of Saturn, and of the inner ring of that planet, as well as his detailed reports on the nebulæ, which about that time had become a prominent subject of interest, fully sustained that reputation.

Father De Vico however is most popularly known as an observer by his numerous and successful discoveries in the cometary system, which he was one of the earliest in more recent times to take up as a systematic study. During the years 1845, 1846, and 1847 he discovered no less than eight of these mysterious bodies, in seven of which his claim to priority of discovery is undisputed. The eighth had been observed by another astronomer two days before it was discovered (independently however) by Father De Vico.

Another more humble but hardly less useful work undertaken by Father De Vico, was an improved and enlarged system of astronomical maps and charts, in which he is said to have made considerable progress; but in this and other works which he had commenced, he was interrupted by the Revolution of 1848, by which, in common with the other members of his order, he was driven from Rome. He was treated with much distinction during his exile by his fellow-astronomers in France and England, and received more than one invitation to fix his residence in either of these countries; but the circumstances of his order at that time determined him upon establishing himself in the United States of America, and he had almost completed his arrangements for the purpose, when he was seized with acute inflammation of the chest, and was carried off after a short illness. He died in London on the 15th of November 1848, at the early age of forty-three. Father De Vico is chiefly known in literature by his contributions to the 'Raccolta Scientifica,' a scientific journal which owed its origin principally to himself, and which is still continued under a new form.

(*Ragguaglio intorno alla Vita e ai Lavori del P. Francesco de Vico*, Roma, 1851.)

VICTORIA, ALEXANDRINA, Queen of the United Kingdom of Great Britain and Ireland. [In the 'Penny Cyclopædia,' the history of the Kingdom is briefly given under the names of the respective Sovereigns; and that history is brought up to the accession of our present Queen. In this historical point of view, and not as the biography of a living personage, we continue the series of Monarchs, but upon somewhat different a plan, as we shall presently explain.]

Queen Victoria, the only child of Edward, Duke of Kent, the fourth son of George III., and of Maria Louisa Victoria, a daughter of Francis, Duke of Saxe-Coburg Saalfeld, was born at Kensington Palace, London, May 24, 1819. The Duchess of Kent, who is the sister of Leopold, King of Belgium, was the widow of the Prince of Leiningen, on whose death in 1814, she had been left the guardian of her youthful sons and the ruler of their territory, both which duties she fulfilled with remarkable care and prudence. The Duke of Kent died on January 23, 1820, leaving his widow in charge of their infant daughter. On the accession of Victoria to the throne on June 20, 1837, she found Lord Melbourne at the head of the government, and she willingly continued him in that post. On February 10, 1840, the Queen was married to Prince Albert-Franz-August-Karl-Emmanuel, the second son of Ernst-Anton-Karl-Ludwig, Duke of Saxe-Coburg-Gotha. On November 21, 1840, the Princess Royal was born, who was married, January 25, 1858, to the presumptive heir of the Prussian monarchy. On November 9, 1841, was born Albert Edward, Prince of Wales: on April 25, 1843, Alice Maud Mary; on August 6, 1844, Alfred Ernest Albert; on May 25, 1846, Helena Augusta Victoria; on March 18, 1848, Louisa Caroline Alberta; on May 1, 1850, Arthur William Patrick Albert; on April 7, 1853, Leopold George Duncan Albert; and on April 14, 1857, Beatrice Mary Victoria Feodore.

We have considered it desirable, in the instance of our present Queen, when the public events of the reign so completely belong to our own immediate times, to deviate from the plan which has been pursued in the biographies of the other English sovereigns. A connected historical sketch could scarcely be given without some expression of opinion; and we therefore prefer to notice, in the dry form of a chronological abstract, the most prominent circumstances of the past one and twenty years. The historian of this remarkable period will point to it as an epoch of unparalleled progress in all that makes a nation prosperous and great. He will describe the steady advance of the most enlarged principles of political action, without the slightest disturbance of that respect for law and order, in the absence of which no accession of freedom can be permanent. He will mark a growth of industrial prosperity so mighty and so rapid, that it could only be accomplished by a people living under the stability of a monarchy and the liberty of a representative government. He will see the happiest development of the aim at an universal social improvement, not to be effected by sudden changes, but with an accelerated energy at every step, which gives the hope that the inequalities in the condition of the people may become far less onerous than in any previous period, and eventually produce a community more united by common interests than any other in the world. He will dwell upon the progress of the civilising Arts—how Music has again become an enjoyment for all; how Painting has received a more important impulse in the extension of taste, than it ever derived from mere patronage; how the higher branches of Art have come to the aid of manufactures; how, if Literature has become less bold and original, it has applied itself to the advance of the knowledge and amusement of a body of readers, who have increased tenfold since Queen Victoria came to the crown. Above all, it will record the growth of the domestic virtues; the universal contempt with which the low indulgences of a former generation are regarded; and with some differences upon minor points of doctrine and ceremonial observance, how the great religious principle which has ever distinguished Protestant England prevails throughout the land in companionship with that spirit of free inquiry, derived from our scientific progress, from which truth has no reason to shrink. How large a portion of the great characteristics of our time have been derived from the influence of the personal character of Queen Victoria, the future historian will feel it his duty to set forth. It is impossible for any thinking man, who has had the happiness to live under her benignant rule, not to feel how essentially that rule has contributed to the welfare of his country. It is a great feature of this reign, that during seventeen years it was a reign without the excitement of foreign warfare. A prince with martial propensities might have plunged the country into European and even trans-Atlantic quarrels. But let it not be forgotten that, when the sword was to be drawn in a just cause, a more animating example was never presented than that derived from the patriotic spirit of Victoria; and that the world felt that, after forty years' peace, Great Britain, under a Queen, was as warlike as under the most chivalrous leader, and far more just and considerate towards other nations, than in the days when war was held the greatest glory. In the chronological abstract which follows, will be found the record of some events which have a natural bearing upon the great characteristics of the reign of this queen. But there are others, far more numerous, and some more important, which cannot be indicated in such a form. We only attempt to offer an aid to the memory of the reader when he desires to know the date of some remarkable occurrence which belongs to the public history of the period.

1837. June 20, Queen Victoria succeeded to the throne, and was proclaimed on June 21. The Duke of Cumberland succeeded his brother as King of Hanover, as the succession is restricted to males, and thus the connection of the royal family with the Continent was sundered after continuing for 123 years. July 6, William IV. was buried at Windsor. November 20, the Queen in person opened the new parliament, and in her speech called attention to the insurrection in Canada. December 14, the Canadian rebels were defeated at St. Eustace in Lower Canada, their chiefs saving themselves by flight. December 29, the American United

States steamboat Caroline, which had brought assistance to the rebels, was attacked and burnt, on the territories of the United States.

1838. January 5, the Canadian insurgents, under Dr. Mackenzie, surround Toronto, but are repulsed by the governor, Sir Francis Head; and a proclamation of the President of the United States forbids the attacks of its citizens on neighbouring states. January 10, the London Royal Exchange was burnt down. January 16, the Earl of Durham was appointed governor-general of her majesty's possessions in North America, with extraordinary powers, in order to effect the adjustment of the disputes there. April 23, the Sirius (which left April 4) and Great Western (April 8) steam-ships arrived at New York from England, being the first vessels which crossed the Atlantic by steam power alone. May 31, a lunatic named Thom, who assumed the name of Sir William Courtenay, and proclaimed himself king of Jerusalem, having excited a number of deluded followers against the Poor-Law Act, a contest ensued with the military near Canterbury, and Thom having shot two men was himself shot by one of the soldiers. June 28, the coronation of Queen Victoria, attended by Marshal Soult, the old opponent of the Duke of Wellington, as ambassador from the King of the French. July 31, the new Irish Poor Law and the International Copyright Acts were passed. On August 10 and 15, the Hackney and Stage Coaches and the Irish Tithe Compositions Acts were passed. August 16, the Queen prorogued parliament. On September 17, the London and Birmingham Railway was opened throughout its entire length. October 9, the Earl of Durham declared his intention of resigning the governorship of Canada, in consequence of some of his proceedings being disapproved. November 1, the rebels were defeated at Napierville. On November 4, there were riots at Montreal. In November, intelligence was received that Dost Mohammed Khan, the chief of Cabul, had joined Persia with an intention of attacking the British possessions in India, whereupon the governor-general had adopted the cause of Shah Soojah in his claims on the throne of Afghanistan. [AFGHANISTAN, *S.* 1.] November 17, the rebels were again defeated near Prescott, in Upper Canada, and the insurrection was wholly suppressed. December 12, a proclamation was issued against illegal Chartist assemblies, several of which had been held at night in various parts of the country, those attending them being armed with guns, pikes, &c.

1839. January 7, the Académie des Sciences at Paris made a report on the invention of M. Daguerre, the originator of the daguerreotype process, which has been followed by the photographic process. January 20, the troops of the East India Company occupy Aden. May 6, the government having been defeated in the House of Commons on a bill for suspending the constitution of Jamaica, where the House of Assembly had refused to pass the prisons' bill, Lord Melbourne announced to the House of Lords, on the 7th, that the ministry had resigned. On the 8th, Sir Robert Peel received her Majesty's command to form an administration; but owing to the refusal of the Queen to dismiss the ladies of her household, he declined the commission, and on the 10th Lord Melbourne was reinstated. June 8, ratification of the treaty for the separation of Holland from Belgium. June 14, the Designs Copyright Act passed. July 15, Chartist riot at Birmingham suppressed by the military, but not till a large amount of damage had been done. August 17, the Postage Act passed, enacting a uniform rate throughout the kingdom for all letters not exceeding half an ounce in weight, and it gave the Treasury the power of fixing the rate at first, though it was to be ultimately one penny. This was done by reducing all rates above 4*d.* to that sum, leaving all below 4*d.* unaltered. It came into operation on December 5; and on January 10, 1840 the uniform half-ounce rate was reduced to one penny. The Act was for one year only, but it was confirmed in 1840. November 4, Newport in Monmouthshire was attacked by a party of Chartists, estimated to number about 10,000 men, under the command of John Frost, an ex-magistrate. They were opposed by the mayor, Mr. Phillips, and a party of special constables, assisted by about thirty soldiers. The rioters broke the windows of houses, fired on the inmates, and the mayor was wounded; upon which the soldiers fired, made a sortie, and dispersed the mob, of whom about twenty were left dead on the spot. The next day Frost and some others of the leaders were apprehended; on December 31, they were tried, found guilty of high treason, and sentenced to death, but the punishment was commuted to transportation for life, and in 1856 a free pardon was granted to them. November 23, the Queen announced to the Privy Council her intended marriage with Prince Albert. November 24, the trade between England and China was stopped by order of Lin, the Chinese Imperial commissioner.

1840. January 11, a Chartist outbreak contemplated at Sheffield was discovered and prevented, some of the leaders being apprehended. Slight disturbances took place about this time also, in a few other towns of the North. January 16, parliament opened by the Queen, and Lord John Russell brought before the House of Commons the case of Stockdale, who had brought an action against Hansard, the printer to the House, for a libel contained in some of the papers printed by order. He had obtained a verdict, issued execution, and the sheriffs of Middlesex had seized and sold some of Hansard's property. The House declared all these proceedings breaches of privilege. At different times, and after considerable discussion, Stockdale, his attorney, the two sheriffs, and some subordinate agents, were committed to the custody of the sergeant-at-arms. A bill was subsequently brought in by Lord John Russell, for exempting from such actions all papers ordered by the House to be printed, which was passed on April 14. February 10, the marriage of the Queen took place, attended with festivities throughout the country. March 15, the English ambassador at Naples presented a note, complaining of the establishment of a monopoly of the trade in sulphur granted to a French company, in contravention of the treaties with England. As the Neapolitan government refused satisfaction, an English fleet was ordered to Naples to adopt coercive means; but by the mediation of France hostilities were prevented, and the sulphur trade restored to its former course. May 6, the new stamps and envelopes for pre-paid letters came into use. June 4, the Act for the better effecting Tithe Composition in England and Wales received the royal assent. July 3, the fort of Amoy, in China, was destroyed by the English fleet, and on the 10th, the island of Chusan was taken. July 23, the Act for uniting the provinces of Upper and Lower Canada received the royal assent. August 7, the Act against employing children to sweep chimneys, and on August 10, that for regulating Irish Municipal Corporations, received the royal assent. August 11, the parliament was prorogued. August 25, the Carlist insurrection in Spain having been suppressed, the English auxiliaries evacuate San Sebastian and Pasages. December 2, Mehemet Ali, of Egypt, who had been for some time resisting the claims of the Sultan of Turkey to the sovereignty over Egypt, who had invaded and taken possession of Syria, at length, subdued by Turkey assisted by England and France, accepted on this day the terms proposed. Commodore Napier with an English fleet had greatly distinguished himself by his successful attacks on Beyrout and Acre. December 15, the remains of Napoleon Bonaparte, which England had allowed to be removed from St. Helena, were this day deposited with great ceremony in the Hôtel des Invalides, having been brought to France by a French squadron under Prince de Joinville.

1841. January 9, a meeting of the Repeal Association was held in Dublin, to receive the accounts of the preceding year; and during the spring several monster Repeal meetings were held to hear the addresses of Daniel O'Connell, some of which were attended by as many as 150,000 persons. Jan. 9, the Bogue forts at Canton were attacked and taken by the British forces. January 20, after some further hostilities, the Chinese government proposed terms, by which Hong-Kong was ceded to Great Britain, direct official communication between the two powers granted, some additional ports opened to trade, and an indemnity of six millions of dollars paid. January 26, parliament commenced its sittings. Feb. 10, the union of the Canadas proclaimed at Montreal, and Lord Sydenham took the oaths of office. February 13, a dinner given to Lord John Russell in London, to celebrate the foundation of the most recent colony of Great Britain—New Zealand. On March 15, at a meeting of the Vice-Chancellor, heads of houses, and proctors, of the University of Oxford, a resolution was passed condemning the Puseyite Tracts, which had lately excited much attention. March 23, Father Mathew continues his efforts in Ireland in favour of temperance. On this and two succeeding days, he was said to have administered the pledge to 120,000 persons. March 31, the annual meeting of the Metropolitan Anti-Corn-Law Association was held, numerous meetings with a similar object having been held in various parts of the country. April 28, a meeting called by the Archbishop of Canterbury, in London, to raise funds for sending ont bishops to the colonies, when a large snbscription was obtained. On the same day, the preliminary expedition of the second colony to New Zealand sailed under the command of Captain Wakefield; the colony to be formed on the principle proponnded by E. G. Wakefield, limiting the area, and applying the land prodnce fund to the pnrpose of obtaining labour. May 18, a great meeting held at Manchester, to petition for a total repeal of the Corn-Laws. Many other meetings for the same purpose were held throughout the conntry, some of which were disturbed by the attempts of Chartists to incorporate a petition for nniversal suffrage. May 28, hostilities re-commenced at Canton. The British forces, nnder Sir Hugh Gough, took two forts, and the town capitulated, having agreed to the previons terms and to pay six millions of dollars within one week. May 27, the case of the seven ministers of the presbytery of Strathbogie was brought before the assembly of the Scottish Church; when they were snspended for having obeyed the order of the civil courts in placing the minister of Marnoch against the order of the Assembly. A large minority protested, and a numerous meeting was held in Edinburgh on the following Monday (31st), to express their sympathy with the deprived ministers. On the 27th Sir Robert Peel brought forward a resolution in the Honse of Commons, declaring that the ministry did not possess the confidence of the country. Jnne 4, the debate terminated, and the resolution was carried by 312 against 311. On the 7th, Lord John Rnssell informed the Honse, that in consequence they should appeal to the country. On the 22nd the parliament was prorogued and dissolved. June 21, the Act for the Commntation of Copyhold and Customary Tenures, and that for affording Facilities for the Conveyance and Endowmeuts of Sites for Schools received the royal assent. Angust 19, the new parliament met. An amendment to the address was moved by Sir R. Peel; and after a debate, the amendment was carried. On the 30th, the ministers announced their resignation, and Sir R. Peel was commissioned to form a new ministry. In September, accounts arrived from varions parts of the country, representing the extreme distress of the mannfactnring districts of the conntry. October 4, a great fire occurred in the Tower, which destroyed the storehouses and the small-arms armoury. December 31, Lord Ashbnrton was appointed to a special mission to the United States, in order to settle the various differences between the two conntries, which he concluded in September 1842.

1842. January 17, the first stone of the new Royal Exchange was laid by Prince Albert. February 8, about 600 deputies of the Anti-Corn-Law Association assembled in London, to promote its objects. April 29, a new law for a graduated scale on the importation of foreign corn received the royal assent. May 4, the Boers of Port Natal having thrown off their allegiance to the British government, are attacked by Captain Smith with a small force, whom they defeat, bnt were beaten in a second action on June 26, and forced to snbmit. May 30, John Francis fires a pistol at the Queen, who escaped uninjured; Francis was tried for the attempt at the Old Bailey, found guilty, and sentenced to be hung, bnt the pnnishment was commuted to transportation for life. June 4, there were riots at Cork and Ennis, occasioned by want of food arising from the potato rot in 1841; and great distress and discontent continned to exist among the mannfactnring population of England. June 16, the treaty with the Chinese not having been ratified, the British forces entered the river Yang-tze-Kiang, and seized several forts with numerous cannon; and on the 19th they took possession of Shanghai. June 22, Sir Robert Peel's bill imposing an Income Tax of 7*d.* in the pound on incomes of 150*l.* a year and upwards received the royal assent. July 9, a deputation from the Anti-Corn-Law Association waited on Sir R. Peel, to represent the extreme distress of the labouring poor. July 30, a law received the royal assent, bestowing a representative government on New South Wales. August 8, a serious riot took place at Manchester owing to the distress, and the riots extended snbsequently to other towns in the North. August 12, the Bankruptcy Amendment Act received the royal assent. Angust 29, the Queen and Prince Albert visit Scotland. September 30, a special commission was held to try the offenders in the late riots, when fifty-four were convicted, and sentenced to various periods of imprisonment.

1843. January 9, O'Connell announced at a weekly meeting of the Repeal Association that "1843 is and shall be the great Repeal Year." January 20, Mr. Edward Drummond, the private secretary of Sir Robert Peel, was shot at Charing-Cross by a man named M'Naghten, who was acquitted on March 4, on the ground of insanity, and removed to Bethlehem Hospital. On February 2, parliament assembled. February 17, the forces of the Ameers of Sinde were defeated by Sir C. Napier, who, on the 20th, took Hyderabad, and subsequently annexed Sinde to the British empire. [SINDE, *S.* 1; INDIAN EMPIRE, *S.* 2.] Abont the end of this month, the Rebecca Riots took place in Wales, the object of which was the removal of oppressive turnpike tolls. The riots continued through several months. March 25, the Thames Tunnel was opened. May 18, the secession of the supporters of the non-intrusion principle took place from the General Assembly of Scotland, when above four hundred ministers resigned their parishes. May 30, Natal was annexed to the colony of the Cape of Good Hope. July 3, the Cartoons for the embellishment of the new Palace at Westminster were exhibited to the public. August 17, an Act for the pacification of the Scottish Church received the royal assent, bnt had no effect in staying the disruption. Angust 22, a great Repeal Meeting held on the hill of Tara. August 24, parliament was prorogued. Angust 28, the Queen and Prince Albert embarked at Sonthampton, on a visit to Louis Philippe at the Château d'En; on September 13, they visited tho King of the Belgians at Ostend. August 29, Father Mathew holds a great Temperance meeting in London, and in the conrse of a few weeks administers the pledge to 74,000 persons. On September 9, the French took possession of Otaheite. September 28, the Anti-Corn-Law Association renewed its meetings in London. October 7, the Irish government issued a proclamation forbidding the Repeal meetings, and O'Connell recommends snbmission. On the 14th, Mr. O'Connell, his son, and several other Repeal leaders, are arrested and held to bail on a charge of conspiracy and sedition. October 27, the Welsh special commission opened at Cardiff for the trial of the Rebecca rioters, the principal cnlprit being a young farmer, who was sentenced to imprisonment for twenty years. Most of the others were let off, on pleading guilty, and on condition that the riots should cease.

1844. January 29, the Grand Dnke of Saxe-Cobnrg, father of Prince Albert, died. February 1, parliament was opened. February 12, after a trial which lasted twenty-four days, O'Connell and his companions were fonnd guilty. A new trial being refused by the judges, on May 11, O'Connell was sentenced to a year's imprisonment and a fine of 2000*l.*; on September 2, the judgment was reversed, on appeal, by the House of Lords, and he was restored to liberty. March 5, Mr. Pritchard, the British ex-consnl at Otaheite, was seized and placed in confinement, by M. Bruat, the French governor, whose conduct, after much contention, was subsequently disavowed by his government. April 12, a treaty of annexation proposed between Texas and the United States was rejected by the Senate. On May 11, a meeting was held nnder the presidency of Lord Ashley, for improving the habitations of the poor. June 1, the Emperor Nicolas of Russia visited England. June 6, the Factories Act, regulating the employment of children and young persons, received the royal assent. June 14, a discussion was raised in the Honse of Commons on the subject of Sir James Graham opening letters at the Post-office. He contended that he had the right, bnt would give no further explanation. The letters said to be opened were addressed to Mazzini, and the information thns obtained had enabled the Austrian government to seize the brothers Bandiera, who had landed in Italy for the purpose of creating an insurrection. A Committee of Examination was appointed by Lords and Commons, but they only reported that the power had been occasionally exercised. July 22, a treaty was signed between England and Hanover for the settlement of the Stade duties. August 8, a meeting was held in Manchester for the formation of pnblic parks, and 25,000*l.* were subscribed by November 1. September 5, parliament was prorogued. November 19, a meeting was held at Birmingham, for the establishment of public parks and baths.

1845. January 11, the Archbishop of Canterbury addressed a letter to the clergy of the Established Church, on the disputes raised by the introduction of Puseyite practices in the ceremonies of the Chnrch, as to which he would not give an anthoritative opinion, but recommended moderation. February 4, parliament was opened by the Qneen in person. On the 14th, Sir Robert Peel made his financial statement:

he proposed to continue the income tax, to repeal all duties on export, to abolish the duties on 430 articles which yielded only a trifling income, also those on cotton-wool, glass, and staves, and to substitute an annual licence for the auction duties: these were ultimately carried. March 6, Sir Robert Peel brought in a bill to enable Jews to hold municipal offices, which was passed on March 14. May 5, a bazaar in aid of the Anti-Corn-Law Association was held in Covent Garden Theatre, by which 25,000*l.* was realised. On the 22nd a meeting was held in London for the establishment of baths and wash-houses, under the presidency of the Duke of Cambridge. May 23, the Arctic expedition of discovery, under Sir John Franklin, sailed from Greenhithe, and, unfortunately, never returned. May 28, a terrible fire took place at Quebec, and on the 28th of June another. In the two fires 2947 houses were destroyed, and 20,000 persons left destitute: parliament voted 20,000*l.* for their relief; subscriptions were raised, and collections were made in all the churches, under the authority of the Queen's letter. May 29, a new convention between England and France for the better suppression of the slave trade was signed. June 15, a French and English squadron attacked Madagascar, in consequence of the Queen of Madagascar having threatened the traders of those countries with expulsion: they destroyed some forts and part of a town, but nothing satisfactory was accomplished. June 30, Sir R. Peel's Act for the endowment of Maynooth College received the royal assent; and on July 21, the Acts for the establishment of museums in large towns, for the endowment of the new colleges in Ireland, and for the amendment of the Poor Law in Scotland. October 31, Mr. Waghorn arrived with the East India mail, which he had brought for the first time by the Overland route. During this month the railway mania reached a crisis, and a panic ensued, by which many were ruined. November 19, the Irish Roman Catholic bishops condemn the new Irish colleges. November 22, Lord John Russell issues his letter to the electors of London, declaring for a total repeal of the Corn Laws. December 10, it having been previously understood that there had been many discussions in the cabinet on the subject of the Corn Laws, it was made known that ministers had resigned, and that Lord John Russell had been sent for to form a ministry. On the 20th, he having failed, Sir R. Peel was again sent for, and re-accepted office.

1846. January 3, the corporations of London and Dublin presented addresses to the Queen representing the sufferings caused in Ireland by the potato-rot of the previous year. January 5, a meeting of agricultural labourers was held at Wootton-Basset in Wiltshire, at which they petitioned for the abolition of the Corn Laws. January 11, the New Zealand chiefs, who had previously committed several outrages on the British settlements, were attacked and defeated: on the 19th they made their submission. January 22, the parliament was opened by the Queen, who referred to the failure of the potato crop, and recommended the consideration of the propriety of relaxing protective duties. On the 27th Sir R. Peel announced his intended repeal of the Corn Laws. March 13, potatoes having risen to a famine price in Ireland, a treasury order was issued allowing the importation of Indian corn, rice, and buckwheat, at a nominal duty of one shilling per quarter. April 4, the governor of the Cape of Good Hope commenced a war upon the Caffres, who had been committing depredations on the colonists. June 9, the town of St. John's, Newfoundland, was destroyed by fire; the damage done amounted to 1,000,000*l.* June 12, a treaty with the United States for the settlement of the Oregon boundary was agreed upon by the senate at Washington. On the 26th the Corn Duties Repeal Act, and the Customs Duties Act, which gave great freedom to commerce, received the royal assent. On the same day, on the motion for the second reading of the Protection of Life Bill (a coercive measure for Ireland), the ministers were defeated, and immediately resigned. On July 6, Lord John Russell and other members of the new ministry were sworn into office. July 28, W. S. O'Brien and many others seceded from the Repeal Association, because O'Connell had denounced all attempts to obtain their object by physical force. August 26, an Act for the establishment of Public Baths and Washhouses received the royal assent, and also the Act for establishing County Courts. September 4, twenty-four districts in Ireland were declared by proclamation to be in a state of distress, and the provisions of the Labour Rate Act were directed to be put in operation in them. September 14, a formal protest was made by the British government against the marriage of the Duke de Montpensier, a son of the King of the French, with the sister of the Queen of Spain. October 2, the distress in Ireland continuing, and the provisions of the Labour Rate Act proving worse than useless, the lord lieutenant issued a circular authorising the undertaking of works of permanent utility. December 18, the island of Labuan was taken formal possession of by the agents of the British government. December 18, a meeting was held in Edinburgh to consider as to the best means of relieving the distress in the Highlands and Islands of Scotland, where 330,000 persons were without the means of subsistence.

1847. January 2, the British Association established, by which large sums were raised by subscription for the relief of the distress in Ireland and Scotland, in both of which countries numbers were dying of starvation. January 19, parliament was opened by the Queen, who directed the attention of the Houses to the great distress prevailing, and called on them to provide measures for its relief. May 13, Daniel O'Connell died at Genoa, while on his way to Rome. June 8, the new Irish Poor Law Bill received the royal assent; on the 21st, that for the improvement of towns; and on the 23rd parliament was prorogued. October 17, thanksgivings were offered up in all the churches for an abundant harvest. October 23, in consequence of a great monetary pressure, the temporary suspension of Sir R. Peel's Bank Restriction Act was ordered, and the order was withdrawn November 23. November 18, parliament re-assembled, and passed an Act for the suppression of crime and outrage in Ireland.

1848. February 21, the revolution commenced in Paris by which Louis Philippe ceased to be King of the French. On the 24th the king abdicated. On the 26th the republic was proclaimed. Louis Philippe and his family fled, and arrived in England at the beginning of March. April 10, a proposed great Chartist demonstration on Kennington Common, near London. The government however had appointed special constables; an intended procession was prevented, and the affair passed off harmlessly. May 15, the state trials in Ireland commenced; the jury could not agree in a verdict as to Mr. O'Brien and Mr. Meagher. Mitchell was tried on May 22 for seditious writing in the 'United Irishman,' found guilty, and sentenced to fourteen years' transportation. July 29, an engagement took place between the Irish rebels and the government forces at Ballingarry: the rebels were easily defeated. On August 5, W. S. O'Brien was captured, and on the 12th Meagher, O'Donohue, and Lyne. August 20, twenty Chartist leaders arrested in the Blackfriars Road. August 29, Sir H. Smith defeated the rebels under Pretorius at Bloem Platts, in the Cape of Good Hope colony. August 31, the Health of Towns Act received the royal assent. September 30, the Chartist trials were concluded in London, and Dowling, Cuffey, and others were sentenced to transportation for life. October 9, the trial of the Irish rebels concluded, and O'Brien, Meagher, O'Donohue, and M'Manus were sentenced to death.

1849. During this year the Hungarian insurrection against Austria and the popular risings in Germany succeeded the revolution in France of 1848, but Great Britain took no part in these commotions. May 11, on the appeal of Smith O'Brien and others to the House of Lords the judgment was confirmed, and on July 9, they were all transported. On May 13 a large meeting was held at Cape Town to protest against the attempt to make the Cape a penal settlement, and the efforts made were ultimately successful. On June 26, the Act for repealing the Navigation Laws received the royal assent, and on the 18th the Irish Encumbered Estates Act. In August a report was furnished to the Cabinet at Washington by Colonel Mason, confirming the discovery of vast quantities of gold in California. On September 16, prayers were offered up in the churches for the removal of cholera, which had been long raging in England. On November 5, Russia and Austria demanded the expulsion or imprisonment of the Hungarians who on the defeat of the insurrection had taken refuge in Turkey: Turkey refused to comply with the request, and applied for assistance to England, which sent a fleet that entered the Dardanelles. December 1, the Dowager Queen Adelaide died. December 16, a large assemblage of tenant farmers and cottiers took place at Mullinahone in Tipperary to petition for Tenant Right.

1850. January 10, the Enterprise and Investigator leave Woolwich in search of Sir John Franklin. January 25, a meeting held in the Mansion House, London, in furtherance of the Industrial Exhibition of all nations. July 26, Baron

Rothschild, having been elected for the city of London, attended the House in order to take his seat, bnt was refnsed becanse he ohjected to take the oaths on the faith of a Christian. Angust 5, the Act for regulating metropolitan interments, forbidding hnrials in chnrch-yards, received the royal assent, as also an Act for the better government of the Anstralian colouies, forming Victoria into a separate colony, and giving it a representative legislature. Angust 14, the Act enabling town councils to estahlish pnblic libraries and musenms also received the royal assent. Angust 21, the Queen embarked at Osborne to visit the King of the Belgians. September 24, the pope issned a hnll estahlishing a Roman Catholic hierarchy iu England, which, on its promulgation, occasioned great agitation. October 8, Captain M'Clnre, iu the Iuvestigator, discovered the North-West Passage hy Prince of Wales's Strait. The ship was subseqnently frozen np, and the crew were not rescned till April, 1853, when they made their way over the ice to Melville Island. November 22, a meeting of the clergy of the Estahlished Church was held at Oxford to protest against the pope's hull, which was followed by pnhlic addresses for the same purpose to the Queeu from varions parts of the conutry. December 31, Sir Harry Smith, governor of the Cape of Good Hope, declared war against the Caffres. He had been attacked hy them and narrowly escaped on the preceding day, and the Caffres defeated our troops in several places.

1851. Jannary 27, Earl Grey iu a despatch places the Clergy Reserves at the ahsolute disposal of the legislature of Canada. Fehruary 4, Parliament opened, and the Qneen allnded to the Ecclesiastical Titles bill, as occasioned hy the pope's recent hull. Fehruary 22, the Rnssell miuistry resigned, in conseqnence, as stated hy Lord John, of the smallness of their majority against Mr. Disraeli's motion iu favour of agricultnral protectiou, and of Mr. Locke King having carried a motion against them iu favonr of the extension of the county franchise. Ou the recommendation of the Duke of Wellington the Russell ministry resumed their places on March 3. May 1, the Great Exhibitiou of the Industry of all Nations in Hyde Park was opened hy the Queeu. May 22, the governor of New South Wales issued a proclamation forhidding the search for gold iu the newly discovered gold regions without a license. By the beginning of June 20,000 persons were employing themselves at the diggings. August 1, the royal assent was given to the Ecclesiastical Titles Assumption and the New Metropolitan Cattle Market Acts. October 23, Kossuth arrived at Southampton, on the 30th he went in procession to the Gnildhall of London, where an address from the city was presented to him. November 6, the Caffres defeated a British force at Waterkloof. Decemher 2, the Prince-President of France dissolved the legislative assemhly, arrested Cavaignac, Changarnier, Thiers, and others, and ou Jauuary 2, 1852, his continned authority was voted hy 7,439,216 votes against 640,737.

1852. January 1, the Roman Catholic synod of Thurles prohihited the Roman Catholic clergy from holding any office whatever iu the Queen's colleges in Ireland. February 3, the parliament met; on the 20th the ministry were heaten on the Local Militia Bill, and on the 23rd they resigned; they were succeeded hy one under the presidency of the Earl of Derhy, who, ou annonucing his acceptance of office on the 27th, deprecated the attempts which were heiug made to produce a panic-fear of invasiou hy the French. April 13, Major-General Cathcart, who had snperseded Sir H. Smith as goveruor of the Cape, issued a proclamation recognising the independence of the Boers of the Vaal river. Jnne 1, the electric telegraph between England and Ireland opened for communicatiou. Juue 2, the indepeudeuce of Greytown was guaranteed by the Euglish and American governmeuts. June 30, the Act granting a representative constitution to New Zealand received the royal asseut. July 1, the parliament was dissolved. July 3, a great Tenant-Right meeting at Waringstown in Ireland, at which Mr. S. Crawford, M.P., attended, was dispersed by the magistrates. Novemher 2, a great Free Trade banquet held at Mauchester, which was attended hy 3000 persons. Novemher 23, three ships arrived in the Thames with a large quantity of Anstralian gold. December 16, in the new parliament which had assemhled on Novemher 4 the ministry were heateu ou the bndget hy 305 against 286; they immediately resigned; and on the 27th the Earl of Aberdeen announced that he had accepted office, and formed a new ministry.

1853. January 5, the Emperor of China legalised the importation of opium, in order to make it contrihute to the revenne. March 9, a treaty with the Caffre chiefs was concluded by Geueral Cathcart at King William's Town. May 3, Prince Meuzikoff presented the Russian ultimatum to the Turkish government, claiming for the czar the protectorate of the Greek Christians iu the Turkish dominions, which was rejected. May 12, the Industrial Exhihition opened at Duhlin. June 26, the Emperor of Rnssia issued a manifesto against Tnrkey, and announced the march of Russian armies npou its Danubian Provinces. Septemher 27, Tnrkey declared war against Russia. Octoher 22, the French and English fleets entered the Bosphorus. December 5, a protocol was signed at Vienna hy France, England, Anstria, and Tnrkey, for the maintenance of the integrity of the Turkish empire.

1854. February 13, Lord John Russell introduced to the House of Commous his new Reform Bill, which was ahandoned on April 11, in conseqneuce of the state of pnhlic husiness. February 20, the Grenadier and Coldstream guards emharked at Southampton for Tnrkey, and other troops followed iu rapid succession. March 11, the Queen reviewed a fleet at Spithead previous to its sailing for the Baltic. March 28, war declared hy England against Russia. April 22, Odessa bombarded by the French and English fleets. June 7, a treaty concluded at Washingtou for facilitating the iutercourse of the British North American colonies with the United States. Jnne 8, the Crystal Palace at Sydenham opened hy Queen Victoria. June 16, the Act for donhliug the income tax, on account of the war with Russia, received the royal assent. August 7, the Act for regulating Oxford University received the royal asseut. Angust 16, Bomarsund was surrendered to the allied fleet. Septemher 14, the allied army landed in the Crimea, after having suffered severely from cholera during this and the precediug month. On the 15th the Russians evacnated Moldavia, and the Dauuhian Provinces were garrisoned hy the Austrians. On the 20th the hattle of the Alma took place, and the Russians were defeated. [RAGLAN, LORD, *S.* 2; SAINT-ARNAUD, MARÉCHAL, *S.* 2.] October 17, the hombardment of Sehastopol commeuced. Novemher 5, the hattle of Inkermann, when the Russians were again heaten. Ou the 14th a violent storm destroyed many ships ladeu with stores, aud cansed great calamities on shore. This was followed hy a season of great suffering: the roads were impassahle; the weather was hitterly cold; men and horses, ill snpplied with food or shelter, perished iu large numbers, while medical atteudance and hospital accommodatiou were wofully deficieut. Great dissatisfaction was expressed at home, and private snhscriptions to a large amount were raised to alleviate the distress. Miss Nightingale orgauised a staff of nurses, and proceeded with them to Constantinople to snperintend the hospitals, and atteud the sick aud wouuded.

1855. January 6, confereuces hetween the plenipotentiaries of England, France, Austria, and Rnssia, were opened at Vienna. Lord John Russell was the English plenipotentiary, and his couduct in supporting the propositions of Anstria for a peace with Russia, formed the suhject of a parliamentary discnssion on July 6, and led to his secession from office ou July 13. Jauuary 10, Sardinia joined the allies, and undertook to send troops to the Crimea. January 29, Mr. Roehuck's motion for a committee to investigate the causes of the sufferings of the army in the Crimea was carried against the ministry by 305 to 148. Iu conseqneuce the Aherdeen miuistry resigned, and on February 10 was succeeded hy one of which Lord Palmerston was the Premier. March 2, Nicolas, Emperor of Russia, died, and was succeeded hy his son Alexander II. May 24, Kertch occupied hy the allies, whose fleets swept the sea of Azoff, and destroyed several towns and a vast nnmher of vessels. June 18, the French attacked the Malakhoff and the English the Redan, hut were repulsed. July 1, a large assemhlage of persons took place in Hyde Park to protest against Lord R. Grosvenor's Sunday Trading Bill, and some rioting occnrred. The hill wss withdrawu on the next day, hut the meetiugs and the riots were continned on the two following Sundays. July 11, Sveahorg, in the Gulf of Fiuland, was homharded hy the allied fleets. August 14, the Metropolis Local Management Act, constituting a representative hoard for the management of the improvemeuts of the whole metropolis, received the royal assent. Septemher 8, the French captured the Malakhoff, and iu the night the Russians evacuated the sonth side of Sehastopol, of which the allies took possession. Septemher 29, the Russians assaulted Kars, and were repulsed hy the Turks, assisted by Sir W. F. Williams, several other English officers, and Geueral Kmety. October 17, Kinburn, at the month of the Dnieper, surrendered to the allies, and on the next day the Russians blew up the fortress of Oczakoff. November 26, Kars was surrendered to the Russians, after a gallant defence; Sir W. F. Williams and the English officers were made prisoners, and treated with great kiudness by the Russians. November 30, the King of Sardinia arrived at Windsor Castle on a visit to the Qneen. December 19, the united kingdom of Sweden and Norway joined the alliance of the Western Powers.

1856. January 31, the Queen, on opening the session of parliament, announced the acceptance by Rnssia of the terms proposed for a general peace. February 1, Mr. Murray, the British minister to the Persian court, quitted Teheran in consequence of a dispute with the Persian government. February 7, the Queen, having created Sir J. Parke, one of the barons of the Exchequer Court, a peer for life only, a motion to refer the subject to a committee of privileges was carried against the ministers. The committee reported that such a peerage gave no right to sit in parliament, which was confirmed by the House. Ultimately ministers gave way, and Baron Wensleydale was created a peer in the nsual form. April 29, official proclamation made of the peace with Rnssia. May 29, public celebration of the conclusion of peace; magnificent fireworks exhibited in London, Edinburgh, and Dublin, and a general illumination took place. July 12, the allies evacuated the Crimea. July 29, the Act for establishing reformatory and industrial schools for criminal and vagrant children received the royal assent. August 20, the Queen of Oude arrived in England, to appeal against the annexation of her son's dominions to the British possessions in India. September 4, the Royal British Bank stopped payment; on the accounts being investigated gross frauds were disclosed; the failure caused a vast amount of distress; and ultimately the attorney-general undertook to prosecnte some of the directors, seven of whom were found guilty in February, 1858, and six were sentenced to various periods of imprisonment, and one to a fine of one shilling; an Act of Parliament was also passed in 1857 to render trustees more easily punishable for misconduct and misapplication of funds. October 11, the seizure by the Chinese in the Canton river of the 'lorcha' Arrow, gave rise to a series of attacks on Canton, from which place all the foreign commercial residents withdrew. November 10, in consequence of the Persians having taken Herat, in violation of a treaty, war was proclaimed at Bombay against that country. December 11, the collection of pictnres belonging to Mr. John Sheepshanks was made over by him to the government as a gift to the nation.

1857. March 3, the ministry were defeated on a motion by Mr. Cobden, involving censure on them for the attack on Canton. Lord Palmerston then announced his intention of appealing to the country as soon as the indispensable business of the House could be got through. Parliament was dissolved on March 21, and a new one summoned, which met on April 30. In the new elections the most remarkable fact was that Mr. Bright, Mr. Cobden, and most of what were called the 'Peace Party,' failed in getting returned. March 14, the treaty with Denmark for the abolition of the Sound Dues was signed at Copenhagen. An indemnity was to be paid to Denmark, of which England's share was settled at 1,300,000*l*., and the dues ceased from April 1. May 5, the Art Treasures Exhibition was opened at Manchester by the Queen and Prince Albert. May 7, a mutiny broke out in the Indian army. [See INDIAN EMPIRE, *S.* 2.] May 25 and 27, Commodore Keppel, with a British naval force, attacked a number of Chinese junks in Escape Creek, and on June 1, another attack was made on those assembled in Fatshan Creek, in the Canton river. Both attacks were successful, numerous junks were destroyed, a quantity of cannon taken, and a large part of the enemy's force killed. The issue of this war, with the capture of Canton, will be found under CHINA, *S.* 2. June 25, an order in Council directed that in future Prince Albert was to be prayed for in the churches and addressed as the Prince Consort. July 10, the Oaths Bill, by which Jews would have been admitted to parliament, was rejected in the House of Lords, after being carried in the Commons by a large majority. In November (chiefly in consequence of a commercial panic in the United States of America, during which all the banks suspended payment, and bankruptcies to the amount of fifty millions took place) a crisis occurred in Great Britain. Several extensive failures of commercial houses in London, Liverpool, Glasgow, and other towns followed. Two banks in Glasgow suspended payment, one of them in a state of hopeless insolvency, accompanied with the disclosure of imprudent management in discounting an enormous amount of accommodation bills. As early as October 8 the Bank of England raised its rate of discount to 6 per cent., which was increased on the 12th to 7 per cent., on the 19th to 8 per cent., on November 5 to 9 per cent., and on November 9 to 10 per cent. On the 12th the operation of Sir R. Peel's Bank Restriction Act was suspended for the second time, and the Bank of England was authorised by the government to issue notes to an amount not exceeding two millions, for which an Act of Indemnity was passed on December 12. This calmed the panic, confidence was restored, the rate of discount was rapidly lowered, so that by February, 1858, it was reduced to 3 per cent., and the bullion in the bank increased from 6,666,000*l*. on November 11, 1857, to 17,617,283*l*. on March 3, 1858. The effects of the failures abroad, however, which had extended to Hamburg, and most other of the commercial towns of Europe, had a most calamitous influence on the manufacturing indnstry of the country.

On January 14, 1858, an atrocious attempt was made to assassinate the Emperor of the French, by casting explosive balls among the crowd assembled to see him and the Empress proceed to the Opera. The criminals, Orsini, Pierri, Rudio, and Gomez were apprehended; and on its appearing that they had recently left England, where each had resided for various but not very lengthened periods, an outcry was raised in France against England for harbouring conspirators; and a letter was sent by the French ambassador, which was published in the 'Moniteur,' complaining of the defective state of the law in England respecting conspiracy, and asserting that in England it was allowed openly to advocate regicide. Soon after the meeting of parliament Lord Palmerston brought in a bill to remedy this asserted defect, which was ordered to be read a first time by a large majority; but on the motion for the second reading, Mr. Milner Gibson moved an amendment that the French ambassador's letter ought to have been answered by the ministers, and the amendment was carried, on February 19, by a majority of 234 to 215. In consequence of this vote Lord Palmerston announced to the House on February 23, that the ministry had resigned; that the Earl of Derby had been sent for by the Queen, and that he had undertaken the formation of a new ministry. This was accomplished, and the ministry was completed, and met the Houses on the 12th of March. The new cabinet abandoned the conspiracy bill, but continued the prosecution of Dr. Bernard, for the asserted complicity in the conspiracy against the Emperor's life. He was indicted as accessory to the murder of one of the individuals who perished from the explosion of the grenade thrown at the Emperor on January 14, but was acquitted on Saturday April 17, after a trial lasting for six days. After the capture of Canton, the war in China [CHINA, *S.* 2] almost ceased; and since the reduction of Lucknow [INDIAN EMPIRE, *S.* 2], the chief military operations have been the taking of detached forts or towns, and the pursuit and defeat of scattered bodies of the rebels. On April 20, the new Chancellor of the Exchequer (Mr. Disraeli) introduced his budget, in which he announced the reduction of the income tax to 5*d.* in the pound, the equalisation of the duty on Irish distilled spirits with that of England and Scotland, and the imposition of a penny stamp on every cheque issued for payment on a banker, all of which were subsequently agreed to. On April 12 the Oaths Bill was again carried in the House of Commons, but was rejected in the Lords, so far as regarded the clause relieving the Jews. On May 14 Mr. Cardwell introduced a motion of censure on the ministry for having made public a despatch from Lord Ellenborough, as President of the Board of Control, to Viscount Canning, Governor-General of India, condemning the proclamation issued by him. Lord Derby, on behalf of the ministry, disapproved of the publication, Lord Ellenborongh resigned, and after several nights' debate in the House of Commons the motion was withdrawn on May 21.

VICTORIA, or PORT PHILLIP, a British colony in Australia, situated at the southern extremity of the continent, extends between 34° and 39° S. lat., 141° and 150° E. long.; and is bounded N. and E. by New South Wales, from which it is divided by the river Murray, and a line drawn from the head waters of that river to Cape Howe; S. by Bass's Strait and the Pacific Ocean; and W. by South Australia, from which it is separated by the meridian of 141° E. long. The form of the province is triangular, its greatest length being from east to west about 500 miles; its greatest breadth about 300 miles. The area is 98,000 square miles or nearly 63,000,000 acres. The population in 1846 was 32,800; on March 2nd 1851 it was 77,345; on December 31st 1852 it was estimated at 151,127; in February 1858, Bradshaw's 'Monthly Guide to Victoria,' gave the total population as 430,656, including 33,285 Chinese, and 1768 aborigines. In 1855 it was estimated that the population on the gold-fields of Victoria colony was 145,852, of whom 20,546 were Chinese; in this number of Chinese there were 3 women, and 3 children.

From Cape Howe, at the eastern extremity of the province, a line of coast, called the Long Beach, extends 200 miles, in a south-westerly direction to Wilson's Promontory. This part of the coast, which curves slightly inwards, consists for the most part of low and sandy shores backed by hills. Near the centre are several lagoons, and a considerable sheet of water called Lake Wellington. A short distance north of Wilson's Promontory is Corner's Inlet, where a settlement called Alberton has been formed. The inlet is full of shoals, but it forms a harbour for small vessels, and maintains considerable intercourse with Hobart Town, exporting sheep and fat cattle from the adjoining country. Near Cape Wilson are a number of small rocky islands, forming a continuation of the ridge of the Australian Alps. From Wilson's Promontory to the western boundary of the province, the coast-line runs in a north-westerly and westerly direction more than 300 miles. Only three harbours are found on it—Portland Bay, near the western, and Port Phillip and Western Port, near the eastern extremity. Between Portland Bay and Port Phillip, a distance of more than 200 miles, there is no place of safety even for small vessels, with the exception of Warrnambool and Port Fairy, small harbours for coasting vessels. During the summer the south-eastern winds blow on this coast for three months with great force. From Wilson's Promontory to Western Port the coast is mostly high. From Western Port to the western boundary-line it is generally low. The low shores are sandy, except at some places where swamps exist. West of Cape Nelson the coast is bounded by sand-hills.

Western Port affords good anchorage for vessels of considerable size, and is safe, being protected against the southern and south-eastern winds by Phillip Island, which lies across its entrance. Port Phillip, situated at the western entrance of Bass's Strait, is a harbour of great capacity. It is entered by a passage a mile and a half wide, bounded by Cape Nepean on the east, and Cape Lonsdale on the west. The channel is still further narrowed by some shoals which front the entrance. Within, the basin extends about 40 miles north, and about midway attains the same breadth, sending off an arm to the west, where it forms the harbour of Geelong. Hobson's Bay, at the northern extremity of the basin, affords good anchorage for vessels of all sizes, and forms the port of Melbourne. Lighter vessels ascend the Yarra-Yarra 8 miles to the capital, which is only a mile and a half distant by land. Portland Bay, near the western boundary, extends 26 miles from east to west, and 10 miles from north to south, and has good anchorage on its western shores in from 4 to 6 fathoms; but it is open to the south-east winds, and during the south-west gales a swell sets in, causing a heavy surf on the beach.

Wilson's Promontory, the most southern headland of Australia, is formed by a mountain, which is visible at the distance of 15 leagues. This rocky mass may be considered as the commencement of the Australian Alps, a range of mountains which, for a distance exceeding 70 miles, runs to the west of north, and farther on, for about 100 miles, to the east of north, until it approaches 37° S. lat. From this part of the range, which has a mean elevation of 2500 feet above the level of the sea, several lateral ridges extend to the south-east and west. The acclivities both on the east and west are gentle, and are partially overgrown with forests, containing many timber-trees, mostly blue gum and black butt. Near 37° S. lat. the range rises above the snow-line, and this portion of it is called the Ajuk Mountains. The valleys in this district comprise much land no less fit for cultivation than for pasture. That portion of the province which from the eastern declivity of the southern portion of the Australian Alps and the Ajuk range descends to the Pacific, is called Gippsland. It extends along the coast to 148° E. long., and consists of an inclined plane, which however near the mountains appears to descend with great rapidity, as in the middle of the region the plain is only 210 feet above the sea-level. The northern portion of this country is traversed by several ranges of hills, which are of considerable elevation near the principal range, but grow lower as they proceed southward. The valleys exhibit a considerable degree of fertility, and many cattle stations have been established in them. In the centre of Gippsland are plains of considerable extent, which are covered with open forests, and are capable of maintaining numerous herds of cattle. The most southern portion of Gippsland is traversed by several offsets of the Southern Australian Alps, which are covered with forests of blue, green, and black butt, in which numerous timber-trees are found. The whole of Gippsland is abundantly watered by several streams. The country extending north-east of Gippsland to the boundary of New South Wales has been but partially explored.

On the north of Port Phillip the watershed between the rivers falling into the Southern Sea and the Murray occurs about 45 miles from the northern extremity of the harbour, but farther to the west it is between 80 and 100 miles from the sea-shore. On both sides of the watershed the country is hilly and broken, and between 142° and 143° E. long. it rises into mountains. This hilly tract is in general from 30 to 40 miles across. To the south of it is an extensive plain, which descends gently to the sea-shore. Near the sea it is almost level or slightly undulating; but farther north it contains a rather large number of hills, rising from 500 to 700 feet above their bases; among them is Mount Buninyong, which rises 1570 feet above its base. A great number of lakes are scattered over this plain, one of which, called Carangamite, is about 90 miles in circumference. Its waters are salt, as are those of nearly all the others. The isolated hills which rise on this plain appear, from their formation, to be of volcanic origin. The southern part of this plain contains extensive tracts of the finest land for pasture and tillage. West of the river Hopkins (142° 45′ E. long) the land along the sea-shore, as far as Portland Bay, is generally poor, and that lying west of Portland Bay, though better, is only indifferent. But that portion of the plain which lies north of 38° S. lat. contains a large portion of good land. In some parts it is overgrown with thick forests of Eucalyptus trees, *Banksiæ*, *Casuarinæ*, and other trees peculiar to Australia; at other places it is covered with open forests and abundant grass. The numerous hills are thickly wooded, and the best soil is found at their bases.

Of the western division of the province, which, for its beauty and apparent fertility, was called by Sir Thomas Mitchell, who first explored it, Australia Felix, the best portion is that which lies within the hilly tract on both sides of the watershed. Nearly all the ridges by which this tract is overtopped run nearly at right angles to the watershed. The most western of these ridges rises to the elevation of mountains, and has been called the Grampians. Nearly in the centre of the Grampians stands Mount To-ol, or Mount William, which rises to 4500 feet above the sea-level. Mount Abrupt is 1700 feet, and Mount Sturgeon is 1071 feet, in height. The Grampians are surrounded with extensive forests of fine tall timber-trees of Eucalypti.

The country which is drained by the rivers originating in the southern and western portion of the Grampians appears to be the most fertile tract of New South Wales. It is abundantly watered by the Nangeela, or Glenelg, and its tributaries. The soil is black and rich, several feet deep, and rests on a subsoil of clay. The surface of the higher portion of this plain is strongly undulating, and on it are found many small sandhills.

The hilly tract of the watershed east of the Grampians has its surface diversified by numerous narrow ridges of rocks, several round hills of moderate elevation, and many rather narrow valleys traversed by clear and beautiful streams. In some parts the hills are covered with wood; at other places free from wood, but overgrown with grass to the top. About 30 miles east of the Grampians, some more elevated ridges traverse the watershed. They have been named Pyrenees, but the natives call them Peerick Hills. They consist wholly of granite, but are all grassy to their summits, and thinly wooded. East of the Pyrenees the country is more broken and the hills are higher. There are forests chiefly composed of box and lofty blue gum trees. A considerable portion of the hilly country, placed nearly in the centre of it, consists of hills of lava. A very large portion of this hilly country affords excellent pasture.

Between the hilly region of the watershed on the south, the mountain region of the Australian Alps on the south-east, the course of the Murray on the north, and the boundary line of South Australia on the west, lie the plains of the Murray River. The Murray and its tributary the Bayunga flow in wide bottoms, sometimes 8 or 10 miles across, which bottoms are overgrown by high trees, partly swampy or covered with lakes and ponds, but exhibiting an extraordinary degree of fertility in the vigour of their vegetation. In some places are found salt lakes in considerable numbers, but in general the plains are open, grassy, and beautifully diversified with serpentine lines or clumps of wood. Even at a considerable distance from the banks of the rivers water is not scarce, as there are numerous hollows in the plains, which generally contain water. The plains of the Murray are fit both for cultivation and rearing of cattle. The river Murray, rising in the Australian Alps, flows in a north-westerly direction along the boundary of the province, entering South Australia at 34° S. lat., after a course of above 600 miles. In the lower part of its course along the border it has a channel 350 yards broad, with a depth of from 12 to 20 feet. Its chief tributaries, which drain the northern division of the colony, are the Mitta-Mitta, Ovens, Goulburn, Campaspe, and Loddon, most of which are dried up during summer and converted into chains of ponds. The Mitta-Mitta rises in the Australian Alps, not far from Lake Omeo, the neighbourhood of which forms one of the gold-fields of Victoria. The Loddon rises near Mount Alexander, the principal gold-field, and its feeders, after the rainy season, are employed in the process of gold-washing. The Avoca, Avon, and Wimmera flow northward from the Pyrenees and Grampian chains. The Glenelg, collecting several tributaries from the western slopes of the Grampians, flows southward along the frontier, and enters South Australia just before reaching the ocean. The Hopkins, with its several affluents, waters the country south from the Pyrenees, reaching the ocean a little to the eastward of Port Fairy. The Barwon, after flowing in a north-easterly direction to the neighbourhood of Geelong, bends to the south-east, and falls into the sea near the entrance of Port Philip. The Yarra-Yarra, a considerable stream, which washes the capital, is subject to heavy floods during the rainy season. It comes in from the mountains to the east of Melbourne and continues in a very circuitous course to the head of Port Phillip. It is navigable to the city for small vessels and steamers of light draught. The Latrobe, rising in the Great Swamp, which is divided from Western Port by a belt of land a few miles broad, intersects the southern range of the Alps and flows eastward through Gippsland into Lake Wellington. Lake King collects the waters of the Tambo, the Riley, and the M'Arthur, which drain the northern district of Gippsland.

The predominating rocks in the higher masses of the Australian Alps are granite, sienite, and quartz, intermingled occasionally with mica-schists and various other rocks of a slaty texture. Quartz, ironstone, sandstone, and clay-slate are general throughout the other hilly portions of the colony. Veins of coal have been found on the coast between Port Phillip and Cape Otway, besides traces of lead and manganese. Rich veins of copper ore have been met with on the banks of the Yarra-Yarra. The chief mineral however is gold, the discovery of which in 1851 has led to a remarkable increase in the wealth and population of the colony. The gold is found chiefly at Ballarat, 40 miles N.N.W. from Geelong; at Mount Alexander, 75 miles N.W. from Melbourne; and around Lake Omeo, in the Australian Alps. At Ballarat, where the precious metal is found extensively on the ranges and flats and in the beds of the watercourses, a section of the workings exhibits the following series of strata:—Red ferruginous earth and gravel, streaked yellowish and red-clay, quartz gravels of moderate size, large quartz pebbles and boulders with masses of ironstone set in very compact clay, blue- and white-clay and pipe-clay. The gold is uniformly found in the formations superior in position to the pipe-clay. The richest deposits occur in the blue-clay, where the ore is for the most part quite pure. It is washed from the clay in rounded or flattened grains; sometimes it is found in fused pieces of pure metal, at others incorporated with quartz-pebbles, and occasionally in rolled water-worn lumps called nuggets. The quantity found has been enormous. The rush of emigrants and others to the diggings was at first productive of some inequalities and much suffering; but the judicious establishment of a mounted police, and the imposition of a small tax for a licence to dig, reduced the system to great regularity in a short time. The amount of gold exported in 1855 was valued at 10,302,980*l.* In the early part of 1855 serious riots took place at the gold-diggings of Ballarat, in consequence of the miners resisting the payment of the licence fees. This led to the substitution of a tax on gold exported from the colony, instead of the licence fee for diggers.

The climate of Victoria is comparatively mild. The mean temperature of summer is 65°, of winter 48°, of the whole year 57. The atmosphere is so dry and elastic that the heat of summer, sometimes very intense, is less oppressively felt. Hot winds occasionally come from the north, and last from 20 to 30 hours, suddenly raising the temperature to an extreme heat, but they do not occasion great inconvenience, and they are generally succeeded by a refreshing breeze from the ocean. During June, July, and August, the winter months, cold and wet days frequently occur, and at rare intervals light snow showers fall. In August, 1852, snow fell at Bendigo to the depth of seven feet. The average fall of rain for the year is 30·7 inches. The rapid changes of temperature, sometimes 30 degrees in 24 hours, are unfavourable to consumptive patients. Dysentery and a species of ophthalmia prevail to some extent in the hottest months. On the whole, the climate is found agreeable and salubrious. The wild animals found in the province are, the dingo, or native dog; the great gray kangaroo, which abounds in some districts; the rock wallaby, or badger; kangaroo rat; opossum; flying squirrel; wild cat; bandicoot; sloth, or Australian bear; and various others. Among its birds are, the bustard, or wild turkey, which on some of the plains appear in considerable flocks; numerous quails; many species of parrots; the lyre-bird, or Australian pheasant, which frequents the mountains of Gippsland; black swans, which abound in the neighbourhood of Western Port; the emu; magpie; pelican; eagle-kingfisher; and plover. Snakes are numerous. Musquitoes, locusts, and ants appear in great numbers in summer, and also lizards and other reptiles. The bays and rivers abound with fish. Codfish of a large size are found in the rivers of the northern district. Shoals of herrings appear on the coasts in February and March. The most important timber-trees are, the red-gum, lightwood, blackwood, pine, tea-tree, she-oak or siak, honey-suckle, and ironbark. The kangaroo apple-tree, the grass-tree, and the quardung, which forms a fine preserve, are indigenous. The fruits which have been successfully cultivated are, the peach, plum, quince, nectarine, apricot, pear, apple, mulberry, almond, and fig. Several vineyards have been formed. Vegetables are abundant. The potato, turnip, carrot, cabbage, brocoli, and radish, grow to an enormous size. Indigo and flax are indigenous. The tobacco and castor-oil plants and Indian corn grow luxuriantly. The common cereals are produced in great perfection; wheat is of the finest quality, with a return of from 40 to 50 bushels an acre.

The country around Melbourne is equal to any part of Australia for the growth of wheat, Indian corn, and potatoes. In all parts of the colony there are tracts of the finest arable land. But sheep-farming is the principal pursuit in this province, apart from the recent mining operations, and the export of wool has for some years very rapidly increased.

The settled part of the province, comprehending principally the eastern and southern portions, is divided into 24 counties. *Melbourne*, the capital of the colony, is described under MELBOURNE, *S.* 2; but we may add here that in 1854 the receipts were 654,664*l.*, of which a great part was raised by loan; and the expenditure was 569,772*l.*, of which 291,500*l.* were expended on public works in the city. There are 8 daily newspapers, 8 bi-weekly, 3 tri-weekly, and 21 weekly newspapers published in the colony, the greater number of them in Melbourne. Most of them are of a large size, extremely well printed, and some of them edited with great ability.

The second town in the colony is *Geelong*, now an important shipping port, pleasantly situated on the south-western shore of Port Phillip, at the head of Coria or Geelong Bay. It is regularly built, well supplied with water, and is steadily advancing in population and trade. Smaller vessels ascend to the town, but those of greater burden discharge at Port Henry, 10 miles down the bay. The increase of the town of Geelong consequent on the gold discoveries is shown by the town revenue in 1851, 1852, and 1854, which stood thus: 1851—2785*l.* 4*s.* 1*d.*; 1852—10,697*l.* 16*s.* 1*d.*; 1854—241,570*l.* The principal part of the receipts has been laid out in public improvements, a large amount of which has been borrowed by the corporation of Geelong for the purpose of carrying out extensive improvements. A railway to Melbourne has been constructed. Near the mouth of the Yarra on the north-east shore of Port Phillip, are the neat villages of St. Kilda and Brighton, which are resorted to as bathing places by the citizens of Melbourne.

The town of *Portland* is built near the western extremity of the bay of the same name. It has a small population, but occupies a considerable space, being built in streets crossing each other at right angles. There are some whaling establishments in the place, and the wool and other produce of the neighbouring districts are shipped at the harbour, which is inconvenient and exposed. *Belfast*, an active and thriving town, is situated on Port Fairy, some miles east from Portland Bay. It is famed for its butter and cheese, and lies amid some of the best tillage-land in the western division of the province. *Warrnambool*, near Belfast, is a small seaport, having frequent intercourse by trading vessels with Melbourne and Portland. It is the port of a considerable agricultural district. A Presbyterian church, built of stone, replacing a wooden structure, was opened here in the early part of 1855. *Ballarat*, the seat of the gold-diggings of that name, is described by Mr. William Howitt, who visited the place, as containing a large population, who are settling down into regular habits and are constructing a neat, well-laid out, and commodious town.

The principal towns in Victoria colony, in addition to those already mentioned, are:—Alberton, Avoca, Ballan, Beechworth, Benalla, Bendigo, Brunswick, Buninyong, Castlemaine, Chepstow, Colac, Flemington, Kilmore, Kyneton, Mount Alexander, Port Fairy, Prahran, Richmond, Sandhurst, and Wangaratta. Bradshaw's 'Monthly Guide to Victoria' for Feb. 1858, gives the number of post towns as 147.

By an Act of the Legislative Council of Victoria, ratified by the Act of the Imperial Legislature, 18 & 19 Vict., cap. 55, it is provided that there shall be a Legislative Council of 30 members, and a Legislative Assembly of 60 members, for the colony. Members of Council must be 30 years of age, natural born subjects of the Queen, and possessors for at least one year previous to election of lands and tenements in the colony of the value of 5000*l.*, or of the annual value of 500*l.* No judge, minister, traitor, or convicted felon, can be a member. Electors must be 21 years of age, natural born subjects, or naturalised for at least three years, and possessed of freehold property of the clear value of 1000*l.*, or clear annual value of 100*l.*, or leasehold property of 100*l.* yearly. Members of Assembly must be 21 years of age, possessing freehold property to the amount of 2000*l.*, or 200*l.* yearly value. Judges, ministers of religion, and persons who have been attainted for treason, or convicted of felony, are excluded. Electors must be 21 years of age, possessed of freehold property of 50*l.* value, or 5*l.* yearly value, or leasehold property of the clear annual value of 10*l.*, or occupy premises of 10*l.* yearly rent, or have a yearly salary of 100*l.* After the expiration of two years from the passing of the Act no person is to be registered as an elector who cannot read and write. The leading feature of the new charters for Victoria and the other Australian colonies is that, with the exception of a few reserved points in reference to imperial rights, the business of each colony will be managed by its own legislature. In particular the management of the waste lands is committed to the colonial legislature.

The imperial authority is represented by a lieutenant-governor, whose salary is 10,000*l.* per annum, with an allowance of 5000*l.* per annum for salaries of staff, repairs to government-house, travelling, and other expenses. The laws are administered by a chief justice and three puisne judges, who have criminal jurisdiction, and exercise the powers of the Queen's Bench, Common Pleas, and Exchequer courts. There is also a master in equity. Under the new Act, 50,000*l.* a year was to be reserved for the purposes of religious worship, to be distributed in proportion to the respective numbers of the several religious denominations. This sum was to be laid out in assisting to erect places of worship and in payments to ministers, but by a subsequent vote of the Legislative Assembly, this arrangement is to cease at the end of 1858. The religious bodies in the colony are—the Churches of England and Scotland, the Free Church of Scotland, United Presbyterians, Independents, Baptists, Methodists, and Roman Catholics. At the head of the Church of England in the province is the Bishop of Melbourne. At the close of 1852 there were 7841 scholars attending schools in the colony. The colonial revenue in 1851 was 379,824*l.* 12*s.* 4*d.*; in 1852 it was 1,577,181*l.* 8*s.* 1*d.*: the expenditure in 1851 was 409,884*l.* 1*s.* 5*d.*; in 1852 it was 734,961*l.* 18*s.* 2*d.* The estimated income for 1855 was 3,015,683*l.*, and the estimated expenditure 4,801,292*l.*, showing a deficit of 1,785,609*l.*, to provide for which a considerable amount of difficulty was experienced by the government. The estimate for the income, however, was exceeded by more than 100,000*l.*, and the revenue, though in the year showing a considerable decrease in the customs' duty, gave a large increase in the item of land sales, of 12,000*l.* on postage, and in several other branches.

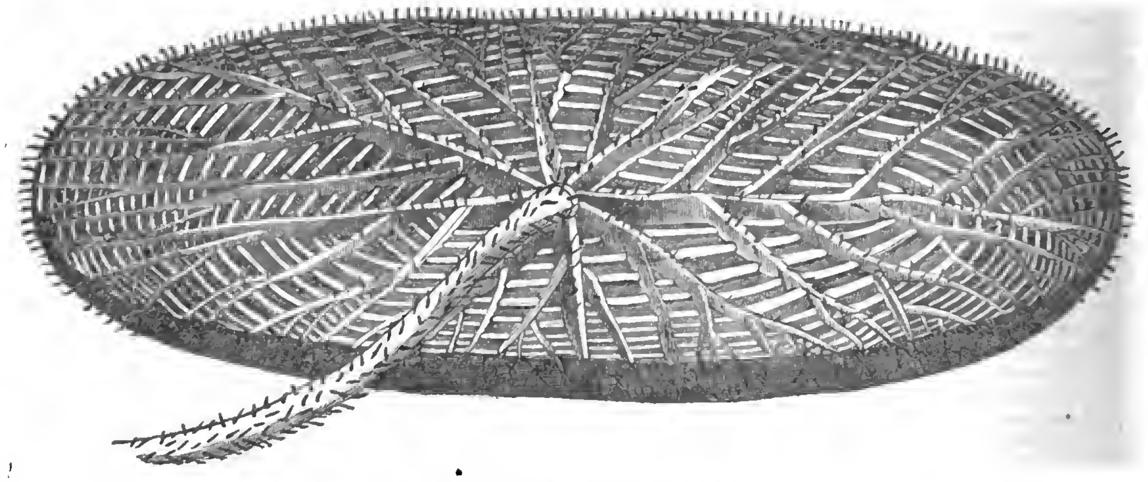
The number of ships entered at the ports of the colony in 1851 was 712, of 129,426 tons; the number in 1852 was 1657, of 408,216 tons. The number of ships registered as belonging to the colony on December 31st 1854 was 272 of 31,985 tons, and 12 steam-vessels of 29,395 tons. The value of the goods imported into the colony in 1851 amounted to 1,422,909*l.*; in 1852 the amount was 7,451,549*l.* From Great Britain alone there was sent to the colony in 1853 goods to the (declared) value of 7,062,387*l.* of British produce and manufactures, besides upwards of 2,200,000*l.* worth of foreign and colonial produce and manufactures. About 21,000,000 lbs. of wool was imported into Great Britain from Victoria colony in 1853. In 1854 the imports had risen to 17,659,051*l.*, but sunk to 12,007,939*l.* in 1855; while the exports had risen in the two years from 11,777,204*l.* to 13,493,338*l.* The imports again decreased in 1856 and 1857.

Port Phillip was discovered and entered by Lieutenant John Murray in January 1802, and was soon after visited by Captain Flinders, who called it Port Phillip, in honour of the first governor of New South Wales. Although occasionally visited in succeeding years, it remained without any settlement till 1835, when the first sales of land took place in the Australian colonies. A settler from Van Diemen's Land having purchased an extensive tract of country from the natives, the government refused to recognise the validity of the purchase, and the entire district adjoining Port Phillip was taken possession of on behalf of the crown. Colonists from Van Diemen's Land, bringing their flocks with them, arrived in great numbers. The New South Wales squatters, with their flocks and herds, came from the north. The district rapidly advanced in population and wealth, and was placed under the control of a superintendent appointed by the governor of New South Wales, till, after repeated representations on the subject, it was, in 1850, separated from that colony, and constituted a distinct province. The bishopric of Melbourne was founded in 1847; the diocese comprises the colony of Victoria. There is one archdeacon, of Geelong.

VICTORIA. [Hong Kong, *S.* 1.]

VICTORIA REGIA, a species of the natural order *Nymphæaceæ.* [Nymphæaceæ.] This splendid plant, in the dimensions of its leaves, their varied tints, the colour, size, and fragrance of its flowers, may deservedly be called the queen of flowers. The following is the account of its discovery by Sir Robert Schomburgk:—"It was on the 1st of January 1837, while contending with the difficulties nature opposed in different forms to our progress up the river Berbice, that we arrived at a point where the river expanded and formed a currentless basin. Some object on the southern extremity of this basin attracted my attention; it was impossible to form any idea what it could be, and, animating the crew to increase the rate of their paddling, we were shortly afterwards opposite the object that had raised my curiosity—a vegetable wonder. All calamities were forgotten; I felt as a botanist, and felt myself rewarded;—a gigantic leaf, from five to six feet in diameter, salver-shaped, with a broad rim, of a light green above and a vivid crimson below, resting on the water. Quite in character with the wonderful leaf was the luxuriant flower, consisting of many hundred petals, passing in alternate tints from pure white to rose and pink. The smooth water was covered with the blossoms, and as I rowed from one to the other I always observed something new to admire." The leaves are very large, measuring five or six feet in diameter. They have an orbicular form, the upper surface is bright green, and they are furnished with a rim round the margin from 3 to 5 inches in height; on the inside the rim has a green colour, and on the outside, like the under surface of the leaf, it is of a bright crimson; they have prominent ribs, which project an inch high, radiating from a common centre; these are crossed by a membrane, giving the whole the appearance of a spider's web; the whole leaf is beset with prickles, and when young is convolute. The stock of the flower is an inch thick, and studded with prickles. The calyx is 4-leaved, each sepal is 7 inches in length and 4 inches broad; the corolla covers the calyx with hundreds of petals; when first opened it is of a white colour, but subsequently changes to pink. It is very fragrant. Like all other water-lilies, its petals and stamens pass into each other, a petal often being found surmounted with half an anther. The seeds are numerous, and imbedded in a spongy substance. This plant has by some botanists been placed in the genus *Euryale*, whilst Lindley thinks it is nearer *Nymphæa*, from which it differs in the sepals and petals being distinct, the papilla of the stigma being prolonged into a horn, and the changing colour of its petals.

This splendid plant has now been successfully cultivated in many of the hot-houses of this country. Beautiful specimens are to be seen in the Royal Gardens at Kew, where it first flowered in September 1849, and at the Crystal Palace, Sydenham.



Leaf of the Victoria Water-Lily (*Victoria Regia*).

VIDOCQ, FRANÇOIS-JULES, the chief of the detective brigade (Brigade de Sûreté), at the prefecture of the Paris police, established in 1812, whatever must be thought of his early life as a thief and inmate of the convict yards, undoubtedly did real service to France, by his active pursuit of the marauders who levy contributions on their neighbours' goods. He was born at Arras, the chief town in the department of the Pas de Calais on the 23rd of July 1775. His father was a baker, and was chosen to supply the local government, during the revolution, with bread, flour, &c. Young François was employed in the business before he was thirteen; but formed acquaintances who led him to purloin his father's money by means of several artful contrivances. These being detected, the boy began to pilfer the stock, spending the proceeds with his companions at a neighbouring wine shop. A watch was at length set over him; which did not prevent his stealing ten silver forks and spoons, and pledging them. For this offence his father gave him in charge, when he was sent to the House of Correction for a few days. While in confinement he was incited by a young fellow-prisoner to rob his father again, by picking the lock of the till, and taking out the whole contents, amounting to 80*l*. Having divided this money with his accomplice, he left Arras, intending to sail for the United States; but the high price of the passage made him change his mind; and being at Ostend a few days after, he was plundered by a sharper of all his ill-gotten gains.

In this state of destitution, he hired himself to an itinerant showman, who kept a small ménagerie. His allotted task consisted at first in sweeping out the cage and the reception room. His master, after promoting him to the rank of tumbler and acrobat, wanted him to play the part of a savage who eats raw flesh and drinks blood. The wretched boy refused to undertake this new character, and was discharged. He next took service with the master of a puppet show; from whom he passed into the hands of a peregrinating quack-doctor. At length weary of this hard probation of vagrant life, which had lasted two years, the seeming penitent returned home, and a kind old priest prevailed on his father to forgive him and receive him. This was in 1791, in his sixteenth year.

But he was too idle and restless for regular work; so he enlisted (after one or two escapades), in the regiment of Bourbon, and set out for Belgium, then the seat of the new war, between France and Austria. He was present in several actions, and was made a corporal; but, having quarrelled with his drum-major, and challenged him to fight, he deserted to avoid a court martial. He then enlisted in the 11th chasseurs, and fought at the battle of Jenappes, November 6, 1792. Having distinguished himself at the capture of Longivy, under Kellermann, October 20, 1792, and being of unusual stature for his age, he was made a corporal of grenadiers. A day or two after he was recognised as a deserter, when he made his escape to the Austrian outposts. Unwilling however to fight against his own countrymen, he counterfeited illness, and began to teach fencing.

After a short stay with the Austrians, he got back to France, entered the 14th regiment, and then returned to the 11th, being present at several actions, and being wounded three times. One of his wounds obliged him to return to Arras, where in consequence of a quarrel he was denounced to the Revolutionary Tribunal as a 'Modéré,' and thrown into prison. However he was soon after released, owing to the good offices of Mademoiselle Chevalier, the daughter of the notorious Joseph Lebon. He married her in 1793, but they separated almost immediately. The next year he went to Brussels, became a professed gambler, made love to a countess under a feigned name, and repenting of his treachery or fearing punishment for bigamy, just as he was about being married to her, confessed the imposture, was rewarded with a considerable sum of money, and took the diligence for Paris, which he entered for the first time in 1796, at the age of twenty-one.

He had not been in the capital many weeks, before the dangerous society of gamblers, swindlers, and loose women, left him once more penniless; which compelled him to return to the army of the north. Several fresh instances of folly, three imprisonments, and as many escapes, succeeded; after this he was confined in the prison of Douai, where he remained eight months. During his confinement, he was mixed up in a case of forgery, which in his autobiography he tries to explain as an act of inadvertence, rather than of guilt. For this however he was tried, convicted, and sentenced to eight years' penal servitude at the galleys. As they conducted him, bound to the chain, he excited a revolt among the convicts, but the attempt to escape having failed, he reached Brest, and remained six years at the bagne. In this place he completed his studies of the manners, the crafts, the habits, of every class of thief. Two years before the expiration of his penalty, he contrived to escape from the convict-yard, assumed the name of Duval, and returned to his own neighbourhood, where he became an usher to a school at Ambricourt, near Lille. He was soon re-captured, and sent to Toulon. From this convict-yard, he then made what he calls "his finest escape." After this he joined a band of freebooters in the south, who plundered the stage-coaches on the highroads. But these malefactors having detected the brand of the convict on his shoulder, dismissed him from their company, having first made him swear not to betray them. He resolved to be revenged; and this incident became the turning-point in his fortune.

As he was making for the north, Vidocq, having no passport, was arrested and taken before a magistrate, to whom he offered to give such intelligence as would enable him to surprise his late comrades in the act of plunder. For this purpose, he applied for a temporary release. But the magistrate demurred. "Suppose, on my way to prison," said Vidocq, "I get away from my keepers, come back to you, and resume my bondage, will you then grant me the provisional freedom I now solicit?"—"Yes," replied the judge. He escaped, and made good his offers to assist justice. This service was followed by others far more considerable. These events took place in 1804, but he continued for several years the slave of his antecedents. In 1806 he went to Paris again, where he maintained himself by following the handicrafts which he had learned during the course of his nomadic life. He became a toy manufacturer, a dealer in hardware, and a tailor; but other thieves, who had known him in prison, and who were well acquainted with his embarrassments, left him no peace: sometimes they wanted money, at others they proposed a good bargain; next it was some plunder to be hid. On one occasion they borrowed his cart, to convey the body of a murdered victim to a place of safety. His state in the end became intolerable.

In 1809, driven to extremity, Vidocq presented himself before M. Henri, the commissioner of the secret police of Paris, acknowledged his critical condition, and offered to give valuable information in case he might be allowed to come and go freely. This proposal was not accepted until his solicitations had been several times renewed, in the midst of which he was once more arrested. On this occasion he was sent to Bicêtre, when M. Henri, interested by his perseverance, and struck with the pointed nature of his proposals, which he continued to make by correspondence, at last consulted the Minister of Police, Pasquier, who returned a favourable answer, in which Vidocq was instructed to furnish information. His revelations then became so numerous and so important, that his liberty was granted him not long after.

The qualities he displayed in his new functions soon attracted attention. Few detective officers ever possessed so much presence of mind, keen intelligence, bodily strength, courage, and diligence; besides that fluency of slang and banter, which is the eloquence of the vulgar. He made it a point, from the outset of his new vocation, to produce at once the culprit and the proofs of his crime. The receivers of stolen goods found in him a more relentless enemy than the thief. At first he held but a humble employment under the regular police officers; but in 1813 he was withdrawn from their control, and placed under the order of M. Henri alone. His captures were extraordinary. The famous thief Delzève, and Folard, the robber who afterwards stole the medals of the Royal Library, were surprised at their work, and handed over by this secret agent to justice. La Courtelle, a sort of St. Giles's, infested with the worst vagabonds, was purged; the great burglar, Desnoyers, and thirty-two of his accomplices, were taken. About the same time, the famous brigade of detective police (Brigade de Sûreté), directed by Vidocq, was formed, consisting at first only of four men; in 1817 the number rose to twelve; and in 1824, when its complement was full, it contained twenty-eight detectives. "It was with this limited force," says Vidocq, "that I had to watch and look after 1200 returned transports, and issue every year from four to five hundred writs." In the single year 1817, he effected 772 arrests, and 39 seizures of stolen goods. His useful brigade cost but 2000*l.* a year, of which he enjoyed a salary of 200*l.* During the whole term of his official employment, he was the butt of continual charges, suspicions, and open accusations. He was said to take part in every crime, to incite robberies for the sake of arresting his dupes, and to have a share in all the plunder. This obloquy rose so high as at length to alarm the government, and in 1825 he was superseded in his functions by Lacour, whose antecedents resembled his own. In 1826 he established a paper manufactory at Saint-Mandé; and in 1827 he wrote his autobiography, which was published in Paris, by the bookseller Tenon, in 1829, in 4 vols. In 1831-32 he was employed to detect some of the political agitators of the day, but his vocation was not either permanent or precise. Then, in 1834, he set up an office for information on behalf of Trade and Commerce, the object being to enable the fair trader, when applied to for credit, to ascertain the degree of trust to which his new customer was entitled. In 1844, stimulated by the success of Eugène Sue's 'Mysteries' at Paris, and certain works of the same questionable character, which had appeared in London, he republished his Mémoires, under the title of 'Les Vrais Mystères de Paris.' The morbid taste for notoriety of any kind which then seemed to exist, induced Vidocq to visit London, and exhibit himself, with many curious articles used by French burglars, in the rooms of the Cosmorama in Regent Street. But this speculation did not answer his expectations. Soon after he fixed himself in Belgium, where he died in 1850.

VILLARSITE. [MINERALOGY, *S.* 1.]

VINET, ALEXANDRE-RODOLPHE, was born at Lausanne on the 17th of June 1797. His father, who held an official appointment in his native canton, a man of superior attainments, but a somewhat stern disciplinarian, was himself Alexandre's earliest instructor. While still a youth, his studies were chiefly directed to theology, he having been devoted to the service of the church; but then, as throughout life, literature possessed for him a predominant attraction, and so diligently had he laboured in this field, that at the age of twenty he was appointed professor of the French language and literature at the gymnasium of Basel. Two years later, 1819, he was ordained at Lausanne a minister of the protestant church, and the same year he married; but he continued to reside at Basel, where he, during the ensuing years, took an active and prominent part in the great religious movement or 'revival' which occurred amongst the Swiss protestant churches. Besides various pamphlets which he put forth in connection with this movement and with the proceedings of those who were opposed to it, he published in 1826 an elaborate 'Mémoire en faveur de la Liberté des Cultes,' and he gradually came to be regarded as one of the leaders of the evangelical party.

M. Vinet remained at Basel till 1837 diligently fulfilling his scholastic duties as professor of French literature and eloquence, the latter chair having been created for him in 1835, and in 1829 he published, as a text-book for his class, his 'Chrestomathie Française,' a work of great taste and knowledge, which, in the later editions, consists of 3 volumes: 1, 'Littérature de l'Enfance,' 2, 'De l'Adolescence,' 3, 'De la Jeunesse et de l'Age Mûr,' and including a rapid but admirable survey of French literature. In 1831 the literary journal 'Semeur' was commenced, and for several years M. Vinet was one of its chief contributors; and in 1837 he published a selection of his essays contributed to it, with other miscellanies, under the title of 'Essais de Philosophie Morale.' In 1837 Vinet was invited by the authorities to take the chair of practical theology in the academy of his native city of Lausanne, and, with some regret at leaving Basel, he accepted the invitation. The religious discussions in the canton had decided the government to appoint a commission of the four classes of clergy to draw up a new constitution of the church, and M. Vinet was chosen a delegate for the class of Lausanne and Vévay. He took a part in all the protracted discussions which followed, but he could not bring himself to acquiesce in the decisions of the majority, and, accordingly, upon the promulgation of the new constitution which was to come into operation in 1841, he, at the end of 1840, formally seceded from the national church, and resigned his professorship of theology. His opinions had in fact from the publication of his 'Mémoire en faveur de la Liberté des Cultes' in 1826, been approximating more and more closely towards 'voluntaryism,' and from this time he became a decided, and, among French Protestants, perhaps the most distinguished advocate of the entire separation of church and state. His matured views on this subject he gave to the world in 1842 in an 'Essai sur la Manifestation des Convictions religieuses, et sur la Séparation de l'Église et de l'État, envisagée comme conséquence nécessaire et comme garantie du principe,' a work which was translated into English in 1843 under the title of 'An Essay on the Profession of Personal Religious Conviction, and upon the Separation of Church and State, considered with reference to the Fulfilment of that Duty.' But Vinet was far from being the harsh or bigoted advocate of extreme opinions. Whilst firmly adhering to his own views, he exhorted to a wide tolerance of the honest convictions of others, and his later years were spent in preaching peace and brotherly love, and seeking by the amenities of literature to soften the asperities of theological controversy.

His last labour was the elaboration of a constitution for the Free Church of the canton of Vaud, formed by the ministers who seceded from the establishment in 1845, and which he induced the committee appointed by the Church in 1846 to prepare the constitution, to adopt in its integrity. With the Synod however, in which the ultimate adoption of the constitution was vested, he was less successful, and the material alterations there introduced, are said to have preyed severely on his frame, already enfeebled by protracted ill-health. He continued however with increased diligence his professional duties and literary studies till his powers gave way: he died on the 10th of May, 1847.

A list of the chief works, not already mentioned, of M. Vinet, will sufficiently indicate the character of his mind and the range of his pursuits. Among his theological works may be named his 'Discours sur quelques sujets religieux' (1831, of which a fourth edition appeared in 1845), and 'Nouveaux Discours,' &c. (1841), from which two works selections have been translated into English and published in America and Edinburgh under the title of 'Vital Christianity;' and the posthumous publications 'Théologie Pastorale,' and 'Homilétique ou Théorie de la Prédication,' of both of which English versions have appeared; 'Liberté religieuse et Questions ecclésiastiques:' 'Études sur Blaise Pascal;' 'Études Evangéliques,' and 'Nouvelles Études Evangéliques,' which have been rendered into English as 'Gospel Studies.' His two chief literary works are his 'Histoire de la Littérature Française au XVIIIe Siècle,' 2 vols., which appeared in an English version in 1854, and 'Études sur la Littérature Française du XIXe Siècle,' 3 vols. 8vo: 1, 'De Staël et Châteaubriand;' 2, 'Poëtes Lyriques et Dramatiques;' 3, 'Poëtes et Prosateurs.' All these works are accurate reflections of the mind and character of the author. Pure in sentiment, elegant and finished in style; clear, eloquent, brilliant rather than profound in thought; and everywhere pervaded by an earnest and conscientious spirit, they are works which will be read with pleasure and respect even by those who differ widely from their opinions. As a preacher, M. Vinet bore a high character for eloquence and earnestness; and as a teacher, he greatly increased the reputation of the schools of Basel and Lausanne, while his personal character was in every way admirable.

(E. Scherer, *Alexandre Vinet—Notice sur sa Vie et ses Écrits*, Paris, 1853; and an excellent essay on the *Life and Writings of Vinet*, in No. 42 of the 'North British Review,' Aug. 1854.)

VIOLET. [VIOLA.]

VIPER'S GRASS. [SCORZONERA, S. 2.]

VISCONTI, LOUIS JOACHIM, son of Ennio Quirino Visconti, was born at Rome in 1797. His father was compelled at the close of 1799 [VISCONTI, E. Q.] to remove with his family to Paris, and there the young Visconti was carefully educated. Having selected architecture as his profession, his father, as soon as he was of sufficient age, placed him with the architect Percier [PERCIER, CHARLES, S. 1], so well known by his works on the Louvre, a building with which the name of the pupil was to become still more intimately associated. Under Percier, Visconti made a distinguished progress, carrying off at the Architectural School five medals, and a second prize for the plan of a library. Shortly after the termination of his pupilage, he obtained an appointment as inspector of public buildings; and subsequently that of architect and surveyor of the third and eighth arrondissements of Paris, an office he held for above a quarter of a century. He was further, in 1825, appointed architect of the Bibliothéque Royale, and he is said to have made no less than twenty-nine plans and elevations in the hope of being directed to give to that building an architectural character equal to the grandeur of its contents, but his ambition was not gratified. Although not called upon to construct any important edifice, M. Visconti found ample employment in connection with the offices he held; and to him was entrusted some of the public monuments with which Paris has of late years been adorned. Several of the finest fountains in Paris, including those of St. Sulpice, the Place Louvois, Gaillon, and Molière, were executed from his designs. The tomb of Napoleon I. is also by him, and is his grandest work of the kind, but he also designed the monuments of Marshals Soult, St. Cyr, Suchet, Lauriston, and those of some other generals and eminent men. He was likewise called upon to design innumerable triumphal arches and other temporary structures for fêtes and occasions of public rejoicings and ceremonies, and his taste and fertility of invention were generally admired. He also designed several hotels and private residences. But the work with which his name will be most permanently connected is, perhaps, the completion of the Louvre, and its connection with the Tuileries. The Emperor Napoleon III. having decided on completing this the favourite project of the first Napoleon, M. Visconti was directed to prepare the necessary plans, and these having met with the emperor's approval, the first stone of the new works was laid on the 25th of July 1852. The operations were pressed forward with the greatest vigour, but Visconti did not live to see this his greatest work completed. He died on the 29th of December, 1853, having been struck with apoplexy, which is said to have been brought on, or hastened, by over-exertion and anxiety. Visconti's plans were carried out to completion under the superintendence of M. Lefuel, who was appointed to succeed him, and on the 14th of August, 1857, the vast undertaking was declared finished, and the junction of the Louvre and the Tuileries was inaugurated with great pomp by the Emperor. Of course in such a work, the new buildings having to be rendered uniform in their elevation with those already existing, there was little room for originality, but it is admitted that Visconti has overcome the difficulties arising from the peculiarities of site, &c., in a very masterly manner, and that he has by his additions,—which while harmonising with the older portions, are more ornate and sumptuous in style,—rendered it one of the most magnificent royal residences in Europe.

VITALITY, a term equivalent to that of Life, and applied to the functions performed by living bodies, that is, plants and animals. Linnæus defined the three kingdoms of nature as follows:—Minerals grow; Plants grow and live; Animals grow, live, and feel. Here the fact of living is made to distinguish between minerals and plants, and the inquiry is naturally made for a definition of life. It is often assumed to be a set of actions under the controlling influence of a vital principle, but, as such a principle has never been demonstrated, it must only be regarded as an assumed cause. Some writers have supposed that all the phenomena of life may be resolved into the action of chemical and physical forces acting upon special forms of matter, and that in plants and animals are presented the results of chemical and physical activity in forms in which it does not exist amongst minerals. Coleridge, in his 'Idea of Life,' contends that the collective activities of the material universe is as much a life, and its parts as much entitled to be regarded as living, as a plant in its special organs.

Setting aside however the idea of a vital principle, or confining this term to the force which regulates and produces the specific form in each individual animal or plant, and which is then applicable as well to minerals, there are a certain set of phenomena in plants and animals to which the term 'vital' seems especially applicable. This term may be thus applied without in any manner assuming the existence of any force independent of those which are known to influence all matter upon the surface of the earth.

Thus, the growth and reproduction of cells may be regarded as a vital process; also the contractibility of the muscular tissue, and the sensibility of the nervous tissue. These processes are called collectively Vital Processes. The force by which cells grow has been called the Organising Force, the Plastic Force, the Assimilative Property, and the Metabolic Property. The contractibility of the muscles has been properly called Muscle-Force, whilst the sensibility of the nerves has been called Nerve-Force.

That these forces are dependent on physical forces is seen in the fact that plant-cells will not grow without light. Muscle-force and nerve-force are not producible but by the assimilation of materials that have been formed by chemical actions produced by heat and light.

The natural philosopher has demonstrated that electricity, galvanism, and magnetism, are different manifestations of the same force. He has rendered it probable that motion, heat, light, and chemical affinity, are also convertible forces. The physiologist has followed this train of thought, and rendered it probable that, with regard to muscle-force and nerve-force, they are but differentiations or other manifestations of the physical forces. Muscle-force and nerve-force depend upon the destruction (chemical change) of cells which are formed out of materials (protein) which have been formed by the influence of heat and light upon the carbonic acid and ammonia supplied to the cell of the plant. A certain amount of protein is the expression of a certain amount of chemical change, and this again in decomposition is the expression or the amount of vital force, which a part composed of protein will exhibit. Vital phenomena are found to be but the expressions of chemical and physical change, and result in one or other of the physical forces. This view of the nature of vitality does not lead to materialism, as the consciousness of man exists independently of the physical changes which go on in his body, and the character of his mind is formed in virtue of its retaining impressions from the ever-active changes which go on in his body through the agency of the vital forces. [MUSCLE; NERVE and NERVOUS SYSTEM; MOTIONS OF PLANTS; VEGETABLES, VEGETABLE KINGDOM; CELLS, *S.* 2.]

(Matteucci, *Electro-Physiological Researches*, in *Philosophical Transactions;* Matteucci, *On the Physical Phenomena of Living Beings;* Grove, *On the Correlation of the Physical Forces;* Reynolds, *Objects and Scientific Position of Physiology; British and Foreign Medical Review*, vol. xxx.)

VIVIANACEÆ, *Vivianads*, a natural order of Exogenous Plants with free stamens, no disc, albuminous seeds, a curved embryo, permanent petals, and a ribbed calyx. The species are herbaceous or half-shrubby plants, with opposite or whorled leaves, without stipules. They are related to *Tiliaceæ* and *Tropæolaceæ*. All the species inhabit Chili and South Brazil. There are 4 genera and 15 species.

VOGEL, DR. EDUARD, was born March 7, 1829, at Leipzig, where his father, Dr. Carl Vogel, was master of one of the principal schools. He was educated at Leipzig, and afterwards studied astronomy at Berlin under Professor Encke. He resided in London about two years at Mr. Bishop's Observatory, Regent's Park. It having been deemed expedient to send out another person to assist Drs. Barth and Overweg in making their scientific observations in Central Africa [AFRICA, *S.* 2; OVERWEG, *S.* 2], a suitable person was found in Dr. Vogel, who volunteered his services with enthusiasm. He left London accompanied by two volunteers from the corps of Sappers and Miners, in February 1853. Dr. Vogel was provided with astronomical, magnetical, and other instruments suitable for his own purposes, and also to supply the place of those of the other two travellers which might have been injured or lost in their journeys. Dr. Vogel and his companions reached Mourzuk, in Fezzan, August 8, 1853, and remained there till the middle of October. They accomplished successfully their journey across the Great Desert, and reached Lake Tchad on the 6th of January 1854. A revolution had taken place at Kuka, and there was a new sultan and also a new vizir, by whom however Dr. Vogel was received kindly. Dr. Vogel continued his explorations in Central Africa after the return of Dr. Barth to Europe. He visited Yacoba, and on the 30th of April 1855 crossed the Chadda at the same place where the Pleiad steamer, under the command of Dr. Baikie, had anchored the previous year. In the early part of 1857 a despatch received by the British government enclosed a copy of a letter from Corporal Maguire to the British consul at Tripoli, dated Kuka, November, 1856, which announced the reported assassination of Dr. Vogel in the kingdom of Wadai. Corporal Maguire was one of the two volunteers from the corps of Sappers and Miners, who accompanied Dr. Vogel to Central Africa, and he then stated that he was coming home with the observations and instruments. A paragraph in 'The Times' newspaper, of the date of August 21, 1857, stated that "the official confirmation of the murder of Dr. Vogel, at Wara, the capital of Wadai, has just been received. He was beheaded by order of the Sultan. Corporal Maguire was murdered by a party of Tuaricks some six miles to the north of Kuka." The other engineer had previously returned to London.

VOLBORTHITE. [MINERALOGY, *S.* 1.]

VOLTAITE. [MINERALOGY, *S.* 1.]

VOLVOX, a genus of organic beings referred by Ehrenberg to his family of *Infusoria*. Siebold was the first to doubt the correctness of Ehrenberg's classification, and the result has been that through the subsequent researches of Williamson, Busk, and Cohn, the species of *Volvox* are now regarded as forms of the vegetable kingdom.

Ehrenberg describes three species of *Volvox: V. globator*, *V. aureus*, and *V. stellatus*. A fourth form is described by Ehrenberg under the name of *Sphærosira Volvox*.

The following is Mr. Busk's account of these forms of *Volvox:*—

"The more common and best known form of *Volvox globator*, to the naked eye, or under a low power, appears as a transparent sphere, the surface of which is studded with numerous regularly placed green granules or particles, and which contains in the interior several green globules, of various sizes in different individuals, though nearly always of uniform size in one and the same parent globe.

"These internal globes, which are the young or embryo *Volvox*, at first adhere to the wall of the parent cell, although the precise mode of connection is not very apparent. When thus affixed, they are in a different concentric plane to the smaller green granules. At a later period, and after they have attained a certain degree of development, these internal globes become detached, and frequently exhibit a rotatory motion, similar to that of the parent globe.

"In the form of *Volvox*, termed *V. aureus* by Ehrenberg, the outer sphere, or cell, exhibits precisely the same structure as the above, the only apparent difference between them consisting in the deeper green colour of the internal globules. These however soon exhibit a more important distinctive character in the formation of a distinct cell-wall of considerable thickness around the dark-green globular mass. This wall becomes more and more distinct; and, after a time, the contents, from dark-green, change into a deep orange-yellow; and simultaneously with this change of colour the wall of the globule acquires increased thickness, and appears double.

"The third form, or *Volvox stellatus*, differs in no respect from the two former, except in the form of the internal globules, which exhibit a stellate aspect, caused by the projection on their surface of numerous conical eminences, formed of the hyaline substance of which the outer wall of the globule is constituted. The deep green colour of the contents of these stellate embryoes, and their subsequent changes into an orange colour, at once point out their close analogy with those of *V. aureus*. I have no doubt of their being merely modifications of the latter: and in fact the two forms are very frequently to be met with intermixed, and on several occasions I have observed smooth and stellate globules in the interior of one and the same parent globe.

"The organism described and figured by Ehrenberg, under the name of *Sphærosira Volvox*, also presents the appearance of a transparent globe set with green spots, but it differs from the foregoing in two important respects:

"1. In the absence of any internal globules or embryoes.

"2. In the irregular size of the green granules lining the wall, which, instead of being of a uniform size, are of various dimensions."

Mr. Busk and Professor Williamson, in the first volume of the new series of the 'Microscopical Society's Transactions,' have furnished in great detail an account of the development of these curiously organised granules. From their observations, it appears that the green ciliated granules which stud the surface of the *Volvox* are produced from a central embryonic mass of protoplasm by successive division by segmentation. Mr. Busk observed in these green granules a curious phenomenon.

"It will also be observed, that each ciliated cell or zoospore, as it may analogically be termed, contains a green granular mass or masses, composed, for the most part probably, of chlorophyll granules and a more transparent body, which I suppose may be regarded as a nucleus, and derived, as it would appear, from one of the bright spherules which have been noticed before. At an early period after the maturity or completion of the zoospores they exhibit a minute circular clear space, or sometimes, but I think rarely, more than one, which is worthy of very attentive consideration. This space is of pretty uniform size in all cases, and about 1-9000th of an inch in diameter. It may be situated in any part of the zoospore, or not unfrequently in the base, or even in the midst of one or other of the bands of protoplasm connecting it with its neighbours. Its most important character consists in its contractility—a property already known to be possessed by similar spaces or vacuoles in vegetable spores; but what appears to me a very curious, and as yet unnoticed, peculiarity of this contraction, consists in the fact that it is very regularly rhythmical. In several cases in which I have watched the phenomenon in question, uninterruptedly, for some time, the contractions or pulsations occurred very regularly at intervals of about 38″ to 41″. In one case, however, if I was not misled in the observation, the interval was about twice this, namely, 1′25″. The contraction, which appears to amount to complete obliteration of the cavity of the vacuole, takes place rapidly or suddenly, as it were, whilst the dilatation is slow and gradual." This contraction of vacuolar spores has since been observed by Cohn in a species of *Protococcus*.

Mr. Busk thus sums up the result of his observations upon *Volvox globator*:—

"1. That it originates in an apparently nucleated discoid cell, which is generated in the interior of the parent, and liberated in a perfect though not fully matured form, within which are contained similar germs.

"2. That the contents of this apparently nucleated discoid cell, consisting of a grumous material, and refractive amylaceous (?) spherules, after a time undergo segmentation, at the same time exhibiting a distinct wall, beyond which is a delicate areola, apparently of a gelatinous consistence.

"3. That this segmentation, attended with a corresponding augmentation in the number of the refractive spherules, terminates ultimately in the formation of numerous contiguous particles or segments.

"4. That these ultimate segments are gradually separated from each other, remaining connected only by elongated processes or filaments, and constituting the ciliated zoospores of the mature *Volvox*.

"5. That these zoospores at first are simple masses of protoplasm, containing a transparent nuclear body, and that afterwards they present for a time clear circular spaces, which contract rhythmically at regular intervals; and are subsequently furnished with a brown eye-spot; and at a very early period with two long retractile cilia, which arising from an elongated hyaline beak penetrate the parent cell-wall, and exert active movements external to it.

"6. That in a concentric plane internal to these ciliated zoospores are placed the germs of future individuals destined to follow the same course."

VÖRÖSMARTY, MIHALY or MICHAEL, an eminent Hungarian poet and prose writer, was born at Nyér, in the county of Fejervár, called by the Germans Stuhlweissenburg, in the year 1800. His father, whom he lost early, was steward to a nobleman. Michael went in 1817 to Pesth to study law, and in 1824 he was admitted as an advocate, but he early adopted literature as a profession. In 1821 appeared his first drama, 'King Solomon,' founded on the History of King Solomon of Hungary, and in 1824 another drama, 'King Sigismund,' between which, in 1822, was published his romantic poem of the 'Triumph of Fidelity.' It was as an epic poet that he attained the greatest celebrity: his 'Zalan Futása,' or Flight of Zalan, his 'Cserhalom,' and his 'Tündervölgy,' or Enchanted Valley, the first published in 1824 and the last in 1827, are considered the finest narrative poems in the Hungarian language.

For some years Vörösmarty was editor of the 'Tudomanyos Gyüjtemény,' or Repository of Science, a monthly magazine, which lasted under his guidance and that of others for a quarter of a century, and was during its continuance the chief organ of Hungarian periodical literature. He was afterwards concerned with Bajza and Schedel in the editorship of the 'Athenæum,' a periodical not unlike the London 'Athenæum,' which had for a time great and deserved success. In 1830, on the establishment of the Hungarian Academy at Pesth, he was appointed one of its members, and soon afterwards its secretary, and for some years his life flowed in an unbroken course of literary labours and literary fame. In general his reputation stood higher among the educated classes than among the people; but one of his lyric poems, the 'Szózat,' or Appeal, written in 1840, enjoyed a double success; it rose at once to a strong popularity among the people, like that of the 'Marseillaise' in France, and the Hungarian Academy presented the poet with a ducat for every line. Some of the lines of the 'Szózat,' the subject of which is the fate and prospects of the Hungarian nation, have since acquired a melancholy increase of significance:—

> "For come there will, and come there must,
> To us a better time.
>
> "And if it come not, then come Death
> To end our dark career,
> And be our country, drenched in blood,
> Laid on a glorious bier."

It was natural that at the outbreak of the revolution in 1848 the poet of the 'Szózat' should be called on to take a part, and he was elected deputy for the county of Bacska. His course in the Assembly however was far from meeting the approval of some of the more fiery patriots. The popular and impetuous Petöfi, the Hungarian Burns, was so indignant at one of Vörösmarty's votes that in a poetical address to him he renounced his friendship. [PETÖFI, *S.* 2.] On the final triumph of the Austrians Vörösmarty was brought to trial and condemned as a member of some of the revolutionary committees, but was released and pardoned after a short imprisonment. Such however was the effect produced upon him by the calamities of his country, that he sunk into a deep melancholy, and lived for two or three years in retirement, without suffering pen and paper to come in his sight. At length, in 1854, his friends roused him in some degree from this state of depression, and he undertook a translation of Shakspere, some of whose plays he had rendered into Hungarian in happier days. The task was still not completed when Vörösmarty died at Pesth, on the 9th of November 1856.

An edition of the works of Vörösmarty was issued by his friends Bajza and Schedel as part of the collection of the Hungarian classics, entitled the 'Nemzeti Könyvtar,' or National Library. It was published in 1847. The divisions adopted for the writings are Lyric Poetry, Narrative Poems, Dramas, More Recent Poetry, Novels and Tales, and Miscellaneous Writings in Prose, which are subdivided into Essays on Language and Literature, and Dramatic Criticisms. The whole are comprised in one thick octavo volume, printed in double columns, but would occupy nine or ten ordinary octavos. Vörösmarty's writings are more distinguished for classical correctness of form than for striking originality of substance. His narrative poems are written in hexameters on the classical model, for which the Hungarian is perhaps better adapted than any other modern language. His lyric as well as his epic poetry is estimated at a high value by native critics; but the very qualities that excite their admiration render their beauties difficult of transfer.

W

WACKÉ, a barbarous name formerly much employed by German geologists, and thence introduced into English geology. It is regarded as a soft and earthy basalt, but has been used in other senses, and rather indefinitely. (Ansted, *Elementary Geology*.)

WAGHORN, LIEUT. THOMAS, R.N., was born in the early part of the year 1800, at Chatham, in Kent. He entered the royal navy as a midshipman, November 10, 1812. Before he had quite completed his sixteenth year he had passed in navigation for a lieutenant before the Royal Naval College, at Portsmouth. He was paid off in 1817, and after serving some time as a mate in a free trader to Calcutta, was appointed in 1819 to the Bengal Pilot Service, in which he remained till 1824. He then volunteered for the war in Arracan, and was appointed to the command of the Matchless, East India Company's cutter, and of a division of the gunboats connected with the flotilla and army. He was employed in much service by land as well as by sea, was in five engagements, and was once wounded in the right thigh. He returned to Calcutta in 1827, and soon afterwards entered into communication with the government authorities there with respect to a project which he had conceived of communication by steamers between Great Britain and the East Indies. Having returned to England with recommendations from some of the chief members of the Bengal government, he immediately began to advocate in London, Liverpool, Glasgow, and other large towns, as he had previously done at Madras, Mauritius, and the Cape of Good Hope, the great project which he had in contemplation, and to the accomplishment of which he applied the whole force of his energetic mind and will. Unfortunately the chief authorities of the post-office, as well as nearly the whole of the East India directors, were averse to the project. But in October 1829 Lord Ellenborough, president of the Board of Control, and Mr. Loch, chairman of the Court of Directors, engaged him to proceed through Egypt to Hindustan with despatches for Sir John Malcolm, governor of Bombay, and he was directed to join the Enterprise steamer at Suez on the 6th of December. The Enterprise however having broken her machinery on the voyage from Calcutta to Bombay, was not there, and Mr. Waghorn, rather than return to England with the despatches, sailed down the Red Sea in an open boat, without chart or compass, directing his course by the sun and stars. In six days and a half he reached Jiddah, on the coast of Arabia, a distance of 628 miles, whence he proceeded by ship to Bombay. This journey convinced him of the advantagee of the line of commnnication through Egypt, and by Suez down the Red Sea to Bombay. With nnabated energy and perseverance, supported only by the Bombay Steam Committee, he was enabled to complete the overland route three entire years before it was taken np by the British government. He accomplished the building of the halting-places and the establishment of the hotels on the desert between Cairo and Suez. He supplied carriages, vans, and other necessary means of conveyance, and also placed small steamers on the canal of Alexandria and on the Nile, as well as suitable steamers on the Red Sea. From 1831 to 1834 the overland mails to and from the East Indiee were worked by himself. In 1832 he brought under the notice of the Pasha of Egypt the advantages which would result to that country from the formation of a railway between Cairo and Suez, but that improvement of the overland route has not yet been undertaken. He attained the naval rank of lieutenant March 23, 1842, after which he retired on half-pay. In the winter of 1847 Lieutenant Waghorn effected a saving of thirteen days by performing the journey by the way of Trieste, instead of through France, and he also explored other routes, by Genoa, and through the Papal States, taking steamer at Ancona. The prosecution of the Trieste line in 1846 involved Lieutenant Waghorn in pecuniary eugagements, from which the sacrifice of his entire property was insuffioient to release him. A short time before his death a pension was granted him by the British government, of which he lived to receive only the first quarterly payment. He died January 7, 1850, at Pentouville, London, in the forty-ninth year of his age, worn out by a life of anxious labour and exposure to inclemencies of weather and climate. A small pension was granted by the British government to his widow, to which a small addition was made by the East India Company from a fund at their disposal.

WAGNERITE. [MINERALOGY, *S.* 1.]

WALES, NEW SOUTH. Under this head was given a description of the whole country when it formed but one colony, aud before the rapid expansion, the exploration of the interior, the discovery of gold, and the vast increase of the population, made it necessary to divide the territories into four colonial governments. New South Wales, however, still maintains a sort of metropolitan character, and as its boundaries now vary from those formerly mentioned, and as its geographical features have become better known, it will now be fully described, even at the risk of an occasional repetition of what had been previously stated. Where the accounts disagree the present is to be taken as founded on better information.

New South Wales extends over the south-eastern portion of Australia. Its western boundary has been fixed by the grant of the colony of Southern Australia, whose eastern boundary extends from the shoree of the Southern Sea along 141° E. long. to 26° S. lat. The northern boundary-line of New South Wales has not yet been definitely fixed, but is generally taken as 26° S. lat., the same as Southern Australia, as there are settlements, particularly since the gold discoveriee, north of Moreton Bay, which is in 27° S. lat. On the east New Sonth Wales is washed by the Pacific. On the south the Murray forms the boundary between it and the newly-constitnted province of Victoria from South Australia to its source, whence the line turns southerly through the Australian Alps west of Mount Wellington, and then takee an arbitrary straight line south-easterly to Cape Howe, which is the most southerly point of the province, in 37° 5′ S. lat., 150° E. long. The extreme length is 893 miles, the average breadth about 600 miles, which givee an area of 535,800 square miles. The most north-western portion of the country, extending over perhaps one-third of the whole surface, has scarcely been visited by any European. The population of the colony was estimated in 1856 at 266,189, of whom 147,091 were males.

Surface, Soil, and Climate.—The physical constitution of this country is very peculiar. The interior consists of wide plains, interrupted only by comparatively short ranges of high hills or low mountains. The waters collected in these plains are all nnited into one river, the Murray, which disembogues within the territories of South Australia. On the east and south the plains are surrounded by higher land, which constitutes the watershed between the rivers joining the Murray and those which run into the sea. This watershed is in general about 100 miles from the shores.

The Australian Alps commence at Wilson's Promontory, and extend into New South Wales by Mount Wellington. In this range rise the Murray and the numerous streams which, flowing more or less westward, nltimately fall into it and form it into a river, having abundance of water all the year round, whilst most of the large rivers which run into the interior become dry during the summer months. Farther north, in the Warragong Chain, the Murrumbidgee with its affluents takes its source, and is likewise a pereunial river; east and north of this are Yass Plains and the hilly tract inclosing Lake George. The elevated plains extend, uuder the name of Goulburn and Breadalbane Plains, about 40 miles farther north, to the southern extremity of Cockbundoon Range, which constitutes the southern part of the Blue Mountains, east of which rune the Shoalhaven river to the sea. The Blue Mountains commence in 34° 30′ S. lat., and run northward to the Monundilla Range, in 32° 40′ S. lat. From the eastern side descend the Nepean, the Colo, the Wollondilly, and the Macdonald rivers, all of which find their way to the sea through the Hawkeebury at Bullen Bay; on the weet side descends the Lachlan and its affluents, which join the Murrumbidgee. The mountains are of sandstone; the highest point, King's Table Land, attains a height of 3400 feet above the flat country. At the distance of from 60 to 70 miles north of the Monundilla Range is the Liverpool Range, running east and west. This range extends to about 32° S. lat. On its northern side are Liverpool Plains, between 150° and 151° E. long. In these parts its southern slope rises with a precipitous acclivity, and in some places nearly perpendicular above the plains which lie south of it. Its elevation is probably 1500 or 2000 feet above the base. Where the slope is not too rapid it is thinly wooded. On account of the steepness of the ascent, only two places have been found at which it can be traversed with ease: the western called Pandora Pass, near 150° E. long.; and the eastern, called Hecknadüey, west of 151° E. long. When the summit of the passes is attained, a short descent brings the traveller to the Liverpool Plains. A ridge from the Monundilla Range to these mountains divides the affluents of Goulburn River, a tributary of Hunter River which falls into the Pacific, from those of the Cudgegong and Talbragar, which fall into the Macquarie. A considerable portion of thie ridge is without trees, overgrown with buehes, and grassy; but on the rising grounds are forests composed mostly of apple trees, iron-bark, stringy-bark, and box.

The coast-line on the east extends in a general direction of north-north-east from Cape Howe to Cape Byron, when it recedes a little to the west. There are numerous harbours formed by the mouths of the rivers flowing into the Pacific. The chief of these, proceeding from south to north, are—Twofold Bay, at the mouth of the Towamba, immediately north of Cape Green, one of the boldest promontories along the coast; Barmouth, Bateman Bay, Sussex Haven, Jervis Bay, Shoalhaven, Port Hacking, Botany Bay, Sydney, Port Jackson, Broken Bay, Port Hunter, Port Stephene, Farquhar and Harrington Inlets at the mouths of the Manning and Lansdowne rivers, Port Macquarie, Trial Bay, Shoal Bay at the mouth of the Clarence River, in 29° 5′ S. lat. whence there is no other till we come to Moreton Bay, with its group of islands extending 70 miles from north to south. In this extent the shore presents every variety of appearance. From Cape Green to Shoalhaven River the cliffs are generally low; from Shoalhaven River, north of 30° S. lat., to Hunter River, north of 35° S. lat., they present a range of bold perpendicular cliffs of sandstone lying in horizontal strata, occasionally interrupted by sandy beaches, the high land retiring to a considerable distance. Numerous sand-hills occnr along the remaining part of the coast. Port Stephens ie a bar-harbour, so that small vessele only can enter it; those of larger description are compelled to anchor ontside. In some parts especially north of Trial Bay (30° 50′ S. lat.) and south of the month of Clarence Rivsr, are tracts of coast many miles in length, where it is rocky and rises to a considerable elevation. The harbours are only found at the mouths of the nnmerons rivers.

Rivers.—The larger rivers which drain the country between the Pacific and the watershed have water all the year round. They generally flow in beds which are deeply depressed below the common level of the conntry, and between banks which rise perpendicularly, or nearly so, from 100 to 200 feet and freqnently higher, so that the streams are inaccessible, except at a few places. They are of little use either for irrigation or for transport. The *Shoalhaven River*, the most sonthern of the considerable rivers of this region, rises on the tabls-lands east of the Warragong Mountains, and rnns abont 90 miles northward, measured in a straight line, and then about 40 miles eastward. About 20 miles from its mouth occurs the last rapid, np to wbicb the tide flows. The mouth of the river is mnch obstructed by shoals and sand-banks. The *Hawkesbury* falls into Broken Bay. It rises under the name of Wollondilly, on the connecting table-lands, and receives nearly all the waters which are collected on them. It flows into a deep bed, sinking into a deep ravine, when it is no longer accessible. The lsst rapids occnr near Windsor, from which place it is navigable for moderate vessels. Windsor is only 40 miles from the sea in a straight line, but 100 miles at least following the windiugs of the river, whose waters are fresh for 30 miles below the town. Its estuary, Broken Bay, is surrounded by rocks, and has several good anchoragss even for large vessels, the best of which is called Pittwater. The wbole course of the river exceeds 250 miles. Sometimes the floods of this river rise to 90 feet above its usnal level, and the inundations then lay waste tbe fertile tracts on its banks. *George's River* falls into Botany Bay. It runs hardly 60 miles, but is navigable for boats from Liverpool, downwards, a distance of about 12 miles in a direct line, but 24 miles following the windings of its course. *Hunter River* disembogues into Port Hunter. It has two great branches, one called Hunter and the othsr Goulburn. The first rises in the Liverpool Range, the other in the connecting ridge, and both have very tortnous courses. The navigation begins at Maitland, about 20 miles from Port Hunter by land, bnt nearly 40 miles by water, aud a steamboat plies regularly between that town and Sydney. This river often rises rapidly after heavy rains, and in some places to the height of 50 feet.

The navigable rivers which drain the conntries north of the Hunter are the Manning, Hastings, Apsley, Clarence, and Brisbane. The Manning and the Hastings botb fall into Port Macquarie, whicb is a bar-harbour, admitting only vessels of 100 tons bnrden; and it is dangerons to enter, except at fnll tide, on acconnt of the rapid current, which sets the vessels ashore upon the shoals on the northern side of its entrance. Outside the bar is good anchorage for ships of the largest class, except when the wind blows strong on the shore. Within the bar is secure anchorage for a great number of vessels.

North of Port Macquarie is the vallsy which is drained by the *Apsley* or *Mac Leay River*, which divides about 12 milss from the sea into two branches, iuclosing a large island. The main brancb at the northern end forms the harbour of Trial Bay, wbich has a bar across, baving from 12 to 17 feet of water upon it. This river is navigable to a distance of more than 50 miles from the sea, when farther progress is impeded by a fall, which occnrs where the river issues from a narrow glen, whose sides rise 900 feet above its hed. Below this place the river runs through a wide valley, in which there are some plains destitute of timber, and gently-rising hills covered with openiug forests and grassy pastures. Farther north is the valley of the *Clarence River*. The month of the river is at Shoal Bsy, 29° 20′ S. lat. The bar across its entrance has 12 feet of water on it at high tides. *Brisbane River* falls into Moreton Bay, and is navigable by ships drawing 16 feet of water 20 miles np, at which point a ridge of rocks crosses the bed, but to a distance of more than sixty miles from the sea it may be navigated by boats. Several of its tributaries are also navigable for some miles from their months. The conutry on both banks of tbe river presents an alternation of hills and level tracts. The soil, which is very good, is overgrown with bigb trees, among which are cedars and cypress-trees of great magnitude. The higbest bills lie on the north side of the river, where some rise from 700 to 800 feet. The farthest sources of the Brisbane are in the Coast Range, which here offers an easy passage to the interior by a gap which occurs south of 28° S. lat., north of Mount Mitchell, which is 4120 feet above the sea.

All tbe rivers draining the interior of New South Wales, as far as it is known, appear to belong to the river basin of the Murray. The rivers composing this extensive system consist of nnmerous streams that flow westward from the higb lands running north and sonth through New Sonth Wales. The Murray itself we have noticed as dividing the colony from Victoria, and it enters South Australia at Table-Land Cliffs, and after flowing in a westerly direction about 90 miles in a direct line, it turns to the south and enters the sea at Encounter Bay. The Murrnmbidgee, after it has itself received the Lachlan, falls into the Murray in 143° E. long. Tbe Darling, by its npper brancbes, drains the country extending from 32° to 28° S. lat. Its most northern branch, the Condamine, rises on the Darling Downs, in 28° S. lat., runs northward as far as 26° S. lat., 151° 4′ E. long., then turns westward to 149° E. long., and then sonth-westward till it joins the Darling on its left bank. From the sonth it receives the Bogan, a considerable stream, risiug in the Harvey Range; and it is probable that the Macquarie, at least during the rainy season, disembogues into it part of its water from the marsh in which it is lost.

Geology, Mineralogy, &c.—The general account of the geology of the island has been given nnder Australia, *S.* 2. Sir R. I. Murchison bad asserted that gold mnst exist in the country under certain formations; and the same theory had been promulgated in the colony by the Rev. W. B. Clarke, on the gronnd that the strata of the Anstralian mountains running north and south throngh Victoria and New South Wales, were of the same formation as those of the Sierra Nevada in California, and the Ural Mountains in Russia, namely, granite mixed witb qnartz and schistose slate; but it was not till 1849 that the actnal existence of gold was discovered. In 1851 fnrther discoveries were made, Mr. Hargraves disclosed tbe places wbere be bad fonnd gold, and when the government officer was sent to examine the places, he found persons already working them. On May 22nd instructions were given by the governor to grant licences to diggers at 30*s.* per month. The first discoverers obtained the gold by washing the detritus from the beds of the creeks, and the earth from the shores; bnt it was soon found that the richest deposits were in the quartz, and means were fonnd to crush the rock and obtain the gold. On August 5th the governor issned a notice that the licences would only apply to the gold-washers, and that on gold obtained by crushing, a royalty mnst be paid of from 5 to 10 per cent. Policemen were appointed to the varions stations, and escorts furnished for bringing the gold from the diggings to the ports of Sydney or Melbonrne. In a short time the towns aud villages were deserted, all the nsual avocations abandoned, the ships in barbour left nnmanned, and every one capable of labour repaired to the diggings. An immigration ensued almost without a parallel.

Respecting other metals we have little to add to what is said nnder Australia, *S.* 2.

Iron-ore is known to exist in several places, especially on the west of Blue Mountains. Several extensive coal-measures have been fonnd, two of which are worked. Tbose found near the month of the Hunter River, near Newcastle, are extensively worked, and their produce is shipped to Sydney. The coal-beds near Western Port are also very large, and have been worked for several years. Limestone is abundant in some places, and some kinds of marble are worked on the banks of the Wollondilly.

Soil, Agriculture, and Agricultural Productions.—The soil of so extensive a conntry must necessarily vary greatly. Many parts are distinguisbed for their fertility, and it is probable that at least one-fourth part is wsll adapted for cultivation, and that one-half would afford good pastnrage for sheep and cattle. In addition to the various species of grain and artificial European fruits and vegetables, that succeed well in varions places, the sugar-cane, the vine, aud tobacco are raised. Although the growth of grain has been constantly on the increase, New Sonth Wales has always been an importing country, and the inflnx of population in consequence of the discovery of the gold-fields must render it for a considerable time still more so. The colonists have been at some pains to introduce many kinds of fruit-trees and vegetables, and they have in most cases done it with tolerable success. There are oranges, lemons, citrons, nectarines, apricots, peaches, plums, cherries, figs, quinces, pears, apples, mulberries, pomegranates, grapes, raspberries, strawberries, bananas, guavas, pineapples, gooseberries, currants; almonds, walnuts, chestnuts, and filberts. Gooseberries succeed in the colder and more elevated countries, as near Bathurst. In the kitchen-gardens are raised melons, water-melons, pumpkins, capsicums, cabbages, turnips, and some other vegetables.

The first sheep introduced into the colony were from England, and the wool was of indifferent quality; but as soon as it became evident that wool might become a source of wealth, and yield an important article of export to the mother country, several landed proprietors were at considerable expense to get merino sheep. The quality of the wool has been much improved. The wool imported into Great Britain from New South Wales in 1855 amounted to 17,671,684 lbs. The breed of cattle is a mixture of the Bengal buffalo variety with humpy shoulders, and various English breeds which have been introduced. They are fine large animals. In some parts, especially on the Plains of Bathurst, the dairies are well attended to, butter being made to a great extent, and also cheese not inferior to the common cheeses of England. Bullocks are mostly used for draught. The horses are remarkably hardy and can undergo great fatigue. Pigs find abundant food in the uncultivated tracts, and are easily fattened with maize. Goats have been introduced, and thrive amazingly in those parts which have a barren soil, and are overgrown with shrubs.

Poultry is in great abundance: geese, ducks, turkeys, guinea-fowls, and common fowls thrive surprisingly, without any particular care being taken of them.

Industry and Manufactures.—The manufacturing industry of the colony has made considerable progress, though the production and export of native commodities form the staple of the occupation of the inhabitants. The most numerous manufacturing establishments are the mills for grinding and dressing corn, turned by wind, water, horses, or steam. There are also manufactories of woollen-cloth, hats, soap and candles, and of articles of furniture; distilleries, breweries, iron- and brass-foundries, rope-yards, and ship-building yards. As spermaceti-whales and black whales frequent the sea adjacent to the eastern entrance of Bass's Strait and the strait itself, and a great number of seals are found on the islands in the same part of the sea, the whale and seal fishery became a source of gain to the colonists, and is still carried on, though it has fallen off considerably.

Commerce.—New South Wales, considered as a commercial country, holds a very high rank among our colonies, if its population is taken into account. Including the large quantities of wool, tallow, hides, and sheep-skins, Great Britain imported goods from New South Wales, in 1854, to the value of 4,050,126*l.*; and exported articles to the value of 5,981,003*l.* These amounts have decreased in the years 1856 and 1857, but are still very large. Considerable quantities of gold also pass through Sydney.

Divisions of the Country.—The more closely-settled portion of the colony is divided into 37 districts, 21 of which were added in 1847. Out of these are formed 40 counties, of which the first settled 21 are conterminous with the districts. The other counties do not occupy the whole of the districts, nor do the districts occupy the whole of the territory, but it is a regulation of government that no land can be sold beyond their limits. The extreme boundaries of county lands have come therefore to be called the boundaries of location, and according as lands lie within or beyond these boundaries, a different system is followed in the management and civil government of them.

Within the boundaries the whole country is divided into police districts, each having a bench of petty sessions and a magistrate; and of these districts, which are of unequal size, there are at present about 40. Beyond the boundaries the country is also roughly divided into districts, in each of which there is a commissioner of crown lands, who is the chief magistrate of it, and has under his command a small force of mounted constables, who are called the Border Police. Within the limits of location, land is either sold or let on lease; beyond the limits it is neither sold nor let, but licences are granted, at the discretion of the crown commissioner, for the occupation of such portions of land as may be desired by proprietors of stock, on each of which licences a fee of 10*l.* is payable annually, and an assessment is levied on the stock depastured there. Each allotment of land for which a licence is thus given is called a station, and the stations may vary in extent from 5000 to 30,000 acres. The amount received for licences in 1852 was 36,928*l.*, and land was sold to the amount of 41,273*l.* In 1856 the land revenue including licences and sales, amounted to 298,158*l.*

New South Wales is divided into two bishoprics, Sydney and Newcastle, the Bishop of Sydney being the metropolitan of Australia; the other bishops are those of Melbourne, Adelaide, Tasmania, New Zealand, and Christchurch, which forms a second bishopric in New Zealand. There is an archdeacon in New South Wales who is styled Archdeacon of Cumberland, one of the districts. In 1853 the number of clergymen in the colony was 163, of whom 47 were supported wholly by voluntary contributions. Of the whole number, 78 belonged to the Church of England, 32 were Presbyterians, 32 Roman Catholics, 16 Wesleyans, 4 Independents, and one was of the Jewish persuasion.

There is a considerable number of roads within the boundary of location. Various lines of roads, which have been made at considerable expense, traverse these districts, and various others have been made or are making in consequence of the gold discoveries, to facilitate transport to and from the commercial towns and ports. A regular post is established, and all letters not exceeding half an ounce in weight are delivered at a uniform rate of twopence. Newspapers are exempted from postage.

Education.—Sydney University, incorporated and endowed by the Act of Council, 14 Victoria, No. 31, was inaugurated on October 11th 1852. In 1858 the degrees conferred by it were declared by order in council to give the same privileges as those conferred by the universities of Great Britain. There are three colleges or Grammar schools —two at Sydney, called Sydney College and Australian College, and King's School at Paramatta. These schools are supported by the payments of the students. The elementary schools are mostly maintained by government. In 1855 there were attending school only 18,975 children, and many of these irregularly.

History.—The history of a colony so recently established may be soon told. New South Wales was discovered by Captain Cook in 1770, though the western and northern coasts of the island had been previously visited by Dutch navigators. In 1787 the British government decided to form a convict establishment in Australia, "to empty the jails and houses of correction" of the mother-country, and eleven ships were therefore sent, which arrived at Botany Bay, where it was intended to form the settlement, on January 20th 1788. Botany Bay was found inconvenient, and the establishment was removed to Sydney by the governor, Capt. A. Philip, who had been sent out with the fleet. The early progress of the colony, owing to the circumstance that the first settlers were only convicts, was so slow that its population in 1810 did not exceed 10,000 individuals. About that time one of the landed proprietors ascertained that the climate and soil of the colony were favourable to the rearing of sheep, and many persons consequently went to the colony to settle; but they soon found themselves embarrassed for want of room, and it appeared impossible to extend the settlements farther westward, as several attempts to pass over the Blue Mountains had been frustrated by the nature of the range, which consists of sandstone masses, furrowed by numerous ravines, whose sides are so steep that it is impossible to ascend them. In 1813 three enterprising individuals, Blaxland, Wentworth, and Lawson, succeeded in passing over the mountains; and in the same year followed the discovery of that fine pastoral country the Downs of Bathurst. In the following year a practicable line of road was constructed over the mountain ranges by convict labour. Mr. Oxley, in 1817, began the task of exploring the interior. Since this period some portion of the country has been nearly every year discovered and explored. Among the discoverers may be particularly mentioned Allan Cunningham, Lieut. Sturt, Count Streletzki, (who first asserted that gold was to be found in the mountains), Mr. Eyre, Mr. Windsor Earle, Messrs. Landor and Lefray, Sir Thomas Mitchell, and Dr. Leichardt, who, leaving New South Wales, reached the Gulf of Carpentaria, and who, on a second journey, lost his life in the interior. The results of their discoveries have been given in the geographical notices of Australia and of the several colonies.

The system of transportation has been discontinued of late years.

Towns.—The capital is SYDNEY. *Bathurst* is a thriving town, 198 miles W.N.W. from Sydney, on the west of the

Blue Mountains, situated on the upper part of the Macquarie. It derived its importance at first from being the chief place of trade of the rich pasturage, Bathurst Plains, which surround it. It has since become of still greater importance from its vicinity to the gold diggings of Ophir, which lie from 20 to 28 miles west from it. *Boyd*, or *East Boyd*, as it is sometimes called, is a small but rising port-town, near the southern border of the colony, on the mouth of the river Towamba, which here falls into Twofold Bay. *Brisbane* is at the northern extremity of the colony, situated on the river Brisbane, about 10 miles from its mouth. It is a flourishing town, in an agricultural district. Tobacco and wine are produced. *Campbellton* is on the coast, about 20 miles S. from Sydney, and has considerable trade and manufactures, particularly of leather. *Liverpool* is about 16 miles W. from Sydney, on the left Bank of George's River. It is an inland town, surrounded by a rich and well cultivated country, which secures it much retail business. *Macquarie*, or *Port Macquarie*, is a small but increasing town, at the mouth of the river Hastings, which a little higher up receives the Wilson and Maria rivers, and forms a tolerably safe bay. It is about 120 miles N. from Hunter River. *Maitland* is on the right bank and about 40 miles from the junction of Hunter River, at the junction of the Wallis creek. The river here first becomes navigable for sloops. The coal-mines in the neighbourhood have greatly contributed to the prosperity and increase of this place, which is properly two towns, East Maitland and West Maitland. In East Maitland are a court-house and jail, and in West Maitland are numerous stores and some good hotels. A steamer runs regularly from Maitland to Sydney. *Newcastle*, about 70 miles N. by E. from Sydney in a direct line, is built at the month of the Hunter River, which forms a harbour deep enough for merchant vessels, but the entrance is narrow and crooked. The town owes its importance chiefly to the collieries in its neighbourhood, which are extensively worked. It gives title to a bishop. *Paramatta* is situated at the mouth of the small river Paramatta, and at the head of the harbour of Port Jackson. It is 18 miles by water and 15 miles by land from Sydney. The principal street is a mile long; at the end farthest from the harbour is the country residence of the governor of the colony. Daily communication is kept up with Sydney by means of stage-coaches and steam-boats. The observatory at Paramatta (founded in 1821) was the private property of Lieut.-General Sir Thomas Brisbane, an active and well-informed astronomer, during his residence in the colony as governor. At his return to England, the government adopted it as a public establishment, and it is now under the superintendence of an observer appointed by the Admiralty. At Paramatta are two lunatic asylums, one of which is for convict lunatics and invalids. *Windsor*, about 30 miles N.W. from Sydney, stands on the right bank of the Hawkesbury, which is navigable for a few miles above the town for coasting vessels. This circumstance and the fertility of the country which extends along both sides of the river above the town have raised it to some commercial importance. There are at Windsor mills for grinding grain, breweries, and tanneries.

The Government.—This consists of a governor-in-chief, with a secretary, treasurer, and auditor-general, with the necessary subordinates, and an executive council, all appointed by the imperial government at home. In accordance with the 18 & 19 Vict., cap. 54, passed in August, 1855, there is a legislative council, consisting of such number (not fewer than 21) as the governor and council may determine, and a legislative assembly of 54 members. For the legislative assembly, the qualifications of electors are, that they must be natural-born or naturalised subjects of her Majesty, of the age of 21, possessing a freehold estate within the district of 100*l.* clear value above all incumbrances or charges on it, for at least six months before the date of the writ or the last registration, or occupying a dwelling-house for six months of the clear annual value of 10*l.*, or a lodging of 10*l.* yearly rent, or having a salary of 100*l.* a year, or holding a licence to depasture lands within the district, or holding a leasehold estate in the district of the yearly value of 10*l.* of which the lease has not less than three years to run, and on which in all cases the rates and taxes due to within three months of such election or registration have been paid, and who is not attainted of treason, or convicted of felony, &c. By a recent act of the legislature the election of members now takes place by ballot. No minister of religion can be a member. The legislature administers, in conjunction with the governor, the affairs of the colony, without reference to the mother country, except in such cases as the governor may think doubtful or important enough to require to be brought under the special consideration of the home government. The amount of the civil list specified in the Act, including the expense of the civil and judicial establishments of the colony, is 64,300*l.*; and a sum of 28,000*l.* a year is appropriated for the purposes of public worship. The waste lands in the colony are under the management of the colonial legislature.

The governor and council are empowered to levy customs on goods imported, but no duty is to be imposed on any article from one country that is not alike imposed on the same article from other countries. No duties however are to be levied on articles imported for the supply of her Majesty's land or sea forces; nor has the colonial government the power to grant any exemption, or impose any duty, at variance with any treaty concluded by her Majesty with any foreign power.

In the administration of justice there are a chief judge and three puisne judges, with an attorney-general, a solicitor-general, and a crown solicitor. Magistrates are appointed in the various districts by the governor, and quarter sessions and petty sessions are held in various places at frequent intervals.

WALL-PELLITORY. [PARIETARIA, *S.* 1.]

WALL RUE. [ASPLENIUM, *S.* 1.]

WALLACHIA, with its neighbouring principality of MOLDAVIA, has become interesting from the discussion which has arisen respecting the government of what are called the Danubian Principalities: whether they are to be united under one governor, with an almost nominal dependence on the Turkish emperor: or whether with separate governments under the immediate suzerainty of Turkey. The following are the present administrative districts of both provinces, with the chief towns and the population according to the latest available returns, those of 1850.

Wallachia is divided into 18 districts, administered by officers called Isprovniks. Ten of these districts are in the mountainous and hilly parts of the country; eight in the plain and low country along the Danube.

	Districts.	Population.	Chief Town.
Upper Wallachia.	Romnik Sarat	111,342	Romnik Sarat
	Buzeo	137,645	Buzeo
	Sacineni	121,230	Bucovu
	Pracova	130,434	Ployesei
	Dambovitza	116,987	Turguvici

WALLICH, NATHANIEL, M.D. and Ph.D., F.R.S., London and Edinburgh, a celebrated botanist, was born at Copenhagen on Jan. 28th, 1786. He commenced his botanical studies under the direction of Professor Vahl, and went to India in 1807 at the age of one-and-twenty in the capacity of surgeon to the Danish settlement in Serampore. In 1815 he was nominated to the temporary charge of the Calcutta Botanic Garden, which appointment was subsequently permanently confirmed on the recommendations of Dr. Fleming, Mr. Colebrooke, and Sir Joseph Banks. Dr. Wallich's exertions during the thirteen years that elapsed before his first return to Europe added greatly to the extent and value of the previously extensive collections of this garden. He also transmitted to Europe and America a vast quantity of hitherto unknown and beautiful plants. In 1820 Dr. Wallich made a botanical excursion to Nepaul, in the course of which he collected a great variety of plants, many of which he forwarded to London. A severe fever, caught on his descent to the plains, confined him to his bed for two months and compelled him to seek benefit from a voyage to Penang, Singapore, and some other places in the Straits of Malacca, from which, after an absence of five months, he returned on the last day of the year 1822, rich in botanical collections and with renewed health. In 1824 he commenced the publication of a selection from his Nepaul collections under the title of 'Tentamen Floræ Nepalensis Illustratæ,' of which two numbers, containing 25 plates, were issued. These plates were the botanical first fruits of the new art of lithography in India, and both drawings and lithographs were executed by native artists under Dr. Wallich's direction.

In the following year he was deputed by the government to inspect the timber forests of the Western Provinces, and availed himself of this opportunity to examine and collect plants in the kingdom of Oude, the valley of Degra, &c. Excursions to other parts of India were undertaken at various times by Dr. Wallich, which enabled him still further to increase the immediate stores of botanical treasure he had accumulated. His health had now however suffered so severely from repeated attacks of illness that, in 1828, he visited England, bringing with him the great bulk of his collections. He then with the consent of the East India Company proceeded to distribute his duplicate specimens amongst the public and private herbaria throughout the world. The type collection, containing a complete series of all the species, was presented by Dr. Wallich to the Linnæan Society of London. At this time he completed his work, entitled 'Plantæ Asiaticæ Rariores,' consisting of 300 beautifully executed coloured plates. In 1833 Dr. Wallich returned to India and resumed the charge of the Botanical Garden, which however his health obliged him finally to resign in 1847, when he again arrived in England. He was the author of numerous papers and reports on horticultural and botanical subjects, published in the 'Transactions of the Asiatic Society of Calcutta,' Sir W. J. Hooker's 'Journal of Botany,' and the 'Linnæan Transactions.' He became a Fellow of the Linnæan Society in 1818, and in 1849 one of its vice-presidents. He was a man of warm affections, ready wit, and pleasing manners, and devoted in his attachment to his favourite science. It must not be forgotten that he did more than any one else, to introduce into the gardens and greenhouses of England the beautiful and luxuriant plants of India, and it is from his collections and descriptions, and presentations to our public and private gardens that we are indebted more than to any other source for our acquaintance with the Flora of that district.

He died at his house in Upper Gower-street, London, on the 28th of April 1854, in the 69th year of his age.

WALTER, JOHN, late manager and principal proprietor of 'The Times' newspaper, was born in 1784. His father, John Walter, who was born in 1739, was known as the logographic printer, from his having obtained a patent for an invention named Logography, or the art of printing with entire words, their roots, and terminations, instead of the arrangement of single letters. On the 1st of January, 1788, he published the first number of 'The Times,' and was during eighteen years printer to the Board of Customs, but that employment was taken from him about 1805, in consequence of the opinions expressed in 'The Times' with reference to Lord Melville's administration at the Admiralty. He died November 16, 1812, at Teddington, Middlesex.

The late John Walter became a joint proprietor and the exclusive manager of 'The Times' at the commencement of the year 1803. It would not be easy to describe the improvements which were made in 'The Times' under his management. The munificent sums paid to the editor and to those literary gentlemen of the highest class who furnished the leading articles, the large staff of reporters at liberal salaries for parliamentary debates, law proceedings, and public meetings, the large amount and accuracy of information, the almost universal correspondence, the competition even with the government for priority of intelligence, the distinct arrangement of the matter, the application of steam power for the printing, and the marvellous rapidity with which the whole is produced, have raised 'The Times' to a position of social and political importance in which it is without a rival not only in Great Britain but in Europe.

The invention of the printing-machine, and the use of the steam-engine as a moving power have produced so great a revolution in the process of printing, as to require a brief statement of the origin and progress of the invention. As early as 1804 an ingenious compositor named Thomas Martyn had made the model of a machine for printing, which met with the approval of Mr. Walter, who expended a considerable sum in the attempt to complete the machine; but having exhausted his own funds, and his father, who had hitherto assisted him, having refused him any further aid, the attempt was abandoned. About the same period Mr. Kœnig, a native of Germany, had made some progress in the contrivance of a machine for printing. Having met with no encouragement in his own country, he came to London, where he was introduced to Mr. Bensley, a well-known printer, who being satisfied as to the feasibility of the projected improvement, supplied the necessary funds. An ingenious assistant of the name of Bauer was also engaged, and the work proceeded till the year 1809, when Mr. Bensley, requiring additional funds, invited the late Mr. George Woodfall, and Mr. Richard Taylor, both well known printers, to join him and Mr. Kœnig in taking out a patent, which they did, the machine even then being so far advanced as to satisfy them as to the prospect of success, and to enable them to have the specifications drawn up. The first patent bears date March 29, 1810. It was taken out in the name of Frederic Kœnig, and was assigned by articles of partnership to the firm of Bensley, Kœnig, Woodfall, and Taylor. Mr. Kœnig states ('The Times,' December 8, 1814) that "sheet H of the 'New Annual Register' for 1810, 'Principal Occurrences,' was printed by machine, and it is, I have no doubt, the first part of a book ever printed by a machine." The machine was set to work regularly in April, 1811. Another patent for a machine on an improved plan was taken out October 30, 1812. It was completed in December that year, and printed about 800 copies an hour. A third patent for another improved machine was taken out July 23, 1813. Mr. Kœnig's first machines were worked by hand, the machines in fact being independent of the motive power. Mr. Perry, of the 'Morning Chronicle' was applied to, but declined to purchase a machine. Mr. Walter, however, seeing the invention accomplished and the machine in full operation, gave an order for two machines, which were to be worked by the power of a steam engine. Notwithstanding violent opposition from the pressmen, the machines were completed on adjoining premises, and on the 29th of November, 1814, 'The Times' was printed for the first time by machines worked by steam-power. The number impressed in the hour was then about 1100. Great improvements have since been made by the late Professor Edward Cowper and others, in the machines for printing books as well as newspapers. About 12,000 per hour is the number now printed of 'The Times,' and the total number per day is upwards of 50,000.

Mr. Walter married in 1818. Having purchased a fine estate in Berkshire, he became a candidate for the representation of that county in December, 1832, and was returned. He was re-chosen in 1835, but in 1837 resigned his seat in consequence of the opinions of the majority of those who had elected him being opposed to his own on the question of the new Poor Laws. In 1840 he offered himself for the borough of Southwark, but was rejected. In April, 1841, he was returned for the borough of Nottingham, and at the general election the same year announced himself as a candidate, but in consequence of serious rioting, withdrew half an hour before the poll was opened. He died July 28, 1847, at his residence, Printing-House Square, Blackfriars, London.

WARBURTON, ELIOT BARTHOLOMEW GEORGE, eldest son of the late Major G. Warburton, of Aughrim, county Galway, Inspector-General of Constabulary in

Ireland, was born in 1810: he represented a branch of an old Cheshire family. He received his early education at home and under the care of a tutor: then entered Queen's College, Cambridge, but after his second term he migrated to Trinity, where he took his degree. He was subsequently called to the bar, but soon ceased to practise, and turned his attention to the care and improvement of his Irish estates. He first became known to the world as an author by his captivating work on the East and Eastern Travel, entitled the 'Crescent and the Cross,' which was first published in 1845. This work at once acquired unusual popularity, and is now (1858) in the 13th edition. It was followed in 1849 by his 'Prince Rupert and the Cavaliers,' a brilliant history and vindication of the gallant prince, who so chivalrously distinguished himself in the civil war under Charles I. He next published 'Reginald Hastings,' a romance referring to and illustrative of the same period. Shortly afterwards he edited the 'Memoirs of Horace Walpole and his Contemporaries.' His last work, which was published after his death, is entitled 'Darien, or the Merchant Prince;' it is a tale founded on the colony established about the middle of the 17th century by a Scottish adventurer named Paterson, on that portion of the northern coast of South America which abuts on the Isthmus of Panama, and is known by the appellation of Darien. Mr. Eliot Warburton married a daughter of the late E. Grove, Esq., of Shenstone Park, Staffordshire, and niece of Sir E. Cradock Hartopp, Bart., by whom he left issue, two sons. He was lost in the ill-fated ship Amazon, which was burnt off the Land's End, January 4, 1852.

WARD, ROBERT PLUMER, was the sixth son of Mr. John Ward, a Spanish merchant resident at Gibraltar, who had married a Miss Raphael, a Spanish Jewess; and was born on the 19th of March, 1765. He was educated at a small school at Walthamstow and at Christchurch, Oxford, under Dr. Cyril Jackson. He was called to the bar at the Inner Temple in 1790. Having gone the Northern Circuit without much success, he secured employment in cases before the Privy Council. In 1805 he was appointed by Mr. Pitt one of the Welsh judges, but soon afterwards retired from the legal profession in order to undertake the more congenial duties of under-secretary of State for Foreign Affairs. From 1807 till 1811 he was a Lord of the Admiralty under the late Lord Mulgrave and the Right Hon. Charles Yorke; he served the office of Clerk of the Ordnance from the latter date till 1823, when he was appointed one of the auditors of the Civil List—a post which has since been abolished. He served as high sheriff for the county of Herts in 1832, and for many years held a seat in parliament, which he entered in 1802 as member for the borough of Cockermouth, and subsequently for the since disfranchised constituency of Haslemere. Amongst all his political and official duties, Mr. Ward found time and leisure for the composition of several works of history and of fiction. Of the former, the best known is his 'History of the Law of Nations in Europe from the time of the Greeks and Romans to the age of Grotius,' which was published in 1795, and was praised for its research, its breadth of view, and soundness of principle. Of his novels, 'Tremaine' and 'De Vere' are those which have attained the widest circulation. The former was published anonymously in 1825, and the latter in 1827. His other works are—'An Inquiry into the Conduct of European Wars,' 1803, a pamphlet which first enlisted on his side the patronage and favour of Pitt; 'Illustrations of Human Life,' 1837; 'Pictures of the World,' 1838; an 'Historical Essay on the Revolution of 1688,' 2 vols. 8vo, 1838; and, lastly, 'De Clifford,' a novel, published in 1841.

From the middle of 1809 till late in life Mr. Ward kept a political diary, which has since been published down to the year 1820. It is valuable as an historical document, and as throwing some light on the state of things under the Perceval and Liverpool administrations. Mixing largely with the world of politicians, and being equally skilful in gathering and prompt in recording the gossip of the day, Mr. Ward was able to collect many really curious public facts relating to Canning, Castlereagh, the much-debated question of the Regency, and the proceedings against Queen Caroline, which are not to be found in any other publication. The later portion of the 'Diary' is at present withheld from publication, owing to the warmth of its political partisanship and the severity of its comments on living statesmen. The 'Diary' will be found in the 'Memoirs of the Political and Literary Life of Robert Plumer Ward, Esq.,' published in 1850 by his friend and relative the Hon. Edmund Phipps, 2 vols. 8vo.

Mr. Ward was thrice married: first, in 1796, to a daughter of C. J. Maling, Esq., by the Dowager Countess of Mulgrave; secondly, in 1828, to Jane, daughter of the Hon. and Rev. George Hamilton, son of the seventh Earl of Abercorn (by his countess Anne, daughter of Colonel John Plumer, M.P. for Herts in the 17th century), and in consequence assumed the additional name and arms of Plumer; his third wife was a Mrs. Okeover, a daughter of the late General Sir George Anson, G.C.B. He had the misfortune to see nearly all his children carried off by consumption, with the exception of his only son by his first wife, now Sir Henry George Ward, governor of Ceylon. He died at Okeover Hall, on the 13th of August, 1846.

WARDLAW, RALPH, D.D., was born at Dalkeith, in the county of Mid-Lothian, Scotland, on the 22nd of December, 1779. His father, William Wardlaw, was in business as a merchant, his mother, Anne Fisher, was daughter of James Fisher, and granddaughter of Ebenezer Erskine, two of the founders of the Scotch Secession Church. Ralph received his early education at the public schools of Glasgow, to which city his parents removed shortly after his birth. He entered the University of Glasgow in October, 1791, and at the close of the first session, before he was thirteen years of age, carried off the Muirhead prize in the Humanity class. He was distinguished as a diligent and careful student, and gained several other prizes in his university course. He was at first inclined to adopt the medical profession, but finally decided in favour of the Christian ministry. With this view he attended from 1795 till 1800 the divinity hall of the Secession Church, then conducted at Selkirk by the Rev. George Lawson. Mr. Wardlaw decided to join the Scottish Independent denomination, which was then being organised by Messrs. Haldane, Aikman, and Ewing, and from the first he took a respectable, and very soon a leading position among the ministers of that body. A building having been erected by a number of his friends in Glasgow, with a view of obtaining him as their minister, a church was formed, and Mr. Wardlaw commenced his services on February 16, 1803. This position he maintained with much credit to himself, and usefulness to the Independent body and to the dissenting community at large, till his death, a period of more than fifty years. On August 23rd 1803, he married his cousin, Miss Jane Smith, daughter of the Rev. Mr. Smith, of Dunfermline, by whom he had a family of eleven children. In 1811 Mr. Wardlaw was elected Professor of Systematic Theology in the Theological Academy of the Independent body, which was then established in Glasgow. In 1818 he received the Diploma of D.D. from Yale College, Connecticut, and in December of that year his congregation removed to a large and handsome chapel in West George-street, the erection of which had been rendered necessary by the increasing attendance on his ministry. In 1848, Dr. Wardlaw's health being somewhat impaired, the Rev. S. T. Porter was chosen as copastor, a connection which existed for about two years, when differences arose in consequence of charges made or supported by Mr. Porter against Dr. Wardlaw, the result of which was, the separation of Mr. Porter and a portion of the members from West George-street church, and the formation of a new church under Mr. Porter's pastoral charge. In this case, the deacons and the great body of the congregation adhered to Dr. Wardlaw, and a crowded meeting was held in the City Hall to express sympathy for him, and to present to him a piece of plate as a testimonial. In February 1853, the completion of the fiftieth year of his ministry was celebrated by special services and a public meeting, in connection with which a large sum of money was collected, and expended in erecting 'The Wardlaw Jubilee School and Mission House,' at Dovehill, a destitute part of the city. He died on December 17th, 1853, within a few days of completing his seventy-fourth year.

Dr. Wardlaw took an active part in various public questions, and engaged in several controversies, chiefly theological, which gave rise to some of his most elaborate publications. He was frequently invited to London to preach anniversary sermons, and speak at public meetings of the great religious societies. On several occasions he declined invitations to accept professorships in the Independent Theological Academies in England. In April 1833, he delivered in London eight lectures in defence of Congregationalism, forming the first series of an annual course called 'The Congregational

Lecture.' In April 1839, at the request of the Protestant Dissenting Deputies, he delivered eight lectures in Freemasons' Hall, London, in answer to the Lectures on Church Establishments, which had been delivered in London the previous year by Dr. Chalmers. As a preacher, Dr. Wardlaw was much esteemed by members of all denominations. His discourses, which were very carefully prepared, were generally written out, and read with a clear and silvery voice, and a calm but impressive elocution. The following list contains the titles of his principal productions: many single sermons, including several funeral discourses for distinguished ministers, and other friends, were likewise published by him. In 1803 he edited a Hymn Book for the Congregationalists in Scotland, containing several hymns of his own composition. In 1807 he published 'Three Lectures on Romans IV., v. 9-25,' on the question of infant baptism; in 1810, 'Essay on Mr. Joseph Lancaster's Improvements in Education;' in 1814, in one volume, 8vo, 'Discourses on the Socinian Controversy,' in answer to Mr. Yates, the Unitarian minister in Glasgow; in 1816, in 8vo, 'Unitarianism incapable of Vindication,' in reply to Mr. Yates's 'Vindication of Unitarianism;' in 1817, 'Essay on Benevolent Associations for the Poor;' in 1821, in 2 vols. 8vo, 'Expository Lectures on the Book of Ecclesiastes; in 1825, 'A Dissertation on the Scriptural Authority, Nature, and Uses of Christian Baptism;' 'The Divine Dissuasive to the Young against the Enticements of Sinners;' 'Man Responsible for his Belief,' in answer to Lord Brougham's inaugural discourse; in 1829, 'Introductory Essay to Doddridge's Practical Discourses on Regeneration;' a volume of Sermons; in 1830, 'Two Essays: I. On the Assurance of Faith; II. On the Extent of the Atonement and Universal Pardon;' in 1832, 'Discourses on the Sabbath;' 'Civil Establishments of Christianity tried by the Word of God; in 1833, 'Christian Ethics; or Moral Philosophy on the Principles of Divine Revelation;' in 1835, 'Two Lectures on the Voluntary Church Question;' in 1836, 'Friendly Letters to the Society of Friends; in 1839, 'National Church Establishments considered;' being the lectures delivered in London in reply to Dr. Chalmers; 'Sketch of the Life and Character of the Rev. Dr. McAll of Manchester,' prefixed to Dr. McAll's Sermons, edited by Dr. Wardlaw; in 1841, 'Letters to the Rev. Hugh M'Neile, M.A., on some portion of his Lectures on the Church of England;' in 1842, 'Lectures on Female Prostitution; in 1845, 'Memoir of the Rev. John Reid,' Missionary at Bellary in the East Indies, and Dr. Wardlaw's son-in-law; 'The Life of Joseph and the Last Days of Jacob: a book for Youth and for Age;' 'Strictures on Dr. Halley's Congregational Lecture on the Sacraments,' in reference to Infant Baptism, &c.; in 1848, 'Congregational Independency, in contradistinction to Episcopacy and Presbyterianism, the Church Polity of the New Testament;' in 1852, (his last work) a 'Treatise on Miracles.' Dr. Wardlaw was likewise a contributor to various religious periodicals. Of Dr. Wardlaw's sons, one is a missionary in India, another a merchant in Glasgow.

(W. L. Alexander, D.D., *Memoirs of the Life and Writings of Ralph Wardlaw, D.D.*)

WARNEFORD, REV. SAMUEL WILSON, was the son of the Rev. Francis Warneford, vicar of St. Martin's York, of an old and wealthy North Wiltshire family, and he was born at Sevenhampton, near Highworth, in Wiltshire, in 1758. At the usual age he was sent to University College, Oxford. Ill-health prevented his attaining any academical honours, but he graduated M.A. 1786, and B.C.L. in 1790. In 1796 he married a daughter of Loveden Loveden, Esq., with whom he acquired a considerable fortune; but a few years left him a widower without issue. In 1809 he was presented by his college to the rectory of Lydyard Milicent, Wilts, valued at 500*l.* per annum; in 1810 he was presented to the rectory of Bourton-on-the-Hill, in Gloucestershire, valued at 700*l.* per annum; and in the same year he took the degree of D.C.L. He lived at Bourton very plainly and moderately, and from an early period devoted a great part of his property to the promoting of large establishments beneficial to the public, for which purpose he carefully abstained from the common practice of bestowing trifling eleemosynary sums, refusing, it is said, assistance even to the poorer members of his own family. But there was no ostentation in his princely gifts; many indeed were anonymous. He founded schools and almshouses in his own parish. He was a contributor to schools, colleges, and hospitals throughout the kingdom. On the Clergy Orphan School, at various times, he bestowed 13,000*l.*; and he contributed large sums for church purposes, particularly in his own county of Gloucester, and in Nova Scotia. He founded an hospital at Leamington, which bears his name; and one for lunatics on Headington Hill, near Oxford. To King's College in London he presented anonymously several donations of 500*l.* each; but to Queen's College, Birmingham, the total amount of his contributions was upwards of 25,000*l.* This institution was commenced by Mr. Sands Cox as a school of medicine, and Dr. Warneford liberally afforded pecuniary assistance, thereby enabling him to expand the school into a college, which was ultimately patronised by royalty. When it was found desirable to add other departments of education, Dr. Warneford was again the chief contributor; and desirous that religious instruction should be afforded, he founded the college chapel, and furnished the means for ensuring permanent religious teaching. In 1844, in recognition of his wide-spread beneficence, the bishop of Gloucester conferred on him an honorary canonry in Gloucester Cathedral; and in 1849 a statue of him was erected in the Warneford Lunatic Asylum at Oxford, the expense being defrayed by public subscription. He died at Bourton on January 11, 1855, enjoying good health till within a few days of his death. He bequeathed 2000*l.* to the Christian Knowledge Society, and 2000*l.* to the Society for the Propagation of the Gospel, in addition to previous gifts.

WART-CRESS. [SENEBIERA, *S.* 1.]

WARWICKITE. [MINERALOGY, *S.* 1.]

WASHINGTON, a Territory of the United States of North America, lies between 45° 25′ and 49° N. lat., 110° 30′ and 124° W. long. It is bounded E. by the Rocky Mountains, which separate it from the Territory of Nebraska; N. by the parallel of 49° N. lat., which separates it from British North America; W. by the Pacific Ocean; and S. by the Territory of Oregon. The area is 123,022 square miles. The population in 1857 was estimated at 10,000. At the Census of 1850 Washington formed a part of the Territory of Oregon, which contained 13,294 inhabitants. The country separated from Oregon, in order to form the Territory of Washington, then contained less than 2000 inhabitants, exclusive of the native Indians, who probably number about 7000 or 8000.

In its general character Washington has a marked resemblance to OREGON. The surface is greatly broken, it being traversed from south to north by three parallel ranges of mountains, the northern prolongation of the Oregon ranges, while the Rocky Mountains, as in that Territory, form its eastern boundary. The coast from the mouth of the Columbia to the entrance of Gray's Harbour, or, as it was named by Vancouver, Whidbey's Bay, a distance of 45 miles, is rocky and almost unbroken. The entrance to Gray's Harbour is about 2½ miles across, but the harbour itself opens to a width of 5 or 6 miles, and is 12 miles deep. It affords well-sheltered anchorage in some places, but it is everywhere encroached on by sand-banks, and its mouth is obstructed by a bar, which only admits the passage of vessels drawing under 10 feet of water. From Gray's Harbour to Cape Flattery, or Cape Classet, a lofty promontory at the southern side of Juan de Fuca Strait, a distance of about 80 miles, the coast is high, rocky, and only broken by two or three unimportant streams. The Strait of Juan de Fuca, which forms the northern boundary of the coast of Washington, is a vast arm of the sea, about 10 miles wide at its mouth and 100 miles deep. [VANCOUVER ISLAND, *S.* 2.] The southern coast consists of perpendicular sandy cliffs of moderate elevation, from which the land gradually rises towards the craggy mountains of the interior. About 70 miles from the mouth of the strait is a long low sandy point which forms a good anchoring-ground; and beyond this is a deep bay about 9 miles across, and 3 miles from its eastern point is Protection Island, so named by Vancouver from its position at the entrance to Port Discovery. Immediately beyond Port Discovery is Port Hudson, an equally safe and good though somewhat smaller harbour: Vancouver and Wilkes unite in describing these as among the very finest harbours on the western coast of North America. Beyond this harbour is a deep inlet named Admiralty Inlet, which soon divides into two arms—the smaller one named Hood's Canal, bearing to the south-west, and stretching far into the interior; while the main arm proceeds due south for about 40 miles, where it terminates in a broad sound named Puget's Sound. Both these branches afford good anchorage; but Puget's Sound is broken by several inlets, and affords the greatest possible security and ample space. Vancouver speaks of these harbours and the contiguous country in such terms as might suggest the suspicion that he had been carried away by the ardent feelings of a discoverer; but Mr. Wilkes, the commander of the U. S. Exploring Expedition, fully corroborates all that Vancouver had asserted: he says, that "nothing can exceed the beauty of these waters and their safety: not a shoal exists within the straits of Juan de Fuca, Admiralty Inlet, Puget's Sound, or Hood's Canal, that can in any way interrupt their navigation by a 74-gun ship. I venture nothing in saying there is no country in the world that possesses waters equal to these." It is around Puget's Sound that the commerce of the Territory is chiefly establishing itself. Numerous settlements have been already formed along its shores. The tides rise 18 feet in Puget's Sound. The Sound is full of islands, and receives several small rivers.

Like Oregon, this Territory is naturally divided into three nearly parallel districts, determined by the course of the mountain ranges: a western, or coast section; the middle section, lying between the Cascade and the Blue Mountains; and the Rocky Mountains' region. The western section lies between the Cascade Mountains and the sea, and is much broken in surface, being intersected by spurs from the Cascade Mountains. The greater part of this section is covered with forests of lofty trees; pines often occur from 200 to 300 feet in height, and of corresponding girth, and some of the pines rise to a height of 200 feet without a branch. The most prevalent trees besides pines are firs, oak, ash, spruce, cedars, arbor vitæ, &c., with a dense undergrowth of hazels, roses, &c. The hills are generally of basalt, and some, like Mount Olympus, near Juan de Fuca Strait, are of considerable altitude. The soil is in parts a light brown loam, in others a light vegetable mould with a sandy and gravelly subsoil. Generally, it has considerable fertility. The river-bottoms afford good farming-land, the prairies and the uplands excellent pasture-ground. The climate is mild and salubrious, though somewhat moist; the winters are short, and snow seldom lies long on the ground. Game abounds.

The Cascade Mountains continue, as in Oregon, in a generally northern direction, and about 150 miles from the coast. Their highest cones rise to an altitude of upwards of 13,000 feet, and they form a barrier of very difficult passage between the western and middle sections of the territory. The country between the Cascade and Blue Ranges is wider than the corresponding district in Oregon. Between the Snake and the Flathead or Clarke rivers is a plain, or rather a rolling prairie, which extends nearly 200 miles in length and 100 miles across in its widest part. The soil is arenaceous, and the country little fitted for tillage; but the plain is covered with a good grass, and can afford pasturage for immense flocks and herds. The river-bottoms have an alluvial soil of various quality, but generally productive. The hills are comparatively bare of wood, and infertile. The climate of this middle section is cooler, drier, and more salubrious than in the western section; but the varieties of temperature are much greater. No dew falls here. The Blue Mountains are considerably broken and interrupted, but generally run north and south. The country east of them to the Rocky Mountains is interrupted throughout by offsets from the Rocky range, and transverse ranges connecting the main chains. Nothing can well exceed the wild magnificence of much of this country, with its vast and snow-clad mountainous tracts, deep valleys, tremendous gorges, lofty cataracts, and rushing torrents. It is of course little suited for agricultural operations, but the bases of the hills are generally covered with timber, and about the lakes, from which flow the head streams of the Columbia, the Spokane, and the Flathead rivers, are spots of remarkable fertility as well as of surpassing beauty. But all this district is left to the native Indians, who are a warlike and implacable race. The chief dependence of these Indian tribes is on hunting, and they barter the furs to the servants of the Hudson's Bay Company for tobacco and articles of European manufacture; but the fur-bearing animals are rapidly decreasing in number. The Rocky Mountains are described elsewhere. [Rocky Mountains; Nebraska, *S.* 2.] There are two or three practicable passes in this range along the territory of Washington, but they are much more difficult than the Great South Pass.

The principal river is the Columbia, which belongs equally to Washington and Oregon; it is described under Columbia River. Its northern branches rise in the Rocky Mountains within the Hudson's Bay Territories, and unite in Washington; the united stream traversing the Territory in a generally southern direction, and receiving numerous tributaries. It forms the Columbia by the junction of the Saphin or Lewis River. The principal tributaries of the northern branch of the Columbia are the Kootanie or Flat Bow, the Flathead or Clarke, and the Spokane rivers: they are all very rapid streams, but navigable by boats for some distance. The chief river north of the Columbia is the Chekalis, which rises in the Cascade Mountains, and pursues a very tortuous course to its outfall in Gray's Harbour. Its course is very rapid, and it is only navigable by canoes; it receives several small streams from the high grounds about Hood's Canal and Puget's Sound. The Nisqually and Tenalquit, or Shute's rivers, fall into Puget's Sound; they are both navigable for some distance, but will probably prove of greater value for their mechanical power. In the interior are numerous lakes, the larger being chiefly expansions of the northern branches of the Columbia, the Spokane, and the Clarke rivers.

At present the rearing of horses and cattle has attracted most attention from the settlers, but agriculture is rapidly extending. The productions are similar to those of Oregon [*S.* 2]. Wheat is the chief grain crop; maize has not been much grown hitherto. The forests will for many years supply an unlimited quantity of fine timber. Coal is found in the neighbourhood of Puget's Sound, and near the Chekalis and Monticello rivers. Iron and other metals have been found; but mining operations have as yet been little heeded. A few manufactories have sprung up. The fisheries will probably become an important part of the industry of Washington. All the rivers abound in fish; salmon being especially abundant. Fish also abound on the coasts. Whales frequent the coasts and the mouth of Juan de Fuca Strait. Shell-fish are very abundant. The commerce of Washington is yet in its infancy, but it is steadily increasing. Nearly all the commerce centres in the district of Puget's Sound.

Washington has as yet no town of many inhabitants. The political capital, principal commercial town, and port of entry is *Olympia*, on the right bank of the Tenalquit or Shute's River, at its entrance into Puget's Sound. This town boasts of its hotel, stores, saw- and grist-mills—the first in the Territory—newspaper, &c.; and contains 600 inhabitants. The other more important places are: *Columbia City*, on the right bank of the Columbia, below Fort Vancouver; *Monticello*, the capital of Lewis county, and the place where the convention was held which led to the separation of Washington from Oregon; *Nisqually*, on the east side of Puget's Sound, the property chiefly of the Puget's Sound Agricultural Company, whose farms supply provisions to the servants of the Hudson's Bay Company west of the Rocky Mountains; and *Pacific City*, on the right bank of the Columbia at its entrance into the Pacific Ocean, which appears likely to become a place of some trade.

Washington was separated from Oregon, and received a territorial constitution, by Act of Congress, March 2, 1853. By this Act the right of voting is vested in every free white male 21 years old then resident in the territory. The Legislative Assembly consists of a council of 9 members, chosen for three years, but one-third to vacate their seats each year; and a House of Representatives of 18 members, elected annually. The governor is appointed by the president and senate for four years. All laws passed by the legislature must be submitted for confirmation to Congress. No law can be passed interfering with the primary disposal of the soil; or taxing the property of non-residents higher than that of residents. Sections 16 and 36 in every township are to be reserved for schools.

WATT, JAMES, the eldest son of the celebrated James Watt, was born on 5th of February, 1769, and died, unmarried, at his seat, Aston Hall, in Warwickshire, near Birmingham, on the 2nd of June 1848.

Mr. Watt had early directed his son's attention to natural philosophy and chemistry, and he had also applied himself to the practical study of mineralogy. It is scarcely known, and has not been recorded in any previous biographical work, that he was for a short time, when in his twentieth year only, one of the secretaries of the Literary and Philosophical Society of Manchester, then just founded, one of the earliest, and perhaps still the most distinguished of the provincial scientific associations. To the 'Memoirs' of this society he communicated two papers in 1789, one on the mine (at Anglezark, near Chorley, in Lancashire) "in which the aërated [carbonate of] barytes is found," and the other "on the effects produced by different combinations of the Terra Ponderosa [barytes] given to animals." Though he was not, as has been said, the actual discoverer of the carbonate of barytes at Anglezark, he was the first to describe, in the paper here alluded to, the circumstances under which it occurred, and to make known the fact that the specimens examined and the supplies of the mineral from which was prepared the muriate, which had been recently introduced into medical use by Mr. Adair Crawford, F.R.S., had been obtained from that locality. His also were some of the earliest experiments on the poisonous effects of the combinations of barytes.

A remarkable episode now occurred in the life of the young philosopher—for such, at this period, we may call him. Mr. Watt had directed his son's attention to the study of science on the Continent; and—accompanied, as it would appear, by his friend Thomas Cooper, one of the vice-presidents of the Manchester Society, and who afterwards became professor of chemistry in Columbia College, in America—he proceeded to Paris. But here, carried away by the enthusiasm then prevalent in what was termed the cause of liberty, he sympathised with the Girondists and Jacobins, and even took some open and avowed part in their earlier tumultuous agitations, in company with Cooper, and subsequently with Wordsworth the poet also. Southey has recorded, from the information of James Watt himself, that so highly was he at first regarded by the French leaders, that he was the means of preventing a duel between Danton and Robespierre. A more public exhibition of zeal in the cause he had espoused, in which Cooper also took part, was afterwards denounced by Burke in the House of Commons. The licence and excesses of the revolutionary parties however opened the eyes of the young enthusiast to the real nature of the principles he was supporting, and he then endeavoured to mitigate as far as possible the violence which be foresaw he must in future deplore. This became eventually the cause of his quitting Paris and abandoning his French associates and their objects; for Robespierre, at the club of the Jacobins, insinuating that Cooper and his compatriot were emissaries of Pitt, the British prime minister, James Watt indignantly silenced his formidable antagonist from the tribune in a brief but impassioned harangue, delivered in excellent French, carrying with him the feelings of the rest of the audience. On returning home he learned that his life was no longer safe for a day, instantly left Paris, succeeded with difficulty in making his way to the south, and did not rest until he arrived in Italy.

Not long afterwards he returned to England, and in 1794, as already intimated, began to be actively engaged as a partner in the management and direction of the steam-engine manufactory at Soho, which necessarily withdrew him from political and also from scientific pursuits, strictly so called, and what he effected in the latter has almost escaped notice.

Mr. James Watt took a part in the progress of steam-navigation, especially as regarded the requisite adaptations in the construction of the engines, not unworthy of his name and of the reputation of the firm of which he became the leading partner. Mr. Henry Bell of Glasgow, who had in 1811 taken the enterprising step of himself trying, in Scotland, at his own risk and under his sole direction, an experiment similar to that which, in the hands of Fulton (whom he had aided), had succeeded so well in America, built several steam-vessels propelled by engines of his own construction. Among these was the Caledonia, of 102 tons and 32-horse power, which was launched in 1815, but from defects in her engines had been little used. In April 1817 she was purchased by Mr. James Watt, who had her machinery taken out and replaced by two new engines of Soho manufacture, of 14-horse power each. In October he went over in her to Holland, and ascended the Rhine as far as Coblenz; having thus been the first to leave the British shores and cross the Channel by so novel and, as it was then esteemed, so hazardous a mode of transit. On her homeward voyage she entered the Scheldt and visited Antwerp, and was then laid up for part of the winter in the harbour of Rotterdam for repairs and alterations. "After her return to the Thames in the spring of 1818," it is stated by Mr. Muirhead, to whose Memoir we are indebted for these particulars of the history of steam-navigation in this country, "Mr. James Watt made no fewer than thirty-one series of experiments with her on the river (the whole number of those experiments amounting to 250), which resulted in the adoption of many most material improvements in the construction and adaptation of marine engines, and in an immense though gradual extension of that branch of the manufacture at Soho." The marine engines manufactured there down to the year 1854, "were in number 319, of 17,438 *nominal*, or 52,314 *real* horse-power."

Some further particulars of Mr. James Watt may be gleaned from the two later publications of Mr. Muirhead. He wrote, in 1823, the Memoir of his father in Macvey Napier's Supplement to the 'Encyclopædia Britannica' (subsequently transferred, in substance, to the seventh edition of that work); and in 1846 he addressed a letter to Mr. Muirhead on his father's claims as to the composition of water; which is prefixed to the 'Correspondence' of the latter on that subject. The publication of his father's specifications of patents and documents relating to them was originally designed and, to a considerable extent, prepared by him; but, from the infirmities of age, confided prior to his decease to Mr. Muirhead, by whom it has been accomplished in the work already cited and described.

WAX PALM. [CEROXYLON ANDICOLA.]

WAX WING. [BOMBYCILLA.]

WEALDEN FORMATION. The Wealden beds comprise a series of layers of clay, sand, and shale, with subordinate beds of limestone, grit, and sandstone, which are more or less regularly distributed, and contain remains of fresh-water *Mollusca*, as species of *Cyrena*, *Unio*, *Paludina*, &c. Fishes, *Sauria*, and Plants, are also found in these deposits, with a few marine *Mollusca*. The following are the characters of the subordinate groups of the formation:—

1. WEALD CLAY.—Average thickness 140 to 200 feet.

Stiff clay of various shades of blue and brown; with subordinate beds of limestone and sand; *Septaria*.	*Paludinæ*, *Cypris Valdensis*, *Cyrena*, &c., the bones of reptiles rarely; scales and bones of fishes.	The Wealds of Sussex, Surrey, and Kent; forming the vale between the Downs and Forest Ridge.

2. HASTINGS SANDS.—Average thickness 400 to 500 feet.

a. Horsted Sand.

Gray, white, ferruginous, and fawn-coloured sand, and friable sandstone, with abundance of small portions of lignite.	Traces of carbonised plants.	Little Horsted, Uckfield, Framfield, Buxhill, Chailey, Fletching, Eridge Park, Tunbridge Wells, &c.

b. Strata of Tilgate Forest.

Sand and friable sandstone, of various shades of green, yellow, and ferruginous, surface oftentimes furrowed. Tilgate stone, very fine, compact, bluish or greenish gray grit, in lenticular masses, surface oftentimes covered with mammillary concretions; the lower beds frequently conglomeritic, and containing large quartz pebbles.	Ferns, and stems of vegetables, bones of Saurian animals, birds, turtles, fishes, &c.; shells of the genera *Unio*, *Cyclas*, *Cyrena*, *Paludina*, &c. Lignite wood.	Loxwood, Horsham, Tilgate Forest, St. Leonard's Forest; Chailey, Ore near Battle, Hastings, &c., Rye, Winchelsea.
Clay or marl; of a bluish gray colour; alternating with sand, sandstone, and shale.	Bones, and shells but rarely. Ferns; and stems of vegetables.	Tunbridge Wells.

c, Worth-Sandstone.

White and yellow friable sandstone and sand.	Ferns and Arundinaceous plants. Lignite, &c.	Worth near Crawley, St. Clement's Caves. Hastings, &c.

3. ASHBURNHAM BEDS.

A series of highly ferruginous sands, alternating with clay and shale, containing ironstone and lignite.	Ferns, Lignite, &c.	Lower part of Hastings Cliffs; near Buxted; West Hothly; Crawley, &c.
Shelly limestone, alternating with sandstone, shale, and marl; and concretional masses of grit.	*Cypris.* Shells of the genera *Cyclas* and *Cyrena*; lignite carbonised vegetables.	Archer's Wood, near Battle; Brightling, Pounceford, Burwash, Hurst Green, Eason's Green.

The Dover Railway traverses the beds of the Wealden between Red Hill and the branch-line to Tunbridge Wells, exposing the Weald Clay and Upper Hastings Sands.

The fossils of this group are as follows:—

Plantæ.

Carpolithes Mantelli.	*Lonchopteris Mantelli*, Brong.
Clathraria Lyelli, Mant.	*Pterophyllum Brongniarti*, Mant.
Endogenites erosa, Mant.	*Sphenopteris Mantelli*, Brong.
Equisetites Lyelli, Mant.	*S. Phillipsi*, Mant.
Lonchopteris Huttoni, Presl.	*S. Sillimani*, Mant.

Insectæ.

Carabus elongatus, Brod.	*Termes grandævus*, Brod.
Cerylon striatum, Brod.	*Æshna perampla*, Brod.
Acheta Sedgwickii, Brod.	*Simulium humidum*, Brod.
Blatta Stricklandi, Brod.	*Platyura Fittoni*, Brod.
Cixius maculatus, Brod.	*Tanypus dubius*, Brod.
Ricania fulgens, Brod.	*Sciophila defossa*, Brod.

Pholidophorus ornatus, Ag.	*Pycnodus Mantelli*, Ag.

Reptilia.

Cetiosaurus, 2 species.	*Platemys Mantelli*, Owen.
Chelonia, 2 species.	*Poikilopleuron Bucklandi*, Desl.
Goniopholis crassidens, Owen.	*Streptospondylus major*, Owen.
Hylæosaurus armatus, Mant.	*Suchosaurus cultridens*, Owen.
Iguanodon Mantelli, Meyer.	*Trionyx Bakewelli*, Mant.
Megalosaurus Bucklandi, Mant.	*Tretosternon punctatum*, Owen.

(Tennant, *Stratigraphical List of British Fossils.*)

WEAVER, THOMAS, F.R.S., an eminent geologist, was one of the band of scientific men, who, with the late Professor Jameson, the late Leopold von Buch, and Alexander Humboldt, learned the rudiments of mineralogy and geology under the tuition of Werner at Freiberg, where he commenced his studies in 1790. He was long a distinguished and active member of the Geological Society of London, particularly in its earlier days; and was elected a Fellow of the Royal Society on the 9th of March 1826. From 1795 to 1798, and again in 1801, he was concerned, with the gentlemen mentioned below, in the exploration, on account of the government, of the deposits of gold which had been discovered at Croughan Kinshella, in the county of Wicklow, in Ireland. An account of the discovery was given by John Lloyd, Esq., F.R.S., and a mineralogical account of the gold itself by Abraham Mills, Esq., both referring to Mr. Weaver, were published in the 'Philosophical Transactions' for 1796. A particular history of the proceedings of himself and his colleagues, in reference to the gold workings, was given by Mr. Weaver in his Memoir on the 'Geological Relation of the East of Ireland, inserted in the 'Transactions of the Geological Society,' first series, vol. v. He afterwards communicated a paper on the Gold-workings to the 'Philosophical Magazine' for July 1835 (Series 3, vol. vii., p, 1), giving some extracts from the Memoir, with new matter. In the 'Philosophical Transactions' for 1825, is a paper by Mr. Weaver, On the Fossil Elk of Ireland, in which he infers that that animal lived and flourished in the countries in which its remains are now found at a period of time which, in the history of the earth, may be considered as modern. In the Second Series of the 'Trans. Geol. Soc.,' vol. i., is an elaborate memoir by him, entitled 'Geological Observations on Part of Gloucestershire and Somersetshire,' and in vol. v., another, 'On the Geological Relations of the South of Ireland.' He communicated other papers, all on geological subjects, to the 'Annals of Philosophy,' Old and New Series, and subsequently to the 'Philosophical Magazine,' in which (Series 3, vol. ix.) appears a paper on the 'Carboniferous Series of the United States of North America,' a portion of the results of the geological and mining researches in Mexico and the United States in which he was engaged from 1831 to 1834. He died at his residence in Stafford-place, Pimlico, London, on the 2nd of July 1855, having retired from the field of science some years before.

WEBSTER, DANIEL, was born January 18, 1782, in the township of Salisbury, New Hampshire, United States of America. His father, Ebenezer Webster, was descended from Thomas Webster, a Scotchman, who settled at Hampton, on the coast of New Hampshire, in 1636. Ebenezer Webster served as a common soldier against the French and Indians, but rose to the rank of captain before the war terminated. He received in 1763 the grant of an allotment of land in the township of Salisbury, on the upper course of the river Merrimac, and there in 1764 built his log-cabin, when there was no other white man's habitation between it and the settlements at Montreal. He afterwards built a frame-house not far from his log-cabin, on the Elms Farm, and there Daniel Webster was born, and spent his childhood and much of his boyhood. His opportunities for early education were very scanty, working on the farm in summer, and trudging two or three miles through the snow to school in winter. In 1796 he was sent to an academy at Exeter, where he commenced his classical and literary studies. After remaining there a few months, which were well spent, he was placed by his father under the Rev. Samuel Wood, minister of the neighbouring town of Boscawen, with whom he remained from February till August 1797, when he entered Dartmouth College. He remained there four years, completing his college course in August, 1801. He then returned to Salisbury, and immediately commenced his law-studies in the office of a neighbouring attorney; but not long afterwards, in order to assist his elder brother, Ezekiel Webster, to obtain a college education, he took charge of a school at Fryeburg, in the State of Maine; and while this duty occupied him by day, he spent his evenings in copying deeds for the registrar of the county. In September 1802 he returned to the attorney's office at Salisbury, and there remained eighteen months.

In July 1804, Daniel Webster removed to Boston, and entered the office of Mr. Gore, an eminent lawyer, afterwards governor of Massachusetts, with whom he remained eight months, studying chiefly the common law, and particularly special pleading. When about to commence practice he was offered the situation, which had become vacant, of clerk in the Court of Common Pleas for the county of Hillsborough, New Hampshire, a situation to which a large salary was attached. By the advice of Mr. Gore, and in opposition to the wish of his father, who was a judge in the court, he rejected the offer. "Once a clerk," said Mr. Gore, "and always a clerk, with no prospect of obtaining a higher position." Immediately afterwards, in the spring of 1805, he was admitted to the practice of the law in the Court of Common Pleas for Suffolk county, when, in order to be near his father, whose health was then infirm, he opened an office at Boscawen, not far from the paternal residence. His father died in 1806. In May 1807, he was admitted as an attorney and counsellor of the Superior Court of New Hampshire, and in September the same year, relinquishing his office to his brother Ezekiel, he removed to Portsmouth, which was the largest town of New Hampshire as well as the seat of foreign commerce. Ezekiel Webster continued in the successful practice of the law till 1829, when, while pleading a cause in the court at Concord, he suddenly fell down, and expired instantaneously.

Daniel Webster remained at Portsmouth nine years. His practice, mostly in the circuit courts, was very large, but by no means lucrative. In 1808 he married his first wife, by whom he had two sons and two daughters, of whom only one son, Fletcher Webster, survived him. He is a naval officer of the port of Boston. In May 1813 Daniel Webster took his seat in congress as a representative of the Federal party of New Hampshire. Placed by Mr. Clay, the speaker, on the committee of foreign affairs, he made his first speech in the house of representatives, June 10, 1813, in moving a series of resolutions on the Berlin and Milan decrees. In a great fire which occurred at Portsmouth in December 1813, his house, furniture, library, and manuscript collections, were all destroyed. In August 1814 he was again returned as a representative to congress. From March to December 1815 he was busily engaged in the practice of the law at Plymouth, whence, in August 1816, after the adjournment of congress, he removed to Boston, where the causes for trial were of higher importance and the practice was more lucrative.

Mr. Webster retired from congress in 1817. He had purchased an estate of about 2000 acres at Marshfield, about thirty miles from Boston, and his time during the next six years was partly occupied with law business at Boston and partly with the cultivation of his estate. His favourite amusements were angling in the streams and fishing in his yacht. At the end of 1822 he was again elected for Boston, as he was also in 1824 and 1826. In 1827 his first wife died. In January 1828 he took his seat in the senate of the United States, having been elected by the legislature of Massachusetts. He was a candidate for the dignity of president in 1836, but received only the twelve votes of Massachusetts. In the spring of 1839 he visited Europe for the first and only time in his life, and made a hasty tour through England, Scotland and France. When General Harrison became president in 1841 Mr. Webster was appointed secretary of state. In 1842 he negotiated with Lord Ashburton the Oregon boundary, and the treaty which settled that question between Great Britain and the United States was ratified August 20, 1842. In May 1843 he resigned his situation as minister, and retired to private life, but was again elected senator in 1845. He opposed the war with Mexico in 1846, as he had previously opposed the annexation of Texas. In 1848 he was again a candidate for the Presidency, but was unsuccessful. On the death of General Taylor in July 1850, he was appointed secretary of state by Mr. Fillmore, and he continued to perform the duties of that high office till his death, which occurred October 24, 1852, at his country residence, Marshfield.

Daniel Webster, as a statesman, an orator, and a lawyer, was one of the greatest men that the United States of America have produced. As a statesman his principles were founded on comprehensive views and a wide range of information, legal, constitutional, and historical, but during his later years he was suspected of shaping his course too generally with a view to the presidency. He was a decided Federalist. He expressed his belief that if ever the union of the States should be dissolved, the internal peace, the vigorous growth, the prosperity of the States, and the welfare of their inhabitants, would be blighted for ever; but that while the Union endures, all else of trial and calamity which may befall the nation may be remedied or borne. He was undoubtedly the greatest American orator of his day. His power of fixing the attention and producing an overwhelming effect on a deliberative assembly was unequalled. His style was generally argumentative and solid, never deficient of imagery where suitable, but never flowery. Both as a parliamentary orator and a pleader his speeches were distinguished by extraordinary clearness, compactness, and condensation of statement, sound logic, and, when he was excited, by intense earnestness and vehemence. 'The Works of Daniel Webster,' 6 vols. 8vo, Boston, 1851, consist of his speeches in congress, at the bar, and at public meetings, his diplomatic papers, a few letters, and a Biographical Memoir by Edward Everett.

WEIGHTS AND MEASURES. [STANDARD, *S.* 2.]

WEISSITE. [MINERALOGY, *S.* 1.]

WELLINGTON, DUKE OF. Arthur Wellesley was born, as commonly stated, on the 1st of May, 1769, at Dangan Castle, in the county of Meath, Ireland; but in the registry of St. Peter's Church, Dublin, it is recorded that "Arthur, son of the Right Honourable Earl and Countess of Mornington," was there christened by "Isaac Mann, archdeacon, on the 30th of April 1769." It is probable therefore that he was born in March, at Mornington House, Dublin, the town residence of his parents. After the battle of Waterloo he kept his birthday on the 18th of June, the anniversary of that important victory. He was the third son of the first Earl of Mornington. [MORNINGTON, EARL OF.] The family name was originally Wesley, derived from Garret Wesley, of Dangan Castle, and so continued till 1797, when the name was altered to Wellesley by the first Marquis Wellesley. Arthur Wellesley was educated at Eton College, whence he was transferred to private tuition at Brighton, and afterwards to the military academy at Angers in France.

On the 7th of March 1787, the Hon. Arthur Wellesley received his first commission as an ensign in the 73rd regiment of foot. He was gazetted under the name of Wesley, and the young officer is so designated in contemporary descriptions of his early services. In December 1787 he was promoted to the rank of lieutenant in the 76th foot, from which, in the following month, he exchanged into the 41st, and on the 25th of June 1788 was appointed to the 12th Light Dragoons. On the 30th of June 1791 he became captain in the 58th Foot, and on the 31st of October 1792, obtained in exchange a troop in the 18th Light Dragoons. Captain Wellesley was gazetted as major in the 33rd Foot, April 30, 1793, and in the following September obtained by purchase the rank of lieutenant-colonel of that regiment. Before he commenced his career of active service he was attached as aide-de-camp to the staff of the Earl of Westmoreland, then lord-lieutenant of Ireland, and in 1790, having just come of age, he was returned as a member to the Irish parliament for the family borough of Trim, in the county of Meath.

Lieutenant-Colonel Wellesley, in command of the 33rd regiment, sailed from Cork for Flanders, on his first active service, in May 1794, and landed at Ostend to join the British army under the Duke of York, then in the Netherlands. The advance of the French army under Pichegru obliged the British, after several engagements, to retire into Holland, and take up a position on the right bank of the Waal. In January 1795 the retreat was continued by the town of Deventer, through Guelderland and Overyssel, to the river Ems, and thence to Bremen, where the army was re-embarked for England in the spring. During this arduous retreat through a frozen and cheerless country, in the middle of a winter remarkably severe, Lieutenant-Colonel Wellesley commanded a brigade in the rear-guard, and his able dispositions in checking or assaulting the enemy are specially noticed in contemporary accounts of the events.

In the autumn of 1795 the 33rd regiment embarked for the West Indies; but the ships, after being tossed at sea for six weeks, were obliged to put back into Portsmouth, and the 33rd regiment was landed again, and in April 1796 was embarked for India. Colonel Wellesley (for he had been promoted to the rank of Colonel in May of that year) was detained at home through illness, but he joined his regiment at the Cape of Good Hope, and proceeded with it to Calcutta, where he arrived in February 1797, and was placed on the Bengal establishment.

In May 1798, the Earl of Mornington, Colonel Wellesley's elder brother, arrived at Calcutta, having been appointed governor-general of India on the 4th of October 1797. One of the first objects that required his attention was the equivocal attitude of Tippoo Saib, sultan of Mysore, towards the English. In the month of June a proclamation of the French governor of the Isle of France announced the arrival of two ambassadors from Tippoo, to propose an alliance offensive and defensive for the purpose of expelling the English from India, in consequence of which a number of Frenchmen volunteered to join the sultan, and were taken to Mangalore in a French ship of war. These movements of Tippoo were connected with the French expedition to Egypt. The Earl of Mornington wrote several conciliatory letters to Tippoo, to induce him to settle any pending controversy between him and and the East India Company by means of negociation, but at the same time he did not neglect to prepare for offensive operations, and in November an army was assembled at Vellore, under the command of General Harris, ready to enter the territory of Mysore at the first notice. Colonel Wellesley, with his regiment, formed part of this force. The army was joined by a large contingent from the Nizam of the Deccan, an ally of the English; and as the court of Hyderabad expressed a wish that the brother of the governor-general should be appointed to the command of the contingent, General Harris ordered the 33rd regiment to be attached to the Nizam's force, the general command of which was given to Colonel Wellesley. As Tippoo declined to enter into negociations, and was evidently trying to gain time, the allied British and native army was ordered to advance into Mysore, which they entered early in March 1799. On the 27th an engagement took place, in which the left wing of the allies, under Colonel Wellesley, routed a body of Tippoo's choice infantry. The army then advanced to Seringapatam, Tippoo's capital, and Colonel Wellesley was employed to dislodge the enemy from some strong posts in front of the town, which he executed in gallant style, and without loss. The siege of Seringapatam followed, and on the 4th of May the place was stormed by a party under General Baird. After the storming was over, and the confusion began to subside, General Baird desired to be relieved, and Colonel Wellesley was ordered to take the command of the place. By his exertions and firmness he succeeded in stopping the plunder within the town. Tippoo Saib was slain.

In July 1799 Colonel Wellesley was appointed governor of Seringapatam, then the capital of Mysore. During several years that he held almost vice-regal command in Mysore he was fully occupied in organising the civil and military administration of the country, and in the execution of this task he improved his natural talents for business, military and civil, and displayed that quickness of perception and decision of character which have characterised him throughout the whole course of his military career. From the beginning also he paid particular attention to the wants of his soldiers, to the regularity of the supply of provisions, to the management of the hospitals, and to all the particulars of the Commissariat and Quartermaster-General's departments, which constitute half the business of an army, and, to use his own words, if neglected, "misfortune and disgrace will be the result." In the mean time also, by his justice and humanity, and the strict discipline that he maintained among the troops, he acquired the confidence and respect of the native population of Seringapatam.

Whilst thus employed in Mysore he was obliged to take the field against one of those bold adventurers, once common in India, named Dhoondia Waugh, who had got together 5000 horsemen, partly from Tippoo's disbanded cavalry, and partly from other predatory bands, and who styled himself 'King of the Two Worlds.' Colonel Wellesley, after a harassing chase of two months, came up with him on the 10th of September 1800, immediately attacked him, and put his army to the rout by a single charge, in resisting which Dhoondia himself was slain. In December of the same year Colonel Wellesley was appointed by the governor-general in council to command a body of about 5000 troops assembled at Trincomalee, in the island of Ceylon, for foreign service, and he accordingly proceeded from Mysore to Trincomalee. The expedition was said to be intended either for Batavia or the Isle of France. Meantime despatches from England arrived, directing 3000 men to be sent to the Red Sea to act against the French in Upper Egypt, whilst an expedition from Europe, under Sir Ralph Abercrombie, was attacking Lower Egypt. The governor of Madras sent Colonel Wellesley a copy of the despatches from home, and as he knew that his brother, the governor-general, when he ordered the assembling of the force at Trincomalee, had some expectation of its being required for Egypt, Colonel Wellesley, upon his own responsibility, moved at once the whole force to Bombay, where it could be supplied with provisions and other necessaries previous to sailing to the Red Sea, and where he would be ready to receive final orders from the governor-general. He sailed from Trincomalee about the middle of February 1801, and arrived at Bombay about the middle of March. The governor-general had appointed General Baird to command the Egyptian expedition, leaving to his brother the choice of going under him as second in command, or retaining his own command in Mysore. When Lord Mornington learnt that Colonel Wellesley was at Bombay with the whole Trincomalee force, he could not disapprove of this movement, as he had himself intended to send to the Red Sea a larger body of men than that mentioned in the home despatches, but still he thought it ought not to be set up as a precedent, and he required an official explanation of the grounds and motives which had induced his brother thus to act upon his own judgment, without waiting for orders. Colonel Wellesley stated his motives at full length, in a letter, dated Bombay, March 23, 1801. ('Dispatches,' vol. i.) He intended to have proceeded to the Red Sea, and to have served under General Baird; but on the 25th of March he was seized with fever, and soon afterwards returned to his government in Mysore. Before leaving Bombay he transmitted to General Baird a memorandum which he had written concerning the operations in the Red Sea, evincing the research and reflection which he had bestowed on his anticipated command.

Colonel Wellesley made a second stay in Mysore of nearly two years. He was raised to the rank of Major-General in April 1802, and in February 1803 he was appointed to command a force intended to march into the Mahratta territory.

Civil war raged between the Mahratta chiefs Holkar and Scindia. The Peishwa, the nominal head of the Mahratta confederation, was looked upon as an instrument in the hands of the strongest. Dowlut Rao Scindia, who ruled over Malwa and Candeish, had an army of regular infantry and artillery, which had been formed by his father, with the assistance of M. de Boigne, a native of Savoy, and was now under the direction of a French officer of the name of Perron. Scindia exercised paramount influence over the Peishwa at Poonah. Holkar, another ambitious chieftain, who had long been at variance with Scindia, suddenly crossed the Nerbudda and marched with a large cavalry force on Poonah, which he entered after defeating the combined army of Scindia and the Peishwa. The Peishwa escaped to the coast, and put himself under British protection, whilst Holkar placed one of his relations on the seat of power at Poonah.

The Madras army, under Lieutenant-General Stuart, was ordered to advance into the Mahratta territory for the purpose of re-instating the Peishwa, and Major-General Wellesley was appointed to command a select corps in advance, with which he marched rapidly upon Poonah. Having received information on the road that Holkar's people intended to burn the town on his approach, he moved on with the cavalry, and, performing a march of 60 miles in 30 hours, reached Poonah on the 20th of April, and thus saved the town. Holkar's people retired without fighting, and in the following month the Peishwa re-entered his capital. Scindia however and the Raja of Berar, another powerful Mahratta chief, were together in the field making hostile demonstrations against the English and their ally the Nizam, and they were understood to be in correspondence with Holkar, who was to join the league. Seeing this state of affairs, which was yet more dangerous at a moment when by the peace of Amiens the French had just recovered their Indian possessions, the governor-general appointed General Wellesley to the chief command of all the British and allied troops serving in the territories of the Peishwa and the Nizam, with full power to direct all the political affairs of the British government in the same district. ('Despatches,' Fort William, 26th and 27th of June, vol. ii.) The force at his command consisted of about 10,000 troops of all arms, Europeans and natives, including the 19th Dragoons, and the 74th Foot. After some fruitless negociations with Scindia, General Wellesley marched from Poonah to the north, and took by escalade the town of Ahmednuggur, which was garrisoned by Scindia's troops. On the 24th of August he crossed the river Godavery, and entered Aurungabad on the 29th. The enemy manifested an intention to cross the river to the eastward and steal a march upon Hyderabad, but were prevented by General Wellesley marching along the left bank of the river, and placing himself between them and that city. On the 12th of September the British general was encamped 20 miles north of the Godavery. Colonel Stevenson, with the Nizam's auxiliary force, was at some distance from him. Scindia, who had a large mass of irregular cavalry, avoided a general engagement, being afraid of British discipline, and only thought of carrying on a predatory warfare.

About the middle of September, General Wellesley learnt that Scindia had been reinforced by 16 battalions of infantry commanded by French officers, and a large train of artillery, and that the whole of his force was assembled near the banks of the small river Kaitna. On the 21st of September General Wellesley had a conference with Colonel Stevenson, in which a general plan of attack on the enemy was concerted. The General and the Colonel advanced by two parallel routes round the hills, so as to fall at the same time upon the enemy. General Wellesley on the 23rd received a report that Scindia and the Raja of Berar had moved off in the morning with their cavalry, and that the infantry were about to follow, but were still in camp at the distance of about six miles. General Wellesley determined to march upon the infantry, and engage it at once. He sent a messenger to

Colonel Stevenson, then about eight miles on his left, to inform him of his intention, and directing his advance. He moved forward with the 19th Light Dragoons and three regiments of native cavalry to reconnoitre. The infantry, consisting of two British and five native battalions, followed. After a march of about four miles he saw from an elevated plain not only the infantry, but the whole Mahratta force, consisting of nearly 50,000 men, encamped on the north side of the river Kaitna; the right, consisting of cavalry, was about Bokerdou, and extended to their corps of infantry, which was encamped near the village of Assaye, with 90 pieces of artillery. General Wellesley determined on attacking the infantry on its left and rear. He moved his little army to a ford beyond the enemy's left, and, leaving the Mysore and other irregular cavalry to watch that of the enemy, he crossed the river with his regular horse and infantry, and having ascended the bank, which was steep, formed his men in three lines, two of infantry, and the third of cavalry. This was effected under a brisk cannonade from the enemy's guns. Scindia at the same time made a corresponding movement in his line, by giving a new front to his infantry, which was made to rest its right upon the river Kaitna, and its left upon the village of Assaye and the Juah stream. His numerous and well-served cannon did fearful execution among the British advancing lines. General Wellesley, seeing this, gave orders to abandon the artillery, and for the infantry to charge with the bayonet. The charge proved irresistible on the right and centre of the enemy; the British took possession of the guns, and the enemy's infantry gave way. But the British right suffered a very severe loss from the guns at the village of Assaye, and the enemy's cavalry, seeing the gaps thus made in the ranks, charged the 74th regiment, when Colonel Maxwell, with the 19th Dragoons, rode to its rescue, and drove back the assailants with great loss. The native infantry in the British service proceeding too far in the pursuit, many of the enemy's artillerymen, who had thrown themselves down among the carriages of their guns, as if they were dead, turned their pieces against the advancing infantry, and at the same time several of Scindia's battalions formed themselves again, thus placing the sepoys between two fires. Colonel Maxwell charged and dispersed those battalions, but he lost his life. The 78th British regiment, which was on the left of the line, remained firm with unbroken ranks in the midst of the confusion, and contributed greatly to check the enemy. General Wellesley led the regiment in person against the village of Assaye, where the enemy made the stoutest resistance, but at last gave way. It was near dark when the firing ceased. The enemy retired in great disorder, leaving behind the whole of his artillery, ammunition, and stores. Colonel Stevenson arrived on the field after the battle, and undertook the pursuit. The loss of the united army, British and native, in this splendid victory consisted of 22 officers and 386 men killed, and 57 officers and 1526 men wounded, in all nearly one-third of the force engaged, exclusive of the irregular cavalry. The enemy left more than 1200 dead, and a great number of wounded on the field of battle. General Wellesley had two horses killed under him, and his orderly's head was torn away by a cannon-ball as he rode beside him.

While General Wellesley was defeating the Mahrattas in the south, General Lake gained a complete victory at Allyghur, in the plains of Hindustan, over another part of their force under M. Perron, which had occupied Delhi. The Mahratta power was now broken, and after several marches and countermarches, and desultory negociations, Scindia asked and obtained a truce at the beginning of November; but the Raja of Berar still kept the field, and General Wellesley, coming up with him in the plains of Argaum, found Scindia's cavalry, together with the Raja's forces, drawn up in battle array. The battle of Argaum was fought November 29, 1803. The British line advanced in the best order. The 74th and 78th regiments were attacked by a large body of Persian mercenaries in the service of the Raja of Berar, which was entirely destroyed. Scindia's cavalry charged one of the Company's regiments, and was repulsed, when the whole Mahratta line retired in disorder, leaving 38 pieces of cannon and all their ammunition in the hands of the British. The British cavalry pursued the enemy for several miles, taking many elephants, camels, and much baggage. Colonel Stevenson soon after took by storm the strong fort of Gawilghur, and this exploit concluded the campaign. The Raja of Berar now sued for peace, and General Wellesley drew up the conditions of the treaty, by which the Raja ceded to the Company the province of Cuttack with the district of Balasore, and dismissed his European officers. Scindia was glad to follow the example, and on the 30th of December he signed a treaty of peace, by which he ceded to the Company all the country between the Jumna and the Ganges, besides numerous forts. In February 1804, General Wellesley crossed the Godavery to put down the independent freebooting parties which were carrying devastation through the West Deccan. Following them rapidly from hill to hill, he gradually dispersed them, and took their guns, ammunition, and baggage. Peace was thus restored to the peninsula of India.

In March, 1804, General Wellesley paid a visit to Bombay, where he was received with marked honour and loud acclamations, and an address of the British inhabitants of Bombay was presented to him, as a commander "equally great in the cabinet as in the field." The British inhabitants of Calcutta voted him a sword of the value of 1000*l.*, and the officers of the army of the Deccan presented him with a service of plate of the value of 2000 guineas, with the inscription, "Battle of Assaye, September 23, 1803."

On the 24th of June 1804, General Wellesley broke up the army in the Deccan, in pursuance of orders from the governor-general, and the following month he returned to Seringapatam, where he received from the native inhabitants an affecting address, in which they "implored the God of all the castes and all nations to hear their constant prayer, whenever greater affairs might call him away from them, to bestow on him health, glory, and happiness." ('Dispatches,' vol. iii., p. 420.) It may be here observed that during the whole of his career in India, as afterwards in the Spanish peninsula, General Wellesley, ever firm and just, showed himself always inclined to humanity and mercy whenever they could be exercised without detriment to justice or to the safety of others; and of this humane disposition his 'Dispatches' contain numerous instances.

In July 1804, General Wellesley was called to Calcutta to assist in military deliberations. Several important memoranda on the political and military affairs of India, which are given in the third volume of the 'Dispatches,' were written by him about this period. In November of the same year he left Calcutta for Madras, whence be returned to Seringapatam. In February 1805 he again repaired to Madras, and obtained leave to return to England. About the same time his appointment by the king to be a Knight Companion of the Order of the Bath was known in India, and published in the general orders; and in the following March the thanks of both Houses of Parliament to Major-General Wellesley, for his services, were likewise published in the general orders in India. On the 10th of March 1805 Sir Arthur Wellesley sailed from Madras for England.

General Sir Arthur Wellesley landed in England in September 1805. In November of the same year he was sent to Hanover in command of a brigade in the expedition under Lord Cathcart, which was intended to make a diversion whilst the French army was engaged on the banks of the Danube against Austria and Russia. The tergiversation of the Prussian cabinet, and the disastrous battle of Austerlitz (December 1805), disconcerted the plans of the allies, and the English returned from Hanover to England in February 1806, without having seen any active service. Sir Arthur Wellesley was now appointed to the command of a brigade of infantry stationed at Hastings. In January 1806, when the news was received of the death of the Marquis of Cornwallis, he was appointed Colonel of the 33rd regiment. On the 10th of April 1806, he married Lady Catherine Pakenham, third daughter of the Earl of Longford. In that year he was elected member for the borough of Rye, and from his seat in the House of Commons he defended the administration of his brother the Marquis of Wellesley in India. In April 1807 Sir Arthur Wellesley was appointed secretary for Ireland, the Duke of Richmond being lord-lieutenant of Ireland, and in that capacity was sworn a member of his Majesty's Privy Council. In August of the same year he was appointed to a command in the expedition sent to Copenhagen, under Lord Cathcart and Admiral Gambier. On the 29th of August General Wellesley's division attacked the Danish troops at Kioge, carried their entrenchments, and entered the town of Kioge, where they took a large military store and nearly 1200 prisoners. This was the only action of any importance which took place by land. The bombardment of Copenhagen having induced the Crown Prince of Denmark to listen to terms, General Wellesley was appointed by Lord Cathcart, together with Lieutenant-Colonel Murray and Sir Home Popham, captain of the fleet, to draw up the articles of the capitulation, which were agreed to by the Danish goverment on the 7th of September, and by which the Danish fleet and naval stores were delivered to the British government till the general peace. General Wellesley returned to England with the expedition, and resumed his duties as secretary for Ireland. In the following February (1808) he received in his place in the House of Commons, the thanks of that House for his important share in the success of the Copenhagen expedition, by which Napoleon was deprived of the assistance of the Danish fleet, upon which he had reckoned in his plans against England.

In the spring of 1808 a military force was assembled at Cork, intended, it was believed, to act against the Spanish colonies of South America, Spain being, through French influence, at war with England. But the invasion of Portugal and Spain by Napoleon, occurring about the same time, gave a new destination to the English expedition. The people of Spain declared against the invaders, and sent to England to ask for assistance. Juntas, or local governments, were formed, and peace was proclaimed between Spain and England. The main strength of the Spanish patriots appeared to be in the north, in the mountainous provinces of Asturias and Galicia, which were as yet untouched by the French, and the deputies who came to England from those provinces requested the employment of an English auxiliary force to effect a diversion by landing on some point of the coast of Portugal. Sir Arthur Wellesley, who had been promoted to the rank of Lieutenant-General, April 25, 1808, was appointed in the following June to the command of the force intended for the Peninsula, consisting of about 9000 infantry and a regiment of light dragoons, with the promise of an additional force of 10,000 men to follow in a short time. These formed altogether a respectable military force, but the importance of the occasion warranted exertions even greater than these, for the Spanish peninsula had now become the field on which the great question was to be decided whether France was to govern Europe, and dictate to all other states, Great Britain included.

Sir Arthur Wellesley landed at Coruña July 20, 1808. The junta of Galicia asked for nothing but arms and money. They declined the assistance of a British auxiliary force, but they advised General Wellesley to land in Portugal, to rescue that kingdom from the French grasp, and thus to open a ready communication between the north and south of Spain. This was in accordance with Sir Arthur Wellesley's own views, and the general instructions that he had from home. He accordingly sailed on to Oporto, which town had already risen against the French; and there he found the warlike bishop, who was at the head of the insurrection, and had gathered together about 3000 men indifferently armed and equipped. He also learned that 5000 Portuguese regular troops were stationed at Coimbra, on the Mondego. Having made arrangements with the bishop for the supply of mules and horses, General Wellesley sailed to the south as far as the Tagus to get fresh information as to the strength and position of the French troops near Lisbon. On the 30th of July, he anchored in Mondego Bay, which he fixed upon for the landing of the expedition. The landing took place on the 1st of August, near the small town of Figueira, on the south bank of the Mondego. The number of troops landed was about 9000. On the 5th Major-General Spencer joined him from Cadiz with about 4000 more.

The French force in Portugal at the time, under Junot, consisted of 16,000 or 18,000 men, from which deducting the garrisons of Almeida, Elvas, Peniche, Setubal, and other places, there remained about 14,000 men for the defence of Lisbon. Their communications were cut off from their countrymen in Spain, for, since the surrender of General Dupont, the Spanish patriots were masters of Andalucia and Estremadura, and in Old Castile the French troops under Bessières had not advanced westward further than Benavente, being observed by the Spanish army of Galicia. About the same time the French abandoned Madrid and retired to the Ebro. A clear stage therefore was left for the contest in Portugal between Wellesley and Junot, whose respective disposable forces were nearly equal, the French however having the advantage of a considerable body of cavalry.

On the 9th of August the English began their march southward. The advanced guard entered the town of Leiria on the 10th, where it found the Portuguese force of 5000 men under General Freire, who, having appropriated to the wants of his men the stores which, by an agreement between the junta of Oporto and Sir Arthur Wellesley, were intended for the English, further demanded that his corps should henceforth be furnished with provisions by the English commissariat, a preposterous request with which General Wellesley declined to comply. Freire then refused to advance with the English, but remained behind at Leiria, and was with difficulty prevailed upon to allow about 1600 of his men to join Sir Arthur. On the 14th the English entered Alcobaça, and on the 15th Caldas, following the road to Torres Vedras, which runs parallel to the sea-coast. It was near Roliça, about ten miles beyond Caldas, that the first engagement took place. But before relating the operations of the campaign, it will be convenient to describe the position of the French in Portugal.

When the Spaniards had risen against the invaders, the spirit of resistance spread to Portugal, the natives of which country had equal motives for being dissatisfied with the French rule. The French had with their army several Spanish regiments, which were scattered about the country in the several garrisons. The Spanish troops which were at Oporto, forming the principal part of that garrison, hearing of the news from Spain, revolted against the French commander, seized him, together with the few French soldiers that he had with him, and set off with their prisoners for Spain, leaving the Portuguese at liberty to act as they pleased. A junta was then formed, with the bishop at their head, in the name of the Prince Regent of Portugal, and the whole of the provinces north of the Douro rose against the French. The insurrection spread southward into Beira. In the south the people of Algarve rose, and those of Alemtejo followed their example, being supported by a body of Spanish troops. The town of Evora became the centre of the insurrection in that quarter. The French General Loison, who had been sent to repress the insurgents in the north, was quickly recalled by Junot and sent into Alemtejo. He entered Evora after a desperate resistance on the part of the inhabitants, and the town was given up to indiscriminate massacre. General Margaron executed like vengeance at Leiria, sparing neither age nor sex. Similar scenes took place at Guarda in the north, and at Beja and Villaviçosa in the south. In these butcheries however the French were also losing their own men daily, for the peasantry were always hovering about their line of march, ready to cut off stragglers and intercept the communications. "The whole kingdom," observed Sir Arthur Wellesley in one of his first despatches after landing in Mondego Bay, "with the exception of the neighbourhood of Lisbon, is in a state of insurrection against the French. Their means of resistance are however less powerful than those of the Spaniards. The Portuguese troops have been completely dispersed, their officers have gone off to Brazil, and their arsenals are pillaged or in the power of the enemy. Their revolt, under the circumstances in which it has taken place, is still more extraordinary than that of the Spanish nation. They have in the northern part of the kingdom about 10,000 men in arms, of which number 5000 are to march with me towards Lisbon, the remainder are employed in a distant blockade of Almeida, and in the protection of Oporto, which is now the seat of the government. The insurrection is general throughout Alemtejo and Algarve to the southward, and in Entre Douro e Minho, Tras-os-Montes, and Beira, to the northward; but for want of arms the people can do nothing against the enemy."

The French commander-in-chief, Junot, on the news of the landing of the English, determined to abandon the provinces, except the fortresses of Elvas and Almeida, and to collect his force in the neighbourhood of Lisbon. He sent a division of about 5000 men, under De Laborde, towards Leiria, to keep the English in check; and he ordered Loison, who had returned from his expedition into Alemtejo, and had crossed the Tagus at Abrantes, to join De Laborde at Leiria. But the rapid advance of the English obliged De Laborde to fall back before he could be joined by Loison, and now De Laborde determined to make a stand alone in the favourable position of Roliça, hoping every moment to see Loison appear on his right.

General Wellesley, having driven the enemy's pickets from Obidas, marched on the 17th of August to attack De Laborde. He formed his army into three columns: the right consisting of Portuguese was ordered to make a demonstration on the enemy's left; the left to ascend the hills on the enemy's right, and thus watch the approach of Loison; and the centre, which was the column of attack, to march along the valley to the front of De Laborde's position. The French, after a gallant defence, were obliged to retire, which they did in good order, being protected by their cavalry. They withdrew to Torres Vedras, where they were joined by Loison's corps. The loss of the French in the engagement at Roliça was supposed to be above 600 killed and wounded, besides three pieces of cannon; that of the British was 480. It must be observed here, once for all, that the losses of the French throughout the war were never accurately known, as they published no returns, whilst the British official returns of killed, wounded, and prisoners, made by the respective officers in command of regiments after a battle, were always published in the 'Gazette.'

On the 18th of August General Wellesley advanced to Lourinha, keeping along the coast-road leading to Mafra. On the 19th he moved to Vimiero, where he was joined the next day by Generals Anstruther and Ackland, with two brigades just arrived on the coast from England, and which raised his force to about 17,000 British, besides 1600 Portuguese. At the same time, however, General Wellesley was superseded in the chief command by Lieutenant-General Sir Harry Burrard, who arrived from England. The government at home had determined, in consequence of the propitious appearance of affairs in the Peninsula, to have there an army of 30,000 British troops, and with that view they ordered the corps of Lieutenant-General Sir John Moore, which had just returned from a fruitless expedition to the Baltic, to proceed to Portugal; and they gave the chief command of the army to Lieutenant-General Sir Hew Dalrymple, governor of Gibraltar, with Sir Harry Burrard under him as second in command; and Lieutenant-Generals Sir John Moore, Sir Arthur Wellesley, the Hon. John Hope, Lord Paget, and Mackenzie Frazer, to command respectively divisions of the army.

Sir Harry Burrard arrived in a frigate in Maceira Bay, near Vimiero, on the evening of the 20th, and General Wellesley immediately went on board, and reported to him the situation of the army, and his own intended plan of operations, which was to march along the coast-road to Mafra, and thus turn the strong position which De Laborde and Loison had taken at Torres Vedras. By this means he would oblige the French either to give battle or retreat to Lisbon under great disadvantages. Sir Harry Burrard however decided not to advance any farther till the arrival of the reinforcements under Sir John Moore. But the enemy in the meantime was bringing the question to a speedy issue.

Junot, having joined De Laborde and Loison at Torres Vedras with all his force, estimated at about 14,000 men, of whom 1600 were cavalry, attacked the English in the position of Vimiero early in the morning of the 21st of August. The principal attack was made upon the British centre and left, with a view, according to a favourite French expression in those times, of driving the English into the sea, which was close in their rear. The attack was made with great bravery and steadiness, but was as gallantly repulsed by the British; it was repeated by General Kellerman at the head of the French reserve, which was also repulsed; and the French, being charged with the bayonet, withdrew on all points in confusion, leaving many prisoners, among them a general officer, and 14 cannon, with ammunition, &c., in the hands of the British. The loss of the French in killed and wounded was estimated at about 1800, and that of the British was 720. Sir Harry Burrard landed, and was present on the field during part of the engagement, but he declined assuming the command, or in any way interfering with General Wellesley's dispositions, till the enemy was repulsed. Towards the close of the action, when the French were seen retiring in confusion, General Wellesley wished to follow up his victory; General Ferguson on the left was actually close upon the retreating enemy, and if General Hill and the advanced guard had marched straight upon Torres Vedras they would have reached it before the French, who would thus have been cut off from Lisbon, and perhaps obliged to lay down their arms. Such was Sir Arthur's view; but Sir Harry Burrard thought it advisable not to move any farther, especially on account of the superiority of the enemy's cavalry. General Ferguson was ordered to desist from pursuit, and the French officers were thus enabled to rally their men, and make good their retreat to Torres Vedras.

On the 22nd of August Sir Hew Dalrymple, the commander-in-chief, landed in Maceira Bay, and assumed the command. In the course of the day General Kellerman appeared with a flag of truce on the part of Junot to propose an armistice, preparatory to entering upon a convention for the evacuation of Portugal by the French. The terms were discussed between General Kellerman and Sir Hew Dalrymple, who in the end directed General Wellesley to sign the armistice. Among the articles there was one which prejudged the terms of the final convention by stipulating that the French army should not "in any case" be considered as prisoners of war, and that all the individuals composing it should be carried to France with arms and baggage, and "their private property of every description, from which nothing should be detained!" This, of course, would include the church plate and other public and private property which the French had taken either at Lisbon or in the various towns which they had sacked in consequence of the insurrection, and which they had divided among themselves. General Wellesley did not "entirely approve of the manner in which the instrument was worded;" but the articles being laid before the commander-in-chief, were signed by him that same evening. The armistice however was made subject to the approbation of the Admiral, Sir Charles Cotton; and as one article of it stipulated that the Russian fleet in the Tagus, under Admiral Siniavin, should enjoy all the advantages of a neutral port, Sir Charles objected to this, but offered to enter into a separate arrangement with the Russian admiral. On the 25th Sir Hew Dalrymple signified to Junot that the armistice would be at an end on the 28th at noon, unless a convention for the evacuation of Portugal by the French should be agreed upon before that day. In the mean time the army had made a forward movement from Vimiero to Ramalhal, near Torres Vedras, within the boundaries stipulated by the armistice. Sir John Moore had also arrived in Maceira Bay, and his troops were about being landed. Junot, now perceiving the necessity of coming to terms, commissioned General Kellerman to confer with Colonel Murray, quartermaster-general to the British army, about the final convention. The favourable moment for pushing upon the French was now past; and if they could not be brought to evacuate the country by sea, they might either defend themselves within Lisbon, or cross the Tagus to Elvas, which, being a place regularly fortified, would have required a long siege, during which the British army could not have been made available in Spain. ('Dispatches,' iv., p. 120.) General Wellesley handed to Sir Hew Dalrymple a memorandum for Colonel Murray, suggesting, among other things, a separate agreement with the Russian admiral, and the propriety of devising some mode to make the French give up the Church plate which they had seized. On the 29th the draft of the proposed convention was brought to the British head-quarters at Torres Vedras, and, being laid before a meeting of general officers, several alterations were made, and the form so altered was returned to Junot, and was at last signed by him on the 30th, with the omission of several of the alterations, and was ratified by Sir Hew Dalrymple on the 31st. Sir Arthur Wellesley was not present at the final ratification, being then at Sobral with his division. This document has become known by the name of the Convention of Cintra, though it was arranged at Lisbon, and finally ratified at Torres Vedras. The article which gave most offence was that by which the French, under the name of baggage, were allowed to carry off much of the plunder of Portugal. Some limits however were put to this abuse by a commission being appointed, with General Beresford at the head, to superintend the strict execution of the terms of the convention. Through the exertions of the commissioners the spoils of the Museum and the Royal Library were restored, together with the money taken from the public treasury. With regard to the Russian fleet, it was agreed that the ships should be held as a pledge by Great Britain during the war, and that the crews should be conveyed home in British ships.

The French embarked in the month of September, and the British troops took possession of the forts of Lisbon in the name of the Prince Regent of Portugal. The whole country being now free from the enemy, a council of regency was appointed, of which the active Bishop of Oporto was a member. The joy of the Portuguese in general was manifested in the most unequivocal manner. But in England the terms of the convention were the subject of severe and loud censure, and the government appointed a board of inquiry to examine into the matter. Sir Hew Dalrymple and

Sir Harry Burrard were recalled in order to be examined by the Board, as well as Sir Arthur Wellesley, who had already asked and obtained leave to return to England. The court sat in the month of November, and, after a long examination, reported that, the Convention of Cintra having been productive of great advantages to Portugal, to the army and navy, and to the general service, the court was of opinion that no further military proceeding was necessary on the subject, "because, however some of us may differ in our sentiments respecting the fitness of the convention in the relative situation of the two armies, it is our unanimous declaration that unquestionable zeal and firmness appear throughout to have been exhibited by Lieutenant-Generals Sir Hew Dalrymple, Sir Harry Burrard, and Sir Arthur Wellesley, as well as that the ardour and gallantry of the rest of the officers and soldiers on every occasion during this expedition have done honour to the troops and reflected lustre on your Majesty's arms." The king adopted the opinion of the board.

Sir Arthur Wellesley's employment in the Peninsula being now terminated, he resumed the duties of his office as Chief Secretary for Ireland, whither he proceeded in the month of December. Parliament having re-assembled in January 1809, he returned to London to resume his seat in the House of Commons. On the 27th of January he received, through the Speaker, the thanks of the House for his distinguished services in Portugal; and, a few days afterwards, the House of Lords passed resolutions to the same effect, which were communicated to Sir Arthur by the Lord Chancellor.

Campaign of 1809.—Napoleon, with an army of more than 200,000 men, having burst through the Spanish lines, and routed the troops, forced in person the strong pass of the Somosierra on the 30th of November 1808, and four days afterwards was in possession of Madrid. Meantime, Soult, with an overwhelming force, had been sent against Sir John Moore, who had advanced into Spain as far as Salamanca. This movement was followed by the disastrous retreat of the small army under Sir John Moore, the battle of Coruña, January 16, 1809, in which the heroic commander was slain, and the embarkation of the British forces for England. The French, following up their success, spread over Leon and Estremadura to the borders of Portugal, and Soult, having overrun Galicia, marched into the northern Portuguese provinces, and carried Oporto by storm against the native troops. The small British force which had been left in Portugal when Sir John Moore advanced into Spain was concentrated by General Sir John Cradock for the defence of Lisbon. The unfavourable turn of affairs in Spain induced the British government to make another effort to save Portugal from invasion, and at the same time to assist the Spaniards in their momentous struggle. Sir Arthur Wellesley, having previously resigned his office of Secretary for Ireland as well as his seat in parliament, was sent to Portugal to assume the chief command of the British forces in the Peninsula. He arrived at Lisbon April 22, 1809, with his staff. He was followed by reinforcements of infantry and several regiments of cavalry. These, together with the Portuguese regulars under General Beresford, whom the Prince Regent had appointed to the chief command of his army, enabled him to bring into the field a force of about 25,000 men, with which he marched at the end of April to dislodge Soult from Oporto, leaving a division under General Mackenzie on the Tagus to guard the eastern frontiers of Portugal against the French General Victor, who was stationed near Merida, in Spanish Estremadura. The army under General Wellesley, having assembled at Coimbra, moved on the 9th of May in the direction of Oporto, and drove back the French troops, which had advanced south of the Douro. On the 11th of May the English occupied the southern bank of that river opposite the city of Oporto. The French had destroyed the bridges and removed the boats to their own side, and Soult was preparing to retire leisurely by the road to Galicia.

General Wellesley sent a brigade under General Murray to pass the river about four miles above Oporto, whilst the brigade of Guards was directed to cross the river at the suburb of Villanova, and the main body under the commander-in-chief was to attempt a passage in the centre by means of any boats that they could find. The Douro at that spot is very rapid, and nearly three hundred yards wide. About ten o'clock in the morning of the 12th of May, two boats having been discovered, General Paget with three companies of the Buffs crossed the river, and got possession of an unfinished building on the Oporto side, called the Seminario. The French in Oporto were taken by surprise. They sounded the alarm, and marched out to attack the Seminario, but, before they could dislodge the first party that had landed, General Hill crossed with fresh troops, and, protected by the British artillery from the southern bank, maintained the contest with great gallantry, until General Sherbrooke with the Guards crossed lower down into the very town of Oporto, amidst the acclamations of the inhabitants, and charged the French through the streets. Meantime the head of Murray's column, which had crossed at Avintas, making its appearance, Soult ordered an immediate retreat, which was effected in the greatest confusion. He left behind his sick and wounded and many prisoners, besides artillery and ammunition, and retired by Amarante with the view of passing into Spain through Tras-os-Montes; but finding that Loison had abandoned the bridge of Amarante, which was taken possession of by the Portuguese, he marched by Guimaraens, Braga, Salamonde, and Montalegre, into Galicia. In this disastrous retreat the French were obliged to destroy the remainder of their artillery and part of their baggage, and the road was strewed with dead horses and mules, and French soldiers, many of whom were put to death by the peasantry before the advanced guard of the British could save them.

Soult lost about one-fourth of his army, but the retreat was effected with great ability under the most unfavourable circumstances. General Wellesley pursued the French as far as Montalegre, and, having driven them out of Portugal, retraced his steps to the south. The passage of the broad and rapid Douro, effected in broad day, in presence of a French marshal at the head of 10,000 veterans, was one of Wellington's finest achievements. The English lost in the attack of Oporto only 23 killed and 98 wounded.

On taking possession of Oporto, General Wellesley issued a proclamation, strictly enjoining the inhabitants to respect the French wounded and prisoners, and he wrote to Marshal Soult to request him to send some French medical officers to take care of their sick and wounded, as he did not wish to trust them to the Portuguese.

The attention of Sir Arthur Wellesley was now turned towards Spain. It was necessary to strike a blow in that country, and the present occasion appeared favourable. The condition of the national cause of Spain had improved since Napoleon had left that country in January. None of his generals had individually the same means that he had at his disposal, and there was not a sufficient bond of union among them all to make them act in concert. Each had a separate command over a large division of the country, and was in a great measure independent of the others, and Joseph Bonaparte, who had been established in Madrid as king of Spain, had little or no control over them, and had not himself sufficient military skill to direct their movements. Each marshal therefore, and there were five or six in the Peninsula, acted by himself, and the warfare became complicated and irregular. Marshal Victor, Duke of Belluno, commanded the first corps in Estremadura, near the borders of Portugal, having about 35,000 men, of whom however only 25,000 were under arms. General Sebastiani commanded the fourth corps in La Mancha, which mustered about 20,000 men under arms. A division of reserve under Dessolles stationed at Madrid, together with King Joseph's guards, amounted to about 15,000 men. Kellerman's and Bonnet's divisions, stationed in Old Castile and on the borders of Leon and Asturias, comprised about 10,000 more. All the above troops, amounting to about 60,000 disposable men, were considered to be immediately under King Joseph for the protection of Madrid and of Central Spain, and also to act offensively in Andalucia and against Portugal by the Tagus and the Guadiana. Soult had a distinct command. He had mainly to occupy the northern provinces of Spain and to act through them against Portugal. He had under his immediate orders the second corps, mustering about 20,000 men under arms; the fifth, or Mortier's corps, amounting to 16,000; and Ney, with the sixth corps, about 16,000. Soult's force in all was about 52,000 men in the field. These were the two French armies with which the English advancing from Portugal were likely to be brought into collision. Besides these there were in Eastern Spain the third and seventh corps, making together about 50,000 men, under Suchet and Augereau, who were pretty fully employed in Aragon and Cataluña; and 35,000 more were scattered in the various garrisons and lines of communication.

The fortresses and fortified towns in the hands of the French were: 1st, on the northern line, San Sebastian, Pemplona, Bilbao, Santona, Santander, Burgos, Leon, and Astorga; 2nd, on the central line, Jaca, Zaragoza, Guadalajara, Toledo, Segovia, and Zamora; 3rd, Figueras, Rosas, and Barcelona, on the eastern coast. But Soult, after being driven out of northern Portugal, had withdrawn from Galicia; and Ney, following the same movement, completely evacuated that extensive province, including the forts of Coruña and Ferrol. A misunderstanding or disagreement between those two commanders led to the deliverance of Galicia; which was an important event in the war, for the French never regained that part of Spain.

Marshal Soult reached Zamora in the beginning of July, and hovered about the eastern frontiers of Portugal. Ney arrived at Astorga. Victor was posted between the Tagus and the Guadiana, his troops suffering much from malaria. Mortier, with the fifth corps, on the road from Zaragoza to Valladolid, received orders from France to halt; and the Imperial Guards, which Napoleon had ordered into Spain, and which had arrived at Vittoria, were hurriedly ordered to march to the banks of the Danube. This was in consequence of the Austrian war, which had just broken out. The French in Spain were now reduced to a state of inactivity, and Andalucia and Valencia were still untouched by them.

The Spanish armies, though always beaten in the open field, had been reorganised. General Cuesta, commanding the army of Estremadura, reckoned at 38,000 men, was posted on the Guadiana. This was the force with which General Wellesley had to co-operate in an advance from Portugal into Spain for the purpose of attacking Victor and attempting to reach Madrid. The British commander had not as yet seen a Spanish army in the field, and he could have no precise notion of its defective organisation and discipline. He however soon obtained that knowledge when he came in contact with Cuesta. But there was another obstacle which made him hesitate, and that was the difficulty of obtaining provisions and means of transport for his army in Spain. His letters during the whole of this campaign teem with painful details on this subject. The people, the local authorities, the generals, and the Junta, all seemed unanimous in their unwillingness to provide for the English, although sure to be amply repaid for their supplies. While Cuesta's army abounded with provisions and forage, Sir Arthur could not get enough to supply his men with half rations. "The French," he observes, "can take what they like, and will take it, but we cannot even buy common necessaries."

The British army entered Spain in the beginning of July by the road of Zarza la Mayor and Coria, and the head-quarters were at Plasencia on the 8th. Cuesta crossed the Tagus by the bridge of Almaraz, and the two armies made their junction at Oropesa on the 20th. Sir Robert Wilson, with the Lusitanian Legion, one Portuguese and two Spanish battalions, moved on to Escalona, about eight leagues from Madrid, threatening the rear of Victor's army, which was posted at Talavera de la Reyna. On the 22nd the combined Spanish and British armies attacked Victor's outposts at Talavera, and drove them in. The enemy would have suffered more if General Cuesta had not been absent from the field. The British columns were formed for the attack of the French position on the 23rd, as General Wellesley wished to attack Victor before he was joined by Sebastiani, but General Cuesta "contrived to lose the whole of the day, owing to the whimsical perverseness of his disposition."—(Dispatch to J. H. Frere, 24th of July, vol. iv., p. 526.) On the morning of the 24th Victor retired across the Alberche to St. Olalla on the Madrid road, and thence to Torrijos, where he was joined by Sebastiani's corps, and soon after by King Joseph in person, attended by Marshal Jourdan with the Guards and the garrison of Madrid. General Cuesta, who now seemed eager for battle, although General Wellesley recommended him to be very cautious in his movements, followed Victor to St. Olalla, and pushed his advanced guard to Torrijos, when the French attacked him briskly on the 26th, and obliged him to fall back upon the British, on the Alberche. On the 27th General Wellesley, expecting to be attacked, took up his ground in the position of Talavera.

The position of the English army was daily becoming more critical, for Soult was rapidly advancing from Salamanca, by the Puerto de Baños, upon Plasencia, in the rear of the British. General Wellesley had charged Cuesta to guard the mountain-pass of Puerto de Baños, but the Spanish general sent only 600 men thither, a force which of course proved insufficient to arrest Soult's march. General Wellesley did not know that Ney had unexpectedly evacuated Galicia, and was also advancing from Astorga upon the British left. Mortier also, with the 5th corps, was at Valladolid, ready to move forward; so that there were more than 50,000 fighting men of the enemy behind the mountains of Plasencia, ready to act on the left flank and rear of the British, who had besides 50,000 more in front of them. The British force in the field did not exceed 20,000. There were a few more battalions on their march from Lisbon to join the army, but they did not arrive till after the battle. The Spanish army of Cuesta mustered about 34,000 men, such as they were. The Portuguese regular troops, under Beresford, had remained to guard the north-east frontier of Portugal, towards Almeida. It had been previously agreed between General Wellesley, Cuesta, and the Spanish Supreme Junta, or Central Government, that General Veneges, who was at the head of the Spanish army of Andalucia, consisting of about 25,000 men, should march through La Mancha upon Madrid, whilst Wellesley and Cuesta were advancing by the valley of the Tagus. Venegas did advance through La Mancha, but it seems that he received counter-orders from the Supreme Junta which had the effect of slackening his march; he however made his appearance at last towards Aranjuez and Toledo, and it was his approach on that side which induced King Joseph to engage Wellesley and Cuesta, in order to save his capital. If he had kept the Allies in check for a few days longer, Soult's arrival at Plasencia would have obliged the English to retire precipitately. But King Joseph fearing that Venegas from the south, and Sir Robert Wilson, who, with the Lusitanian Legion, was hovering in the neighbourhood on the north, would enter Madrid and seize the stores, reserves, &c., he and Marshal Victor determined to give battle to the Allies in front: for if they were defeated, Madrid could be easily protected. General Wellesley, perceiving, from the movements of the enemy, that a battle was at hand, with much difficulty prevailed upon Cuesta to fall back with him upon the position of Talavera, where there was good ground for defence. He placed the Spanish army on the right near the Tagus, before the town of Talavera, its front protected by redoubts, ditches, mud walls, and felled trees. In this position they could hardly be seriously attacked. The British infantry on whom the general could depend, occupied the left of the line, which was open in front, but its extreme left rested upon a steep hill, which was the key of the whole position. The whole line extended in length about two miles.

On the 27th of July the French moved from St. Olalla, crossed the river Alberche, drove in the British outposts, and attacked two advanced brigades of the English, which fell back steadily across the plain into their assigned position in the line. Victor now attacked the British left, whilst the 4th corps made a demonstration against the Spaniards on the right, several thousands of whom, after discharging their pieces, fled panic-struck to the rear, followed by their artillery, and creating the greatest confusion among the baggage retainers and mules, &c.; and it was with difficulty that Generals Wellesley and Cuesta prevented the rest of the Spanish troops from following the example. Luckily the position of the Spanish army was strong in front, and the French, not knowing exactly what was going on, made no further attack on that side; their efforts were directed against the British left, which they succeeded for a moment in turning, and they gained the summit of the hill; but General Hill, being ordered to that point with more troops, drove the French down after an obstinate struggle which lasted till after dark, and in which the French lost about 1000 men and the British 800. Next morning, the 28th, the French renewed the attack on the hill on the British left, and were again repulsed after losing about 1500 men. After a pause of some hours the attack was renewed upon the whole British front. Heavy columns of French infantry of Sebastiani's corps twice attacked the British right under General Campbell, which joined the Spanish army, but were each time repulsed by the steady fire of the English; a Spanish cavalry regiment charging on their flank at the same time, they retired in disorder, after losing a number of men and 10 guns. In the mean time a French division, supported by two regiments of cavalry, again advanced to turn the British left, and here a cavalry fight occurred in which the 23rd Light Dragoons lost one-half of their number. General Wellesley had taken the precaution of posting the Spanish division of Bassecour in the rear, together with the cavalry of both armies, and the sight of these effectually precluded any further advance of the French on that side. The principal attack of the French was against the British centre, which consisted of the Guards and the German Legion. The French columns came resolutely close up to the British line, but they were received with a discharge of musketry which made them reel back in disorder. The Guards then charged them, and in the ardour of the moment were carried too far, upon which the enemy's supporting columns and dragoons advanced, and those who had been repulsed rallied and faced again, while the French batteries poured their shot upon the flank of the Guards, who in their turn drew back in some disorder; at the same time the German Legion, which was on the left of the Guards, being hard pressed by the French, got into confusion, and the British centre was thus broken. This was the critical moment of the battle. General Wellesley, who, from the hill on the left of the position, had a clear view of the whole field, seeing the charge of the Guards, and expecting the issue of it, immediately ordered the 48th regiment, under Colonel Donellan, which was posted on the hill on the left, to advance in support of the centre, and at the same time directed General Cotton's light cavalry to advance. The 48th moved on in perfect order amidst the retiring crowds, and wheeling back by companies let them pass through the intervals; then, resuming its line, the 48th marched against the right of the pursuing columns, plied them with destructive discharges of musketry, and closing upon them with a firm and regular pace, checked their forward movement. The Guards and Germans quickly rallied, and the brigade of light cavalry coming up from the rear at a trot, the French began to waver, and at last gave way and retired to their original position, their retreat being protected by their light troops and artillery. The British, reduced to less than 14,000 men, and exhausted by fatigue, were unable to pursue them; and the Spanish army, which had been scarcely engaged, was incapable of making any evolutions; and thus about six in the evening all fighting and firing ceased, each army retaining the position that it had occupied in the morning. The French were repulsed at all points, and lost two generals and nearly 1000 men, and about 6000 wounded, besides the loss of 17 guns. On the side of the British, two generals and 800 men were killed, and three generals and about 4000 men wounded.

The next morning, July 29th, at daybreak, the French army made a retrograde movement, recrossed the Alberche, and took a position on the heights of Salinas. On that day General Robert Craufurd reached the English camp from Lisbon with the 43rd, 52nd, and 95th. This was the light brigade, which afterwards acquired a military celebrity for its gallantry and the quickness of its movements.

Sir Arthur Wellesley passed the 29th and 30th in establishing his hospitals in the town of Talavera, and endeavouring to get provisions, as his men were nearly starving. In this he was not at all assisted by the Spanish authorities or the Spanish inhabitants. "We are miserably supplied with provisions"—thus he wrote to Lord Castlereagh on the 1st of August from Talavera: "the Spanish armies are now so numerous that they eat up the whole country. They have no magazines, nor have we, nor can we collect any, and there is a scramble for everything. I think the battle of the 28th is likely to be of great use to the Spaniards; but I do not think them in a state of discipline to contend with the French." ('Dispatches,' iv., p. 554.)

King Joseph, with the 4th corps and the reserve, moved on the 1st of August farther back to Illescas, on the road between Madrid and Toledo, in order to oppose the army of Andalucia under Venegas; and Victor, who had remained on the Alberche with the 1st corps, retreated likewise on the road to Madrid, from alarm at the movements of Sir Robert Wilson on his flank. Soult was now advancing from the north with no less than three corps, one of which, commanded by Mortier, entered Plasencia on the 31st, having passed, without encountering any resistance, the defile of Baños, which Cuesta had promised to guard. Soult himself, with the 2nd corps, entered Plasencia on the 1st of August, whilst Ney was moving on from Salamanca in the same direction. The French found Plasencia deserted by most of the inhabitants, and they could learn no intelligence of the position of the British and Spanish armies, except vague rumours of a battle having been fought a few days before. On the 2nd of August Sir Arthur Wellesley learnt that the enemy had entered Plasencia. Supposing that Soult was alone with his corps, which he estimated at only 15,000 men, and that his intention was to join Victor, he determined to encounter him before he could effect the junction: he therefore marched on the 3rd of August to Oropesa with the British army, leaving Cuesta at Talavera, particularly recommending him to protect the hospitals; and in case he should be obliged by any advance of Victor to leave Talavera, to collect carts to move away the wounded. The position of the hostile armies was now very singular: they were all crowded along the narrow valley of the Tagus, from the neighbourhood of Madrid to the frontiers of Portugal. King Joseph and Sebastiani were at Illescas and Valdemoro, between Madrid and the Tagus, while the advanced posts of Venegas were on the left or opposite side of the river, opposite Toledo. Victor was lower down on the right bank, at Maqueda, near the Alberche, watching Cuesta, who was at Talavera. General Wellesley was farther down, at Oropesa. Soult was on the Tietar, on the road from Plasencia to Almaraz. Beresford, with the Portuguese, was said to be moving farther west along the frontiers of Portugal. "The allies under Wellesley and Cuesta held the centre, being only one day's march asunder; but their force, when concentrated, was not more than 47,000 men. The French could not unite under three days, but their combined forces exceeded 90,000 men, of whom 53,000 were under Soult; and this singular situation was rendered more remarkable by the ignorance in which all parties were as to the strength and movements of their adversaries. Victor and the King, frightened by Wilson's partisan corps of 4000 men, were preparing to unite at Mostoles, near Madrid; while Cuesta, equally alarmed at Victor, was retiring from Talavera. Sir Arthur Wellesley was supposed by King Joseph to be at the head of 25,000 British; and Sir Arthur, calculating on Soult's weakness, was marching with 23,000 English and Spanish to engage 53,000 French; while Soult, unable to ascertain the exact situation of either friends or enemies, little suspected that the prey was rushing into his jaws. At this moment the fate of the Peninsula hung by a thread, which could not bear the weight for twenty-four hours: yet fortune so ordained that no irreparable disaster ensued." (Napier's 'History of the Peninsular War,' b. ix.)

In the evening of the 3rd of August, Sir Arthur Wellesley learned that Soult's advanced posts were at Naval Moral, and consequently between him and the bridge of Almaraz, on the Tagus, thus cutting his line of communication with Portugal. At the same time letters from Cuesta informed him that King Joseph was again advancing to join Victor, and that Soult must be stronger than was supposed; and that therefore he, Cuesta, would quit Talavera that evening, and join the British at Oropesa. Sir Arthur immediately replied, requesting Cuesta to wait at least till next morning, in order to cover the evacuation of the British hospitals from Talavera. But Cuesta was already on his march, and early on the morning of the 4th appeared near Oropesa. Sir Arthur by this time had learned from intercepted letters that Soult's force was much stronger than he had supposed, though he could not guess its full strength. Cuesta's retreat would immediately bring the King and Victor upon him. He was placed between the mountains and the Tagus, with a French army advancing upon him on each flank; the retreat by Almaraz was cut off; he had seen enough of Cuesta and the Spanish army not to rely upon them on a field of battle; and he could not, with 17,000 British, fatigued and in want of provisions, fight successively two French armies, each much stronger than his own. His only remaining line of retreat was across the Tagus, by the bridge of Arzobispo, below Talavera. By taking up a line of defence beyond that river he might keep open the road by Trujillo to Badajoz. This however must be done immediately, before the enemy intercepted the road to Arzobispo. Sir Arthur communicated his determination to Cuesta, who, according to his custom, opposed it: he wanted now to fight the French at Oropesa; but the English general told him sternly that he might do as he liked—that he, Sir Arthur, was responsible for his own army, and should move forthwith. Accordingly, on that morning, the 4th of August, the British army filed off towards Arzobispo, where it crossed the river with its artillery, stores, and 2000 wounded from Talavera, and took a position on the other side. Thus the British army was saved from impending ruin. Here ended the fighting campaign of the British for 1809.

Sir Arthur Wellesley now moved his head-quarters to Deleytosa, and afterwards to Jaraicejo, on the high road to Badajoz, leaving a strong rear-guard to protect the south bank of the Tagus, and prevent the enemy from passing the river. The bridge of Almaraz had already been broken by the Spaniards. Cuesta, following the British movement, passed to the south of the Tagus by the bridge of Arzobispo, followed close by the French, who, discovering a ford, crossed the river on the 8th with a numerous cavalry, overpowered the Spanish rear-guard, and seized the guns. General Wellesley however caused the remainder of the Spanish artillery to be dragged up the mountain of Meza d'Ibor, a strong position, while the British guarded the equally strong pass of Mirabete, facing the bridge of Almaraz. The line of defence of the Allies was thus re-established. Meantime King Joseph recalled Mortier's corps, which had crossed the Tagus at Talavera, and ordered it to join Sebastiani against Venegas, who had again advanced to Almonacid, near Toledo. Marshal Ney, on the other side, whom Soult had directed to ford the Tagus below Almaraz, could not discover the ford. Soult now proposed to march with his three corps by Coria and Abrantes, and reach Lisbon, by the right bank of the Tagus, before the English; but Ney, Jourdan, and King Joseph opposed the plan, and soon afterwards a despatch came from Napoleon, dated after the battle of Wagram, from the Austrian emperor's palace at Schönbrunn, forbidding further offensive operations till the reinforcements which the termination of the Austrian war placed at his disposal should reach Spain.

The Emperor Napoleon now, to crush his enemies, trusted chiefly to his overwhelming masses, which he recruited so cheaply by means of the conscription. The proportion of cavalry in his armies in Spain was beyond all precedent. Napoleon was resolved to play a sure game. He had already 200,000 men in Spain, and yet he did not think them enough. His generals had adopted the same views. "It is large masses only, the strongest that you can form, that will succeed:" thus wrote Soult to King Joseph before the battle of Talavera. It is worthy of remark that Sir Arthur Wellesley, writing about the same time, said—"I conceive that the French are dangerous only when in large masses."

Soult's army now went into cantonments in Estremadura and Leon, near the borders of Portugal. Sebastiani having defeated Venegas at Almonacid, drove him back upon the Sierra Morena. King Joseph was again residing quietly at Madrid.

In England, on the receipt of the news of the battle of Talavera, Sir Arthur Wellesley was raised to the peerage by the titles of Baron Douro and Viscount Wellington.

On the 20th of August Lord Wellington removed his head-quarters to Badajoz, and placed his army in cantonments on the line of the Guadiana. His chief motive was the neglect of the Spanish authorities in supplying his army with provisions, which obliged him to draw near his magazines in Portugal; and another reason was, the impossibility of co-operating with the undisciplined Spanish armies. Lord Wellington had contrived, notwithstanding Cuesta's neglect, to carry away 2000 sick and wounded from Talavera; the remaining 1500, whom he was obliged to leave there, he recommended earnestly to the French generals, Mortier and Kellerman, and his expectations were not deceived. Marshal Mortier in particular showed the utmost kindness to the British wounded, and would have them attended to before his own men.

In October Lord Wellington repaired to Lisbon, and proceeded to reconnoitre the whole country in front of that capital, for it was then that he resolved upon the construction of the celebrated lines of Torres Vedras, which enabled him to baffle all the efforts of the French in the following year. We can only refer the reader to the 'Memorandum' which he wrote at Lisbon on the 20th of October for Lieutenant-Colonel Fletcher, of the Engineers, in which he clearly points out the double line of position, the entrenchments and redoubts, the number of men required at each post, &c., as if the whole were already in existence before his eyes. This paper, so remarkable considering the epoch and circumstances in which it was written, is a most striking evidence of Wellington's comprehensive mind, his penetration, and foresight. (See 'Dispatches,' vol. v., pp. 234-39). Of his plan however nothing was said or even whispered at the time. He returned to his head-quarters at Badajoz, whence he made an excursion to Seville, where be conferred with his brother the Marquis Wellesley, who was then the British ambassador in Spain, and whom he accompanied to Cadiz. On the 11th of November he returned to his head-quarters at Badajoz. At the same time another fatal blunder was committed by the Spaniards. About the middle of November the Supreme Junta ordered the army of Andalucia, joined by the greater part of the army of Estremadura, to advance suddenly upon Madrid, and this without any previous communication with Lord Wellington, who was at Badajoz, or with the Duke del Parque and other Spanish commanders in the north of Spain. Venegas, the general of the army of Andalucia, had been superseded by Areizaga, an inexperienced young officer, who was in favour with the Junta. Old Cuesta had also retired, and made room for Eguia in the command of the army of Estremadura. These two armies, which constituted the principal regular force of the Spaniards, and which, posted within the line of the Tagus and along the range of the Sierra Morena, protected, and might long have protected, the south of Spain, were thrown away upon a foolish attempt. Areizaga, with nearly 50,000 men and 60 pieces of artillery, advanced into the plains of La Mancha, and was attacked on the 16th of November, in the open fields of Ocaña, by the two French corps of Mortier and Sebastiani; and, although his men fought with sufficient courage, yet he was completely routed, with the loss of more than one-half of his army, and all his baggage and artillery, with the exception of 15 guns. About the same time the Duke del Parque, with 20,000 Spaniards in the north, advanced from Salamanca against Kellerman, but he was beaten, and driven to the mountains of Peña de Francia. The French, north of the Tagus, were thus left at liberty to attack Ciudad Rodrigo and the frontiers of Portugal. "I lament," thus Lord Wellington writes from Badajoz on the news of these mishaps, "I lament that a cause which promised so well a few weeks ago should have been so completely lost by the ignorance, presumption, and mismanagement of those to whose direction it was intrusted. I declare that, if they had preserved their two armies, or even one of them, the cause was safe. The French could have sent no reinforcements which could have been of any use; time would have been gained; the state of affairs would have improved daily; all the chances were in our favour; and in the first moment of weakness occasioned by any diversion on the continent, or by the growing discontent of the French themselves with the war, the French armies must have been driven out of Spain. But no! nothing will answer except to fight great battles in plains, in which the defeat of the Spanish armies is as certain as the commencement of the battle. They will not credit the accounts I have repeatedly given them of the superior numbers even of the French: they will seek them out, and they find them invariably in all parts in numbers superior to themselves. I am only afraid now that I shall be too late to save Ciudad Rodrigo, the loss of which will secure for the French Old Castile, and will cut off all communication with the northern provinces, and leave them to their fate."

Lord Wellington's anxious looks were now directed towards the north-east, for he foresaw that the storm would burst upon Portugal from that quarter. He accordingly retired from Spanish ground altogether into Portugal, and moving through Alemtejo with the mass of his army in December, crossed the Tagus at Abrantes; and thence marching to the Mondego, fixed his head-quarters at Viseu in January 1810, having his outposts along the frontiers of Spain towards Ciudad Rodrigo. He left General Hill's division south of the Tagus to protect Alemtejo. In the mean time both he and Beresford were indefatigable in their endeavours to raise the Portuguese regular army to a state of efficiency in numbers, armament, and discipline.

Campaign of 1810.—By his campaign of 1808 General Wellesley had delivered Portugal from the French. By the campaign of the early part of 1809 he had again repelled a fresh invasion of the northern part of that kingdom. The subsequent Spanish campaign of the same year, which was undertaken with a view to assist the Spaniards in driving the French away from Castile and recovering Madrid, failed through want of good management on the part of the Spanish generals, and of discipline in the Spanish armies. The battle of Talavera, the first fought by Wellington on Spanish ground, though glorious to the British arms, led to no useful result, and the British general was obliged to evacuate Spain. Fresh blunders on the part of the Spaniards led to the conquest of Andalucia by the French. The war in Spain then assumed the character of a partisan warfare, and Wellington saw that it would be in vain for the present to expect that

Spain could make any adequate effort to shake off the French yoke. Portugal however was free, and Wellington thought that she might be preserved by means of a British force of 30,000 men, assisted by an effective Portuguese army, in addition to the militia, even supposing the French should obtain possession of the remainder of the Peninsula. This he stated in a letter to Lord Castlereagh, written from Merida, 25th of August, 1809, soon after his retreat from Talavera. In that remarkable letter he gives his opinion, founded upon facts, of the utter inability of the Spanish armies, as they were then constituted, to keep the field against the French. The following passage, which concludes his exposé of Spanish military affairs, deserves notice:—"I really believe that much of this deficiency of numbers, composition, and discipline, is to be attributed to the existing government of Spain. They have attempted to govern the kingdom, in a state of revolution, by an adherence to old rules and systems, and with the aid of what is called enthusiasm; and this last is, in fact, no aid to accomplish anything, and is only an excuse for the irregularity with which everything is done, and for the want of discipline and subordination of the armies. People are very apt to believe that enthusiasm carried the French through their revolution, and was the parent of those exertions which have nearly conquered the world; but if the subject is nicely examined, it will be found that enthusiasm was the name only, but that force was the instrument which brought forth those great resources under the system of terror, which first stopped the Allies; and that a perseverance in the same system of applying every individual and every description of property to the service of the army, by force, has since conquered Europe." The system by which the French supported their large armies in Spain, as they did everywhere else, was that of taking possession by force of everything they wanted. They ordered rations at every town, and they arrested, shot, or hanged all who put any obstacle in their way. The English generals, the allies of Spain, could not do this.

Wellington's thoughts were now directed to the defence of Portugal, of the practicability of which he entertained little or no doubt. He did not mean that he should be able to defend the whole frontier of Portugal, for that is too extensive, and is open on too many points, but that he could secure the capital and other strongholds, and the mountains and fastnesses, so as to maintain his hold and tire out the invaders. The question whether Portugal was worth defending at the enormous cost which it would entail upon England, he left for ministers at home to decide. As long as the British kept possession of Portugal the French tenure of Spain was insecure; and circumstances might, and indeed must, arise when the British and allied forces could issue out of Portugal to renew a regular war in Spain for the final expulsion of the French. Napoleon was well aware of this, and was anxious to expel the English from Portugal, for that country formed the position of support for all military operations against the French in the Peninsula. ('Dispatches,' vol. vi. p. 368.) The Portuguese in a body had confidence in the British nation and army, they were loyal to their prince, detested the French, and their troops had submitted to British discipline. Portugal was a sincere and tolerably docile ally of England, which Spain was not and could not be. In an official letter to Lord Liverpool, dated Badajoz, 14th of November, 1809, after he had given directions for fortifying the lines near Lisbon, Wellington stated that Portugal might be defended by a British effective force of 30,000 men, in aid of the whole military establishment of Portugal, consisting of about 45,000 regulars, which however were as yet far from effective. And in a confidential letter also to Lord Liverpool, of the same date, he says—"I do not think the French will succeed in getting possession of Portugal with an army of 70,000 or even of 80,000 men, if they do not make the attack for two or three months, which I believe now to be impossible. I conceive not only that they may, but will, make the attack before they will subdue the north of Spain. The centre of Spain, or old Castile, is already subdued. . . . . . My opinion is that the enemy have neither the means nor the intention of attacking Portugal at present, and that they would be successfully resisted. I am likewise of opinion that when they shall receive their reinforcements they can be successfully resisted." And as he had foreseen, so it happened.

Wellington continued in his head-quarters at Visen till the end of April, 1810, watching the movements of the French in Old Castile, and preparing against their attack upon Portugal, which he expected would be made in earnest that year. The French armies in Spain had received large reinforcements during the winter from Germany, in consequence of the peace between France and Austria. Junot and Drouet, with two fresh corps, had entered Spain, followed by a part of Napoleon's imperial guards. Ney, Kellerman, and Loison, with about 60,000 men, were, in the month of April, in Old Castile and Leon, evidently preparing for an attack upon Portugal. As a prelude they had besieged and taken Astorga from the Spaniards, and were making preparations for the siege of Ciudad Rodrigo, which was defended by a Spanish garrison.

Soult was now in the south of Spain, with Victor and Mortier under his orders, and was busy in organising his military resources and establishing his military command in Andalucia. There is a very interesting report by Soult to the Prince of Wagram, dated Seville, 4th of August, 1810, which is given in the Appendix to Napier's third volume, and which shows the activity and administrative abilities of that commander, and, at the same time, the misunderstandings between him and the nominal King of Spain, Joseph Bonaparte, and his Spanish ministers. General Regnier was in Estremadura, ready to co-operate with his countrymen in the north in the invasion of Portugal by either bank of the Tagus. His movements were anxiously watched by General Hill, with about 12,000 British and Portuguese, stationed on the frontiers of Alemtejo. At the south-western extremity of Spain, Cadiz, strong by its situation, was garrisoned by a British force, of about 7000 men, under General Graham, in addition to the Spanish troops; and the French, under Victor, were blockading the place. In the north, the Spanish patriots remained in possession of Galicia and Asturias, but not in sufficient force to effect any powerful diversion. In the east of Spain, Valencia and Murcia still held out, but Cataluña was the only province in which the Spaniards, under O'Donnell, the best of the Spanish generals, kept up a regular system of warfare against the French. O'Donnell was assisted by the nature of the ground, which was interspersed with numerous fortresses, and also by the English squadron along the coast, and by the organisation and daring spirit of the Catalonian militia. But the struggle in that province was too remote to have any influence on the operations in Portugal and Andalucia. The conquest of Portugal was the great object of the French campaign of 1810.

About the middle of May Marshal Massena, Prince of Essling, arrived at Valladolid, having been sent by Napoleon to take the command of the army assembled in Old Castile and Leon, which assumed the name of the 'Army of Portugal.' He had also military command over the provinces of northern Spain. His force consisted of the 2nd corps under Regnier, 6th corps under Ney, and 8th under Junot, and the reserve cavalry under Montbrun—in all 72,000 men under arms for the field, besides garrisons, detachments, &c., in the provinces of Valladolid, Santander, and Leon. To the above number was afterwards added, in the course of the campaign, the 9th corps, under Drouet, consisting of about 18,000 men. Lord Wellington had to oppose the whole of this force with about 54,000 British and Portuguese regular troops. There was moreover a considerable Portuguese militia, employed mostly in the garrisons and in the provinces beyond the Douro, in Alemtejo and Algarve—in short, on the wings of the regular force. It must be observed also that Massena could concentrate his whole force for his attack on Portugal north of the Tagus, whilst Lord Wellington was obliged to leave part of his force south of that river, to guard against any sudden movement from the French army of Andalucia, which was more than 60,000 strong, of which a part might attempt to advance into Alemtejo. Again, Massena's troops were mostly old soldiers, flushed with success and in a high state of discipline, whilst Lord Wellington could only confidently rely upon the British part of his force, about 25,000 men, as the Portuguese regular army was yet untried, and the militia were so defective in organisation as not to be trusted in the open field. Marshal Beresford however had taken great pains with the Portuguese regulars, many of the officers were English, and Lord Wellington had brigaded several of their regiments with the British.

Early in June the French invested Ciudad Rodrigo almost in sight of the British advanced division, which was posted on the Azava. On the 25th they opened their batteries, and the Spanish governor, a brave old officer, defended himself till the 10th of July, when, a practicable breach being made, the French entered the place by capitulation. Wellington could not risk his army for the relief of Ciudad Rodrigo: his object was to defend Portugal, and, above all, Lisbon. He states in the clearest manner his reasons for not attempting to relieve Ciudad Rodrigo in his despatch to Lord Liverpool from Pero Negro, 27th of October 1810, in answer to the charges in the French 'Moniteur.' He retained his position on the left bank of the Coa, and the French advanced to that river, and in so doing the corps of Ney encountered the British light division under General Craufurd, who disputed the ground against a much superior force, and lastly effected his retreat by a bridge across the Coa, which the French unsuccessfully attempted to pass. The fire of the British killed and wounded about 1000 of them. This fight was against Lord Wellington's intentions, for it was useless, but it gave Massena a specimen of the resistance that he had to encounter in his march to Lisbon, which was the declared object of his expedition. On entering the frontiers of Portugal, after taking Ciudad Rodrigo, Massena issued a proclamation to the Portuguese in the usual style of French proclamations of those times, abusing the English as the cause of all mischief, and attributing the presence of an English army in Portugal to the "insatiable ambition" of England. He sneered at the English for not having attempted to relieve Ciudad Rodrigo, which he knew they could not have done in the face of an enemy three times as strong. Massena ended by recommending to the Portuguese population to remain quiet, and receive the French soldiers as friends, assuring them of protection for their persons and property. How this last promise was kept from the beginning is stated by Lord Wellington in a counter proclamation which he issued a few weeks afterwards, dated Celorico, August 4:—"The time which has elapsed during which the enemy have remained upon the frontiers of Portugal has fortunately afforded the Portuguese nation experience of what they are to expect from the French. The people had remained in some villages trusting to the enemy's promises, and vainly believing that, by treating the enemies of their country in a friendly manner, they should conciliate their forbearance, and that their properties would be respected, their women would be saved from violation, and that their lives would be spared.— Vain hopes! The people of these devoted villages have suffered every evil which a cruel enemy could inflict. Their property has been plundered, their houses and furniture burnt, their women have been ravished, and the unfortunate inhabitants whose age or sex did not tempt the brutal violence of the soldiers, have fallen the victims of the imprudent confidence they reposed in promises which were only made to be violated. The Portuguese now see that they have no remedy for the evil with which they are threatened but determined resistance. Resistance, and the determination to render the enemy's advance into their country as difficult as possible, by removing out of his way everything that is valuable, or that can contribute to his existence or facilitate his progress, are the only and certain remedies for the evils with which they are threatened. The army under my command will protect as large a proportion of the country as will be in their power; but it is obvious that the people can save themselves only by resistance to the enemy, and their properties only by removing them. The duty however which I owe to his Royal Highness the Prince Regent, and to the Portuguese nation, will oblige me to use the power and authority in my hands to force the weak and the indolent to make an exertion to save themselves from the danger which awaits them, and to save their country; and I hereby declare that all the magistrates or persons in authority who remain in the towns or villages after receiving orders from any of the military officers to retire from them, and all persons of whatever description who hold any communication with the enemy, and aid and assist them in any manner, will be considered traitors to the state, and shall be tried and punished accordingly." ('Dispatches,' vi. pp. 229, 230.)

Massena remained nearly a month inactive on the line of the Coa before he began the siege of Almeida, the frontier fortress of Portugal on that side. The French broke ground before it on the 15th of August, and Lord Wellington moved his army to the front to take advantage of any opportunity which might be afforded of relieving the place, which was defended by a Portuguese garrison commanded by an English officer. The French opened their fire on the 26th of August, and on the night of the 27th, in consequence of the explosion of a magazine containing nearly all the ammunition in the place, and by which a large part of the town and defences were destroyed, the governor was obliged to capitulate. Wellington was greatly disappointed, for he reckoned on the place detaining the French till the rainy season set in. He then fell back with the main body of his army to the valley of the Mondego. Another considerable pause occurred in Massena's movements, but on the 15th of September the French army began their march down the valley of the Mondego by the right bank of the river, in the direction of Coimbra, through Visen. "There are certainly," Lord Wellington observed, "many bad roads in Portugal, but the enemy has taken decidedly the worst in the whole kingdom."

Wellington, who had retired by the left bank, then crossed the river, and took up a strong position in front of Coimbra, along a high ridge called the Serra de Busaco, which extends from the Mondego northwards. General Hill joined Wellington with his division from the south, leaving some troops on the left bank of the Mondego to secure the high road to Lisbon on that side. With this exception Lord Wellington's whole army was collected upon the Serra de Busaco. On the 26th of September the French army, consisting of the 2nd, 6th, and 8th corps, assembled before it, and some skirmishing took place. In the morning of the 27th the French attacked in great force both the right and the left of the English position; one French column reached the top of the ridge, and was in the act of deploying when it was repulsed by General Picton's division, as well as another which could not even reach the summit; and on the left the French were likewise repulsed and thrown down the hill by a charge with the bayonet from Craufurd's division and a Portuguese brigade. The French lost one general and about 1000 killed, two generals and about 3000 wounded, and one general and several hundred men prisoners. The loss of the Allies did not exceed 1300. "This movement," says Wellington, "has brought the Portuguese levies into action with the enemy for the first time in an advantageous situation, and they have proved that the trouble which has been taken with them has not been thrown away, and that they are worthy of contending in the same ranks with British troops in this interesting cause, which they afford the best hopes of saving." ('Dispatches,' vi., p. 475.)

One of the motives of Lord Wellington in fighting the battle of Busaco was to give time to the population of the country in his rear to remove out of the way of the enemy with their goods and provisions, especially from Coimbra, a populous and wealthy town, but the orders given to that effect were ill obeyed. Massena did not attempt again to force the position of Busaco, but moved off his army by the pass of Boyalva, in the mountains north of Busaco. Lord Wellington had directed Colonel Trant to occupy this pass with the Portuguese division; but Trant missed the direct road, and arrived too late and with too small a force to arrest the march of the French, who descended into the maritime plains, and seized on the road leading from Oporto to Coimbra in the rear of the British.

On the 29th of September the Allies quitted the position of Busaco, and, crossing the Mondego, began their retreat towards Lisbon. On the 1st of October the British rear-guard, after some skirmishing with the French, evacuated Coimbra, accompanied by all the remaining inhabitants, who ran away with whatever moveables they could carry, and the sick, the aged, and the children, on carts, mules, and donkeys, not knowing whither they were going, and encumbering the road, whilst the French cavalry was hovering on the flank and rear. It was a piteous sight, and one which those who saw it can never forget. The French entered the forsaken city, where they found ample stores of provisions. On the 2nd of October Lord Wellington's head-quarters were moved to Leiria, where he stayed two days, the French following slowly, and the British and Portuguese effecting their retreat with great ease and regularity. General Hill with his division moved by Thomar and Santarem, the centre of the army by Leiria and Rio Mayor, and the left by Alcobaça and Obidos. Massena followed in one column by the centre or Rio Mayor road. Some skirmishing only took place between his advanced guard and the light division which formed the British rear. On the 8th the allied army entered the lines which had been prepared for them, just as the autumnal rains, which fall very heavily in Portugal, were beginning to set in. Never was a retreat, before a formidable enemy, effected with more ease or so little loss.

On the 10th of October the whole army was within the lines.

The line of defence was double. The first, which was 29 miles long, began at Alhandra on the Tagus, crossed the valley of Arruda, which was rather a weak point, and passed along the skirts of Mount Agraça, where there was a large and strong redoubt: it then passed across the valley of Zibreira and skirted the ravine of Runa to the heights of Torres Vedras, which were well fortified; thence the line followed the course of the little river Zizandre to its mouth on the sea-coast. The first line of defence followed the sinuosities of the mountain tract which extends from the Tagus to the sea about 30 miles north of Lisbon. Lord Wellington's head-quarters were fixed at Pero Negro, a little in the rear of the centre of the line, where a telegraph was fixed corresponding with every part of the position. The second line, at a distance varying from six to ten miles in the rear of the first, extended from Quintella on the Tagus, by Bucellas, Monte Chique, and Mafra, to the mouth of the little river S. Lourenço on the sea-coast, and was 24 miles long. This was the stronger line of the two both by nature and art, and, if the first line were forced by the enemy, the retreat of the army upon the second was secure at all times. Both lines were secured by breastworks, abattis, stone walls with banquettes, and scarps. In the rear of the second line there was a line to secure the embarkation of the troops, should that measure become necessary, enclosing an entrenched camp and the Fort of St. Julian. More than 100 redoubts or forts, and 600 pieces of artillery were scattered along these lines. Lord Wellington had received reinforcements from England and Cadiz; the Portuguese army had also been strengthened, and the Spanish division of La Romana, 5000 strong, came from Estremadura to join the allies, so that the British commander had about 60,000 regular troops posted along the first and second lines (Dispatch to Lord Liverpool, vol. vi. p. 582), besides the Portuguese militia and artillery which manned the forts and redoubts and garrisoned Lisbon, a fine body of English marines which occupied the line of embarkation, a powerful fleet in the Tagus, and a flotilla of gun-boats flanking the right of the British line. Altogether these lines of defence were of stupendous strength, conceived by the military genius of Lord Wellington, and executed by the military skill of the British engineer officers.

Massena seems to have been taken by surprise at the sight of the lines, and he employed several days in reconnoitering them. He made some demonstrations in order to make the British divisions show out their force; but after one or two slight attacks, which were repulsed, he made no further attempt. He put the second and eighth corps partly in the villages and partly in bivouacs in front of the right and centre of the British position, leaving the sixth corps at Otta in his rear. He established his depôt and hospitals, and commenced forming magazines at Santarem, and for this purpose sent moveable columns to scour the country for provisions, for he had entered Portugal without magazines, every soldier carrying fifteen days' bread, which many however threw away or wasted on the road. The country had been partly stripped by the inhabitants, who had retired to the mountains or within the lines, and the French foraging parties destroyed what was left, so that for many leagues in rear of the French the country became a scene of devastation and almost a desert. In addition to this, the Portuguese militia under Trant, Millar, and Wilson, came down from the north and cut off all communication between Massena's army and the Spanish frontier. Whilst the French were in march for Lisbon, as they thought, Colonel Trant surprised Coimbra, seized many prisoners, and all the sick and wounded, between four and five thousand in number, whom he removed to Oporto. Trant and Wilson came down towards Ourem, Thomar, and the banks of the Zezere, hovering in the rear of Massena, who was obliged to move back a whole division to hold them in check. Towards the end of October, Massena sent 2000 men across the Zezere in order to re-open a communication with Spain by way of Castello Branco; and General Foy proceeded with a strong escort by way of Penamacor to Ciudad Rodrigo, whence he hastened to Paris to inform Napoleon of the real state of affairs in Portugal.

Massena had now given up all idea of attempting to force the British lines unless he received large reinforcements. He had entered Portugal with about 70,000 men, of whom 15,000 had been either killed or taken prisoners or were in the hospitals; his army had become very sickly in consequence of privations and of being exposed to inclement weather mostly without shelter, and bivouacking in low grounds. On the 15th of November he began a retrograde movement, with great order and caution, for the purpose of placing his army in cantonments for the winter. On the 17th the French second corps was established at and near Santarem, in a very strong position; the eighth corps at Pernes; and the sixth corps at Thomar, farther in the rear. Massena's head-quarters were fixed at Torres Novas. The British light divisions and cavalry followed the French movements and took some prisoners, but nothing of importance occurred. Lord Wellington, leaving part of his troops in the lines, moved forward the remainder towards the Rio Mayor, which separated him from the French position at Santarem. Hill's division was placed on the left bank of the Tagus, opposite Santarem. Wellington's head-quarters were fixed at Cartaxo. Both armies were now in cantonments for the winter. Thus ended the campaign of 1810. As a defensive campaign on the part of Lord Wellington it was successful, for the French army at the end of that year held no other ground in Portugal than that on which its divisions stood, being hemmed in between the northern bank of the Tagus, the Rio Mayor, and the ridge of the Serra de Estrella, having the allied regular force on its front and flanks, and the Portuguese militia on its rear, and its communications with Spain intercepted.

All the north of Portugal was free from the French, and also the whole of the kingdom south of the Tagus, and the fine country near Lisbon. All the large towns, Lisbon, Oporto, Coimbra, Abrantes, were in possession of the Allies, as well as all the fortresses, with the exception of Almeida. As the French had advanced by the valley of the Mondego and the country west of the Serra de Estrella, the people of that tract of country had in great measure deserted it and carried off the provisions; but the population east of the mountains, and between them, the Tagus, and the Zezere, had remained in fancied security, so that, when Massena withdrew his army to that quarter, he found the towns of Thomar, Pernes, Torres Novas, and Golegão inhabited and untouched. The corn-mills, little injured, were quickly repaired; cattle and corn were procured in abundance, especially from the fine plains of Golegão, which supplied them with Indian corn; and the French thus obtained provisions at least for part of the winter. And, what was worse for the Allies, a number of boats were left behind at Santarem on the right bank of the Tagus, by means of which the French had the power of crossing the river whenever they liked. This annoyed Lord Wellington more than anything else, and he expressed himself strongly concerning the remissness of th Portuguese Regency in neglecting to give or not enforcing the necessary orders for removing everything out of the reach of the enemy, as he had urged them to do months before. "The French could not have stayed if the provisions had been removed. . . . All our military arrangements are useless if they can find subsistence on the ground which they occupy. . . . . Then the boats are left at Santarem in order to give the enemy an opportunity of acting upon our flanks. . . . . It is heartbreaking to contemplate the chance of failure from such obstinacy and folly." (Dispatches to Charles Stuart, the English Ambassador to the Portuguese Regency, October 16 and 18, and November 1.)

The perverse spirit of the Portuguese Regency had manifested itself ever since the fall of Almeida. There was a faction in the Regency, at the head of which was the Patriarch (former Bishop of Oporto), who wanted to control and direct the operations of the British commander, and, as he would not allow himself to be directed by them, they thwarted him in every way. In a remarkable letter addressed to Mr. Stuart from Gouvea, September 7, Lord Wellington had denounced their practices:—"In order to put an end at once to these miserable intrigues, I beg that you will inform the Portuguese Government that I will not stay in the country, and that I shall advise the King's Government to withdraw the assistance which his Majesty affords them, if they interfere in any manner with the appointments of Marshal Beresford's staff, for which he is responsible; or with the operations of the army; or with any of the points which, under the original arrangement with Marshal Beresford, were referred exclusively to his management. I propose also to report to his Majesty's Government, and refer to their consideration, what steps ought to be taken if the Portuguese Government refuse or delay to adopt the civil and political arrangements recommended by me, and corresponding with the military operations which I am carrying on. But it appears that the Portuguese Government have lately discovered that we are all wrong; they have hecome impatient for the defeat of the enemy, and, in imitation of the Central Junta of Spain, call out for a battle and early success."

In another letter, dated Rio Mayor, October 6, addressed likewise to Mr. Stuart, Lord Wellington says:—"You will do me the favour to inform the Regency, and above all the Principal Souza, that, his Majesty and the Prince Regent having intrusted me with the command of their armies, and likewise with the conduct of the military operations, I will not suffer them, or anybody else, to interfere with them; that I know best where to station my troops and when to make a stand against the enemy; and I shall not alter a system formed npon mature consideration upon any suggestion of theirs. I am responsible for what I do, and they are not; and I recommend them to look to the measures for which they are responsible, and which I long ago recommended to them, viz. to provide for the tranquillity of Lisbon, and for the food of their own army and of the people, while the troops will be engaged with the enemy. As for Principal Sonza, I beg yon to tell him from me that I have had no satisfaction in transacting the husiness of his conntry since he has been a member of the government; that, being embarked in a course of military operations, of which I hope to see the successful termination, I shall continue to carry them on to the end, hnt that no power on earth shall induce me to remain in the Peninsula for one moment after I shall have ohtained his Majesty's leave to resign my charge, if Principal Souza is to remain either a member of the government or to continue at Lisbon. Either he must qnit the country or I will; and if I should be ohliged to go, I will take care that the world, or Portugal at least and the Prince Regent, shall be made acquainted with my reasons. . . . . I have but little doubt of success; hut, as I have fought a sufficient number of battles to know that the result of any one is not certain, even with the best arrangements, I am anxious that the Government should adopt preparatory arrangements, and take out of the enemy's way those persons and their families who would suffer if they were to fall into their hands." A perusal of this correspondence is ahsolutely necessary to enable a person to form a just idea of the difficulties which Lord Wellington had to contend with, and of the strength of mind which enahled him to rise superior to them.

Campaign of 1811.—During the months of January and February the armies in Portugal remained in the same respective positions. The low lands heing flooded rendered field operations impossible. Meanwhile the 9th corps under Drouet had entered Portugal hy the valley of the Mondego, with a large convoy of provisions from Spain, and had reinforced Massena's army, by being posted on its right about Leiria. At the same time Soult, who commanded the army of Andalucia, received orders from Napoleon to act in concert with Massena, hy attacking Portngal south of the Tagus; and a new French army was formed in the north of Spain, consisting of about 70,000 men, and placed under Marshal Bessières, duke of Istria, who was ordered to support and fnrnish all necessary assistance to the army of Portngal. (Letter from Berthier, Prince of Wagram, to the Prince of Essling (Massena), Paris, Jannary 16, 1811; another from the same to the Duke of Dalmatia (Soult), Jannary 24, 1811; and another from the same to the Prince of Essling, February 7, 1811; in Appendix to Napier, vol. iii.) "Make a bridge across the Tagus," said Napoleon, "and let Massena and Sonlt form a junction. Meantime keep the English in check, and make them lose men every day by engagements of the advanced guards. Their army is small, and they cannot afford to lose many men. Besides, people in London are much alarmed about their army in Portugal; and when the season becomes favourahle let the main operations be carried on on the south bank of the Tagus."

Such were the gigantic efforts made by the master of half of Europe to crush an English army of 30,000 men, whilst Lord Wellington, after urgent applications to ministers at home, received reinforcements to the amonnt of from 6000 to 7000 men only in the heginning of March. But all Napoleon's efforts did not prevail. Massena was waiting for Sonlt to appear on the left bank of the Tagus opposite to his position, but Soult was obliged to maintain the blockade of Cadiz, in which there was a British garrison of 6000 men; he was obliged to leave Sebastiani on the side of Granada and Mnrcia to keep in check the Spanish armed parties; and he could not therefore dispose of more than 20,000 men, with whom he durst not enter Alemtejo, leaving the Spanish fortress of Badajoz in his rear. He therefore hegan by attacking the fortress of Olivença, which he took January 22, and then marched to Badajoz. On the 19th of February he defeated a Spanish force of nearly 12,000 men under General Mendizabal, which was posted on the river Gebora, an affinent of the Gnadiana, and then commenced the siege of Badajoz.

In the mean time Massena remained in his position at Santarem, waiting for Sonlt's appearance on the Tagus, till he became so distressed for provisions that he could wait no longer. All the means of collecting provisions hy violence were exhausted, large moveahle columns had been sent at different times both on the side of Castello Branco and on that of the Mondego, which scoured the conntry and carried away cattle and provisions, committing horrihle excesses, which were retaliated hy the infuriated peasantry npon the French stragglers and wonnded. The discipline of the army was broken by this harbarons system of warfare. They had no less than 10,000 sick; they could ohtain no news from Spain, and had no more provisions left than wonld serve the troops during their retreat to the frontiers.

In the beginning of March Massena moved his sick and baggage hy degrees to the rear, and after demonstrations in various directions the divisions of his army filed off in the direction of Pomhal. Santarem was evacuated in the night of the 5th of March, and next morning it was entered hy the English. Massena however had gained two days' march, and his army was not overtaken by the English till the 10th, when it was concentrated on a table-land hefore Pomhal, presenting a front of resistance. There was some skirmishing with the light division, whilst Wellington brought np his other divisions, hut the French having gained time for their haggage to file off, retreated on the 11th through the town. A detachment which Ney had left in the castle of Pomhal was driven away with some loss hy the English, and in the night Massena continued his retreat. On the 12th the English advance fonnd Ney with the French rear-guard posted on a high table-land in front of the village of Redinha, when another skirmishing took place. As the French seemed disposed to stand their ground, and made a show of considerable force, Lord Wellington formed his army in line and moved on to the attack, when, after a general discharge from the French battalions, which hid them in smoke, the French were again in full retreat through the village, and joined that evening the main body at Condeixa, where one road leads to Coimhra and another ascends the valley of the Mondego. Massena's intention was to seize Coimbra and, if possible, Oporto, and there to wait for reinforcements from Spain, and he had sent a division under Monthrun to secure the bridge of Coimhra. Wellington had foreseen his intention, and had ordered Wilson and Trant with the Portuguese militia to look to the security of the important town of Oporto, and to abandon the line of the Mondego, which was fordable in many places, and retire across the Douro, removing all the boats. Coimbra was thus necessarily left to a surprise by the French retreating army. But it luckily happened that Trant lingered behind at Coimbra with a small force, and, having destroyed one arch of the bridge, and placed guards at the fords, he determined to defend the town, thinking that, if he could parry a sudden assault, Massena could not stay long on the left bank of the Mondego with the allied army at his heels. On the 11th of March Montbrun appeared at the suburb of Santa Clara, and on the 12th made an attempt to force the bridge, but his men were repulsed by grape-shot. Montbrun fancied that Trant had been reinforced with some English regiments by sea, and having made his report, Massena relinquished the idea of crossing the Mondego, and determined to retreat by Ponte de Mnrcella and the left bank of the Mondego. Thns Coimbra was saved from the impending visitation.

Massena resumed his retreat on the 13th of March in rather a hurried manner, being on the point of having his left turned by Picton's division, which had marched by a path over tbe mountains of Ancião. Ney, in command of the rear-guard, set fire to the town of Condeixa, in order to stop the British artillery, but the light division pursued the retreating enemy, and penetrated between their columns, until night stopped any further pursuit. By the aid of darkness the French got together again, and on the morning of the 14th, when the fog which enveloped the mountains began to clear off, Ney was seen posted on a hill near Casal Nova. The light division attacked him; and Picton's and Cole's divisions appearing on his left, he renewed his retreat with admirable precision from ridge to ridge, covering his rear with guns and light troops, until he gained the strong defile of Miranda de Corvo, where the main body of the French was already posted. Massena, fearing that Cole's and Nightingale's divisions, which were advancing by the road of Espinhal, might gain his rear, set fire to the town of Miranda in the night, and passed the river Ceira, an affluent of the Mondego, destroying a great quantity of his baggage and ammunition, and leaving Ney to cover the passage of the river, without however risking an action. Ney remained on the left bank, and took up a position near the village of Fons de Arronce. The Allies coming up about four o'clock in the afternoon of the 15th, Wellington commenced an attack on Ney's troops, in which the French lost 500 men, one-half of whom were drowned in endeavouring to pass the swollen river in their rear. Night put an end to the fight, but not to the confusion; for as the French baggage and other incumbrances were pressing along the bridge, panic spread among their troops, who, in the midst of the disorder, darkness, and rain, fired upon one another. In the night Ney blew up part of the bridge, and moved on his corps, keeping a rear-guard on the right bank the whole of the 16th. The Allies halted on the left bank that day, partly because the river was not fordable, and partly because they were in want of provisions, especially the Portuguese troops, for the Portuguese Regency, in spite of the urgent representations of Wellington and Beresford, had neglected to collect the means of carrying provisions along with the army. Nothing could be got from the country, which had been twice ravaged. Some of the Portuguese brigades were actually starving; many men fell off and died, and to save the rest the British supplies were shared with them. The British commissary-general's means were thus overlaid, and the whole army suffered in consequence. (Dispatches to Charles Stuart, dated Louzão, March 16, and Pombeiro, March 18, and another to the Earl of Liverpool of March 16.) On the 17th the British army crossed the Ceira over a trestle bridge, the French having withdrawn in the night.

Massena had taken up a strong position on the river Alva, another affluent of the Mondego, which was swollen by the rains, and had destroyed the bridge of Murcella, apparently intending to remain there some days. He had also sent out detachments to scour the neighbouring country for provisions. But Wellington marched three divisions by the mountains of Quiteria to Arganil, on the Upper Alva, which movement obliged the French marshal to abandon the Lower Alva, and continue his retreat by Moita, towards Celorico. The English army crossed the Alva near Pombeira, and collected at Moita on the 19th. Here again Massena destroyed much of his baggage and ammunition, for want of cattle to drag it, and also forsook the foraging parties that he had sent out, which were intercepted and taken by the English, to the number of about 800 men. The main body of the allied army halted at Moita for several days, in order to give time for the provisions to come up which had been sent round by sea from Lisbon to the Mondego. The light division and cavalry however continued to follow the French, who reached Celorico and Guarda on the 21st, and remained there for several days, and re-opened their communications with Almeida and the Spanish frontier. The retreat of the French, properly speaking, may be considered as having terminated here—a fortnight's retreat "in which the French commander displayed infinite ability, but withal a harsh and ruthless spirit. I pass over the destruction of Redinha, Condeixa, Miranda de Corvo, and many villages on the route; the burning of those towns covered the retrograde movements of the army, and something must be attributed to the disorder which usually attends a forced retreat; but the town of Leiria and the convent of Alcobaça were given to the flames by express orders from the French head-quarters; and although the laws of war, rigorously interpreted, authorise such examples when the inhabitants take arms, it can only be justly done for the purpose of overawing the people, and not from a spirit of vengeance when abandoning the country. But every horror that could make war hideous attended this dreadful march. Distress, conflagration, death in all modes! from wounds, from fatigue, from water, from the flames, from starvation! On every side unlimited violence, unlimited vengeance! I myself saw a peasant hounding on his dog to devour the dead and dying; and the spirit of cruelty, once unchained, smote even the brute creation. On the 15th the French general, to diminish the encumbrances of his march, ordered a number of beasts of burden to be destroyed. The inhuman fellow charged with the execution ham-stringed 500 asses, and left them to starve, and thus they were found by the British army on that day. The mute but deep expression of pain and grief visible in these poor creatures' looks wonderfully roused the fury of our soldiers, and so little weight has reason with the multitude when opposed by a momentary sensation, that no quarter would have been given to any prisoner at that moment. Excess of feeling would have led to direct cruelty. This shows how dangerous it is in war to listen to the passions at all, since the most praiseworthy could be thus perverted by an accidental cómbination of circumstances." (Napier, 'Peninsular War,' vol. iii., pp. 471, 472). Lord Wellington, habitually sober in the expression of his sentiments, assumes even a more decided and indignant tone on the same occasion. In his official dispatch to Lord Liverpool, dated March 14, after detailing the movements of the French to that day, he thus continues:—"I am sorry to be obliged to add to this account that their conduct throughout this retreat has been marked by a barbarity seldom equalled, and never surpassed. Even in the towns of Torres Novas, Thomar, and Pernes, in which the head-quarters of some of the corps had been for four months, and in which the inhabitants had been invited, by promises of good treatment, to remain, they were plundered, and many of their houses destroyed, on the night the enemy withdrew from their position, and they have since burnt every town and village through which they have passed. The convent of Alcobaça (a splendid structure) was burnt by orders from the French head-quarters. The bishop's palace and the whole town of Leiria, in which General Drouet had had his head-quarters, shared the same fate; and there is not an inhabitant of the country, of any class or description, who has had any dealing or communication with the French army, who has not had reason to repent of it, and to complain of them. This is the mode in which the promises have been performed and the assurances have been fulfilled which were held out in the proclamation of the French commander-in-chief, in which he told the inhabitants of Portugal that he was not come to make war upon them, but, with a powerful army of 110,000 men, to drive the English into the sea." ('Dispatches,' vol. vii., p. 358).

On the 25th of March the French abandoned Celorico, but retained the position of Guarda. On the 29th however Lord Wellington moved his columns up the steep hill of Guarda, when the French retreated to the Coa, without firing a shot—the rear-guard in excellent order. On the 2nd of April the British army came up with them, and found them posted on the right bank of the Coa. On the 3rd the light division passed the Coa on the left of the French, and drove in their light infantry; but the main body of the French advanced, and a rain-storm coming on at the moment, the men of the light division could not see that they were pushing too far. When the weather cleared up, the French, seeing that only a small force had crossed the river, attacked it in columns with cavalry. Three times the 43rd and 52nd regiments were driven back towards the river, and three times they rallied and beat back the enemy. At last, Picton's division having crossed the Coa, and the 5th division also making its appearance by the bridge of Sabugal, the whole French army retired upon Alfayates, having sustained considerable loss in men and also in baggage. This was called the combat of Sabugal, in which the light division lost about 200 men. On the 4th the French were about Aldea da Ponte and Aldea Velha, on the extreme frontier of Portugal, and on the 6th they crossed the Agueda into Spain. Thus terminated the third and last French invasion of Portugal. They left a garrison in Almeida, which was blockaded by the English. "The enemy's loss in this expedition to Portugal is immense—I should think not less than 45,000 men, including the sick and wounded; and I think that, including the 9th corps, they may have now 40,000 men on this frontier." (Dispatches to Lord Liverpool, April 9, 1811). A great part of the loss of the French, in killed, was from the hands of the Portuguese peasantry, who revenged themselves for the injuries which had been inflicted on their countrymen during the six or seven months that the French had remained in Portugal, by killing every straggler whom they could lay their hands upon before the British columns came up. Dismal scenes of suffering and death presented themselves along the whole line of that disastrous retreat—bodies of dead soldiers, generally naked, carts broken down on the road, carcases of horses and mules. Some of the poor creatures seemed to have

:rawled or been dragged ont of the road to die behind the oose stone walls with which the fields are enclosed; and, on ooking over the stone walls into the fields, they were seen ying in clusters of three or four or more, in all sorts of posiions. Portuguese villagers, men and women, were occaionally seen insulting and kicking the bodies of dead 'renchmen on the road, when they were properly reproved nd driven away by a British non-commissioned officer. It vas chiefly in the mountain valleys of the Serra de Estrella hat the work of destruction had been carried on by the 'rench during the winter of 1810-11. The marauding paries went searching for provisions in those sequestered valleys, nd when they fell upon a hamlet or farm-house they showed io mercy to the inmates. Sometimes in the mountains they ounced upon several families huddled together in a cave, vith a provision of Indian corn or pulse to last them for he winter. The males were soon despatched—the females pared for a time, bnt not in mercy. It happened however t times that these marauding parties were small, and they vere overpowered by the peasantry, who gave no quarter.

The orders given by the Regency of Portugal, at Lord Vellington's request, for the people of Beira and Estreaadura to withdraw from the open country upon the advance f the enemy, had caused a vast influx of population within he lines during the winter. These people were assisted artly by their own countrymen, and partly by a gift of 00,000*l.* voted by the British Parliament, and by subscripions raised in England. After the retreat of Massena they eturned to their homes, when the poorer class received urther assistance during the remainder of that year and the ollowing winter.

Lord Wellington having placed his army in cantonments etween the Coa and the Agueda, and made arrangements for he blockade of Almeida, set out for the south to see the tate of affairs on the Guadiana. Marshal Beresford comaanded the allied troops in Alemtejo, in the absence of General Hill, who had gone home on leave. The Spanish General Mendizabal, having heen utterly defeated by the 'rench in the preceding February, Soult had invested the ortress of Badajoz, the governor of which, General Menacho, vas unfortunately killed by a cannon shot. The command f the garrison devolved upon General Imar, who, on the 0th of March, only one day after the breaching battery had pened, and the breach was far from practicable, surrendered he place, although he knew by a telegraphic dispatch that a arge British and Portuguese force was advancing to his relief, s Massena being then in full retreat, Lord Wellington had ent troops to reinforce Beresford and to save Badajoz. In he mean time General Graham, with the British garrison of Cadiz, defeated the French under Victor in the battle of Barrosa, bnt not being supported by the Spanish troops, he vas obliged to return to Cadiz.

Marshal Soult having obtained Badajoz, repaired to Seville; and Mortier, who succeeded him in command in Estremadura, laid siege to Campo Mayor, a weak place vithin the frontiers of Portugal, with a garrison of only a few iundred men; but the commander, a Portuguese officer of ngineers, defended himself bravely until a regular breach vas made, when, being summoned, he asked of Mortier our-and-twenty hours more to wait for succour. Mortier ranted the honourable demand of the brave veteran, and t the expiration of the time agreed upon the place was urrendered.

Marshal Beresford, having been reinforced from the north y Lord Wellington, was advancing at the head of 22,000 nen; and at his appearance, on the 25th of March, the 'rench, hastily evacuating Campo Mayor, withdrew to Badajoz after a sharp skirmish with the British cavalry. Beresford had orders from Wellington to invest Badajoz efore the enemy could provision and repair their conquest. Crossing the Guadiana, he advanced into Spanish Estreaadura, Mortier having retired before him, and Beresford laced his army in cantonments abont Zafra and Merida to over the siege of Badajoz. He began by besieging and aking Olivença; and shortly afterwards, April 20, Lord Vellington arrived from the north, reconnoitred Badajoz, and rdered immediate operations against the place. The unxpected surrender of Badajoz had been a severe blow, and ie considered its recapture essential to his future operations, or he had formed the plan of advancing into the heart of Spain, and obliging the French to evacuate Andalucia. (Dispatch to Lord Liverpool, vii., p. 523.) But the possession f Badajoz not only protected the French positions in Andalucia and Estremadura, but gave them the key of the southern provinces of Portugal. While making the preparatory arrangements for the siege, Lord Wellington was recalled to the north by Massena's movements. On the 28th of April the British commander was back again, with his head-quarters at Villa Fermosa, near the Coa.

Massena, having recruited his army at Salamanca to a certain extent, was anxious to throw provisions into Almeida. He had repeatedly applied for reinforcements, and, above all, provisions, in the most urgent manner to his brother marshal, Bessières, duke of Istria, who held, by Napoleon's orders, a separate command in the north. Bessières however seems to have paid no great attention to these applications, for we find Massena writing to him from Ciudad Rodrigo on the 29th of April, when he was actually on his march to relieve Almeida, in the following terms:—"My dear Marshal, your letters are to me inconceivable. In that of the 20th you tell me that yon can give me no assistance. In that of the 22nd yon tell me that, on the 25th or 26th, you will join me wherever I may be, and that the head of your column will be at Salamanca on the 26th. By your letter which I receive now, you tell me that your cavalry and your artillery were, on the 27th, still one day's march from Salamanca; and you conclnde that my movement must be by this time at an end, and yon say that you regret not having been able to cooperate in it. . . . . I beg of you again to send without delay biscuit, flonr, and corn, to Ciudad Rodrigo, for the place has not fifteen days' provisions." (Napier, 'Peninsular War,' vol. iii. App. pp. 620-22.)

On the 2nd of May, Massena, having been joined at last by some cavalry, moved from Ciudad Rodrigo, and crossed the Agueda, with 40,000 infantry, 5000 horse, and about thirty pieces of artillery, for the purpose of relieving Almeida. He expected every day to be superseded in his command, and he wished to make a last effort for the sake of his own military character. Lord Wellington could muster no more than 32,000 men, of which force only 1200 were cavalry. He however determined to fight rather than give up the blockade of Almeida. He drew back his army half way between the Agueda and the Coa, and placed it in an extended line on a table-land between the two parallel rivers Turones and Das Casas, which are affluents of the Agueda; his left on Fort Conception, covering the blockade of Almeida; the centre opposite the village of Almeida; and the right at Fuentes de Oñoro, extending towards Nava d'Aver, on the road to Sabugal: the whole distance being nearly seven miles. He had the Coa in his rear, with the bridge of Castello Bom in case of a retreat. The front of the British position was protected by the river Das Casas, flowing through a deep ravine, in which lay the village of Fuentes de Oñoro; but to the right of this village the table-land turned back towards the Turones, leaving a plain between it and the hill of Nava d'Aver. The French advanced in three columns, one of which took post on a ridge which overhangs the village of Fuentes de Oñoro, and nearly parallel to that occupied by the Allies. They then attacked the village, which was stoutly defended by the British. The French at one time took possession of part of it, but were charged and driven away by a fresh brigade of British infantry. Night put an end to the fight. The Allies lost about 250 men, and the French somewhat more. The next day, Massena, who had been joined by Bessières with a body of the Imperial Guards, reconnoitered the position of the Allies; and on the 5th of May he made a grand attack with the greater part of his force on the British right, which he expected to turn by the plain which extends between the hill of Fuentes de Oñoro and that of Nava d'Aver, and between Poço Velho on the river Das Casas to the Turones, which last stream flowed in the rear of the British position. Had they passed the Turones, the French would have spread into the open country about Freuada, and cut off the English from the Coa. The French, crossing the Das Casas at Poço Velho, attacked the Spanish party of Julian Sanchez, and drove him from Nava d'Aver; they then charged the 7th and light divisions, which formed the British right. The light division immediately formed into squares; but the numerous French cavalry fell upon the 7th division before it could effect a like formation. The troops however stood firm; and although some were cut down, the enemy was checked by the steady fire of the Chasseurs Britanniques, a foreign regiment in the British service, and of the other regiments of the 7th division. Lord Wellington however, considering his position too far extended to the right, gave up Nava d'Aver and his communication with Sabugal, and ordered the 7th and light divisions to retire across the plain, and the 1st and 3rd divisions to wheel back and take up a new alignement on a steep ridge which runs from the Das Casas and Turones, nearly at right angles with the original position. The village of Fuentes de Oñoro thus became the left of the new position, and the right was at Frenada, beyond the Turones, and between that and the Coa. This movement was well executed, though under very critical circumstances, for the British squares had to cross a vast plain, exposed to the charge of a numerous French cavalry supported by artillery, the British cavalry being too weak to give much protection. The non-combatants, who had gathered behind the British line, were hurrying away, driven by the French horsemen across the plain. Colonel Napier says that "in all this war there was not a more dangerous hour for England. The whole of the vast plain, as far as the Turones, was covered with a confused multitude, amidst which the squares appeared but as specks; for there was a great concourse, composed of commissariat followers of the camp, servants, baggage, led horses, and peasants attracted by curiosity, and finally the broken picquets and parties coming out of the woods. The 7th division was separated from the army by the Turones; 5000 French cavalry, with fifteen pieces of artillery, were close at hand impatient to charge; the infantry of the 8th corps was in order of battle behind the horsemen; the wood was filled with the skirmishers of the 6th corps; and if the latter body, pivoting upon Fuentes, had issued forth, while Drouet's divisions fell on that village, while the 8th corps attacked the light division, and while the whole of the cavalry made a general charge, the loose multitude encumbering the plain would have been driven violently in upon the 1st division, in such a manner as to have intercepted the latter's fire, and broken their ranks. No such effort however was made; Montbrun's cavalry merely hovered about Craufurd's squares, the plain was soon cleared, the cavalry took post behind the centre, and the light division formed a reserve to the right of the 1st division, sending the riflemen among the rocks to connect it with the 7th division, which had arrived at Frenada, and was there joined by Julian Sanchez. At the sight of this new front, so deeply lined with troops, the French stopped short, and commenced a heavy cannonade, which did great execution, from the closeness of the allied masses; but twelve British guns replied with vigour, and the violence of the enemy's fire abated: their cavalry then drew out of range, and a body of French infantry attempting to glide down the ravine of the Turones, was repulsed by the riflemen and light companies of the Guards. But all this time a fierce battle was going on at Fuentes de Oñoro. Massena had directed Drouet to carry this village at the very moment when Montbrun's cavalry should turn the right wing. It was, however, two hours later ere the attack commenced. The three British regiments (24th, 71st, and 79th) made a desperate resistance; but overmatched in number, and little accustomed to the desultory fighting of light troops, they were pierced and divided: two companies of the 79th were taken, Colonel Cameron was mortally wounded, and the lower part of the town was carried: the upper part however was stiffly held, and the rolling of the musketry was incessant. Had the attack been made earlier, and the whole of Drouet's division thrown boldly into the fight, while the 6th corps, moving through the wood, closely turned the village, the passage must have been forced, and the left of the new position outflanked; but now Lord Wellington having all his reserves in hand, detached considerable masses to the support of the regiments in Fuentes. The French continued also to reinforce their troops, until the whole of the 6th corps and a part of Drouet's division were engaged, when several turns of fortune occurred. At one time the fighting was on the banks of the stream, and amongst the lower houses; at another upon the lower heights and round the chapel, and some of the enemy's skirmishers even penetrated completely through towards the main position: but the village was never entirely abandoned by its defenders; and in a charge of the 71st, 79th, and 88th regiments, led by Colonel M'Kinnon, against a heavy mass which had gained the chapel eminence, a great number of French fell. In this manner the fight lasted until evening, when the lower part of the town was abandoned by both parties—the British maintaining the chapel and crags, and the French retiring a cannon-shot from the stream. ('History of the Peninsular War,' iii. 514-16.)

The total loss of the British was 235 killed, 1234 wounded, and 317 missing or taken prisoners. The loss of the French was certainly greater, judging from the number of dead bodies found in the village. No fighting of any consequence occurred on the left of the British position, where the fifth and sixth divisions were posted to protect the blockade of Almeida, the second corps of the French merely waiting the issue of the battle at Fuentes de Oñoro, and watching for an opportunity of throwing provisions into Almeida, which however did not occur. The battle of Fuentes de Oñoro was of importance, being a regular pitched battle fought by the British in a position of no particular strength, and indeed very weak in one point, under great disadvantage of numbers, and especially of cavalry. The great majority of the troops engaged were British, for the Portuguese were mostly with Marshal Beresford in the south. There were only four British divisions and one Portuguese brigade and about 1000 cavalry engaged against three French corps of infantry and 5000 cavalry. Massena fought the battle for the purpose of relieving Almeida, but he failed, and Almeida a few days afterwards was evacuated by the French garrison in the night. With this battle Massena closed his long and active career. He withdrew his army beyond the Agueda, and soon afterwards Marshal Marmont, duke of Ragusa, arrived at Salamanca to supersede him. The order of Napoleon by which Massena was directed to give up the command to Marmont was not conceived in very gracious terms. He was allowed to take with him to France his son and one of his aides-de-camp only. Marmont was told to take the reins of command with a firm hand. (Napier, 'Peninsular War,' vol. iii., Appendix vii., p. 622.)

Whilst these things were happening in the north, Marshal Beresford had invested Badajoz, when Soult marched from Seville to relieve that place. On the 13th of May, Beresford raised the siege, removed his artillery, platforms, and stores, and prepared to meet Soult in position on the ridge of Albuera with above 7000 British infantry, several Portuguese brigades, and Blake's Spanish corps, in all about 30,000 infantry and about 2000 cavalry, but hardly one-half of this force could be depended upon in the field. He had with him thirty-eight pieces of artillery. On the evening of the 15th Soult came up with about 19,000 chosen infantry, about 4000 cavalry, and fifty guns. He immediately reconnoitred Beresford's position, and determined upon an attack on the right flank of the Allies, which was their weak point, though Beresford had directed his chief attention to the centre, where he had placed his British troops. It was on the French part the same game as at the battles of Talavera and Fuentes; but Wellington was not there, nor were British troops at hand all along the line; and when Beresford, perceiving his mistake, ordered Blake to change his front so as to face the French marching upon his right, Blake refused, saying that the real attack was against the centre by the bridge of Albuera. There was indeed an attack by the French in that quarter, but it was only intended to mask and support the grand attack on the right of the Allies. It was only when the French actually appeared on the table-land on the right, commanding and enfilading the whole position of the Allies, that Blake consented, with much slowness, to change his front. In the mean time the French columns were already in possession of the table-land; their guns opened, and their cavalry outflanking the front, put the Spaniards in disorder, and they gave way. The brigades of the second division, British, were ordered to advance to the right; the first, or Colborne's brigade, while in the act of deploying, was attacked in flank and rear, and nearly destroyed by the French and Polish cavalry: the next, Houghton's brigade, reached the summit, and maintained a desperate struggle. But the men fell fast, ammunition failed, and Beresford began to think of a retreat, which would have been ruinous, when, at the suggestion of Colonel Hardinge, General Cole, with the 4th division, was ordered to march up the hill. It consisted of only two brigades, one Portuguese and the English Fusileer brigade (7th and 23rd regiments), commanded by Sir William Myers. This last brigade restored the fight and saved the army. General Cole directed the Portuguese brigade under General Harvey to move round the hill on the right, whilst Abercrombie's brigade, the last remaining one of the second division, moved up the hill on the left; Cole himself led the brave fusileers up the fatal hill, which was crowned by the French masses and artillery. Six British guns were already in the enemy's possession, the whole French reserve was coming forward to reinforce their front column, and what remained of Honghton's brigade could no longer maintain its position. The gronnd was heaped with dead bodies, and the Polish lancers were riding furiously abont the captured artillery on the npper part of the hill. General Cole at the head of the fusileers, flanked by a battalion of the Lnsitanian Legion nnder Colonel Hawkshawe, dispersed the lancers, recovered the captured guns, and appeared on the right of Houghton's brigade exactly as Abercrombie's issued out on the left. We must now once more borrow Sir William Napier's eloquent pen :—"Such a gallant line, issuing from the midst of the smoke, and rapidly separating itself from the confused and broken multitude, startled the enemy's heavy masses, which were increasing and pressing onwards as to an assured victory: they wavered, hesitated, and then, vomitiug forth a storm of fire, hastily endeavoured to enlarge their frout, while a fearful discharge of grape from all their artillery whistled through the British ranks. Sir William Myers was killed, Cole, and the three colonels, Ellis, Blakeney, and Hawkshawe, fell wonnded, and the fusileer battalions, struck by the iron tempest, reeled and staggered like sinking ships. Suddenly and sternly recovering, they closed on their terrible enemies, and then was seen with what a strength and majesty the British soldier fights. In vain did Soult, by voice and gesture, animate his Frenchmen; in vain did the hardiest veterans, extricating themselves from the crowded columns, sacrifice their lives to gain time for the mass to open out on such a fair field; in vain did the mass itself bear up, and, fiercely arising, fire indiscriminately npon friends and foes, while the horsemen, hovering on the flank, threatened to charge the advaucing line. Nothing could stop that astonishing infantry. No sndden burst of undisciplined valour, no nervous enthusiasm, weakened the stability of their order; their flashing eyes were bent on the dark colnmns in their front; their measnred tread shook the ground; their dreadful volleys swept away the head of every formation; their deafeuing shonts overpowered the dissonant cries that broke from all parts of the tumultnous crowd, as foot by foot, and with a horrid carnage, it was driven by the incessant vigour of the attack to the farthest edge of the hill. In vain did the French reserves, joiniug with the struggling multitndes, endeavonr to sustain the fight; their efforts ouly increased the irremediable confusion, and the migbty mass, giving way like a loosened cliff, went headlong down the ascent. The rain flowed after in streams discoloured with blood, and 1500 unwounded men, the remnant of 6000 nnconqnerable British soldiers, stood trinmphant on the fatal hill." (Napier, 'Peniusular War,' iii., 540-1.)

The day was now won, and Beresford ordering the Portnguese and Spaniards to advance, the French retreated in confusion across the small river on which stands the village of Albuera. About three o'clock the fire had ceased. The allied army had lost in killed and wounded about 7000 men, of whom two-thirds were British. The French lost about 8000 men, including two generals killed and three wonnded. On the 16th of May the two armies remained in their respective positions, and Beresford waited in anxiety for another attack, when he had hardly British soldiers enough for his picquets and to take care of the crowd of wounded. On the 17th however he was reinforced by an English brigade, and the following day Soult retired towards Seville, leaving 800 soldiers severely wounded to the generosity of the English. On the 19th Lord Wellington arrived from the north, followed by two fresh divisions, and gave directions to resume the siege of Badajoz. The trenches were opened, and on the 5th of June, a breach being made in Fort St. Christoval, the assault was given, but failed. On the 9th another attempt at storming was made, which proved equally fruitless. On the 10th Lord Wellington received intelligence that Marmont was marching to the sonth to join Sonlt. He then took up a position near Campo Mayor, along the frontiers of Portugal. The enemy did not choose to attack him, and abont the middle of July, Marmont, again sepsratiug himself from Soult, recrossed the Tagus by Almaraz, and marched on Salamanca. Lord Wellington likewise, leaving General Hill with one British division and the Portnguese in Alemtejo, and giving np the siege of Badajoz for the present, crossed the Tagus with the remainder of his army, and fixed his head-quarters at Fuente Guinaldo, on the line of the Agueda. He was looking towards recovering possession of the important fortress of Ciudad Rodrigo, which his advanced parties surrounded and kept in a state of blockade. Towards the end of September, Marmont, having received large reinforcements from France, moved npon the Agueda, and by his superiority of nnmbers and especially of cavalry, obliged Lord Wellington, after a partial engagement at El Bodon, to withdraw his army, which he did in excellent order to his old position on the Coa, where Marmont did not choose to follow him. Nothing more happened after this on that side for the remainder of the year 1811.

In the sonth, General Hill effected a gallant achievement by surprising the French General Girard, with 4000 foot and 1000 horse, at Arroyos de Molinos, in the neighbonrhood of Caceres, in Spanish Estremadura, on the 28th of October. Hill completely ronted Girard, took 1500 prisoners, with several officers of rank, and the whole of the enemy's artillery, ammnnition, stores, and baggage, with only a trifling loss on the part of the Allies. Hill then advanced to Merida, where he placed his troops in cantonments, that part of Estremadura beiug thns delivered from the enemy.

Lord Wellington, in the second part of 1811, besides having firmly established his complete possession of Portugal, had by his operations within the Spanish frontiers, both north and sonth of the Tagus, given full employment to two French armies, each commanded by a French marshal of high repntation, and prevented them from acting with vigonr either against Galicia in the north or against Cadiz in the south. He had thns fulfilled the promise which he had made the year before of being able to retain possession of Portugal, and to make it a position of support for future operations against the French in Spain, and he continued to hold the same language to ministers at home. ('Dispatches,' March 23, 1811, vii., p. 392.)

In eastern Spain unfortunately the French had obtained in 1811 great successes against the unassisted Spaniards. They took Tarragona by storm in June, when a horrid butchery of the unarmed population took place, without regard to age or sex, to the number, it was stated, of 6000. Still the brave Catalonians, undismayed, continned to carry on the war with unabated zeal. The Spanish General Blake, after being defeated by Suchet near Valencia, shut himself up in that city with his whole army, the last Spanish army which had remained in the field; and in the beginniug of January 1812, he capitulated with 18,000 soldiers, 23 general officers, and between 300 and 400 guns. "I believe," observed Lord Wellington, at the time, "there is no man who knows the state of affairs in that province, and has read Suchet's account of his action with Blake on the 25th of October, who does not believe that, if Blake had not fought that action, Valencia would have been safe. Are the English ministers and generals responsible for the blunders of Blake?" ('Dispatches,' viii., p. 520.)

Campaign of 1812.—Lord Wellington from his headqnarters at Frenada, near the Coa, where he had been apparently quiet dnring the latter months of 1811, had been preparing in secrecy the means of recapturing the important fortress of Ciudad Rodrigo. Under the appearance of repairing and fortifying Almeida he had collected there a battering train and abundant stores. A portable bridge on trestles was also constructed in the same place. He also effected the formation of a commissariat waggon-train, with several hundred waggons constructed for that purpose, in order to supersede the rude carts of Portuguese construction which had been hitherto used as a means of transport for the army, bnt which would have often proved quite ineffectual without the assistance of a large body of Spanish mules and muleteers, which followed all the movements of the divisions of the British army. By the exertions of the engineer officers the river Douro had been rendered navigable as far as the confluence of the Agueda, that is to say, forty miles higher than boats had ever before ascended it. All this was done with so little outward bustle and show that Marmont does not seem to have anticipated any attack upon Cindad Rodrigo, at least for the remainder of the winter. The French marshal had placed his army, the 'Army of Portugal,' in extensive cantonments about Plasencia and Talavera, towards the Tagus, and had detached part of it to the eastward towards La Mancha, and two divisious to the north, to occupy Asturias. Suddenly, Lord Wellington, on the 6th of January, 1812, moved his head-quarters forward to Gallegos, and on the 8th part of the army crossed the Agueda, and immediately invested Ciudad Rodrigo. An external redonbt, on a hill called the Great Teson, was stormed by a party of the light division that very eveniug, and the first parallel was soon afterwards established. On the night of the 13th the fortified convent of Santa Cruz, situated outside of the walls, was surprised and carried; and on the 14th the convent of San Francisco, likewise situated outside the walls, was carried by assault. The second parallel was then completed, and fresh batteries being established, two practicable breaches were made on the 19th, and that very evening orders were given to storm the place. No time was to be lost, as Marmont was known to be advancing to relieve the garrison. A part of the light division under General Craufurd, on one side, and General Mackinnon's brigade, supported by the 94th and 5th regiments, on the other, advanced to the breaches, whilst Colonel Pack's brigade attacked the gate of St. Jago, and in less than half an hour from the time the attack commenced the Allies were in possession of the ramparts, and the garrison then surrendered. ('Dispatches to Lord Liverpool,' vol. viii., p. 549, &c.) The loss of the British was severe. General Mackinnon and many of his men were blown up by the explosion of a magazine on the rampart, which took fire accidentally. General Craufurd, the gallant commander of the light division, was mortally wounded, and died shortly afterwards. General Vandeleur and Colonel Colborne were also wounded, as well as Major George Napier, who led the storming party on the left. The total loss of the British and Portuguese amounted to about 1000 killed and wounded. The loss of the garrison was estimated at about the same, besides 1700 prisoners. A large battering-train and a vast quantity of ammunition and stores were found in the place.

Marshal Marmont heard at Valladolid, on the 15th of January, of Lord Wellington's operations against Ciudad Rodrigo. He quickly recalled Bonet's division from Asturias, collected his other divisions, and marched, as he thought, to relieve the place; but on arriving at Salamanca he heard of its fall. His astonishment was thus expressed in a letter to Berthier:—"On the 16th the English batteries opened their fire at a great distance: on the 19th the place was stormed, and fell into the power of the enemy. There is something so incomprehensible in this that I allow myself no remarks, as I am not yet furnished with the necessary information."

The Spanish Cortes assembled at Cadiz passed unanimously a vote of thanks to Lord Wellington, and conferred on him the title of Duke of Ciudad Rodrigo. In England he was raised to the dignity of Earl of Wellington of the United Kingdom, and parliament, besides a vote of thanks to him and his brave army, annexed to the title an annuity of 2000*l.*

Having repaired in some degree the works of Ciudad Rodrigo, Lord Wellington placed it under the command of a Spanish governor, and prepared to move to the south, for he had made up his mind to take Badajoz, if possible, before Marmont and Soult could unite for its defence. The artillery for the siege was embarked at Lisbon for a fictitious destination, then transhipped at sea into small craft, in which it was conveyed up the Setubal river to Alcacer do Sal, and thence by land across Alemtejo to the banks of the Guadiana. On the 6th of March, leaving one division on the Agueda, Lord Wellington marched the remainder of his army to the south. On the 16th the army crossed the Guadiana, and Badajoz was immediately invested, while several divisions advanced to Llerena and Merida to cover the siege. On the 25th, the Picurina, an advanced post, separated from the body of the place by the small river Rivillas, was taken by storm, and on the 26th two breaching batteries opened their fire on the town. In the meantime Soult was collecting his disposable force at Seville for the relief of the place, and Marmont, in order to effect a diversion, entered Portugal by Sabugal and Penamacor, and ravaged the country east of the Serra de Estrella. Lord Wellington accelerated the operations of the siege. On the 6th of April, three breaches having become practicable, orders were given for the assault in the evening. The various divisions passed the glacis under a tremendous fire from the garrison, which greatly thinned their ranks; and they descended into the ditch, and ascended the breaches, but here they found obstacles which appeared insuperable. Planks studded with iron spikes, like harrows, and chevaux-de-frise formed of sword-blades, effectually stopped the way, and the ramparts and neighbouring buildings were occupied by light infantry, who showered their volleys upon the assailants. Shells, hand-grenades, every kind of burning composition, and missiles of every sort, were hurled at them. At last Lord Wellington ordered them to withdraw just as a report came that General Picton's division had taken the castle by escalade, and soon afterwards General Walker's brigade also entered the town by escalade on the side of the Olivença Gate. The other divisions then formed again for the attack of the breaches when all resistance ceased. The French governor, General Philippon, with a few hundred men, escaped across the Guadiana to Fort San Christoval, where he surrendered the following morning. Great excesses and outrages were committed by the soldiers during the remainder of the night, until severe measures on the part of Lord Wellington restored order. The loss of the Allies was much more severe than at Ciudad Rodrigo, amounting to 72 officers and 963 men killed; and 306 officers and 3480 men wounded. "When the extent of the night's havoc," says Napier, "was made known to Lord Wellington, the firmness of his nature gave way for a moment, and the pride of conquest yielded to a passionate burst of grief for the loss of his gallant soldiers."

Soult collected his army at Villafranca, between Llerena and Merida, on the 8th, when, hearing of the fall of Badajos, he retired before daylight next day towards Seville, pursued by the British cavalry, which made a successful attack on his rear-guard at Villa Garcia.

On the 13th of April Lord Wellington moved the main body of his army back to the north, leaving General Hill south of the Tagus. Marmont, on hearing of this, gave up the blockade of Almeida and Ciudad Rodrigo, and withdrew to Salamanca. Lord Wellington's head-quarters were again at Guinaldo, between the Coa and the Agueda, where they remained till the middle of June, nothing of importance occurring in that quarter during the interval. In the south however General Hill took and destroyed, in the month of May, the forts which the French had constructed at Almaraz on the Tagus, where they had a bridge of boats to secure the communication between the Armies of the North and South.

On the 13th of June Lord Wellington, having completed his preparations for an advance into Spain, broke up from his cantonments with about 40,000 men, leaving General Hill on the Tagus, near Almaraz, with about 12,000 more. On the 17th he appeared before Salamanca. Marmont retired on his approach, and left about 800 men in some forts constructed on the ruins of convents, which commanded the bridge across the river Tormes. The allied army forded the river and entered the town, to the great joy of the inhabitants. "They have now been suffering for more than three years, during which time the French, among other acts of violence and oppression, have destroyed 13 out of 25 convents, and 22 of 25 colleges, which existed in this celebrated seat of learning." ('Dispatches,' ix. p. 239.) The forts were immediately invested, while Marmont's army retired to Toro on the Douro, and the British advance took up a position at San Cristoval, a few miles in front of Salamanca. An attempt was made to carry the forts by escalade, which failed, and Major-General Bowes and 120 men fell in the attack. On the 20th Marmont moved forward again, and, arriving in front of the position of San Cristoval, made a demonstration with his cavalry in the plain, but it ended merely in a skirmish. He made other demonstrations and movements in the following days for the purpose of relieving the forts, but was baffled by the watchfulness of the British general, until on the 27th the forts within Salamanca were taken or surrendered.

Marmont again retired to the Douro in the beginning of July, and took up a strong position on high ground along the northern bank of the Douro, his centre being at Tordesillas. The British and Portuguese allied army took up a line on the left or southern bank of the river, facing the enemy. A great deal of manœuvring, marching, and counter-marching, and changing of front, followed on the part of Marmont, during which the French marshal was reinforced by Bonet's division from Asturias, which had effected a difficult march over the mountains, having been harassed and pressed by the Spaniards from Galicia under Mahy and Porlier. On the 16th of July Marmont threw two of his divisions across the Douro at Toro, when Lord Wellington moved his army to the left, to concentrate it on the Guareña, an affluent of the Douro from the south. On the night of the 16th the French, recrossing the Douro at Toro, ascended the northern bank of the river with their whole army to Tordesillas, when they again crossed over to the southern bank, and by a forced march assembled at Nava del Rey on the 17th. On the 18th they attempted to cut off the right of the British army, consisting of the 4th and light divisions, but were repulsed by several charges of the British and Hanoverian cavalry, as well as of the British and Portuguese infantry. By his manœuvres however Marmont succeeded in establishing his communication with King Joseph and the army of the centre, which was advancing from Madrid to join him. In the mean time the two armies of Marmont and Wellington were in line on the opposite banks of the Guareña. More manœuvring took place on the part of Marmont, who, on the 20th, crossed the Guareña on the right of the Allies, and advanced towards the Tormes by Babilafuente and Villamusa. Lord Wellington followed closely the enemy's movements during part of that day's march, and the two hostile armies moved in parallel lines within half cannon-shot of each other in the finest order; and as the nature of the ground gave either party a temporary advantage the artillery opened fire, but no actual collision took place, though both armies were ready to form in line of battle. Lord Wellington, in his dispatch to Earl Bathurst dated the following day, July 21, observes as follows—"The enemy's object hitherto has been to cut off my communication with Salamanca and Ciudad Rodrigo, the want of which he knows would distress us very materially. The wheat-harvest has not yet been reaped in Castile, and even if we had money we could not now procure anything from the country, unless we should follow the example of the French, and lay waste whole districts in order to procure a scanty subsistence of unripe wheat for the troops. It would answer no purpose to attempt to retaliate upon the enemy, even if it were practicable. The French armies in Spain have never had any secure communication beyond the ground which they occupy; and, provided the enemy opposed to them is not too strong for them, they are indifferent in respect to the quarter from which their operations are directed, or on which side they carry them on. The army of Portugal has been surrounded for the last six weeks, and scarcely even a letter reaches its commander; but the system of organised rapine and plunder, and the extraordinary discipline so long established in the French armies, enable it to subsist at the expense of the total ruin of the country in which it has been placed, and I am not certain that Marshal Marmont has not now at his command a greater quantity of provisions and supplies of every description than we have. . . . . . . I have invariably been of opinion that, unless forced to fight a battle, it is better that one should not be fought by the allied army unless under such favourable circumstances as that there would be reason to hope that the allied army would be able to maintain the field, while that of the enemy should not. Your lordship will have seen by the returns of the two armies that we have no superiority of numbers even over that single army immediately opposed to us; indeed I believe that the French army is of the two the strongest, and it is certainly equipped with a profusion of artillery double ours in number, and of larger calibres. It cannot therefore be attacked in a chosen position without considerable loss on our side. To this circumstance add, that I am quite certain that Marmont's army is to be joined by the King's, which will be 10,000 or 12,000 men, with a large proportion of cavalry, and that troops are still expected from the army of the north, and some are ordered from that of the south; and it will be seen that I ought to consider it almost impossible to remain in Castile after an action, the circumstances of which should not have been so advantageous as to have left the allied army in a situation of comparative strength while that of the enemy should have been much weakened. I have therefore determined to cross the Tormes if the enemy should; to cover Salamanca as long as I can, and above all not to give up our communication with Ciudad Rodrigo; and not to fight an action unless under very advantageous circumstances, or it should become absolutely necessary." ('Dispatches,' ix. pp. 296-98.)

On the 21st both hostile armies crossed the Tormes—the Allies by the bridge of Salamanca, and Marmont's higher up the river by the fords between Huerta and Alba de Tormes. Lord Wellington placed his troops in a position, the left of which rested on the left or southern bank of the river, and the right on one of two steep hills which from their similarity and contiguity are called the Dos Arapiles. On the morning of the 22nd some sharp skirmishing took place, and the French succeeded in gaining possession of the more distant Arapiles, by which they had it in their power to annoy and perhaps turn the right of the British, Marmont's plan being evidently to cut them off from Ciudad Rodrigo. This obliged Lord Wellington to extend his right to a height behind the village of Arapiles, occupying the village itself with the light infantry. After a variety of evolutions and movements on the part of Marmont, which lasted till two o'clock in the afternoon, the French commander, under cover of a very heavy cannonade, "extended his left, and moved forward his troops apparently with an intention to embrace, by the position of his troops and by his fire, our post on that of the Two Arapiles which we possessed, and from thence to attack and break our line, or at all events to render difficult any movement of ours to our right. The extension of his line to his left however, and its advance upon our right, notwithstanding that his troops still occupied very strong ground, and his position was well defended by cannon, gave me an opportunity of attacking him, for which I had long been anxious." (Dispatch to Earl Bathurst, July 24.) Lord Wellington's anxiety is explained by the intelligence which he had received that General Clausel had arrived at Pollos, on the Douro, on the 20th, with the cavalry and horse-artillery of the army of the north, to join Marmont, which he was expected to do on the 22nd or 23rd at the latest. This junction would give Marmont such a superiority in cavalry as greatly to embarrass and endanger the movements of the British.

Lord Wellington, suddenly seizing the opportunity for which he had been waiting, disposed his divisions so as to turn the enemy's left and at the same time attack him in front. General Pakenham, at the head of the third division, steadily ascended the ridge occupied by the extreme left of the French, formed line across their flank, and, being supported by some cavalry, he moved on towards the centre of the enemy, driving everything before him. Wherever the French attempted to make a stand they were charged with the bayonet; the cavalry at the same time charged the enemy in front, and the whole left wing of the French made a disorderly retreat towards their right, leaving many killed and wounded behind, and about 3000 prisoners. Meantime the 4th and 5th divisions, after a very severe struggle, succeeded in driving in the centre of the enemy, whose right however remained unbroken, when General Clausel, who having joined the French army that day, succeeded to the command in consequence of Marshal Marmont being wounded, withdrew his troops with great skill, and formed them in a new position nearly at right angles with the original one. His cavalry was numerous, and his artillery formidable. Lord Wellington directed a fresh attack, and the 6th division, ascending to the enemy's position under a sweeping fire of artillery and musketry, gained the level ground, when they charged with the bayonet, and the 4th division coming up at the same time the French abandoned the ground in great confusion, retreating towards Alba de Tormes, followed closely by the British till night stopped the pursuit, which was renewed by the cavalry on the morning of the 23rd. The cavalry came up with the French rear near La Serna, when three French battalions surrendered, being forsaken by their own cavalry. Clausel retired by Peñaranda to Arevalo, whence he took the direction of Valladolid. The loss of the French was very severe; three generals killed, four wounded; one general, six field-officers, 130 officers of inferior rank, and between 6000 and 7000 men taken prisoners, besides two eagles. Their total loss in killed and wounded could not be ascertained. The Allies had 694 killed and 4270 wounded, but the proportion of officers was very great. General Le Marchant was killed and Generals Beresford, Leith, Cole, Cotton, and Spry, were wounded.

The ultimate though not immediate results of the victory of Salamanca were great, and a French historian, generally very warm in the cause of Napoleon, does not hesitate to attribute to the military and political consequences of that battle the ultimate loss of Spain by the French. (Thibaudeau, 'Histoire de l'Empire,' ch. 83.) Among the political consequences must be reckoned the obliteration of any tendency that there might have been in the minds of some of the influential men in Spain, and even in the Cortes, to give up the English alliance, and make their peace with King Joseph, on condition of his acknowledging the constitution proclaimed by the Cortes assembled at Cadiz in March of that year. The author just quoted says, "We are assured that a negociation to that effect had been entered into, which the battle of Salamanca broke off for ever."

Lord Wellington, having crossed the Douro, reached Valladolid on the 30th of July, Clausel continuing his retreat towards Burgos. King Joseph, with all the troops he could muster at Madrid, about 20,000, had marched by the Escurial on the 21st of July to join Marmont. On arriving at Arevalo he heard of Marmont's defeat, upon which he marched by his right to Segovia to effect a diversion in favour of Clausel's retreating army. Lord Wellington, recrossing the Donro, marched against him on the 7th of August, leaving a force on the Donro to watch Clausel. King Joseph retreated to Madrid, and the Allies having passed the Guadarama, he abandoned the capital and withdrew to the left bank of the Tagus, between Aranjuez and Toledo. Lord Wellington entered Madrid on the 12th, and was received with great acclamations. In consequence of this movement Sonlt raised the blockade of Cadiz, destroying the works which the French had constructed with so mnch labour and expense, and, abandoning western Andalucia, concentrated his forces in Granada. His rear-guard was attacked by an allied Spanish and English force from Cadiz, which drove it from San Lucar, and took Seville by assault. General Hill at the same time advanced from the banks of the Guadiana to the Tagus, connecting his operations with those of the main body of Lord Wellington's army. On his approach King Joseph abandoned Toledo and fell back to Almanza, in Murcia, to keep himself in communication with Soult and Suchet. A great part of sonthern and central Spain was thus freed from the French, who never retook Seville; and this was another resnlt of the battle of Salamanca.

The sitnation of Lord Wellington at Madrid was however critical. Clausel's army in the north had been largely reinforced, and Sonlt, and Snchet, and King Joseph, by forming a junction, might advance from the south, and thus the Allies wonld be attacked by a combined force nearly treble in number to their own. The Anglo-Sicilian expedition of not more than 6000 men, part of whom were foreign auxiliaries, was cooped np in Alicante, and conld not effect any powerful diversion. There was no Spanish force of any magnitnde upon which Lord Wellington could depend for field operations. The Galician army under Santocildes, which was the most effective Spanish corps, after taking Astorga, had advanced towards Zamora, bnt was driven back by Clansel. Ballasteros, who commanded a Spanish force in Andalncia, refnsed to be directed by Lord Wellington, and O'Donnell had been defeated in Valencia by Snchet, and driven into Mnrcia. At Madrid Lord Wellington was treated with enthusiastic admiration, but no active exertions were made in the common canse. The conntry was exhausted, the people appeared disheartened, and the British commander-in-chief could not realise at Madrid, upon drafts on the British treasury, a snm of money adequate to his most pressing wants. To remain at Madrid was therefore impracticable; he must either advance to the north against Clausel, or to the sonth against Soult, and he determined on the first of these movements, for the purpose of striking a blow at Clausel before the French in the sonth and east conld advance to his support. Leaving two divisions at Madrid, he marched with the remainder on the 1st of September for Valladolid, which he entered on the 7th, and, continuing his march towards Burgos, was joined at Palencia by the Spanish army of Galicia, which scarcely mnstered 10,000 men, undisciplined and deficient in equipment. On the 19th the allied army entered Bnrgos, and the French, nnder General Souham, who had assnmed the command in the north, fell back to Briviesca, leaving 2000 men, under General Dubreton, in the Castle of Bnrgos, strong by its position, which had been fortified with care. The possession of that fort was necessary for the security of the allied army in its present advanced and insecure position, and Lord Wellington directed it to be invested forthwith, though he was ill furnished with siege artillery. A horn-work on a hill, which commanded several of the works of the castle, was carried by assault. The fort itself was battered, but with little effect, and sapping was then resorted to. On the 29th, a breach being effected in the outer wall by the explosion of a mine, an attempt was made to storm it, but failed. Another breach was effected in like manner on the evening of the 4th of October, and, being stormed with success, the besiegers were established within the exterior line of the works of the castle. The garrison made two sorties, by which they materially injured the works of the Allies, and occasioned them great loss. Want of ammnnition greatly retarded the operations of the siege. A breach at last being effected, by mining, in the second line on the 18th, orders were given to storm it. A detachment of the King's German Legion carried the breach, and a detachment of the Gnards succeeded in escalading the line; but the enemy brought such a fire upon them from the third line and from the body of the castle, and attacked them with numbers so superior before they conld be supported, that they were obliged to retire with considerable loss. But now the French army of the north advanced with evident intention to raise the siege; and at the same time Lord Wellington learnt from General Hill that the armies of the south and centre, which, being united, mustered 70,000 strong, were advancing from Valencia towards the Tagus, and that the Spanish General Ballasteros had not assumed a position in La Mancha, which the Spanish Government, at Lord Wellington's suggestion, had directed him to take in order to intercept the enemy's movements. The British commander was therefore under the necessity of abandoning the siege of Burgos, and of effecting a retrograde movement in order to draw near to General Hill, who at the approach of Soult abandoned Madrid and retired slowly towards Salamanca.

On the 21st of October the siege of Burgos was raised, and Lord Wellington retired in good order to Palencia, and was joined by a brigade from England nnder Lord Dalhousie, which had landed at Coruña. The French, under Souham, repeatedly attacked the rear-guard of the Allies until they reached the Douro at Tudela, when Souham halted, waiting to be joined by Soult from the sonth. Lord Wellington continned his retreat to the Tormes, being joined on the 3rd of November by General Hill. On the 8th of November the Allies took up their old position on the heights of San Cristoval, in front of Salamanca. On the 10th, Souham and Soult joined their forces, which amounted to 75,000 infantry and 12,000 cavalry, while Lord Wellington's army did not exceed 48,000 infantry and 5000 cavalry. On the 14th the French crossed the Tormes in force near Lucinas. Lord Wellington took position at the Arapiles, being the ground of his former victory; but as the enemy, through his superiority of nnmbers, and especially of cavalry, was in motion to intercept his communications with Cindad Rodrigo, he withdrew to the Agueda, and on the 18th his head-quarters were at Cindad Rodrigo. Sonlt did not follow him close: in fact, the French made no serions movement beyond the Tormes, and soon afterwards they even withdrew a great part of their army from the banks of that river, to place them in better cantonments in Castile. The main army of the British and Portuguese were distributed in their old quarters within the frontiers of Portugal, their left resting at Lamego on the Douro, whilst General Hill's corps moved into Spanish Estremadura, into cantonments, near Coria, and towards the Tagus, placing strong posts at the passes of Baños and Bejar. The campaign of 1812 was now terminated.

During the retreat from Burgos the allied troops suffered mnch fatigue and privation; the weather was very inclement, the roads were deep and miry, and the rivers were greatly swelled, and some of them were breast-high at the fords. Owing to the irremediable difficulty of obtaining provisions in Spain, a great part of the army had neither bread nor biscuit, and the men had only a ration of lean tough beef. which they could not cook, bnt heated npon such smoky fires as they could make, and so ate it half raw. Many irregularities were committed by the soldiers, which Lord Wellington severely reprobated in a circnlar letter which he addressed to all commanding officers of divisions and brigades, dated Frenada, 28th of November 1812. ('Dispatches,' ix., p. 582.)

When the news reached England of the victory of Salamanca, Lord Wellington was advanced in the peerage by the title of Marquis of Wellington, Aug. 18, 1812. On the 3rd of December he received the thanks of Parliament, and on the 7th of the same month the snm of 100,000*l.* was voted to him as a reward for his services, and to enable him to support with dignity the rank to which he had been elevated.

Campaign of 1813.—Napoleon, having lost the best part of his army in his Russian expedition of 1812, not only conld not reinforce his marshals in Spain, but thonght it advisable to recall Marshal Soult, at the beginning of 1813, in order to intrust him with a command in the approaching campaign against the Russians and Prnssians in Germany. Sonlt however only took abont 20,000 men with him from the Peninsula. The French had still about 70,000 to oppose to Lord Wellington, independent of the force under Suchet in eastern Spain. The army still called the 'Army of Portngal,' nnder General Reille, had its head-quarters at Valladolid; that of the centre, under Dronet, was distributed ronnd Madrid; and the head-quarters of the army of the sonth, formerly Soult's, were at Toledo. All these forces were under King Joseph, who was assisted by Marshal Jourdan. Clausel and Foy commanded separate divisions in Aragon and Biscay. Andalncia and Estremadura were free from the French, as well as Galicia and Asturias in the north.

Lord Wellington had been at last appointed by the regency of Spain, with the approbation of the Cortes, to the rank of commander-in-chief of the Spanish armies, and measures were taken to render the Spanish troops more effective than they had hitherto been. But the army upon which he could immediately rely for field operations consisted of about 65,000 infantry, British and Portuguese, and about 6000 cavalry. With this force he opened the campaign of 1813.

About the middle of May, Lord Wellington broke up from his Portuguese cantonments, and put his army in motion for Spain in three bodies, the left under Sir Thomas Graham, the right under General Hill, and the centre under his own immediate command. He directed General Graham to pass by Lamego to the north of the Douro, and march through Tras-os-Montes to Bragança and Zamora, and thence to Valladolid, thus securing the position which the French had taken and had been at great pains to strengthen, along the northern bank of the Douro. The French were taken by surprise, not expecting this movement through Tras-os-Montes. Graham reached the Esla, an affluent of the Douro from the north, without meeting an enemy. On the 1st of June, having crossed the Esla, he encamped near Zamora, the French retreating before him, and, being joined by Lord Wellington from Salamanca, they moved on towards Valladolid. General Hill having crossed the Douro at Toro on the 3rd of June, joined the rest of the allied army, which was likewise joined by the Spanish army of Galicia, and afterwards by another Spanish corps from the south under O'Donnell. The French at Madrid and Toledo, disconcerted by this rapid march of the Allies, and fearing to be cut off from their countrymen in the north, hastily quitted the capital with King Joseph, his court, and retainers, and crossed the Douro at Puente, when the united French army retired to Burgos. On the 12th of June, the Allies continuing their advance, the French abandoned Burgos, destroying the defences of the castle, and retreated by Briviesca to the Ebro, which was the line they intended to defend. They threw a garrison into the fortress of Pancorvo in advance of the river. Lord Wellington, to avoid a useless sacrifice of men in forcing the passage of the Ebro in front of the enemy, moved his left by the road to Santander, through a rugged country, and directed it to pass the Ebro near its source by Rocamunde and San Martino, and then to follow the left or northern bank of the river towards Osma. The French position on the Ebro was thus turned, and the French fell back upon Vitoria after an engagement at Osma, in which they were defeated. The whole allied army, having passed the Ebro on the 15th of June, followed the enemy, and on the 20th was concentrated near Vitoria, where the French had taken a strong position in front of the town, covering the three roads from Madrid, Bilbao, and Logroño, which united at Vitoria.

The two hostile armies were nearly equal in number, amounting to from 70,000 to 75,000 men each. On the morning of the 21st Lord Wellington moved his army for the attack in three great divisions. The left, under General Graham, was directed by a circuitous movement to turn the enemy's right across the Bilbao road, and cut off his retreat to France by the Bayonne road; the right, under General Hill, was to commence the action by crossing the river Zadorra where the road from Madrid to Vitoria intersects the river, and to attack the enemy's left on the high ridge behind the village of Subijana de Alava; and the centre, consisting of the 3rd, 4th, 7th, and light divisions, in two columns, was to attack the French centre. General Hill succeeded, after a severe contest, in carrying the heights of Subijana de Alava, when King Joseph ordered his left to fall back for the defence of Vitoria. In the mean time General Cole, with the 4th and light divisions, crossed the Ebro by the bridges of Nanclaras and Tras Puentes, and soon afterwards the 3rd and 7th divisions crossed the river higher up, and marched against the centre of the French, who received the advancing columns with a destructive fire. General Picton's division, the 3rd, coming in contact with a strong body of the enemy, drove it back, and took its guns. The other divisions coming up, the French abandoned their position, and began their retreat in good order towards Vitoria. But while this was passing in front, General Graham, moving along the road from Bilbao, had attacked the French right, which was posted on the heights beyond the Zadorra, above the village of Abechuco, and had dislodged it from thence, and then, ascending the right bank of the Zadorra towards the road to Bayonne, he carried the village of Gamarra Mayor: at the same time the Spanish division of Longa carried the village of Gamarra Menor, which is on the right bank of the river opposite the road to Bayonne, which runs along the left bank, the heights of which were occupied by two divisions of French infantry in reserve. Towards the evening however the main body of the French army having been driven through the town of Vitoria, the divisions on their right withdrew hastily from their position; and then General Graham, crossing the Zadorra, took possession of the Bayonne road, by which the French were retreating, and this movement threw their army into irretrievable confusion. Their columns were obliged to alter their line of retreat, and take the road to Pamplona, abandoning all their baggage, artillery, ammunition, military chests, and the court equipage of King Joseph, and were followed after dark by the Allies. It was the most complete defeat that the French ever experienced in Spain. On this occasion the Spanish divisions under Generals Morillo and Longa, who were in the field with the British and Portuguese army, behaved remarkably well, and were honourably mentioned in Lord Wellington's dispatch after the battle. The total loss of the Allies was 740 killed and 4174 wounded. The loss of the French was stated by themselves at 6000. About 1000 prisoners fell into the hands of the Allies. But the French lost also 151 guns, 415 caissons, more than 100 waggons, an immense quantity of ammunition, and all the baggage of the army, and the baton of Marshal Jourdan. They carried away only one gun to Pamplona. King Joseph's carriage was seized, and he had hardly time to escape on horseback. Many carriages belonging to his court, with ladies, were also taken.

The French, leaving a strong garrison at Pamplona, continued their retreat to France. General Foy, who was not present at the battle, being near Bilbao, likewise fell back upon Bayonne, and was pursued by General Graham. A French garrison remained at San Sebastian. General Clausel, who was coming up from Logroño with about 15,000 men, hearing of the result of the battle, turned hastily back to Zaragoza, and thence by Jaca and the central Pyrenees, into France, having lost his artillery. Suchet alone remained with his army in Cataluña and Valencia, having his hands fully employed in that quarter.

Lord Wellington, having established the blockade of Pamplona, and directed General Graham to invest San Sebastian, advanced with the main body of his army to the Pyrenees, to occupy the passes from Roncesvalles to Irun, at the mouth of Bidasoa.

When the news of the battle of Vitoria reached England, there were great public rejoicings; and Lord Wellington was appointed a Field Marshal of England. "You have sent me," thus wrote to him the Prince Regent of England, "among the trophies of your unrivalled fame, the staff of a French Marshal, and I send you in return that of England." The Spanish Cortes, by a decree, created him Duke of Vitoria, and granted him in perpetuity the estate of Soto de Roma, in the kingdom of Granada.

When Napoleon, in his camp in Saxony, heard of the disaster of Vitoria, he was sorely vexed, and he immediately sent Marshal Soult to the Army of Spain, with the rank of 'Lieutenant of the Emperor.' Soult arrived on the Spanish frontier on the 13th of July, and set about restoring order and confidence in his army, which consisted of nine divisions of infantry (nearly 80,000 men), and three divisions of cavalry. He told them, in a proclamation dated July, that the disasters of the preceding campaign were owing to pusillanimous councils and unskilful dispositions of their late commanders. "Let us not, however," added he, "defraud the enemy of the praise which is due to him. The dispositions and arrangements of their general have been prompt, skilful, and consecutive, and the valour and steadiness of his troops have been praiseworthy." He concluded by saying that his instructions from the emperor were "to drive the enemy from those lofty heights which enable him proudly to survey our fertile valleys, and drive them across the Ebro. It is on the Spanish soil that your tents must next be pitched, and your resources drawn. . . . Let the account of our success be dated from Vitoria, and the birth of his Imperial Majesty be celebrated in that city."

Marshal Soult's first object was to relieve Pamplona. With this view he collected the main body of his army at St. Jean Pied de Port, and on the 25th of July attacked, with between 30,000 and 40,000 men, the British right at Roncesvalles. General Cole moved to the support of that post, but the French having turned the British position, General Cole considered it necessary to withdraw in the night, and march to Zubiri. In the meantime two French divisions attacked General Hill's position in the Puerto de Maya, at the head of the valley of Baztan. At first they gained ground, but were again driven back, when the retrograde movement of General Cole, on his right, induced General Hill to withdraw likewise to Irurita. Lord Wellington, who had his head-quarters at Lesaca, on the left of the army, heard of these movements late in the night, and concentrated his army to the right. On the 27th the French made a partial attack on the 4th division, near Sorauren, but were repulsed. On the 28th Soult directed a grand attack, first on the left, by the valley of the Lanz, and then on the centre of the British position. The 4th division (General Cole's) sustained nearly the whole brunt of the attack, and repulsed the enemy with the bayonet. In one instance the French succeeded in overpowering a Portuguese battalion on the right of General Ross's brigade, at the chapel of Sorauren, which obliged General Ross to withdraw, and the enemy established himself for a moment on the line of the Allies; but Lord Wellington directed the 27th and 48th regiments to charge, and the French were driven down the hill with great loss. On the 29th both armies remained inactive. Soult changed his plan, and on the 30th endeavoured to turn the British left by an attack on General Hill. He collected a large body on his right for this purpose, and by manœuvring on the left flank of Hill's corps, obliged him to withdraw from the height which he occupied behind Lizasso to another range about a mile in the rear, where, however, General Hill maintained himself against every effort that was made to dislodge him. At the same time Lord Wellington attacked the French corps in his front, in a strong position, between the valley of the Lanz and that of Arga, and obliged them to retire. On the morning of the 31st the French were in full retreat into France, by the various passes of the Pyrenees, followed by the Allies, who took many prisoners and much baggage. These various combats are designated by the name of the 'Battles of the Pyrenees.' On the 1st of August Lord Wellington took possession of the passes in the mountains.

During the month of August, General Graham was pressing the siege of San Sebastian. On the 31st of August the assault was made, and the town was carried, but with great loss, and after a most determined resistance. The French garrison retired to the castle. Many excesses were committed by the British and Portuguese soldiers after they had entered the town. Most of the houses were plundered, and it was not till the 2nd of September that order was restored by severe measures. The castle of San Sebastian capitulated after a few days. The siege and capture of the place cost the Allies nearly 4000 men, killed and wounded. Three British general officers were wounded, and Sir Richard Fletcher, the commanding officer of engineers, was killed.

In the month of October, Lord Wellington moved his left across the Bidasoa upon French ground, and took possession of the hills called La Rhune. The French made only a slight resistance, as Marshal Soult had already fixed upon the line of the river Nivelle in his rear for a position. On the 31st of October the French garrison of Pamplona, 4000 strong, having lost all hopes of relief, surrendered themselves prisoners of war. Early in November Lord Wellington made his preparations for marching his whole army into France, where they would find good cantonments for the winter. Before however taking this serious step he issued an order of the day to all his troops of the various nations that composed his army, in which he told "the officers and soldiers to remember that their nations were at war with France solely because the ruler of the French nation would not allow them to be at peace, and wanted to force them to submit to his yoke; and not to forget at the same time that the worst of the evils suffered by the enemy in his profligate invasion of Spain and Portugal had been occasioned by the irregularities of his soldiers and their cruelties towards the unfortunate and peaceful inhabitants of the country. To avenge this conduct on the peaceful inhabitants of France would be unmanly and unworthy of the allied nations." But Lord Wellington was not satisfied with mere proclamations and general orders; he enforced them strictly; and whenever he found any part of his troops attempting to plunder, he not only punished by military law those who were caught in the fact, but he placed the whole regiment or brigade under arms to prevent further offence. His greatest trouble was with the Spanish troops, who being badly supplied with provisions by their own government, and having the fresh recollection of the treatment which their countrymen in Spain had met with at the hands of the French, could only be restrained by the strongest measures from retaliating upon the French peasants. He was at last obliged to diminish his army by moving back most of the Spanish troops within the Spanish frontiers.

On the 10th of November the allied army left their cold and cheerless position in the high valleys of the Pyrenees, and descended into the plains on the French side. Soult had a strong position on the Nivelle from St. Jean de Luz to Ainhoe, about 12 miles in length. General Hill, with the British right, advanced from the valley of Baztan, and, attacking the French on the heights of Ainhoe, drove them towards Cambo on the Nive, while the centre of the Allies, consisting of English and Spanish troops under Marshal Beresford and General Alten, carried the works behind Sarre, and drove the French beyond the Nivelle, which the Allies crossed at St. Pè, in the rear of the enemy. Upon this the French hastily abandoned their ground and works on the left of the Nivelle, and in the night withdrew to their entrenched camp in front of Bayonne. Lord Wellington's head-quarters were established at St. Jean de Luz on the right bank of the Nivelle. The Allies went into cantonments between the sea and the river Nive, where their extreme right rested on Cambo. The enemy guarded the right bank of the Nive from Bayonne to St. Jean Pied de Port.

Lord Wellington, being straitened for room and supplies for his large army, determined to cross the Nive and occupy the country between that and the Adour. On the 9th of December General Hill forded the Nive above Cambo, while the 6th division crossed at Ustaritz, and the French were dislodged from their position at Ville Franque. In the night all their posts were withdrawn to Bayonne, and on the 10th the British right rested on the Adour. On that day Soult, resuming the offensive, issued out of Bayonne, and attacked the British left under Sir John Hope, which covered St. Jean de Luz, where the Allies had considerable depôts of stores. The French came on with great spirit, and twice succeeded in driving in the fifth division of the Allies, and twice were repulsed again, the first time by the 9th British and a Portuguese battalion, and the second time by the brigade of Guards. At last night put an end to the fight. Next morning, December 11, Soult, having withdrawn in the night most of his force from the position in front of the British left, prepared to attack the light division with overwhelming numbers. General Hope, suspecting this, had moved part of his troops to their right to support the light division. This occasioned another change in Soult's movements, who again directed several columns against the left at Baronilles. The troops were occupied in receiving their rations, and had barely time to run to their arms; but they withstood the attack, and at the close of the day both armies remained in their respective positions. Marshal Soult now giving up any further attempt on the left of the Allies, and imagining that his repeated attacks on that side must have induced Lord Wellington to weaken his right, changed his plan, and during the night of the 12th moved with his main force to his left to attack the British right. Lord Wellington however had foreseen this, and had given orders to the 4th and 6th divisions to support the right, and the third division was held in readiness for the same object. General Hill had under his immediate command above 13,000 men, and his position extended across from the Adour beyond Vieux Monguerre to Ville Franque and the Nive. Soult directed from Bayonne on the 13th a force of 30,000 men against his position. His columns of the centre gained some ground, but were fiercely repulsed. An attack on Hill's right was likewise successful at first, but was ultimately defeated. Soult at last drew back his troops towards his entrenched camp near Bayonne. General Hill had withstood all the efforts of the enemy without having any occasion for the assistance of the divisions which Lord Wellington had moved towards him. Lord Wellington was well pleased, and said, "Hill, the day is all your own."

Nothing of importance occurred during the few remaining days of the year 1813. Both armies remained in winter-quarters. On the 1st of January in this year (1813) Lord

Wellington had been gazetted as Colonel of the Royal Regiment of Horse Guards, in place of the Duke of Northumberland, who had resigned; and on the 4th of March he had been elected a Knight of the Garter.

Campaign of 1814.—The mighty contest which had been carried on for ten years between France and the rest of Europe was drawing fast to a close. The battle of Leipzig (October 1813) had given the death-blow to the ambition of Napoleon. He had lost another fine army which he had got together with great pains after the disasters of the Russian campaign of the previous year. The scanty remains of his host were driven out of Germany across the Rhine; that river which, according to his early declarations, constituted the natural frontier of France, but which he had not had self-command enough to respect. He was now reduced to the necessity of depending upon the resources of France alone. Lord Wellington had long foretold that, when that should come to be the case, the feelings of the French population would turn against him. Napoleon had hitherto supported his enormous armies chiefly at the expense of foreign states.

On his return to Paris, in November, 1813, Napoleon decreed by a senatus consultum a new levy of 300,000 conscripts. In December he ordered the assembling of 180,000 national guards to garrison the towns and fortresses. He talked however of peace, but he hesitated, and lost time in agreeing to the preliminary basis of a treaty such as was offered to him by the Allied Powers at Châtillon. He left his own envoy there without instructions or powers. He wished in short to try once more the chances of war. On the 25th of January 1814 he left Paris for Châlons to attack the Prussians and Russians.

Lord Wellington now made his preparations to drive the army of Soult from the country on the left of the Adour. About the middle of February, by a succession of movements and partial engagements, he drove the French first across the Bidasoa, and afterwards across the Gave d'Oléron, an affluent of the Adour. On the 27th of February he met Soult's army concentrated at Orthez on the Gave de Pau, attacked and beat it, and pursued it to the Adour, the French retiring eastward towards Auch. On the 1st of March Lord Wellington's head-quarters were at St. Sever, north of the Adour. The loss of the Allies at the battle of Orthez was 277 killed, and about 2000 wounded or missing. The loss of the French army was considerable during the battle, and still more during the retreat, owing to desertion having spread to a great extent, especially among the conscripts, who threw away their arms in vast numbers.

The battle of Orthez had important results. The garrison of Bayonne was now left to its fate, and the road to Bordeaux lay open to the Allies. Lord Wellington gave orders to General Hope for the siege of Bayonne, and detached Marshal Beresford with two divisions to occupy Bordeaux. On the arrival of the Allies at the latter city, the mayor and most of the inhabitants, of their own accord, proclaimed Louis XVIII.

Lord Wellington's business was purely military. In the Spanish peninsula it was to drive the invader out of the country, and leave the people to settle their own affairs. In France, from a similar principle, he was extremely anxious not to countenance a civil war. The Duke of Angoulême having landed in the south of France to excite a movement in favour of the Bourbons, Lord Wellington advised him politely to keep incognito, and to wait for some more imporant demonstration in his favour. When Beresford marched upon Bordeaux he directed him most particularly not to originate or encourage any rising of the Bourbon party. "If they should ask you for your consent to proclaim Louis XVIII., to hoist the white standard, &c., you will state that the British nation and their Allies wish well to Louis XVIII.; and as long as the public peace is preserved where our troops are stationed, we shall not interfere to prevent that party from doing what may be deemed most for its interest: nay, further, that I am prepared to assist any party that may show itself inclined to aid us in getting the better of Bonaparte. That the object of the Allies, however, in the war, and above all in entering France, is, as is stated in my proclamation, Peace: and that it is well known that the Allies are now engaged in negotiating a treaty of peace with Bonaparte: that, however I might be inclined to aid and support any set of people against Bonaparte while at war, I could give them no further aid when peace should be concluded; and I beg the inhabitants will weigh this matter well before they raise a standard against the government of Bonaparte, and involve themselves in hostilities. If however, notwithstanding this warning, the town should think proper to hoist the white standard, and should proclaim Louis XVIII., or adopt any other measure of that description, you will not oppose them; and you will arrange with the authorities the means of drawing, without loss of time, for all the arms, ammunition, &c., which are at Dax, which you will deliver to them. If the municipality should state that they will not proclaim Louis XVIII. without your orders, you will decline to give such orders, for the reasons above stated." ('Dispatches,' xi. p. 558 and 594.)

On the 18th of March Lord Wellington moved his army to Vic Bigorre, and Soult retired to Tarbes, which he abandoned on the 20th, and continued his retreat to Toulouse, where he arrived on the 24th. On the 27th the Allies arrived on the left of the Garonne, in front of Toulouse. The object of Soult was to facilitate a junction with Suchet, who was withdrawing his troops from Cataluña, in consequence of Ferdinand having been sent back to Spain, and acknowledged as King of Spain by Napoleon, who had resorted to this new political stratagem in order to create discord among the Allies. Knowing the character of Ferdinand, he had written to him on the 12th of November 1813, saying, "That the circumstances of the times made him wish to conclude at once the affairs of Spain, where England was fomenting anarchy and Jacobinism, and was depressing the nobility, in order to establish a republic. He (Napoleon) was much grieved to see the destruction of a nation bordering upon his empire, and whose maritime interests were closely connected with his own. He wished therefore to remove all pretence for the influence of England to interfere in the affairs of Spain, and to re-establish the relations of friendship and good neighbourhood between the two nations." (Thibaudeau, 'Histoire de l'Empire,' ch. 94.) A treaty was concluded at Valençay, where Ferdinand had been detained a prisoner for five years, in which Napoleon acknowledged him as King of Spain and of the Indies, and promised to withdraw the French troops from Spain, whilst Ferdinand engaged to cause the English to evacuate the Peninsula.

At last, in the month of March, Napoleon, being hard pressed for troops for the defence of France, and wishing to avail himself of the army of Suchet, which was uselessly cooped up in Cataluña, allowed Ferdinand to return to Spain. Meantime Suchet, who had already detached, early in March, 10,000 men to join Soult, made an offer to the Spanish Regency to withdraw all his garrisons from Cataluña, which were blockaded by Spanish troops, on condition of their being allowed to return to France with their arms. The Regency referred the proposal to Lord Wellington for his opinion, and he recommended them not to allow any capitulation with any French troops, except on the condition of their being prisoners of war. Suchet's garrisons amounted to about 18,000 men, mostly veteran soldiers, who, if they had been able to join Soult on the Garonne, would have made him too strong for Wellington, a part of whose army was stationed before Bayonne and another part at Bordeaux. Suchet, with his disposable force of about 14,000 men, evacuated Cataluña, and re-entered France. In the beginning of April he placed his head-quarters at Narbonne, but did not join Soult.

On the 10th of April Lord Wellington, having crossed the Garonne the day before, attacked Marshal Soult in his entrenched camp on a range of heights between the river Ers and the canal of Languedoc, on the eastern side of the city of Toulouse. Marshal Beresford, with the 4th and 6th divisions, attacked and carried the heights on the French right, and the redoubt which covered and protected that flank; the French however were still in possession of four redoubts and of the entrenchments and fortified houses, from which they could not be dislodged without artillery. At the same time the Spanish division of General Freyre had attacked the French left with great spirit, but were at first repulsed; one regiment, however, the Tiradores de Cantabria, maintained its position under the enemy's entrenchments. The British light division moving up, the whole rallied, and again advanced to the attack. Marshal Beresford, having brought up his artillery, which had been detained by the badness of the roads, continued his movement along the ridge on the right of the French, and General Pack's brigade of the 6th division carried the two principal redoubts and fortified houses in the centre of the French position.

Soult made a powerful attack on the 6th division, which received it with the bayonet, when the French general Taupin was killed. At last the French were driven entirely from the heights, and withdrew across the canal of Languedoc into the town of Toulouse, which Soult prepared to defend. The loss of the Allies at the battle of Toulouse was about 600 killed and 4000 wounded. The French acknowledged the loss of 3200 men.

On the night of the 11th Marshal Soult evacuated Toulouse by the only road which was still open to him, and retired by Castelnaudary to Carcassone. On the 12th Lord Wellington entered Toulouse, to the great joy of the inhabitants, who were relieved from the fearful apprehensions of a siege. The white flag was flying, everybody had put on white cockades, and the people had pulled down Napoleon's statue and the eagles and other emblems of the imperial government. The municipality of Toulouse presented an address to Lord Wellington, requesting him to receive the keys of their city, in the name of Louis XVIII. Lord Wellington told them what he had told the people of Bourdeaux, that he believed that negotiations for a peace were still being carried on with the existing government of France, and that they must judge for themselves whether they meant to declare in favour of the Bourbons, in which case it would be his duty to treat them as allies as long as the war lasted; but if peace should be made with Napoleon, he could not give them any assistance or protection afterwards. ('Dispatches,' xi., p. 630). In the afternoon however of the same day the English Colonel Cooke and the French Colonel St. Simon arrived from Paris, with news of Napoleon's first abdication, and of the establishment of a provisional government in the name of Louis XVIII. From Lord Wellington's head-quarters the two officers proceeded to those of Marshal Soult, who did not think himself justified in submitting to the provisional government, having received no information from Napoleon concerning what had happened, but he proposed an armistice to Lord Wellington. The British commander wrote to him a very polite letter, excusing himself from accepting the armistice, unless the marshal acknowledged the Provisional Government of France. The object of Lord Wellington was to prevent Marshals Soult and Suchet's armies becoming the nucleus of a civil war in France in favour of Napoleon's pretensions for his son. At the same time he made preparations to pursue Soult, if required. At last, on the 18th of April, Soult, having received from Berthier an order to stop all hostilities, concluded a convention with Lord Wellington for the purpose. A line of demarcation was drawn between the two armies. The head-quarters of Lord Wellington remained at Toulouse. Marshal Suchet concluded a like convention with Lord Wellington on the 19th, by which the final evacuation of Cataluña by the French garrisons was provided for.

Before the news of the events of Paris reached Bayonne, the French made a sortie out of the entrenched camp in front of it, on the 14th of April, and attacked the lines of the Allies, who lost about 800 men in this affair, including General Hay, who was killed, and the general in command, Sir John Hope, who was wounded and taken prisoner. General Stopford, of the Guards, was also wounded.

On the 30th of April Lord Wellington set off for Paris, whither he was sent for by Lord Castlereagh. He left General Hill in charge of the army. On the 13th of May he returned to Toulouse, and soon afterwards set off for Madrid, where the army had already taken different sides; O'Donnell and Elio for the king, and Freyre and the Prince of Anglona for the constitution. Having in some degree quieted the contending parties, and got the affairs of the kingdom into a condition for being amicably settled, Lord Wellington returned to France, and on the 11th of June was again with his army at Bordeaux, giving orders for the evacuation of France by the allied troops. On the 14th of June he issued his farewell general orders to the army. ('Dispatches,' xii., p. 62.)

In May 1814 he had been created Marquis of Douro and Duke of Wellington, and the Prince Regent had sent to the House of Commons a message recommending them to grant the Duke such an annuity as would support the high dignity of the title which had been conferred upon him. On the 12th of May an annuity of 10,000*l.* was granted to him, to be at any time commuted for the sum of 300,000*l.*, which was ultimately increased to 400,000*l.* On the 23rd of June the Duke of Wellington arrived in London, and on the 28th received in his place in the House of Peers the thanks of that House, and on the 1st of July he received likewise the thanks of the House of Commons, through the Speaker.

Peace of 1814.—After the establishment of peace by the treaty of Paris, May 30, 1814, the Duke of Wellington was sent in July as ambassador to the court of France. The Congress of Vienna assembled Nov. 1, 1814, and Lord Castlereagh having returned to England at the beginning of 1815, in order to resume his place in parliament, the Duke of Wellington was appointed to succeed him as the representative of Great Britain. In the month of January 1815 the Duke of Wellington repaired to Vienna to attend the general Congress of the European Powers. In the beginning of March, Napoleon, having escaped from Elba, landed at Cannes, on the French coast, and thence marched to Paris, without meeting any obstacle, Louis XVIII. having withdrawn to Ghent. On the 13th of March the ministers of the eight Powers assembled at Vienna, including the ministers of the King of France, signed a paper, by which they declared Bonaparte an outlaw, a violator of treaties, and a disturber of the peace of the world, and delivering him over to public justice. ('Dispatches,' xii., 269, 352.) At the same time they declared that they would maintain inviolate the treaty of Paris. On the 11th of April the Duke of Wellington was appointed to the command of the army to be assembled in the Netherlands.

Campaign of Waterloo, 1815.—In the middle of April the Duke of Wellington repaired to Brussels to prepare for the impending military contest. An English army was assembled in Flanders, including the Hanoverian Legion, and was joined by the troops of the King of the Netherlands, of the Duke of Brunswick, and of the Prince of Nassau. In all he had about 76,000 men under him, of whom 43,000 were British, or Hanoverians in British pay. Of these, deducting sick, detached, &c., there remained present in the field about 37,000 British and Hanoverians. The head-quarters were fixed at Brussels. Marshal Blücher, with the Prussian army, estimated at about 80,000 men, was on the left of the British; his head-quarters were at Namur.

During the month of May, Napoleon by great exertions collected an army of about 120,000 men, chiefly composed of veterans, on the frontiers of Flanders; and on the 11th of June he left Paris to take the command. On the 15th the French crossed the Sambre, and marched to Charleroi, the Prussian corps of General Ziethen retiring to Fleurus. Marshal Blücher concentrated his army upon Sombref, holding the villages of St. Amand and Ligny in front of his position. The Duke of Wellington marched his army upon Quatre Bras, on the road from Charleroi to Brussels. Napoleon attacked Blücher on the 16th, with superior numbers, carried the village of Ligny, and penetrated to the centre of the Prussian position; but the Prussians fought with great gallantry until night, when Blücher withdrew his army in good order to Wavre. In the mean time the Duke of Wellington, with part of his army, was attacked at Quatre Bras by the 1st and 2nd corps of the French army, commanded by Ney, and a corps of cavalry under Kellermann, which however made no impression upon the British position.

On the 17th the Duke of Wellington made a retrograde movement upon Waterloo, corresponding to that of Marshal Blücher. He took up a position in front of the village of Waterloo, across the high roads from Charleroi and Nivelles —his right thrown back to a ravine near Merke Braine, and his left extended to a height above the hamlet of Ter la Haye; and he occupied the house and gardens of Hougoumont, near the Nivelles road, in front of his right centre, and the farm of La Haye Sainte in front of his left centre. The French collected their army, with the exception of the 3rd corps, which had been sent to observe the Prussians, on a range of heights in front of the British position.

About ten o'clock on the morning of the 18th of June the French began a furious attack on the post of Hougoumont, which was occupied by a detachment of the Guards, who maintained their ground against all the efforts of the enemy throughout the day. There was no manœuvring on the part of Napoleon on that day. He made repeated attacks on the British position with heavy columns of infantry, supported by a numerous cavalry, and by a deadly fire from his numerous artillery. His attacks were repulsed with great loss on both sides. In one of these attacks the French carried the post of La Haye Sainte, which was occupied by a detachment of Hanoverians, who, having expended all their ammunition, were cut to pieces. Napoleon then ordered his cavalry to attack the British infantry, which formed in squares to receive them, but all the efforts of the French cavalry could make no impression on the British infantry, by whose steady fire they were brought down in great numbers. The French cavalry was nearly destroyed in these attacks, as well as by a charge from Lord E. Somerset's brigade of heavy cavalry, consisting of the Life Guards, the Royal Horse Guards, and the 1st Dragoon Guards, in which the French cuirassiers were completely cut up. At last, about 7 o'clock in the evening, when General Bulow's Prussian corps began to be engaged upon the French right, Napoleon moved forwards his guard, which he had kept in reserve, to make a last desperate effort on the British left centre near La Haye Sainte, of which the French had already possession. The French guard marched resolutely on in column, with supported arms, under a destructive fire from the British position. They halted at the distance of about fifty yards from the British line, and attempted to deploy, but they became mixed together, whilst uninterrupted discharges of musketry from the British infantry made fearful havoc in their dense mass. They were broken, and gave way down the slope of the hill in irretrievable confusion. On this the Duke of Wellington moved forward his whole line, which he led in person, sweeping away all before him. The French were forced from their position on the heights, and fled in confused masses, leaving all their artillery and baggage on the field of battle. Marshal Blücher now came up with two Prussian corps, and took charge of the pursuit, whilst the British troops rested on the field which they had won at such a fearful cost. The British and German Legion had on that day 2432 killed, 9528 wounded, and 1875 missing; many of the last however joined afterwards. In the preceding battle of Quatre Bras, on the 16th, they had 350 killed, and 2380 wounded, making altogether nearly 15,000 killed and wounded, in an army of about 37,000 British and Hanoverians, of whom however about 5000 were not present on the field of Waterloo, being posted near Braine le Comte, or stationed at Brussels, Antwerp, Ostend, and other places. (Official Returns, 'Dispatches,' xii., 485-87.) More than 600 officers were either killed or wounded at the battle of Waterloo. The gallant General Picton was killed while leading his division to a charge with bayonets. General Sir William Ponsonby, who commanded a brigade of heavy cavalry, was killed by a party of Polish lancers. Colonel de Lancey, quartermaster-general, was also killed. The Earl of Uxbridge, General Cooke, General Halkett, General Barnes, General Baron Alten, the Prince of Orange, and Lieutenant-Colonel Lord Fitzroy Somerset, were among the wounded. Lieutenant-Colonel the Hon. Sir Alexander Gordon died of his wounds soon after the battle. In the battle of Quatre Bras the Duke of Brunswick Oels was killed, fighting at the head of his corps. Such was the termination of the great continental war, which had lasted for twelve years from the rupture of the peace of Amiens in 1803.

After the last charge by his guard Napoleon rode off, in the dusk of the evening, from the field of Waterloo, and returned to Paris, which he was soon afterwards obliged to leave for Rochefort, being deserted by the nation at large. A provisional government was formed by the legislative chambers. The British and Prussian armies marched upon Paris, meeting with little or no resistance; and on the 3rd of July a convention was agreed upon between Marshal Davoust, who commanded the French army at Paris, on one side, and the Duke of Wellington and Marshal Blücher on the other, by which the French army withdrew from the capital, and retired beyond the Loire, and the allied armies occupied Paris. Soon afterwards Louis XVIII. was again restored to the throne of France, and peace was concluded between France and the Allied Powers.

After the return of the Duke of Wellington to England, the House of Commons voted a sum of 200,000*l.*, in addition to the sums previously granted to him; and with this sum the estate and mansion of Strathfieldsaye in Hampshire were purchased, to be held by the Duke of Wellington and his heirs on the condition of presenting a tri-coloured flag to the sovereign at Windsor Castle on the 18th of June every year. The King of the Netherlands conferred on him the title of Prince of Waterloo, and the King of France created him a Marshal of France and Duke of Brunoy.

Peace of 1815.—The battle of Waterloo was succeeded by a peace in Europe which has not since been materially interrupted, except by the short but terrible contest with Russia in 1854-55. To prevent any recurrence of those desolating wars which had just terminated, it was resolved by the Allied Powers that Napoleon should be detained in custody in the island of St. Helena, and that France should be controlled by an armed occupation. The Duke of Wellington was by unanimous choice appointed to the command in chief of the allied forces retained in France for this latter purpose; and it was chiefly owing to his mediation and influence with the allied sovereigns that no penalty of confiscation was enforced upon France, and that the armed occupation of the country was so soon terminated. In September 1818, the King of Prussia and the Emperors of Austria and Russia met at Aix-la-Chapelle, in order to hold a political conference, which was attended by the Duke of Wellington and Lord Castlereagh on the part of the British Crown. At this conference an agreement was concluded for the evacuation of France by the allied armies, and for the restoration of that kingdom to its independent dignity among the European governments. The allied armies began to evacuate France on the 1st of November 1818. A week previously the Emperors of Austria and Russia and the King of Prussia created the Duke of Wellington a Field-Marshal of their respective armies. He returned to England early in November.

When the allied armies were withdrawn from France the military life of the Duke of Wellington may be said to have terminated. He shortly afterwards commenced that life of political and administrative activity in which he attained an influence at home and a reputation abroad greater perhaps than that of any other public character of modern times. On the 1st of January, 1819, he was appointed to the office of Master-General of the Ordnance, and took his seat in the Cabinet as a member of the administration of Lord Liverpool. Though he did not at first take a prominent part in political affairs, he had to bear his share of the unpopularity which was the necessary result of the attempt of Lord Liverpool's government to put down disaffection. When Mr. Canning, on the death of Lord Londonderry in August 1822, succeeded to the office of Foreign Minister, he selected the Duke of Wellington to proceed to the Congress at Verona as the representative of Great Britain. On the 10th of March 1826, the Duke was appointed High Constable of the Tower of London, and in the same year was sent on a special mission to St. Petersburg, the object of which was to induce the Emperor Nicolas to join Great Britain and the other European Powers as mediators in the quarrel between Turkey and Greece. The mission was successful. On the death of the Duke of York, January 22, 1827, the Duke of Wellington succeeded to the office of Commander-in-Chief of the Forces. On the 17th of February following a stroke of apoplexy terminated the political life of the Earl of Liverpool, and early in April Mr. Canning succeeded him as First Lord of the Treasury. The Earl of Liverpool died on the 4th of December 1828.

On the accession of Mr. Canning to office as premier, April 10, 1827, the Duke of Wellington, who had no friendly feeling to him as a man, nor any liking for the popular principles of policy which he professed, sent in his resignation not only of his seat in the Cabinet, which was attached to his office of Master-General of the Ordnance, but also of his office of Commander-in-Chief of the Forces. The majority of the other members of the cabinet likewise resigned their offices. Mr. Canning died August 8, 1827, and was succeeded by Lord Goderich as premier. The Duke of Wellington then resumed his office of Commander-in-Chief of the Forces, but did not join the new ministry, which was of very short duration. Lord Goderich resigned, after holding the premiership till the end of the year.

On the 8th of January 1828, the king sent for the Duke of Wellington and offered him the premiership, which he accepted, though, only eight months previously, he had said in the House of Lords that he was "sensible of being unqualified for such a situation," and that he "should have been mad to think of it," words of which he was reminded at the time, as well as occasionally afterwards. He recalled Mr. Peel and Mr. Goulburn to the Cabinet, and retained five of those who had been favourable to the policy of Mr. Canning, namely Mr. Huskisson, Lord Dudley, Mr. Grant, Mr. Lamb, and Lord Palmerston. The Duke of Wellington now resigned the office of Commander-in-Chief of the Forces, and appointed Lord Hill as his successor. The parliamentary session of 1828 commenced January 29. On the 26th of February Lord John Russell brought forward in the Commons a motion for the repeal of the Test and Corporation Acts. The government opposed the measure, but the motion was carried in a full House of Commons by a majority of 44. Though the Duke did not approve of the policy of this measure, some of his colleagues did; and therefore to avoid a division in the cabinet and opposition to a declared resolution of the Commons, he yielded, took up the bill, and passed it through the House of Lords, in spite of the desperate resistance of Lord Eldon and the other Tories of his school. The Duke also gave his sanction to a corn-bill introduced by Mr. Huskisson. Later in the session however, when a motion was made to disfranchise the corrupt borough of East Retford, and invest Birmingham with the electoral rights which might thus be vacated, the government opposed the motion, but Mr. Huskisson voted for it. Mr. Huskisson was then Colonial Secretary, and feeling that he had placed himself in an awkward position, he wrote to the Duke to explain, and made some allusion as to his willingness to resign. The Duke, who had no liking for Mr. Huskisson's free-trade principles, immediately wrote to say that he had considered it his duty to lay the letter before the king, that is, to advise the king to accept the resignation. Mr. Huskisson, who had not intended to resign, wrote in explanation, but after several letters had passed between them, the Duke continued inflexible. It was related at the time, that when Lord Palmerston and Lord Dudley, as friends of Mr. Huskisson, waited on the Duke, and one of them observed that it was quite a mistake, the Duke replied emphatically, "It was no mistake, could be no mistake, and shall be no mistake." Mr. Huskisson therefore retired, and at the same time Lord Dudley, Lord Palmerston, and Mr. Grant, sent in their resignations, which were accepted. The Duke then called into office the Earl of Aberdeen, Sir Henry Hardinge, Sir George Murray, and Mr. Vesey Fitzgerald. Within a fortnight after the reconstruction of the cabinet, the question of Roman Catholic Emancipation was brought before both Houses. The motion for a committee to inquire into the claims of the Roman Catholics, which had been carried in the Commons, was lost in the Lords, but the Duke's speech on the question was decidedly conciliatory, though he opposed the motion. On the 20th of January, 1829, the king conferred on the Duke of Wellington the offices of Governor of Dover Castle and Lord Warden of the Cinque Ports, after which the Duke occasionally resided at Walmer Castle, the official residence of the Lord Warden, which is situated on the coast of Kent, near Dover.

Mr. O'Connell aided by the Catholic Association had produced, by the process of agitation, a degree of discontent in Ireland which threatened an insurrection of the most dangerous character. Under these circumstances, though the Duke of Wellington and Mr. Peel were both opposed to the granting of the claims of the Roman Catholics, they decided at once that it was better to renounce the principle of political and civil disabilities founded on differences of religious belief than to expose the country to the risk of a civil war in Ireland. There was a difficulty however with George IV. After repeated interviews and arguments he refused his sanction to the proposed measure, till the Duke and Mr. Peel tendered their resignations. He then yielded; and on the 5th of February 1829, when parliament assembled, the king's speech contained a recommendation to review the laws which impose civil disabilities on Roman Catholics, and to consider whether their removal could be effected without danger to the establishment in church and state. In the debates on the speech the Duke in the House of Lords and Mr. Peel in the House of Commons announced the forthcoming measure. On the 10th of March the Roman Catholic Relief Bill was read a first time in the House of Commons, and the division on the third reading, March 30, was, 320 for it, and 142 against it; in the House of Lords, the division on the third reading, April 10, was, 213 for it, and 104 against it. The Bill was then passed, and soon afterwards received the royal assent. The opposition of Lord Eldon, Lord Winchelsea, and other Tories, was violent; but the Duke had brought the whole power of government into action, and triumphantly carried the measure. Lord Winchelsea, writing to a gentleman connected with the new institution of King's College, among other observations on the Duke's motives, imputed to him an intention "to introduce Popery into every department of the state." The Duke demanded an apology for the expressions used, which not being given, a duel ensued between them on the 21st of March. Lord Winchelsea, after the Duke had fired and missed, discharged his pistol into the air, and then tendered the required apology, which settled the dispute.

The parliamentary session of 1830 commenced on the 4th of February. On the 23rd of February Lord John Russell moved for leave to bring in a bill to enable Manchester, Leeds, and Birmingham, to return members to parliament, which was negatived by 188 to 140. On the 28th of May a motion made by Mr. O'Connell for leave to bring in a bill for the radical reform of abuses in the state of the representation of the people in the House of Commons was negatived by 319 to 13; and a motion by Lord John Russell "that it is expedient to extend the basis of the representation of the people," was also negatived by 213 to 117. There was much distress throughout the country among the agricultural and manufacturing classes, and therefore much discontent; but the great body of the people, at that time, appeared to care little about the question of a reform of the House of Commons. A change, however, and that sudden and violent was about to take place.

George IV. died on the 26th of June 1830, and was succeeded by William IV., whose political opinions were believed to be more liberal than those of the deceased king, and whose disposition was known to be more affable and conciliatory. The British parliament was dissolved by proclamation July 24th, and a new one summoned. Almost immediately afterwards an important revolution took place at Paris. Charles X. was driven from his throne, and abdicated; Louis-Philippe was chosen as his successor, with the title of King of the French. The excitement of that revolution extended over the British islands as well as over the continent of Europe. In Great Britain and Ireland the people, preparing for the election of new members of parliament, were everywhere seized with an ardent desire for more liberal institutions, and, as a preliminary step, for changes and reforms of the constituencies which elected the members of the House of Commons.

The new parliament assembled on the 26th of October 1830, and the king's speech was delivered by William IV. on the 2nd of November. During the debate which followed Earl Grey, in the House of Lords, urged the necessity of an immediate reform of the House of Commons; and the Duke of Wellington, in reply, affirmed that "the country already possessed a legislature which answered all the good purposes of legislation, and that the system of representation possessed the full and entire confidence of the country," and declared that he was "not only not prepared to bring forward any measure of reform," but would "resist any such measure as long as he held any station in the government of the country." Public meetings were immediately called throughout the country, which were attended by vast numbers. The Duke had already given offence by his measures against the press and his declaration against reform now roused the people to a state of excitement little short of fury. On the 15th of November the government were in a minority in the House of Commons, and on the 16th the Wellington ministry ceased to exist, and was succeeded by that of Earl Grey. On the 22nd of April 1831 the king dissolved the parliament, in order to ascertain the sense of the people respecting the proposed alteration in the representation of the House of Commons. The new parliament met on the 14th of June, and the Reform Acts for England, Scotland, and Ireland were passed June 7, July 17, and August 7, 1832. The Duke of Wellington opposed the Reform Bills steadily, and spoke frequently in opposition. Hence he became excessively unpopular, and the bitterness of the feeling—at least of the lower orders—may be inferred from the fact, that when he returned from a visit to the Tower, June 18, 1832, he was hooted and roughly treated by the mob, and would scarcely have reached his residence (Apsley House) in safety, if some gentlemen and soldiers had not placed themselves around his horse, and escorted him. The windows of Apsley House were also broken, and he afterwards protected them by iron casings.

The office of Chancellor of the University of Oxford became vacant by the death of Lord Grenville, January 1?, 1834, and on the 29th of the same month the Duke of Wellington was unanimously elected to succeed him. The ceremony of installation took place on the 9th of June following, and was attended by a vast concourse of persons.

On the 8th of December 1834 Sir Robert Peel was gazetted as First Lord of the Treasury, and the Duke of Wellington as Secretary of State for Foreign Affairs. This first Peel ministry terminated on the 8th of April 1835. Lord Melbourne, who had succeeded Earl Grey as premier, again resumed that office. William IV. having died on the 20th of June 1837, was succeeded by Queen Victoria, and Lord

Melbourne retained the office of premier till August 30, 1841, when he resigned, and Sir Robert Peel again became prime minister. The Duke of Wellington accepted a seat in the Cabinet, but without taking office. After the death of Lord Hill, December 10, 1842, the Duke of Wellington succeeded him as Commander-in-Chief of the Forces, and continued uninterruptedly to perform the duties of that office till the termination of his life. The Duke's last political difficulty occurred in 1846, when the repeal of the Corn-Laws had become a necessity. Sir Robert Peel saw the necessity: he knew that there would be a large majority in the Commons, but success in the Lords depended on the influence of the Duke, who refused to support the measure, and Sir Robert Peel resigned office. The Queen then sent for Lord John Russell, but he was unable to form a ministry, and Sir Robert Peel was recalled. The Duke then saw the necessity of the repeal. He put aside his own opinion, stood by his friend Sir Robert, told the Lords distinctly that they must yield to the Queen and the Commons, and by his influence and his proxies passed the measure through the House of Lords, May 28, 1846, by a majority of 47.

The Duke of Wellington died Sept. 14, 1852, at Walmer Castle, aged 83, seeming as if he had fallen asleep in his chair, after a slight illness in the morning. He was buried in St. Paul's Cathedral, London, under the dome, and beside the remains of Lord Nelson. The funeral was public, and similar to that of Nelson, which had taken place Jan. 9, 1806; and during the procession to the cathedral, Nov. 9, the deep sympathy of all classes of the people for the loss of the greatest of Britain's military commanders was as strongly manifested as it had been at the funeral of her greatest naval hero. He was succeeded in his title and estates as Duke of Wellington by his eldest son Arthur, Marquis of Douro, who was born in 1807. The Duchess of Wellington died in 1831.

The leading characteristic of the Duke of Wellington's mind seems to have been sound good sense, based on patient examination into details, and a careful study of the whole in order to arrive at a right conclusion. He made allowance for contingencies, passions, interests, estimated things at their real value, and was rarely wrong. His great principle of action seems to have been a sense of duty rather than the stimulus of glory or ambition. His manner was in general singularly calm. He never seemed to be elated by success, nor depressed by discouragements or difficulties. Quickness of decision and energy of execution marked his character during the whole of his life. He was not inflexible however in carrying out his plans as a commander or his views as a statesman; but altered his course when new information or a change of circumstances offered a sufficient reason for a change of determination. He was regular in his attendance in the House of Lords, and spoke frequently. His influence over the members of that House was such as probably has never been possessed by any other individual. As a public speaker, his delivery, without being fluent or rapid, was emphatic and vehement. In private life he was simple and methodical. He was temperate in the use of food and wine, slept on a hair-mattress on a simple camp-bedstead, was an early riser, and was indefatigable in his attention to business. He seldom made use of a carriage, and continued to ride on horseback when from the infirmities of age he could no longer sit erect, and he also used the exercise of walking even to the last, though his steps were slow and faltering.

WERGELAND, HENRIK ARNOLD, a very distinguished Norwegian poet and political writer, was born on the 17th of June 1808 at Christiansand, where his father, Nikolai Wergeland, a clergyman, was one of the assistant masters at the Latin school. The father, who was much respected, and who survived the son, was one of the deputies who, when in 1814 Norway was severed by the allied powers from Denmark and united to Sweden, met and framed the constitution of Eidsvold, the acceptance of which by Sweden laid the foundation of a new and much more prosperous and glorious period in the annals of Norway. He was afterwards appointed priest of the parish of Eidsvold, the place from which the constitution takes its name, which is at the distance of about 40 English miles from Christiania; and it was there and at Christiania, first at the cathedral school and afterwards at the university, that his son received his education. It was in 1825 that Henrik Wergeland commenced his literary career under the assumed name of Siful Sifadda, by a farce or dramatic satire entitled 'Ah.' It was afterwards followed by twelve other farces of a similar kind, some in verse and some in prose, and mostly of an Aristophanic vein, with a political bearing and a seasoning of personalities. It was not surprising that these productions should arouse the animosity of the parties to whom they referred, and for the ten years from 1827 to 1837 Wergeland's life was passed in what is familiarly called 'hot water.' His contributions to the Norwegian newspapers, some of which he occasionally edited, were very frequent; and his poems, many of which were on political subjects, were hardly less numerous. His admirers were at this time fond of calling him 'the Byron of Norway;' but Dr. R. G. Latham, who knew him personally, and in his 'Norway and the Norwegians' gives an interesting account of a visit to the parsonage of Eidsvold, observes that his productions rather reminded him of those of Elliott, the Corn-Law Rhymer, and that he might be called an 'Elliott Ossian.' His political feelings were intensely and exclusively Norwegian, and so narrow as to be antagonistical even to the other members of the Scandinavian family, the Danes and Swedes. For some time he drew the whole youth of Norway with him, but in 1832 the appearance of an attack upon him by Welhaven, another rising poet and critic—'Henrik Wergelands Digtekunst og Polemik' (Henry Wergeland's Poetry and Polemics)—began to turn the current, though Wergeland's father wrote vigorously in his defence, and at present it may be considered that the public opinion of Norway is in favour of the united action of the three Scandinavian countries. It was regarded however as a great triumph of Wergeland's views that, in 1837, Sweden conceded the point of allowing a separate national flag to Norway. In the following year King Charles John (Bernadotte) paid a visit to Christiania, and Wergeland wrote a complimentary poem on the occasion, which was said to have been received by the sovereign with peculiar gratification. The Norwegian public was surprised to hear afterwards that the king had manifested his feelings by conferring on Wergeland, hitherto regarded as the chief 'radical' of Norway, an annual pension from his own privy purse, and a storm of indignation burst on the head of the poet. His position up to that time had been a somewhat precarious one. So far back as 1834 he had given up the clerical profession, after passing in 1829 his examination as candidate in theology, and officiating for some time as curate to his father. A poem which he had published, under the title of 'Creation, Man, and the Messiah,' which he regarded as his best work, and which many even of his admirers declared themselves unable either to admire or comprehend, contained views and opinions which were not considered compatible with the position of a minister of the church; and the general freedom of his life and opinions was also against him. On quitting theology he studied medicine; in 1836 he was appointed keeper of the university library, and in 1840 keeper of the Norwegian archives. Giving up political writing after his pension, he devoted himself to poetry; and though his productions at this time did not meet with the enthusiastic reception their predecessors had enjoyed, it is now acknowledged that they are the best of his whole career. In 1840 he married, and was enthusiastically attached to his wife. But his constitution, originally athletic and corresponding with his stature of six feet three, was irrecoverably shattered by an immoderate indulgence in brandy, and he died on the 12th of August 1845, at the age of thirty-seven.

A collected edition of the principal works of Wergeland was commenced in 1851 by the Student's Society of Christiania, under the editorship of H. Lassen. The last volume we have seen of it is the eighth, published in 1856, and it was to be completed in nine. The editor, who had the task of collecting many of these writings from magazines, reviews, and newspapers, has also had that of adding notes, which on some occasions were necessary to render them intelligible to those not intimately acquainted with the passing history of Norway at the time during which they appeared. Three volumes of the eight are occupied with poetry, among which 'Jan Van Huysum's Flower-Piece' and 'The Spaniards' are considered by far the best. One volume is filled with the farces: two others with dramatic poems. An early tragedy, entitled 'Sinclair's Death,' is founded on a well-known incident in the annals of Norway, the destruction of a body of Scottish mercenaries in Swedish pay by a treacherous attack of the Norwegian peasantry. An opera entitled 'The Campbells,' and two tragedies, 'The Child-Murderess' and

'The Venetians,' are of particular merit. 'Creation, Man, and the Messiah,' is given in a revised and corrected shape, as left by the author. Of Wergeland's prose writings the most interesting are a volume of short biographies of distinguished Norwegians, and a history of the formation of the constitution of Eidsvold.

WERNERITE. [SCAPOLITE.]

WESTALL, WILLIAM, A.R.A., younger brother of Richard Westall, was born at Hertford, October 12, 1781. He studied at first under his brother, and subsequently at the Royal Academy. Here however his studies were interrupted, by his appointment, in 1801, on the recommendation of the President, West, to accompany Captain Flinders in the Investigator as a draughtsman on his voyage of discovery. Westall was with Flinders for two years, when, the Investigator having been abandoned, he was transferred to the companion ship, the Porpoise, in which he was wrecked on a coral reef on the north coast of Australia on his voyage home. The ship which picked up Westall and his companions was bound to China, and he remained some months in that country, when he secured a passage to India. Here he also remained some time, making a journey into the interior and occupying himself, as elsewhere, in sketching the more striking scenery and objects. Not finding, on his return to England, employment as readily as he anticipated, he made a voyage to Madeira and the West India Islands; and on his return opened, in 1808, an exhibition of the large collection of water-colour drawings and sketches he had made of the various countries he had visited: it proved however an unsuccessful speculation. Captain Flinders returned to England in 1810, and Westall was directed by the government to prepare his sketches for engraving to illustrate the account of the voyage; he was also commissioned to paint several views of the coasts and interior of Australia. Of these he exhibited at the Royal Academy, in 1812, his views of 'Port Bowen,' and 'Seaforth's Isle in the Gulf of Carpentaria;' and the striking character of the scenery, and the rich and novel herbage, which he had depicted with the fidelity of a botanist, rendered them very attractive. They secured his election as Associate of the Royal Academy in the same year: he had for some time previously been a member of the Society of Painters in Water-Colours. Unfortunately perhaps for his reputation, he did not steadily follow up the path he had thus opened. He turned his attention to making drawings for engraving, in which he for many years found ample and profitable employment, but he thus contracted a neatness and prettiness of style which proved destructive of all grandeur of effect when applied in his paintings. Among his best known series of engraved designs are his views of the lakes of Westmoreland and Cumberland, which are drawn with great fidelity, though with some deficiency of power: he was a frequent visitor to this district, where he enjoyed the warm friendship of Southey and Wordsworth, by both of whom he was greatly esteemed. He also drew and engraved in aquatint a series of views of the Caves, and of the Abbeys and other Monastic Ruins of Yorkshire, of the Isle of Wight, Oxford, Cambridge, the Residences of the Poets, &c. His contributions of oil paintings to the exhibitions of the Royal Academy were comparatively few, and in his later years they became fewer than they might else have been, from finding himself in reality excluded from the full honours of that institution. Mr. Westall met with a severe accident, in 1847, by which his left arm was broken, and he received some internal injuries, from the effects of which he never wholly recovered. He died January 22, 1850.

WESTERN AUSTRALIA, in its widest sense, extends over the western portion of the Australian continent, and comprehends all the countries lying west of 132° E. long., the boundary west of South Australia and North Australia; so that the boundary-line between it and the other parts of the continent joins the Indian Ocean east of Cambridge Gulf, and the Southern Sea near the Australian Bight, at Cape Adieu. Thus Western Australia contains about one-fourth of the whole continent, and lies between 35° and 14° S. lat., 115° and 132° E. long. The limits of the British colony, originally established under the name of the Swan River Settlement, are much less, but the boundary has not been definitely settled, and is constantly being extended. It may be said to lie between 30° and 35 8′ S. lat., 115° and 119° E. long., or about 400 miles from south to north, and about 250 miles in breadth.

Coast.—The coast-line presents a much greater variety than most other parts of Australia. In some parts the sea to some distance from the shore is covered with numerous islands, islets, and rocks, which render these countries difficult of access. From this cause an extent of coast-line, about 500 miles in length, has not been surveyed. Tasman Land, between Point Gantheaume and Cambridge Bay, to the northward, has a coast more broken than any other part of Australia, and indented with wide bays, and some narrow inlets, which penetrate a considerable distance into the interior. The coast of Tasman Land has been but slightly examined, so that our information in respect of the natural products of the country is very limited. Within the confines of the colony there are numerous æstuaries, each of which receives several rivers. Of the few good harbours along this coast the best are Rockingham in Cockburn Sound, Albany in King George's Sound, Bunbury in Port Leschenhault, and Augusta, near Cape Leeuwin, on the southern side of the south-western promontory of the island. At the mouth of the Swan River, and at the head of the Melville Water, which runs inland for nearly 80 miles, is the port of Perth, the capital of the colony of Western Australia. The entrance is encumbered and rendered dangerous by several rocks. A lighthouse is placed on Rottenest Island at the entrance, and on some of the more dangerous rocks there are beacons.

Mountains, &c.—A range called the Darling Mountains extends along nearly the whole length of the colony. Its distance from the coast varies from 50 to 150 miles, and its height is from 800 to 3000 feet. It is generally sterile; the granite appears in some places in masses. A profusion of coarse herbage appears on the surface, and plants which resemble the English heath grow in considerable numbers. There are forests of large mahogany and blue gum-trees. In the Darling Mountains have been found roofing-slate, limestone, marl, selenite, siliceous and calcareous petrifactions, magnetic iron-ore, chromate of lead, galena, and copper. Wide valleys bordered by fertile plains occur where basaltic rocks are developed. Columnar basalt is found around Geographe bay, and from thence to Shark Bay a band of coal has been traced a distance of 600 miles.

In that part of Western Australia which borders on the south coast, there are three distinct parallel ranges of mountains running from north to south. The highest and most eastern of these has its southern termination near to King George's Sound, in 35° 6′ S. lat. The second terminates at Cape Chatham, 35° S. lat.; Cape Leeuwin, in about 34° 20′ S. lat., is the southern termination of the third range, which is inferior in altitude, as well as in extent, to the other two: it terminates on the north at Cape Naturaliste, 33° 27′ S. lat. The highest point is Tulbanop, which is stated to attain an elevation of 5000 feet. On the mountains and higher hills the surface is rugged and stony; on the lower sides of both the soil is excellent; but in the principal valleys and the lower grounds, where the sandstone formation prevails, it is of a very inferior description, except where the rivers have brought down an alluvial deposit.

Rivers.—The rivers on the west coast of Australia generally rise at no great distance from the sea. Near their sources they are mountain torrents, but in the lowlands they become slow streams. They are liable to rise suddenly, owing, it is supposed, to the rain which falls near their sources. At other times their channel, in some places many feet deep, is quite dry. They offer little or no facility for internal navigation. The Swan River rises on the western side of the Darling Range. At its mouth is a bar, after passing which the river is navigable, though with difficulty, for some distance. The other rivers are the Avon, the Murray, the Canning, the Harvey, the Preston, the Collie, the Vasse, the Blackwood, the Donnelly, and the Kalgan. The Canning rises in the Darling Range: it is smaller than the Swan, and only navigable for a few miles. Shoals impede the navigation, and in dry weather boats must be pushed over them for fully half a mile. The Murray takes its rise also in the Darling Range, and empties itself into Peel's inlet. The Preston and the Collie unite about 50 miles south of the Murray, and the united stream runs into an æstuary called Leschenhault, and forms a bar, over which the river is very shallow.

For the botany and zoology of Western Australia, see AUSTRALIA.

Climate.—The climate of Western Australia has the same general character as that of Eastern Australia. [AUSTRALIA.] It has not generally been found prejudicial to Europeans, while in the case of some persons it has proved highly favourable. Though variable, the western part of this colony is not so uncertain as New South Wales in the supply of rain and moisture. The average winter temperature is about 58°, that of the summer about 76°.

The wet season begins generally in March and ends in November, the rain being most abundant in August and September. The height of the dry season is during the harvest, in January, when the nights are distinguished by heavy dews. The seed-time lasts from early in May to the end of August. By December the grain is ripe: hay is cut in November. Tomatas, pumpkins, gourds, vegetable-marrow, chillies, egg-plants, besides every English vegetable, ripen in the open air; and also the following among other fruits—melons, bananas, almonds, figs, grapes, peaches, and strawberries. The olive, pomegranate, apricot, plum, mango, lemon, and orange; the mulberry, apple, nectarine, pear, and several others are grown. Fig-cuttings produce fruit the first year, and vines the second or third.

Population.—The aborigines do not amount to more than 1700. The European population here increases very slowly. In 1852 it amounted to 8711, including 705 enumerated among the military, 1432 bond, and 6574 free. According to an official return, Dec. 31, 1855, the European population was 12,818, of whom 8536 were males, and 4282 females. This number included 1470 ticket-of-leave holders, 1310 conditional-pardon-holders, 140 military and their families, and 705 prisoners. Schools are provided at the government expense for children of all religious denominations, as well as for natives, those who are able paying a small sum; and there are other schools in connection with the Wesleyan Methodists. There are about 70 churches and chapels in the colony, of which 20 belong to the Church of England, 4 to Presbyterians, and 3 to Roman Catholics.

Government.—There is a lieutenant-governor, with his staff of officials. The colony is divided for government purposes into 32 counties. On the first establishment of the colony in 1829, it was decided that no convicts should be sent thither, and a system of colonisation was projected, to be carried forward by means of land-sales, but it did not work well. The labourers sent out became landowners, and hired labour became excessively dear. Convict labour has since been requested by the colonists, and has succeeded well; but it prevents free emigration to a considerable extent, for as the pursuits of the colonists are chiefly agricultural, the demand for free labour is not large nor constant. The assisted emigration in 1855 was only 93, and the land-sales in 1856 only amounted to 1779 acres. The public works had been executed under the superintendence of the Royal Sappers and Miners, and consisted of the permanent prison at Fremantle; commissariat stores and offices at Fremantle, Guildford, York, Toodyay, and Bunbury; jails at York, Toodyay, and Bunbury; 272 miles of road made; 28 bridges built, one of which, over the Swan at Guildford, is 480 feet long, and others of considerable size; a jetty 216 feet long, built at Fremantle as a landing from the river, and another 455 feet long, as a landing from the harbour; the lakes at the back of Perth drained, and the swamps in Fremantle filled up; with some minor works. The conduct of the convicts had on the whole been good, and considerable improvement had been developed in their characters.

Commerce.—Though most of the English grains are grown, and the soil is tolerably productive, the exertions of the settlers are chiefly directed to the raising of stock. Wool is one of the chief articles of export; horses, which are sold to supply the cavalry at Madras, are another large article of export; as is sandal-wood, and a species of mahogany, of which there are large forests in the interior. Guano has been found on the islets that lie round Shark's Bay. Attempts have been made to prosecute the whale fishery; and something is done in fishing off the coasts to furnish provisions for the inhabitants. There are many salt-lakes and springs, and a considerable quantity of salt is manufactured.

Towns.—*Perth*, the capital, is situated on the right side of the estuary of the Swan River, near its junction with the Canning. The population is small. The town is however improving, but the houses are scattered over a large area. A bridge has been built across the Canning, another over the Swan, and there is a new jail. *Fremantle* is on the opposite side of the Swan River æstuary, a few miles lower down. It is the seat of the convict establishment, and there is a jail. A lighthouse has been erected upon Arthur's Head, a promontory in front of the town. There are two jetties, one from the river and another from the harbour. *Albany* is a port-town in the south-eastern part of the colony, in King George's Sound. It has a jail, and some trade in timber. *Augusta* is a small port on the eastern side of Cape Leenwin, on the æstuary of the Blackwood River. *Bunbury* is the port town of a district formerly called Australind, of which a small village still retains the name. The harbour of Port Leschenhault, upon which it stands, is a good and large one, but it has little commerce. *Geraldton* is an inland town on the Murchison River, founded in consequence of the commencement of the working of lead-mines there by a company. *Guildford* is a small inland town, a few miles east of Perth. *Northam* is a small inland town, in an agricultural district, east of the Darling Range, on the river Mortlock, and is about 60 miles in a direct line E.N.E. from Perth. *Rockingham* is on Cockburn Sound, and has a good port, and some trade. *Toodyay* is an inland town, about 20 miles N.W. from Northam, and about 50 miles N.E. from Perth, upon the river Toodyay, which pierces the Darling Range, and falls into the Melville Water, but is not navigable. *Vasse* is a small port on Vasse Inlet, in the centre of Geographe Bay, about 20 miles S.S.W. from Bunbury, about 50 miles S. from Vasse, across a fine country, forming the promontory bounded by Cape Leeuwin and Cape Naturaliste. Other small towns of little importance are named York, Picton, Clarence, and Waterloo.

WESTMACOTT, SIR RICHARD, R.A., was born in London in 1775. His father was a sculptor of some eminence in his day, and in his studio (Mount-street, Grosvenor-square), the young Westmacott learned the use of the chisel. In 1793 he went to Rome, where he had the benefit of instruction from Canova. His career as a student in Italy was a distinguished one. He carried off the first prize in sculpture at the Academy of Florence, in 1794; and in 1795 the medal given by the pope. He was elected a member of the Academy of Florence in 1795. After a somewhat prolonged stay in Italy, he returned to London, and was soon recognised as one of the best of the young sculptors of the day; and his future career was on the whole a very prosperous one. His imaginative works were of an exceedingly graceful, chaste, and poetic character, classic in feeling, and in execution resembling that of the modern Italian school; several of these will retain their place among the best poetic works of the English school of sculpture. The most popular is his very pleasing statue of 'Psyche,' executed for the Duke of Bedford, and now, with a companion 'Cupid,' at Woburn. Among the best known of his other poetic works are the 'Euphrosyne,' executed for the Duke of Newcastle; an exquisite figure of 'A Nymph unclasping her Zone,' the property of the Earl of Carlisle; 'The Distressed Mother,' executed for the Marquis of Lansdowne; 'The Homeless Wanderer;' 'Devotion,' &c. He also executed several important works in alto and bas-relief; one of the first of which was probably his portion of the frieze on the Marble Arch (now at Cumberland Gate), the sculptors of other portions being Flaxman and Baily. His latest work in this style was the pediment of the British Museum. He also executed for the late Earl of Egremont, a large alto-relievo in marble of the 'Death of Horace' for the gallery at Petworth. A large portion of his time was however occupied, and much of his reputation now rests, on public monumental statues. Of these it will suffice to mention his statues of Pitt, Fox, Spencer Perceval, and Addison (1809), which, with his monuments of the Duc de Montpensier, and Mrs. Warren, and her Child, are in Westminster Abbey; Sir Ralph Abercromby, Lord Collingwood, and Generals Pakenham and Gibbs, in St. Paul's Cathedral; Lord Erskine in the Old Hall of Lincoln's Inn; Fox in Bloomsbury-square; Francis, Duke of Bedford, in Russell-square; and the Duke of York on the column at Waterloo-place. The so-called 'Achilles,' copied from the statue at Monte Cavallo, Rome, and inscribed by the Women of England to the Duke of Wellington, was modelled by Westmacott, but whether the choice of the figure is to be laid to the charge of his taste, or that of the women of England, we do not know.

Westmacott was elected A.R.A. in 1805, and R.A. in 1816. In 1827 he succeeded Flaxman as Professor of Sculpture at the Royal Academy, which office he held till his death. He was a man of extensive reading and sound judgment, and his lectures were marked by these qualities, and by the absence of pretension. Shortly after her accession to the throne, her Majesty conferred on him the honour of knighthood. He died on the 1st of September, 1856.

WHALEBONE. [WHALES.]

WHEATON, HENRY, an eminent American diplomatist and writer on international law, was horn at Providence, Rhode Island, U.S., in November 1785. Having completed his education at Brown University in his native city, he graduated there in 1802; studied law under Mr. N. Serle, and was admitted to the bar. He then passed a couple of years in Paris and London, during which he acquired considerable acquaintance with civil law, and rendered himself a complete master of the French language. On his return to America he settled in New York; commenced practice in his profession, and in 1812 became editor of the 'National Advocate,' which journal he continued to conduct for about three years with merited success. He contributed to it, among other things, a series of disquisitions on the law of nations. In 1815 he was appointed one of the justices of the Marine Court, and the same year he published a 'Digest of the Law of Marine Captures and Prizes,' which was received by the profession with much favour. He was about this time appointed reporter to the Supreme Court of the United States, an office he held for twelve years; his 'Reports of Cases Argued and Determined in the Supreme Court of the United States,' in 12 vols., are considered to be of great value. He had besides written a life of William Pinckney; contributed numerous articles to the 'North American Review;' published several orations and addresses; and edited several English and other law books. Mr. Wheaton had by this time taken high rank as a civilian. The degree of LL.D. was conferred upon him by Harvard University in 1819, and by Brown University in 1820. He was called upon to lecture upon the subject of international Law, before the New York Historical Society, the New York Athenæum, and other learned societies. He was appointed in 1821 a member of the convention for revising the constitution of New York; and in 1825, a commissioner for revising the laws of that state. He resigned his offices, however, in 1827, on being appointed by President J. Q. Adams as first chargé d'affaires to the court of Denmark. This important post he held until 1834, when he was transferred to the court of Prussia. During his residence in Denmark Mr. Wheaton greatly increased his reputation as a publicist by his conduct on several matters of considerable importance, and by his despatches, in which various questions of international law and policy were discussed. But he also found time to devote to the study of Scandinavian history and literature, the result of which he published in London in 1831, under the title of 'The History of the Northmen, or Danes and Normans, from the Earliest Times, to the Conquest of England by William of Normandy;' this work he afterwards revised, and greatly extended for a French version by M. P. Guillot. He also, in conjunction with Mr. Crichton, wrote a history and description of Norway, Sweden, and Denmark, under the title of 'Scandinavia.'

On the accession of Mr. Van Buren to the Presidency (1837) Mr. Wheaton was raised to the rank of minister plenipotentiary to the King of Prussia; and during his nine years' tenure of this high office, he was regarded as at the head of the American diplomatists in Europe, and his advice was almost invariably sought by other American ministers in all matters of difficulty, whilst his attainments as a publicist, and his personal character and bearing, gave him great weight, and won for him high esteem and respect with the courts and cabinets of the continent. He was recalled by President Polk in July 1846.

Mr. Wheaton's chief literary production, 'The Elements of International Law,' was published in 1836, and at once took its place as a standard work on the important subject of which it treats, and of which it affords a complete survey. This work he followed up by a history of International Law, which he wrote in French in consequence of the Academy of Moral and Political Sciences of the Institute of France offering a prize for a treatise on the subject; it was published at Leipzig in 1841, under the title of 'Histoire du Progrès du Droit des Gens en Europe depuis la Paix de Westphalie jusqu'au Congrès de Vienne, avec un précis historique du Droit des Gens Européen avant la Paix de Westphalie.' The author afterwards remodelled the work, and published it in English in one thick volume (New York, 1845), under the title of 'History of the Law of Nations in Europe and America from the Earliest Times to the Treaty of Washington.' Notwithstanding his advancing years Mr. Wheaton continued after his return to America to pursue his usual studies. He had even accepted the offer of the chair of International Law in Harvard University, and was preparing to enter upon its duties, when he was suddenly cut off on the 11th of March 1848. Since his death there has been published a fourth edition of the 'Elements of International Law. By the late Hon. Henry Wheaton, LL.D. Revised, annotated, and brought down to the present time, with a Biographical Notice of Mr. Wheaton, and an account of the Diplomatic Transactions in which he was concerned. By Hon. William Beach Lawrence, formerly Chargé d'Affaires at London.'

WHEEL-ANIMALCULES. [ROTIFERA, *S.* 2.]

WHELK (*Buccinum*). [ENTOMOSTOMATA.]

WICHTINE. [MINERALOGY, *S.* 1.]

WIDIN, a fortified town in Turkey, capital of Upper Bulgaria, is situated on the right bank of the Danube, opposite the straggling village of Calafat on the left bank, about 130 miles E.S.E. from Belgrade, and has a population of about 25,000. The fortifications, which were previously decayed and weak, were repaired and greatly strengthened by the Turks in 1853-54. The town contains pretty wide streets for a Turkish town; many mosques surmounted with graceful minarets; small bazaars, &c. It is the residence of a Greek bishop, and of the pasha of the province of Widin. The trade of the town is in rock-salt, corn, wine, and agricultural produce. The Austrian Danube steamers put into Widin. The inhabitants of Widin consist of Turks, Greeks, and Armenians: the Christians inhabit suburbs outside the line of the fortifications.

WIFE AND HUSBAND. The chief alterations in the laws affecting the relation of husband and wife have been already stated, but may be shortly summed up in this place. A wife when deserted by her husband may obtain an order to protect her earnings from him or his creditors, and she will then be able to contract as if she were a *feme sole* (20 & 21 Vict. c. 85, s. 21). When the desertion of the husband extends over a period of two years, or when he treats her with cruelty, or commits adultery, the wife may obtain a judicial separation. [SEPARATION, *S.* 2.] When the husband commits incestuous adultery, or to adultery adds the crimes of bigamy or rape, cruelty or desertion for two years, or is guilty besides the adultery of an unnatural offence, the wife may obtain a dissolution of the marriage. [DIVORCE, *S.* 2.] The Act 20 & 21 Vict. c. 85, which has effected these alterations in the law, makes various other provisions, for which however the statute itself must be referred to.

WIFFEN, JEREMIAH HOLME, was born in the neighbourhood of Woburn, in 1792, of Quaker parents, and was educated for the profession of a schoolmaster, a vocation which he followed for several years. He very early however displayed a taste for poetry and literary composition. In 1812 he published a 'Geographical Primer,' for the use of the junior classes of a school, and he contributed some poetical effusions of considerable merit to a volume entitled 'Poems by Three Friends.' He next wrote some spirited stanzas on the portraits in Woburn Abbey, inserted in the Rev. Mr. Parry's 'History of Woburn,' and afterwards reprinted separately as 'The Russells.' In 1819 he published 'Aonian Hours,' and other poems, which attracted the notice of the Duke of Bedford, who appointed him his librarian at Woburn, and his private secretary. From this time he lived in the enjoyment of literary ease, but continued to employ himself actively. In 1820 he published 'Julia Alpinula, the Captive of Stamboul, and other Poems;' in 1822, a translation of the poems of Garcilaso de la Vega; and for many years he contributed original poems and translations to 'Time's Telescope,' and various other periodical works. Among the original pieces may be mentioned 'The Luck of Eden Hall,' as a successful effort in the old ballad style. In 1830 he published a translation of Tasso's 'Jerusalem Delivered,' on which he had been engaged for several years. He adopted the Spenserian stanza, and the versification is free and flowing, but as a whole it is certainly not calculated to supersede the bold and vigorous translation by Fairfax. In 1833 he published in one 8vo volume 'Historical Memoirs of the first race of ancestry whence the House of Russell had its origin; from the subjugation of Norway to the Norman Conquest:' which was followed immediately by two other volumes of 'Historical Memoirs of the House of Russell, from the time of the Norman Conquest.' The first volume is little more than a series of guesses as to the early history of the family, tracing its origin from Olaf, the sharp-eyed king of Berik: but the other two are interesting from the events in which the family can be traced authentically to have been engaged, and they are told with faithfulness, though with pardonable partiality. He latterly studied Hebrew and Welsh, from the last-named of which he made several successful poetical translations. Mr. Wiffen maintained his connection with the Society of Friends, holding offices of trust in it occasionally, until his death, which took place suddenly on May 2, 1856, at Woburn Abbey.

WILL AND TESTAMENT. The 'Wills Act,' 1 Vict. c. 26, has been amended by the Statute 15 & 16 Vict. c. 24. Simple apparently as are the requirements of the first statute, an immense number of questions had arisen upon the language of its provisions; and probate had over and over again been refused to wills, the authenticity of which was beyond any moral doubt. The recent statute is a very curious specimen of legislation; as the simple perusal of it will show, that it is passed not to amend the law, but to provide against the consequences which have been held to follow from the negligence of testators, in not paying strict attention to that enactment of the Wills Act, which requires the instrument to be signed at the "foot or end."

WILLEMS, JAN FRANS, the originator of what is called 'the Flemish movement' for the revival of the cultivation of the Dutch language in Belgium, was born at Bouchout, a village near Antwerp, on the 11th of March 1793. The French sans-culotte army, under Dumouriez, was at that very time advancing to the siege of Antwerp; a party of his soldiers entered Bouchout on the night that Willems was born, and on hearing the state of affairs politely withdrew from his father's house, observing that the new comer would be the first French citizen of the district, and little foreseeing how effective an opponent he would prove to the influence of France in Flanders. The attachment of Willems to the Flemish language first showed itself at the town of Lierre, where he was sent from the age of twelve to fifteen, to learn singing and playing on the organ, and where he was fortunate enough to meet with a protector and educator in the person of Mr. Bergmann, who, in the then cessation of public means of education in Belgium acted as tutor to his own family, and allowed young Willems to share their instructions in Latin and literature. Lierre was still in possession of some of the 'Rêderyk-Kamers,' or Chambers of Rhetoric, the existence of which was one of the most familiar literary features of olden Belgium, and they were in the habit of getting up theatrical entertainments. "The Cecilian Society of the principal church, St. Gummar's, where I every day sang or played the organ, being," says Willems, in a history which he afterwards wrote of the Chambers of Lierre, "in the mind to act some pieces for the benefit of the church, this was the occasion of first bringing me on the stage, and I represented the angel Gabriel bringing the annunciation to the Virgin Mary, in the piece entitled 'The Nativity and Youth of Jesus Christ.' I remember that our manager, Mr. Van den Brande, churchwarden of St. Gummar's, a very pious man, every evening before the curtain rose made us kneel down on the stage, and read the Litany of Our Lady that the performance might go off well. It was strange to see how all the characters were mingled together on their knees, and how St. Joseph and our Lady (N.B., an Our Lady with a beard), Herod, the three kings, the Jewish Scribes and Pharisees, the angels and the devils all joined in the responses, 'Pray for us, pray for us.' I shall never forget it." The mysteries of the middle ages were thus, it will be seen, flourishing in the 19th century in Belgium, as well as in some more remote corners of Europe.

When Willems was a boy of fourteen at Lierre he wrote a poetical satire in Flemish on the authorities of Bouchout, who had arbitrarily dismissed his father from the post of tax-collector. This and some other proofs of talent led his patron Bergmann to advise his parents not to bury him in the obscurity of his native village but send him to Antwerp, where he was placed as clerk to a notary, and, in 1812, contended victoriously against twenty-six competitors for the prize that was offered for the best poem on the battle of Friedland and the peace of Tilsit. An amateur theatre was his favourite recreation, and two plays of his composition, 'The Rich Antwerper' and 'Quintin Matsys,' met with success both on the stage and in print. The union of Belgium with Holland, which followed the overthrow of the French dominion in both countries in 1814, naturally directed attention to the fact that the so-called Flemish language and the language of Amsterdam are in reality but very slightly differing dialects of one common language which was at one time more cultivated in Flanders and at another in Holland. Willems took the lead in reviving and making permanent what it is very singular should ever have been overlooked or forgotten. A spirited poem by him—'Aen de Belgen' (To the Belgians)—published in 1818, exhorted his countrymen not to continue to abandon the language of their fathers, which was also the language of Vondel and Bilderdyk. This poem, which produced a strong sensation, was accompanied by a French translation, which it may be remarked was not a very faithful one. It formed the prelude to Willems's 'Dissertation on the Dutch Language and Literature in connection with the Southern Provinces of the Netherlands' ('Verhandeling over de Nederduytsche Tael- en Letterkunde opzigtelyk de Zugdelyke Provintien der Nederlanden'), which was commenced in 1819 and completed in 1824. In this work, which extends to two octavo volumes, he aimed at tracing the literary history of Flanders and Brabant from the 13th to the 19th century, showing that literature had flourished in those countries as long as the national language was cultivated, but that it had declined since the religious wars which led to the separation of the North and the South Netherlands, because from that period Latin, and particularly French, had been looked upon as the only instruments of literary cultivation in the Catholic Netherlands, while the use of the native dialect, or of one nearly akin to it, had been abandoned to the Protestants of the Seven United Provinces. There was an outcry against the author of this work on two accounts, one from the antagonists of the union of Belgium with Holland, who stigmatised him as a sycophant of the government because his views tended to recommend the government measure of the introduction of Dutch as the official language, the other from zealous Catholics, who were indignant that a Catholic should maintain the superiority of the literature of the Protestant North to the Catholic South. The dissertation had great value at the time of its appearance as the only attempt at a connected history of Flemish literature, but the additional light since thrown on the subject by the researches of Willems himself and of several others has had the effect of rendering it in some degree obsolete. From the time of its publication Willems was looked upon as the champion of the Flemish cause, which he defended against all enemies and in particular against Van de Weyer in a French pamphlet, entitled 'De la Langue Belgique,' which appeared in 1829, only a year before the violent severance of Belgium and Holland.

The revolution of 1830 appeared at first sight to be a mortal blow to the prospects of the Flemish language, and also to the fortunes of its champion. Willems had been placed by the Dutch government in the advantageous post of a receiver of some public dues at Antwerp, where he had been previously appointed by the city as an assistant keeper of archives. He had also been, in conjunction with Van de Weyer, one of the commission for publishing the historical monuments of the South Netherlands. Of these posts he was deprived by the provisional government of Belgium, and sent in an obscure position, with a reduced salary, to the small town of Eecloo, where, declining the offers of the Dutch government to place him in a more advantageous position in Holland, he remained for four years. By that time the indignant remonstrances of some of the chief literary men of Belgium, and in particular of his old opponent Van de Weyer, aroused the government to a sense of his unworthy treatment, and in 1835 he was placed at Ghent in a situation similar to that he had occupied at Antwerp. While at Eecloo he had published a modern Flemish version of the celebrated mediæval poem of 'Reynard the Fox,' which he maintained to be of Flemish origin. On the sale of a copy of an old Flemish manuscript of the poem at London, in the auction of Richard Heber's library, he applied to the Belgian government to secure it for Belgium; it was purchased at his recommendation for 160*l.*, and in 1836 the poem was printed under his editorship, with a preface, in which he maintained his views with great ability. From this time his life flowed in a course of literary labours and honours. A society was formed at Ghent "for the encouragement of the Low-Dutch language and literature," which published a periodical, the 'Belgian Museum' (Belgisch Museum), under the editorship of Willems, which was so entirely his work, that at his death it suddenly ceased, and was brought to a close, with, for its last article, the life of Willems, from which this notice has chiefly been taken. It extends to ten volumes, and is full of interesting matter. The cultivation of the Flemish language, which he had first promoted, went on increasing. In 1841 a Flemish festival was held at the University of Ghent;

two years later a meeting of the 'Taelverbond,' or 'Language Association,' at Brussels, at which Willems officiated as president. The movement was too powerful to be withstood by the government. Willems had no longer to fear disgrace for his exertions, and had already, in 1838, been named a knight of the order of Leopold. The Flemish movement still appears to make progress, and the meetings which have been held of distinguished literary men of both the North and South Netherlands appear likely to result in placing the language in Belgium in a higher degree of estimation than it has been for centuries. Willems however was not destined to witness this triumph. He died at Ghent on the 24th of June 1846, after a very brief illness, of an apoplectic attack.

His works, according to the list given in the 'Belgisch Museum,' are 43 in number, 35 in Flemish, 5 in French, and the remainder in both languages. The most important that have not been already mentioned are his 'Mengelingen van vaderlandschen Inhoud' (Miscellanies on National Subjects), Antwerp, 1827-30; the 'Rhymed Chronicle of Jan van Heelu;' the 'Rhymed Chronicle of Brabant, by Jan de Klerk,' edited for the Belgian Historical Commission; and the 'Chronicle of Edward the Third, king of England, written in rhyme in 1347 by Jan de Klerk,' and first published by Willems at Ghent in 1840.

WILLIAM II. (FREDERICK GEORGE LOUIS), King of the Netherlands and Grand Duke of Luxemburg, was born on December 6, 1792, and under the care of his father was educated in the military academy at Berlin, completing his education in the university of Oxford, where he showed much talent. He entered the military service early, serving his first campaign with the English army in Spain, and in 1811 accepted the rank of lieutenant-colonel in the Spanish service. His courage and activity procured him the esteem of the Duke of Wellington, who made him his aide-de-camp. At the siege of Ciudad Rodrigo he was among the foremost in the storming party, and at that of Badajoz he entered at the head of an English column, whose retreat he had checked. He also distinguished himself at the battle of Salamanca, and on other occasions, for which he was promoted to be aide-de-camp to the king of Great Britain. When in 1814 his father was restored to his kingdom, the Belgians received him gladly as their future sovereign. In 1815 he commanded the army of the Netherlands, and displayed bravery and military skill in the battle of Quatre Bras, and in that of Waterloo, at which he headed his troops, and was wounded in the shoulder. On his recovery he attended the Congress in Paris, and here was made the proposal of his union with the Princess Charlotte of England, which however failed, because, it is said, the prince was unwilling to become an English subject only, even if the first; and he shortly afterwards married Anna Paulowna, the sister of the emperor Alexander of Russia. On the breaking out of the revolution in Belgium in 1830, he repaired first to Antwerp and then to Brussels, where his appearance made a great impression. But his endeavours at a reconciliation failed, and at length, overstepping his commission, on October 16 he recognised the independence of Belgium, for which his father immediately cashiered him, and he withdrew to England, whither he brought his two eldest sons to be educated. In the following year however he was recalled to the command of the army of Holland in the short war against Belgium, in which he was at first victorious, but was at length compelled to retreat by the armed intervention of France. He was then appointed to the command of the army of observation on the Belgian frontier. On the resignation of his father, on October 7, 1840, he succeeded to the government, in which he showed great regard to economy, and a desire to promote financial improvements, but opposed all constitutional reforms. On the breaking out of the revolutionary storm, which spread so widely through Europe in 1848, he was forced to consent to extensive changes, which probably might have been avoided by smaller concessions made earlier. He did not however live long to witness the effect of the alterations, as he died on March 17, 1849.

WILLIAM-HENRY, or SOREL. [Canada, S. 2.]

WILLIAMS, SAMUEL, a skilful designer and engraver on wood, was born at Colchester, Essex, on the 23rd of February 1788. The son of parents in humble circumstances, his early desire to become an artist met with little encouragement, and though he taught himself drawing and painting, he was at the usual age apprenticed to a printer in his native town. While serving his apprenticeship however he taught himself etching, and subsequently wood-engraving. So attached had he become to the latter art, that on the expiration of his term of service he determined to adopt it as his calling, and, possessing some skill in design, he found on proceeding to London little difficulty in procuring employment among the publishers of low-priced works. His earliest patron is said by his son ('Athenæum,' 1853, p. 1261) to have been Mr. Crosby, by whom "a series of 300 cuts was given into the hands of the then untried country artist." Gradually working his way upwards, he eventually took his place among the best designers and wood-engravers of his time. His earlier engravings executed for Whittingham's Novelists and Poets, for Wiffen's 'Tasso,' and the architectural publications of Mr. J. Britton, displayed great freedom and ability —qualities strikingly apparent in his vigorous, characteristic, and original, though occasionally somewhat rude designs made for Hone's 'Every Day Book.' In his later engravings and designs—as those in Howitt's 'Rural Life,' Scrope's 'Days of Salmon-Fishing,' and 'Deer Stalking,' Thomson's 'Seasons,' &c.—he shows much more elaboration and neatness, with an equal evidence of the devoted study of rural life and scenery, but perhaps some loss of power. Throughout life he retained his early ambition of painting in oil, but we are not aware that he executed any works of consequence in that branch of art. He died on the 19th of September 1853. Two of his sons still sustain the reputation of the name of Williams as wood-engravers.

WILSON, PROFESSOR JOHN, was born on the 19th of May 1785, at Paisley in Scotland, where his father was a wealthy manufacturer. He was the eldest son: one of his brothers, James, became distinguished as a naturalist; one of his sisters became Mrs. Ferrier, and the mother of Professor Ferrier of St. Andrews; and another of his sisters married Sir John Macneil. At an early age, the future poet and essayist was sent to a school at Glenorchy in the Highlands kept by the Rev. Dr. Joseph McIntyre; and here he acquired his first enthusiasm for Highland scenery and his love of open air exercises. At the age of thirteen he went to the University of Glasgow, whence, after five years of study, he removed in 1803 to Magdalen College, Oxford. At Oxford he was distinguished no less for his literary genius and attainments—as shown in his carrying off, among other honours, the Newdegate prize in 1806, for an English poem 'On the Study of Greek and Roman Architecture,'—than for the exuberance of his animal spirits, his great physical strength and beauty, and his fondness for athletic sports. He was the best boxer, leaper, and runner about the University. He graduated B.A. in 1807, and in 1810 he took the degree of M.A. "A fair-haired Hercules-Apollo," says a writer, sketching his life at this time, "and with plenty of money enabling him to gratify his tastes whatever they might be, he had scarcely left Oxford, when he signalised his double character by purchasing, or having purchased for him by his father, the small, but beautiful estate of Elleray on Lake Windermere, where as Hercules, he might yacht about at his pleasure, beat the best boatman at the oar, and wrestle or box with the strongest dalesman, and, as Apollo, he might revel in the quiet beauties of the finest of English scenery, indulge undisturbed in poetic dreams of his own, and cultivate with due reverence the society of Wordsworth." Here, besides Wordsworth, he became acquainted with Coleridge, Southey and De Quincey, the last of whom describes the extraordinary manliness of his character at this time, dashed with an eccentricity which showed itself in all kinds of freaks and projects—and among them that of becoming a traveller in Africa. It was at this time (1810) that he married an English lady of wealth whom he met when she was on a visit to the Lakes with her family, and, falling in love with her at first sight, wooed and won with romantic rapidity. He had by this time published some anonymous writings in Coleridge's 'Friend,' and elsewhere; and in 1811 he published anonymously in Edinburgh, 'Lines sacred to the memory of the Rev. James Grahame,'—i.e. the poet Grahame, the author of 'The Sabbath.' Though his summer head-quarters were at Elleray, Wilson spent part of every year in Edinburgh, and the following extract from a letter of Scott to Miss Joanna Baillie will show the impression which he had begun to make in Edinburgh: "The author of the Elegy upon poor Grahame is John Wilson, a young man of very considerable poetical powers. He is now engaged on a poem called 'The Isle of Palms,' something in the style of Southey. He is an eccentric genius and has fixed himself on the banks of Windermere, but occasionally resides in Edinburgh, where he now is. . . . . He seems an excellent, warmhearted, and enthusiastic young man; something too much perhaps of the latter quality places him among the list of originals." The 'Isle of Palms' here alluded to, was published in 1812, and gave Wilson a place among the Lake Poets. In 1815 he was called to the Scottish bar, at which however he never practised; and from that time forward Edinburgh was his accustomed place of residence. He wrote for the 'Edinburgh Review' a criticism on the 4th canto of 'Childe Harold'—his only contribution to that periodical. "His prepossessions, both political and literary, led him to attach himself to the little band of young Tories, with Scott as a cautious veteran to advise them, who were disposed to break out in rebellion against Jeffrey's Whig supremacy in the northern world of letters; and, accordingly, when Blackwood (1817) started his magazine to afford an outlet for native Scottish Toryism similar to that which had been already provided in the 'Quarterly Review' for British Toryism in general, Wilson was one of the first to join him. He had just then added to his laurels, as one of the Lakists, by the publication (1816) of a poem of some length, entitled 'The City of the Plague;' his magnificent physique was the admiration of Edinburgh, so that, as he walked hurriedly along Princes-street in somewhat wild costume, and with his fair hair streaming from under his broad white hat, heads were turned to look at him; and his reputation in social circles was that of a young Goth of genius with powers undeveloped, which would one day astonish Britain." At first Wilson was associated with Lockhart and others in writing for 'Blackwood,' so that it was not till 1824 or 1825, that that publication was identified with him to the full extent.

The connection with Blackwood was an important event in the life of Wilson; and it was speedily followed (1820) by his appointment to the chair of Moral Philosophy in the University of Edinburgh, then vacant by the death of Dr. Thomas Brown. The appointment was made rather on the grounds of Wilson's political opinions and his promising genius than on the evidence of any special works already produced on metaphysics or philosophy, and Sir William Hamilton, afterwards Wilson's colleague, was a defeated candidate on the occasion. Scott, who used all his influence in behalf of Wilson, wrote to Lockhart expressing his hope that if he obtained the appointment, it would give him "the consistence and steadiness of character which are all he wants to make him the first man of the age." The appointment, together with his connection with Blackwood (both of which came at a time when some pecuniary reverses had obliged him to break up his little establishment at Elleray) had, at all events, the good effect of determining Wilson's genius permanently to prose rather than to verse. He still, indeed, wrote verse in the Lakist style in quantity sufficient, when added to what he had already written, to make two octavo volumes of poetry in all in 1825; but this is no proof that in verse he would ever have been more than one of the minor Lake poets. It was in prose, and more especially as a poet in prose, that his genius was to display itself in its full capacity; and both the magazine and the lecture room gave him the necessary opportunities. "He wrote," says the author of the sketch already quoted, "tales for the magazine, in which, while his imagination had as free scope as it had in verse, his constitutional Scotticism, his shrewd observation of Scottish humours, his sensibility to the woes of real life, and his powers of eloquent description and delineation of character, had a still freer and more minute range. Some of these tales, with others written independently, formed collectively his first professed prose-work, published, in 1822, under the title of 'Light and Shadows of Scottish Life,' and followed in 1823 by a one-volume novel called 'The Trials of Margaret Lyndsay.' He wrote also political articles on the questions of the day, in which he blazed out as a Tory in a manner heartily satisfying to his instincts, and yet not possible had he kept to metre. He wrote literary criticisms, in which he advanced and expounded canons of taste, especially in poetry, deeper than those of Jeffrey, and vindicated against that critic and his disciples the poetic claims of Wordsworth and the writers associated with him. He wrote, either as lectures or as articles, subtle philosophical disquisitions, not very connected or systematic perhaps, but gleaming with brilliant ideas, and tinged throughout with that rich and highly-coloured mode of metaphysics which Coleridge was diffusing through England. Lastly, careless of the formality conventionally identified with the gown of a Scotch professor, and that the gown of a professor of moral philosophy, he wrote papers for the magazine in which he was seen relapsing ideally into his character as an untrammelled human being, a bruiser at country-fairs, a sportsman on Scottish hills and rivers, a boon-companion among bacchanalians, commenting on men and manners, on life and literature, from the point of view of an inspired king of the gypsies or from amid the uproarious conditions of a city orgy." Among these papers of riotous phantasy, the most famous were the series called the 'Noctes Ambrosianæ,' which had been begun in 1822 when Lockhart, as well as Wilson, was a contributor to Blackwood, but which, taken up in 1825 by Wilson for himself, after Lockhart's departure for London, were continued by him till 1836, when the death of the Ettrick Shepherd, their principal supposed character, naturally put an end to them. It was these 'Noctes' that carried the name of 'Christopher North' over the world as the pseudonym of Wilson. They were followed by a series called 'Dies Boreales,' which extended from 1836 to 1846, but were less popular.

After the death of his wife, which took place about 1840 and left a profound sorrow in his heart, Wilson was much less active than he had till then been. He still figured as Christopher North in stray papers in 'Blackwood;' in 1842 he even published separately, under the title of 'Recreations of Christopher North,' a selection of his contributions to the magazine; and still as 'The Professor' he was one of the lions of Edinburgh society and the idol of successive classes of students "to whom he lectured his moral philosophy from the backs of old letters, and who cheered him till the roof rang at the end of every eloquent period;" but on the whole, the best of his career was over. Latterly, too, ill-health reduced his once abundant vigour. He continued in the discharge of his professional duties till 1852-53, when paralysis and decay incapacitated him. A pension of 200*l.* a year had been granted to him by government. He lived for a time in retirement at Lasswade, near Edinburgh; and died at Edinburgh on the 3rd of April 1854. In the following year his nephew, Professor Ferrier, who is also his son-in-law, began the publication of a collected edition of his works. Twelve volumes have appeared, including the 'Noctes Ambrosianæ,' the 'Essay on Burns,' which was published separately long ago; the Tales; and the Poems. The series of volumes is now completed, and the world has for the first time the materials before them for an estimate of the genius of Wilson, both as to quantity and variety of production, and as to quality. It is understood that either Professor Ferrier, or Professor Aytoun, who is also a son-in-law of Wilson, will write a biography of their distinguished relative.

WILSON, GENERAL, SIR ROBERT THOMAS, the son of Mr. Benjamin Wilson, a painter in Bloomsbury, was born in 1777. Having been educated at Westminster and Winchester, he went to Flanders as a volunteer in 1793, and in the following year obtained a commission in the 15th Dragoons; by a daring act he saved the Emperor of Germany from being taken prisoner at Villers en Conche. He subsequently served in Ireland during the rebellion of 1798, and also in Holland, and in 1800 succeeded to a majority in Hompesch's Mounted Rifles. He also for a time held a military command in the South West District. Having served for a short time in the Brazils and at the Cape of Good Hope, he was sent on a secret mission to the Continent under Lord Hutchinson. In 1808 he superintended the embodiment of a regiment of Portuguese refugees, and raised and formed the Lusitanian Legion. He afterwards commanded a Spanish Brigade under Sir Arthur Wellesley, and took an active part in the battle of Talavera. From 1812 till 1814 he was British military correspondent at the head-quarters of the allied armies, and for some time held command of the Prussian reserve; at the head of this force he drove back the French to Lützen. He incurred the displeasure of the military authorities by assisting in effecting the escape of Count Lavalette, who had been condemned to death as an accomplice of Napoleon. A narrative of this adventure may be found in the 'Gentleman's Magazine,' vol. 86, part i. p. 625. On the funeral of Queen Caroline he expressed his disapproval of the course pursued by the government with respect to that unfortunate lady, and in consequence was dismissed from the army and deprived of the many foreign orders which he had won by his gallantry. He sat as member for Southwark, in the Liberal interest, from 1818 till 1831, when he retired in favour of Mr. W.

Brougham. Having been restored to his rank in the army, he became a general in 1841, and held the post of governor and commander-in-chief of Gibraltar from 1842 till 1849. He died suddenly in London, soon after his return to England, May the 9th, 1849. He was the author of a translation of General Regnier's 'Campaign in 1801 in the East and in Egypt,' and afterwards of a more correct original narrative of those events, printed in 4to, under the title of an 'Historical Account of the British Expedition to Egypt.' His other publications were 'An Enquiry into the Military Force of the British Empire' (1804), 'Campaigns in Poland with Remarks on the Russian Army' (1811), and a 'Sketch of the Military Power of Russia' (1817), which was severely criticised at the time of its appearance in the 'Quarterly Review:' Sir R. Wilson replied in an animated pamphlet.

WINT, PETER DE, was born at Stone, in Staffordshire, in 1784. He was apprenticed to Raphael Smith, the mezzotinto engraver, and had for a fellow pupil, Hilton, the Academician, whose sister he afterwards married. Abandoning engraving, Mr. De Wint adopted painting in water-colours as his line of art; and was elected a member of the Society of Painters in Water-Colours, in 1810, six years after its foundation. For nearly forty years his pictures were among the leading attractions of the annual exhibitions of that society. He painted almost exclusively home scenery:—Views in Kent, Lincolnshire, &c.; among the lakes and mountains of Cumberland, Westmoreland, and Wales; on the Thames, the Wye, and other rivers; corn-fields, hay-fields, water-mills, and the like, being especial favourites with his pencil. His style was broad, bold, and vigorous, his colour fresh; and in general effect his pictures represented with fidelity the ordinary aspects of English scenery. But he was wanting in refinement, and in aiming at breadth of effect he was often negligent of details. His touch and texture were peculiar; but, allowing for an almost inevitable mannerism, very agreeable and effective. Avoiding all the methods adopted by the younger generation of water-colour painters for producing force and brilliancy, he to the last continued to paint according to the method of the founders of the English school with washes of transparent colours only, but what he thus lost in power and variety he, to some extent, made up in clearness and freshness. He died on the 30th of June, 1849, in his sixty-sixth year.

WORDSWORTH, REV. CHRISTOPHER, D.D., was born June 9, 1774, at Cockermouth, Cumberland. He was the youngest son of John Wordsworth, and the youngest brother of William Wordsworth the poet. He was educated at Hawkshead grammar-school, and at Trinity College, Cambridge, where he went in 1792, and took his degree of B.A. in 1796. He was elected Fellow of Trinity College, October 1, 1798, and in 1799 took his degree of M.A. In 1802 he published 'Six Letters to Granville Sharp, Esq., respecting his Remarks on the Uses of the Definitive Article in the Greek Text of the New Testament,' 8vo, a volume which was praised by Bishop Horsley and Bishop Middleton, and procured him the patronage of Dr. Manners Sutton, Archbishop of Canterbury, who appointed him his domestic chaplain. He married October 6, 1804, Priscilla, daughter of Charles Lloyd, Esq., banker, of Birmingham, and in the same year was preferred to the rectory of Ashby and Obey-with-Thirne in Norfolk, whence he was promoted to the deanery of Bocking, in Essex, May 30, 1808. In 1809 appeared the first edition of his 'Ecclesiastical Biography, or the Lives of Eminent Men connected with the History of Religion in England,' 6 vols. 8vo, which was reprinted in 1818, and again in 1839, with additions, in 4 vols. 8vo. He received by royal mandate the degree of D.D. in 1810, and in that year Dr. Wordsworth published his 'Reasons for declining to become a Subscriber to the British and Foreign Bible Society,' a 'Letter to Lord Teignmouth,' in vindication of his 'Reasons,' and a 'Second Letter to Lord Teignmouth.' In 1814 he published 'Sermons on various Occasions,' 2 vols. 8vo. He was appointed rector of St. Mary's, Lambeth, Surrey, and of Sundridge in Kent, April 10, 1816. Soon afterwards he served as chaplain to the House of Commons. On the 26th of July, 1820, he was installed Master of Trinity College, Cambridge. In the same year he exchanged the livings of Lambeth and Sundridge for the rectory of Buxted, with Uckfield, in Sussex. In 1824 and 1828 he produced two elaborate volumes on the authorship of 'Icōn Basilikè,' which he unhesitatingly ascribed to Charles I. The first volume is entitled 'Who wrote Ικὼν Βασιλική, considered and answered,' 8vo; the second, 'King Charles the First the Author of Icōn Basilikè further proved, in a Letter to his Grace the Archbishop of Canterbury, in Reply to the Objections of Dr. Lingard, Mr. Todd, Mr. Broughton, the Edinburgh Review, and Mr. Hallam,' 8vo. Dr. Wordsworth's last important literary work was his 'Christian Institutes,' 4 vols. 8vo, 1837, designed specially for the use of students in the university and candidates for holy orders. He resigned the Mastership of Trinity College in 1841, and was succeeded by the present Master, Dr. Whewell. From that time he resided at Buxted, where he died February 2, 1846. He was buried in Buxted Churchyard. He had three sons. 1. Rev. John Wordsworth, born July 1, 1805, was Fellow of Trinity College, Cambridge, and died there December 31, 1839. 2. Right Rev. Charles Wordsworth, M.A. and D.C.L., graduated at Christchurch, Oxford, was second master of Winchester College, and is now (1858) Bishop of the United Diocese of St. Andrew's, Dunkeld, and Dunblane, Scotland, to which he was consecrated in 1853. 3. Rev. Christopher Wordsworth, canon of Westminster, the author of many works, and among them Memoirs of his uncle William Wordsworth.

WORDSWORTH, WILLIAM, was born at Cockermouth, Cumberland, on the 7th of April, 1770, the second son of John Wordsworth, attorney-at-law, and law-agent to Sir James Lowther, afterwards Earl of Lonsdale, by Anne, only daughter of William Cookson, a mercer at Penrith. The Wordsworths came originally from Peniston, in Yorkshire, where they had been settled from the Norman Conquest; and the name of Wordsworth's maternal grandmother was Crackanthorpe, of the Crackanthorpes of Westmoreland. The poet was therefore by pedigree a thorough North-of-England man. He had three brothers—Richard, who was two years his senior, and who became a London attorney, and died in 1816; John, who was nearly three years his junior, and who became commander in the navy, and perished by shipwreck off Weymouth in 1805; and Christopher, the youngest, noticed above. [WORDSWORTH, REV. CHRISTOPHER.] He had also a sister, Dorothy, born between William and John. The mother of the family died in 1778, when the poet was only eight years old; the father died in 1783, when the poet was but thirteen.

Till about the time of his mother's death, Wordsworth's early life was spent partly at Cockermouth and partly with his parents at Penrith, where he attended a dame's school; but about that time he was sent, with his elder brother, to a public school at Hawkshead, in Lancashire, whither his two younger brothers followed him. Here he remained till 1787, left very much at liberty to read what he chose, and to wander about in the neighbourhood. "I read," he says, "all Fielding's works, 'Don Quixote,' 'Gil Blas,' and any part of Swift that I liked; 'Gulliver's Travels' and the 'Tale of a Tub' being both much to my taste." Here also he first began to write verses, as school-exercises, and to store his memory with observations of English rural nature. He became a fair Latin scholar, and was taught something of mathematics; but, upon the whole, the acquisitions possible at the school were not great. On the death of Wordsworth's father, which occurred while he was still at school, it was found that the principal part of his property consisted of a debt of 5000*l.* owing to his estate by Lord Lonsdale; a considerable part of what there was besides was expended in a lawsuit with a view to recover this; but enough remained, when scraped together, to complete the education of the children, under the guardianship of two uncles. By them Wordsworth was sent, in October, 1787, to St. John's College, Cambridge, of which college he continued a student till January, 1791, when he quitted Cambridge altogether, having taken his B.A. degree. His recollections of his *Alma Mater* were by no means affectionate or reverential. He says:—

> "I did not love,
> Judging not ill perhaps, the timid course
> Of our scholastic studies; could have wished
> To see the river flow with ampler range
> And freer pace"—

and, in particular, he was repelled by the mechanical manner in which religious forms and exercises were gone through. "Intellectually," says his nephew and biographer, "he and the university were not in full sympathy with each other. He had never been subject to restraint: his school-days were days of freedom; and latterly, since the death of his parents, he was almost entirely his own master. In addition to this, his natural temperament was eager, impetuous, and impatient of control." At college, however, he read and thought much; he studied Italian; and he began to feel himself a poet. He employed the vacations in tours, to gratify his passion for the open air and for scenes of natural beauty and grandeur; and one of these tours, made in the autumn of 1790, with a fellow-collegian, was a pedestrian one through France and Switzerland, at the very time when the French Revolution was in its full tide of progress. In 1791, after taking his degree, he spent some time in London, and made a pedestrian tour in North Wales; and in the autumn of that year he went over to France, where he spent fifteen months in all, partly in Paris, partly in Orleans, and partly in Blois. "It was," he says, "a stirring time. The king was dethroned when I was at Blois: and the massacres of September took place when I was at Orleans." Wordsworth was no mere indifferent spectator of the scenes of the Revolution. At this time of his life he was a vehement republican, and an ardent partisan of revolutionary France against all the rest of the world. He had friends too among the revolutionists of the Girondist party, and so fully did he share their enthusiasm that he even entertained the intention of becoming a naturalised Frenchman, and throwing himself, heart and soul, into the struggle for liberty—believing that what it chiefly wanted to ensure a glorious success was the activity of a few steady, virtuous, and lofty minds, such as he was conscious of possessing. Of this he was still more convinced after Robespierre began to exercise his power. Had he carried out his intention, the probability, as he himself says, is that he would have been one of Robespierre's victims, and have died on the scaffold with some of his Girondist friends. Circumstances however fortunately obliged him to return to England towards the end of 1792, a little before the execution of the king. He took up his abode for the time in London; but his thoughts were still on the other side of the Channel, and he followed the farther course of the Revolution with intense interest, complicated by the feeling that Britain, in declaring war against France, had engaged in an unjust enterprise. Much of the influence of this time, though greatly modified, remained with Wordsworth throughout his life.

From 1792 to 1795, Wordsworth lived in a desultory manner in London and other parts of England. He had been destined for the church, and his friends were much disappointed at his preferring what seemed to them an idle and aimless life. His religious, as well as his political, principles, at this time were not of a kind conformable to the society in which he moved. Poetry, next to republican politics, was his passion; and he had already conceived the possibility of a new kind of descriptive poetry, which should do justice to "the infinite variety of natural appearances that had been unnoticed by the poets of any age or country." In the year 1793 he published his first literary venture, two poems of this kind in the heroic couplet—'An Evening Walk, addressed to a Young Lady,' and 'Descriptive Sketches, taken during a pedestrian tour among the Alps.' It was the time of the rise of a new poetical spirit in England, Bowles and Crabbe having just appeared in the field after Cowper, and the Scottish poet Burns being then in the full flush of his fame. New poets were also springing up; and one of these, Coleridge, thus describes the impression made on him by the volume which Wordsworth had published: "During the last year of my residence at Cambridge, I became acquainted with Mr. Wordsworth's first publication; and seldom, if ever, was the emergence of an original poetical genius above the literary horizon more evidently announced." The volume did not however attract general attention; and for a while, Wordsworth's prospects were very uncertain. Having no independent means of livelihood, he contemplated entering the legal profession and supporting himself meanwhile as a political writer on the liberal side for the London newspapers. From this situation he was rescued by the discerning generosity of a young friend, named Calvert, who on his death in 1795, left him 900*l*., expressly as a token of his admiration and of his wish that he would devote himself to poetry. This sum, judiciously managed, enabled Wordsworth and his sister (who came to live with him about this time, and who exercised a wonderful influence over his spirits and his plans), to live for some seven years, without any necessity on his part to undertake any employment incompatible with his freedom as a poet; and as it fortunately happened that, at the end of that time (1802), a sum of 8,500*l*. was paid over to the family by the second Earl Lonsdale in liquidation of the debt owing to their father by his predecessor, there was again a sufficiency of means for the poet's purposes.

In the autumn of 1795, Wordsworth and his sister settled at Racedown Lodge, near Crewkerne, in Dorsetshire; and here, living in a quiet and happy manner, he wrote his 'Salisbury Plain, or Guilt and Sorrow,' and began his tragedy of 'The Borderers,' neither of which was published till long afterwards. In June 1797, Coleridge, then residing at Bristol, paid his first visit to the Wordsworths; and "for the sake of being near him when he had removed to Nether-Stowey in Somersetshire, we removed," says Wordsworth, "to Alfoxden, three miles from that place." This was in August 1797, and one result of the intimate association thus formed between the two poets was the appearance in 1798 of the 'Lyrical Ballads,' a small duodecimo volume, published by Mr. Cottle of Bristol, the first composition of which was the 'Ancient Mariner' of Coleridge, and the rest, to the number of twenty-two pieces, Wordsworth's. The edition consisted only of 500 copies, the greater portion of which remained unsold; and when Mr. Cottle shortly afterwards gave up business, and sold his copyrights to the Messrs. Longman of London, the copyright of this little volume was valued at *nil*. Mr. Cottle, therefore, begged it back and presented it to the authors. Little affected by the indifference with which the volume had been received, or by the contemporaneous rejection of tragedies which they had respectively submitted to London theatre-proprietors, they were engaged in a new work. In 1798-9, they travelled together in Germany; and on their return, Wordsworth and his sister settled at Grasmere. Grasmere was his residence from 1799 to 1808, when he removed to Allan Bank in the same neighbourhood, and it was on account of his residence in this Lake-district, and the congregation or occasional stay in the same beautiful region of other and kindred spirits, such as Coleridge, Southey, De Quincey, and young Wilson, that the nickname of the 'Lake School' was invented as a designation for him and his companions and disciples. From Grasmere and Allan Bank he made occasional excursions of business or pleasure. Thus in 1802 he made another tour in France; on his return from which he married Mary Hutchinson, whom he had known from her childhood. Wordsworth's sister still continued a member of the household, and the intellectual companion of William in all his labours. In 1803, the poet, his wife, and his sister, set out on a tour in Scotland, in the course of which they made the acquaintance of Scott, and gathered observations and impressions which served as future materials and hints for many poems. Before their departure for Scotland, the poet's eldest child, a son, named John, was born; and the poet's other children were all born either at Grasmere or at Allan Bank—a daughter, Dora, in 1804; a son, Thomas, in 1806; a second daughter, Catharine, in 1808; and the youngest, a son, named William, in 1810.

The period of Wordsworth's residence at Grasmere and Allan Bank (1799-1813) was the period of his memorable struggle against the critics, and of the slow and gradual recognition of his poetic genius. He was incessantly active, turning his observations and thoughts into poems, and he had projected and was occasionally labouring at his great philosophical poem in blank verse, of which 'The Prelude' and the 'Excursion' are the accomplished fragments. What he presented to the public however was his minor pieces. In 1800 appeared a second edition of the 'Lyrical Ballads,' in two volumes, with numerous additions; and there were subsequent editions in 1802 and 1805. In 1807 appeared a distinct collection of pieces, entitled 'Poems in two Volumes;' and in 1809 appeared his political prose 'Essay on the Convention of Cintra.' This last work was published contemporaneously with the first numbers of Coleridge's 'Friend,' to which Wordsworth contributed his 'Essay on Epitaphs.' In 1810 the poet wrote a portion of the letter-press for a volume entitled 'Select Views in Cumberland, Westmoreland, and Lancashire,' edited by the Rev. Joseph Wilkinson—a fine mark of his interest in the lake scenery, and his desire to diffuse the love of natural beauty. It seems to have been Wordsworth's theory not only that the enjoyment of nature has a medicinal effect on the minds of men in general, worthy of being systematically taken into account and resorted to, but also, that it is part of the functions of the poet to minister this influence of nature, by permanently connecting himself with some one spot or district, so as to transfer its peculiar facts and teachings into his poetry. Hence a greater fitness in the name 'Lake Poets' than was intended by those who invented it.

Wordsworth appeared professedly not only as a new poet, but also as the representative and champion of a new theory of poetry. In the volumes he had published up to this time he had not only exemplified his principles of composition in the poems themselves, but he had also propounded and illustrated those principles didactically in prose prefaces and dissertations. He believed, with Coleridge, that the period in the history of English Literature intervening between Milton's age and his own had been, with a few exceptions, a kind of interregnum in English poetry—a period during which poetry had been prosecuted on false principles, both as to themes and as to style; and what he claimed for himself and for those who were associated with him, was the merit of reviving the true notion and art of poetry. The following summary has been given of his views:—"Poetry, according to Wordsworth, takes its origin from emotion recollected in tranquillity; what the poet chiefly does, or ought to do, is to represent out of real life, scenes and passions of an affecting or exciting character. Now, men originally placed in such scenes or animated by such passions use a nervous and exquisite language expressly adapted for the occasion by nature herself; and the poet therefore in imitating such scenes and passions, will recall them more vividly in proportion as he can succeed in employing the same language. Only one consideration should operate to make him modify that language—the consideration, namely, that his business as a poet is to give pleasure. All such words or expressions therefore as though natural in the original transaction of a passionate scene, would be unpleasant or disgusting in the poetic rehearsal, must be omitted. Pruned and weeded in accordance with this negative rule, any description of a moving occurrence, whether in prose or in verse, would be true poetry. But to secure still more perfectly their great end of giving pleasure, while they excite emotion, poets use the artificial assistance of metre and rhyme." In illustrating these views, as to the true nature of poetic subjects, and the true nature of poetic diction, Wordsworth was very severe in his criticism of the poets of the 18th century. Very few of them, he said, had looked at nature for themselves, satisfied with repeating over and over again images and allusions which had become a kind of *property* of the poetic corporation or guild, and which, though originally they might have arisen from genuine observation of nature, had by incessant repetition and attrition become mere lying artificialities; and so, also, very few of them had employed a diction at all resembling the language of real men and women under any circumstances, counting it rather the essence of their craft to use a certain conventional phraseology, called *poetic diction*, in which words were distorted out of their natural order, and the distortion regarded as metrical art.

These views naturally provoked opposition, as similar views had already done when urged by Bowles; and Wordsworth's own poems, exemplifying the views, were either neglected or severely criticised. In the interest of his views he had selected, for many of his pieces, very simple subjects, and had written a language as close as possible to that of real life; and these pieces were fastened on by the adverse critics and held up to ridicule as childish, grotesque, &c. Thus began the great literary controversy as to Wordsworth's poetry—a controversy which lasted almost to the end of Wordsworth's life, though by that time his triumph was, on the whole, decisive, and his admirers included the best part of the nation. The triumph was partly the result of time as affecting the appreciation of what he had already published, partly of the appearance of other poems, thrown out at intervals from his retreat among the Lakes, each making a new impression and some revealing the poet's powers dissociated from those peculiarities which had jarred most on the critics of the old school. In 1813 he took up his residence at Rydal Mount, not far from his former habitations; and here he remained till his death, allowing for occasional visits to London, a second tour in Scotland in 1814, a new continental tour in 1820, a tour in Holland and Belgium in 1823, in North Wales in 1824, on the Rhine in 1828, in Ireland in 1829, in Scotland again in 1833, in Italy in 1837, &c. Before his removal to Rydal Mount, his children Catharine and Thomas had died, leaving two sons and a daughter still alive. His poems were as yet no source of income to him; but just at the time of his removal to Rydal Mount, he was appointed, through Lord Lonsdale's influence, to the distributorship of stamps for the county of Westmoreland, a post which, with light duties and the advantage of permitting him to remain in the district of his affections, afforded him about 500*l.* a year. In 1814 he published his great philosophic poem of 'The Excursion.' It had little commercial success and drew down the critics upon him more than before, including Jeffrey's famous verdict "this will never do;" but here and there it found readers who did not hesitate to recognise in it, as the world now recognises in it, one of the greatest poems in the English language. It was followed in 1815 by 'The White Doe of Rhylstone;' this in 1819 by 'Peter Bell,' dedicated to Southey, and which, though no less attacked than his former poems, was more immediately popular; this, very shortly, by 'The Waggoner,' dedicated to Charles Lamb, and 'Sonnets on the River Duddon.' These poems had, most of them, been in manuscript long before they were published. In 1822 (by which time there had been new editions of some of the previous volumes, and in spite of all opposition, Wordsworth's name was pronounced everywhere as that of a literary power of the highest order) appeared Sonnets and other Poems under the title of 'Memorials of a Tour on the Continent;' several years afterwards appeared his noble series of 'Ecclesiastical Sonnets,' increased in subsequent editions; and in 1835, he published and dedicated to Rogers 'Yarrow Revisited, and other Poems,' the result chiefly of his recent Scottish tour. Other collections of the pieces which he either had written long before or had recently penned were subsequently published; and in 18[illegible] he published a collected edition of his poems in seven volumes, re-arranging them in a new order on a peculiar principle of his own, and with new titles to the separate divisions. Various editions of the whole, in different shapes, have been since published; and after Wordsworth's death appeared his autobiographical poem, 'The Prelude,' written in the early part of the century, and bringing down the narrative of his life till the period of his determination to Poetry after his first political schemes. The death of Wordsworth took place at Rydal Mount on the 23rd of April 185[illegible] when he had just completed his eightieth year; and he was buried in Grasmere Churchyard. In 1839 he had been made D.C.L. of Oxford; in 1842 he had resigned his post of Distributor of Stamps in favour of his younger son, receiving a pension of 300*l.* a year; and in 1843 he had succeeded Southey as Poet-Laureate. His wife and his sister and his two sons survived him. His only daughter Dora had married in 1841 Edward Quillinan, Esq., a gentleman who had been in the army and who is known by various literary works. She was taken for her health to Portugal and Spain, of her travels in which countries she published a journal; and after her return she died in 1847.

The 'Memoirs of Wordsworth' in two volumes were published by his nephew Canon Wordsworth in 1851; and contain many letters, dictations, and conversations, illustrative of the occasions of his poems, of his character and habits generally, and of his progressive views of men and things. Though his life was one of stately retirement, he was a shrewd and diligent observer of all that occurred at home and abroad; and he expressed strong and decided views on the great political events and movements of his time, such as the war with Napoleon, Catholic Emancipation, the French Revolution of 1830, the Reform Bill, the Railway Mania, &c. His views on these subjects were generally Conservative and in contrast with those which he had held so strongly in early life; and in some of his letters and conversations he alludes to this apparent change and gives the philosophy of it. In 1818 he even mixed himself up with local politics in the Conservative interest by publishing 'Two Addresses to the Freeholders of Westmoreland.' He was during the last forty or fifty years of his life a zealous and devout supporter of the Established Church of England. A lofty and serene toleration however pervaded all his views; and his whole life was consecrated from first to last to the service of the great, the permanent, and the noble. His influence on the literature and especially on the poetry of Britain and America in this century, has been immense, and is far yet from being exhausted.

WORM-SEED. [SPIGELIA.]

WORMS. [PHYSIO, PRACTICE OF, *S.* 2.]

WORONZOW, MIKHAIL SEMENOVICH, PRINCE, a very distinguished Russian statesman and soldier, was born at Moscow, in 1782, the son of Semen or Simon Woronzow, who was nephew of the chancellor Woronzow and brother of Princess Dashkov. Semen Woronzow was for many years Russian ambassador to England, where he was first sent by the influence of Prince Potemkin, in 1784, and where he remained in that capacity till 1806, when, retiring from the service, on account of ill-health, he obtained permission from his government to remain in England, and resided in London as a private gentleman till his death in 1832, at the age of eighty-nine. His son was educated in England, his daughter, who died in 1856, married the late Earl of Pembroke, and was mother of the Right Hon. Sidney Herbert. Mikhail Woronzow, living in England to the age of sixteen, was as familiar with the English language and manners as many of his countrymen are with the French. He was a warm admirer of England, and the country of his education certainly had no cause to blush for its pupil. At the age of nineteen he entered the Russian army, in which he fought under Kutuzov against the Turks, and took a distinguished part in the great campaigns against Napoleon I. He commanded a division at the battle of Borrodino, where he was severely wounded, and he led the Russian cavalry at the battle of Leipzig. It is said that on a subsequent occasion, in 1814, his conduct in action elicited from Napoleon the exclamation, "That is the stuff of which marshals are made." Several interesting notices of his opinions and conversation at the time of the occupation of Paris by the allies after Waterloo, are to be found in the diaries of his friend, Sir John Malcolm, printed in the recent Life of Sir John, by Kaye. He commanded the Russian contingent in France from 1815 to 1818, and is said to have paid an enormous sum from his private purse to avoid the disgrace of leaving the debts of Russian officers unpaid when they evacuated the country. In 1823, after his return to Russia, he was appointed Governor of New Russia and Bessarabia, a post which he held for many years, only quitting it for a short time in 1828, to take the command of the Russian army after Menshikov had been wounded at the siege of Varna. To this command was added in 1844, that of the Caucasian Provinces, with an authority superior to that of any preceding governor, Woronzow being made dependent on the Czar alone. He adopted as far as possible a policy of conciliation to the native tribes, while at the same time he pursued the war with such vigour as to capture in 1845 the stronghold of Shamyl, the town of Dargo. The bravery and obstinacy of the mountaineers rendered his military successes in Circassia of no permanent value, but he succeeded in introducing great improvements into the other countries under his government, building towns, making roads, promoting the cultivation of the vine, and setting in general an example of disinterestedness and high feeling. He always continued partial to the land of his youth, he was fond of receiving Englishmen, and his country-seat or palace at Alupka in the Crimea, the finest in the country after the imperial residence of Orianda, was built from the designs of an English architect, Mr. Papworth. He is understood to have been averse to the Russian war with England and France on the Turkish question, in which, by a somewhat singular combination of circumstances, his nephew was the English secretary at war. During the early progress of it he was kept by ill-health at Tiflis, and in March 1854 he obtained a six months' leave of absence, which he spent at Karlsbad and Schlangenbad, but with so little benefit, that in October of the same year he solicited and obtained permission to retire. He died on November 18th 1856 at Odessa, leaving behind him a high reputation among both natives and foreigners for probity and independence.

WORTHITE. [MINERALOGY, *S.* 1.]

WRIT. As to proceedings by *plaint* in the county court, see COUNTY COURTS, *S.* 2. As to writs of recent introduction as part of the process of the superior courts, see INJUNCTION, *S.* 2; MANDAMUS, *S.* 2; SCIRE FACIAS, *S.* 2.

WRIT OF INQUIRY. This writ is no longer issuable in actions in which a debt or liquidated demand in money is sued for. In such cases there is an inquiry as to the amount owing to the plaintiff, before one of the Masters of the court in which the action is brought. In most of such cases, however, a judgment by default for the exact sum due may now be obtained. (Common Law Procedure Act, 1852.)

WRIT OF TRIAL. A proceeding in the nature of a writ of trial may now be resorted to, if either of the parties to an action, in which a sum not exceeding 50*l.* is sued for, so desire. It consists in obtaining the order of a judge to have the cause tried in the county court, on which order, when made, the cause is taken down for trial and there disposed of, precisely as issues are by the sheriff on a writ of trial.

WYATT, RICHARD J., an eminent sculptor, was born in Oxford-street, London, on the 3rd of May 1795. Having chosen sculpture as his profession, he was placed as a pupil with Charles Rossi, R.A.; and about the same time he entered the Royal Academy as a student. During the seven years which he served with Rossi, he twice carried off medals at the Royal Academy. He afterwards worked for a short time in the atelier of Bosio at Paris, and he completed his professional education under Canova, whose acquaintance he had formed in London, and who kindly invited him to Rome, and offered him his advice and assistance in the prosecution of his studies. In the atelier of Canova, he had Gibson for a fellow-student, and the friendship here formed between the young students, who were ultimately to rank together as the first English sculptors in Rome, remained unbroken through life. With Canova Wyatt likewise retained the warmest friendship, till the death of the great Italian master. Wyatt went to Rome in 1821, and he made that city his permanent abode, only once making a brief visit to his native country in 1841. He died suddenly at Rome on the 29th of May 1850.

Wyatt was a man of singularly gentle unassuming temper, and quiet retiring habits. His whole life was spent in the diligent prosecution of his profession—at which he laboured often from dawn till near midnight. The number of his works is very great, and they are of a very unusual order of merit. He was greatest in poetic and classic subjects, in which he displayed a fertility and grace of invention, a singular elegance of thought, and a degree of finish beyond most of his contemporaries. He was undoubtedly one of the purest and most refined of our poetic sculptors. His figures, and especially his female figures, are beautifully modelled, always posed with grace and animation, and always present pleasing forms from whatever side they are viewed. His draperies too are invariably well cast, and he expresses textures truly, yet without breach of sculpturesque propriety. As examples of his style may be mentioned his statues of 'A Nymph entering the Bath'—one of his most beautiful of his many versions of which, was that executed for Lord Charles Townshend; 'Nymph leaving the Bath;' 'Shepherdess with a Kid;' 'Shepherd Boy;' 'Glycera;' 'Musidore;' 'Bacchus:' and 'Penelope,'—an exquisite statue executed for her Majesty; and his admirable groups of the 'Nymph Eucharis and Cupid;' 'Ino and Bacchus:' 'Nymph of Diana taking a thorn from a greyhound's foot;' and 'A Huntress with a Leveret and Greyhound'—his last work. He also produced many excellent portrait busts, some rilievi, and monumental sculpture. At the Great Exhibition of 1851, several of his works were exhibited, and the medal for sculpture was awarded to him though dead. Mr. Wyatt was not a member of the Royal Academy, a bye-law of that institution rendering artists ineligible unless resident in England. Casts from several of Wyatt's works—including most of those named above—are in the Crystal Palace at Sydenham.

WYCH-ELM. [ULMUS.]

WYON, WILLIAM, an engraver and designer of medals and coins, was born at Birmingham in 1795. The pursuits and associations of his family (of German descent) were peculiarly calculated to give direction to his mind and to foster whatever natural abilities he possessed. His grandfather, George Wyon, engraved the silver cup embossed with a design of the assassination of Julius Cæsar, which was presented by the city of London to Wilkes. His father, Peter Wyon, to whom, in 1809, William was apprenticed, was a die sinker of reputation at Birmingham, and with him was associated William's uncle, Thomas, as partner, to whom young Wyon was much indebted. The earliest of his productions of which we find any marked notice were copies of the heads of Hercules and of Ceres; the latter won the gold medal of the Society of Arts, and was purchased by it for distribution as an agricultural prize. A second gold medal from the same body marked the appearance of Wyon's group—'Victory drawn by Tritons.' A few years later he completed a figure of Antinous, which so delighted his father, that he had it set in gold, and wore it constantly until his death.

Wyon came to London in 1816, and won his way through a competition to the post of second engraver at the Mint. Sir Thomas Lawrence was the umpire, and the trial piece the head of George III. His prospects were now most favourable, and his situation altogether agreeable to him—for the chief engraver, Thomas Wyon, was his friend and cousin.

But unexpectedly the latter died, and Mr. Pistrucci was nominated in his place. The new engraver and his chief assistant could not agree. Pistrucci, a skilful artist, is said to have been indolent, and while reserving to himself the greater share of the honour and emolument, to have left the greater amount of labour to Wyon. Under a new Master of the Mint these differences were compromised by an arrangement, which left Pistrucci nominally chief engraver until his death, but gave half his salary to Wyon. We need not dwell on the literary wars that arose out of these occurrences, further than to observe that the younger man found an enthusiastic champion who issued a memoir of his life, and a list of his works, then exceeding two hundred in number. The Royal Academy marked its opinion of this controversy, and of Wyon's own merits, by electing him in 1832, an Associate, and in 1838 an Academician, the first of his department who had ever obtained these honours.

Wyon's works may be divided into coins—pattern pieces of coins not used—medals, and seals. His coins include those of the later years of the reign of George IV., all those of William IV., and all those of her present Majesty which appeared in Wyon's lifetime. He followed Chantrey's models in the coins of both the kings, but was his own designer in the coins of Victoria. The pattern pieces include one of ten pounds for William IV., and one of five pounds (among several others) for the present Queen, which bore a figure of Una on the reverse. These pattern pieces did not become coins through the influence of the body, who, at that time, under the title of moneyers, were the privileged coiners of the country, and who knowing that increased expense would be necessary, took care of their profits, and did not trouble themselves about Wyon's disappointment or the interests of art. His medals include a great range of subjects, and were produced for many different and admirable objects. There are war medals for the Peninsular victories, for Trafalgar, for Jellalabad and Cabul; scientific medals for the Royal Society, Royal and London Institutions, Geological, Geographical, and similar societies, native and foreign; artistic medals, as for the Royal Academy and Art Union; educational, as for Harrow, a gift by Sir Robert Peel; and testimonial, as in the case of the Brodie medal, which bore a head of the man in whose honour it was struck. Most of these medals have for their obverses heads taken from the antique, a few modern, and in some cases, then living personages; and the author had generally aimed, as a matter of course, at a characteristic fitness betwixt the portrait and the accompanying circumstances. Thus, Cicero adorned the Peel-Harrow medal, while heads of Lord Bacon, Sir Isaac Newton, Dr. Wollaston, and Sir Francis Chantrey, were respectively and appropriately connected with the medals of the Royal Institute, the University of Glasgow, the Geological Society, and the Art Union. Many—and among them some of the best—of the reverses were from his own designs; while for others Wyon was indebted to Flaxman, for whom he had an enthusiastic veneration, Howard, and Stothard, who contributed the reverse to a medal of Sir Walter Scott. Wyon's increasing eminence was shown in the various commissions he received from foreign countries; we may especially mention his engagement for a series of Portuguese coins.

The characteristics of Wyon are the combination of two (often opposing) qualities, strength and delicacy, with the indispensable merit of likeness in his portraitures; taken for all in all, we have had no such medal engraver since the days of Simon, the artist who shed so much lustre on this department in the days of the Commonwealth. Wyon died at Brighton, October 29, 1851, in his fifty-seventh year, leaving a son, Leonard, who having aided him in his lifetime, inherited much of his skill at his death. To the latter we owe the well-known medal of Wordsworth; and his name is honourably remembered in connection with the awards of the Great Exhibition; and is thus gratifyingly associated in art as in blood with the subject of our present notice, whose latest works were in commemoration of that same assemblage of the world's industrial and artistic fruits.

Y

YARRELL, WILLIAM, a celebrated British naturalist, was born in Duke-street, St. James's, Westminster, in June, 1784. His father was a newspaper agent, and to his business his son succeeded, and continued in it till nearly the close of his life. When young he was fond of field-sports, and was not only the first shot, but the first angler of his day. The accurate habit indicated by his superiority in these sports, was the prevailing character of his mind. He was not only the first shot in London, but for many years the first sporting authority upon all that had to do with the habits, locality, and appearance of British birds. It was the same with fish. Not satisfied with obtaining his prey, he examined it, preserved it, and described it, and thus became a naturalist. At the age of forty he became a Fellow of the Linnæan Society, and from this time he gave up the gun and rod for the pen. From 1825 to the year of his death, 1856, he became a constant contributor to the Transactions of the Linnæan Society, and the various Journals devoted to natural history literature. His earlier papers were devoted to birds, as the following titles of some of his first scientific contributions show:—'On the Change in the Plumage of some Hen-Pheasants' ('Philosophical Transactions,' 117); 'On the Occurrence of some rare British Birds' ('Zool. Journal,' II.); 'On the small horny appendage to the upper mandible in very young chickens' (Ibid.); 'On the Anatomy of Birds of Prey' ('Zool. Journal,' III.); 'On the Structure of the Beak and its Muscles in the Crossbill' ('Zool. Journal,' IV.) He was one of the first members of the Zoological Society, and contributed many papers to the Proceedings of the Committee of that body. In the first volume of papers published by the Society, Mr. Yarrell contributed no less than seventeen. They exhibit a wide and accurate knowledge of the forms not only of birds but of fishes and mammals. In these papers his dissections are very numerous, and they are very accurate. This is the more remarkable, as Mr. Yarrell had not the benefit of a medical education nor any further means of instruction than those supplied by his own industry. It was in these earlier papers that he demonstrated the true nature of White Bait, and showed that this pet morsel of the London epicure is a true species of fish, and not the young of the Shad, the Herring, or any other species of fish, as had been supposed up to his time. He did not, however, confine himself to British zoology, many of his papers being devoted to foreign animals, as the following:—'On the Anatomy of the Lesser American Flying Squirrel;' 'On the Woolly and Hairy Penguins of Dr. Latham;' 'On the Trachea of the Stanley Crane;' the subjects of his research being in this case the animals dying in the menagerie of the Zoological Society in Regent's Park. He was always an active fellow of the Society, and one of its vice-presidents at the time of his death. He took a deep interest in the progress and development of the Gardens, as well as in the diffusion amongst the people of a taste for his favourite science. His various papers, amounting to upwards of seventy, the names of which are given in the 'Zoological Bibliography of the Ray Society,' prepared him for the two great works of his life, the histories of British Birds and British Fishes. The 'History of British Fishes' appeared in two vols. 8vo, in 1836. It contained original descriptions, with an account of the habits, and a wood-engraving of every British fish. It was in every way an admirable work, containing accounts of several new fishes, with such descriptions as enabled the naturalist to distinguish them, whilst they were rendered by the agreeable style in which they were written attractive to the dullest of anglers. A second edition of this work appeared in 1851. 'The History of British Birds' appeared in 1843. It was on the same plan as that of the fishes. The illustrations in wood were accurate and beautiful, and highly creditable to the enterprise and taste of his publisher Mr. Van Voorst. No work on this subject since the time of Bewick's 'Birds' has been so popular. In many of his details, especially his picturesque tail-pieces, he imitated his great predecessor, but in point of accuracy of description and the homely truthfulness of his account of the habits of birds Mr. Yarrell has had no equal. At the time of his death Mr. Yarrell was treasurer of the Linnæan Society, and had been elected vice-president during the presidency of Robert Brown. Although one of his earliest papers was published in the 'Philosophical Transactions,' Mr. Yarrell was never made a Fellow of the Royal Society. He was once proposed, but some unworthy objections having been made to his admission he withdrew his certificate, and although in the latter part of his life, the Royal Society would have gladly admitted him amongst its fellows, and his certificate was signed, it was too late, he positively refused. In August 1856 he was attacked with paralysis, but although he sufficiently recovered to make a voyage to Yarmouth, he was seized with another fit on the evening of his arrival, and died on the morning of September 1st, 1856. He was interred at Bayford in Hertfordshire.

YEAST, a substance found on the surface of fermenting liquids, and when removed capable of producing fermentation in other liquids susceptible of this action. On placing Yeast under the microscope it presents a number of cells immersed in a mass of amorphous matter. The cells are sometimes single, and at other times several are united together in a kind of chain. These cells are supposed to partake of a fungoid character, and they have been called the Yeast-Fungus, or Ferment-Cells. A genus and species have been constituted for the reception of this organism, under the name of *Saccharomyces Cerevisiæ*.

This plant has been supposed to be the active cause of fermentation, and the carbonic acid given off during that process has been regarded as the result of the growth of the plant. This seems to be a misinterpretation of the phenomena, as the plant is probably the result of the carbonic acid given off during the process of fermentation rather than its cause. Schleiden supposes that these ferment-cells originate in liquids, independently of other cells, and are truly instances of the formation of cells in a free fluid. He observes, however, that they have no power of reproducing other cells. The whole subject of the nature of these cells, their mode of production, and the history of their development, as well as the phenomena of fermentation in general, require further elucidation.

(Schleiden, *Principles of Scientific Botany; Micrographic Dictionary*, articles 'Fermentation,' 'Torula,' 'Yeast.')

YELLOW COPPER ORE. [MINERALOGY, *S.* 1.]

YOUNG, THOMAS, M.D., was born June 13, 1773, at Milverton, in Somersetshire. He was the eldest of ten children of Thomas and Sarah Young, who were both Quakers. In 1780 he was placed at a boarding-school at Stapleton, near Bristol, and in 1782 was sent to the school of Mr. Thompson, at Compton in Dorsetshire, where he remained nearly four years. During this period he studied, besides Latin and Greek, the French, Italian, and Hebrew languages. After his return home he devoted himself almost entirely to the study of Hebrew, and to the practice of turning and telescope-making, which he had been taught by an usher of Compton school. In 1787 he accepted, in conjunction with Mr. Hodgkin, an engagement as private tutor to Hudson Gurney, grandson of Mr. David Barclay, of Youngsbury, near Ware, in Hertfordshire. There he remained till 1792, devoting his leisure hours to the prosecution of his studies in Greek, Latin, and modern languages, Oriental as well as European, and also to mathematics, algebra, fluxions, natural philosophy, and the 'Principia' and 'Optics' of Newton. Mr. Hodgkin in 1793 published 'Calligraphia Græca,' which he dedicated to Young, who had suggested the work, and furnished the writing.

In the autumn of 1792 Thomas Young removed to London, in order to study medicine by the advice and on the invitation of Dr. Brocklesby, an eminent physician, who was his maternal uncle. Young was by him introduced to Mr. Burke, Sir Joshua Reynolds, and other distinguished men; and he attended the lectures of Drs. Baillie, Cruikshank, and John Hunter. In the autumn of 1793 he entered himself a pupil at St. Bartholomew's Hospital, and in October 1794 proceeded to Edinburgh, still further to prosecute his medical studies. Before quitting London for Edinburgh, he had resolved to give up some of the external characteristics of the Quakers; but the change of habits and associations in a short time led to a total and permanent separation from them. He mixed largely in society, began the study of music, and took lessons on the flute, and also private lessons in dancing, and frequently attended performances at the theatre. In the summer of 1795 he made a tour in the Highlands of Scotland.

In October 1795 he left London, in order to make a tour on the Continent. He took a doctor's degree at the university of Göttingen, and prosecuted his studies there during nine months. In May 1796 he made a tour to the Harz Mountains, ascended the Brocken, and descended some of the deepest mines. After leaving Göttingen, he visited Gotha, Erfurt, Weimar, Jena, Leipzig, Dresden, and Berlin, and returned to England in February 1797.

Almost immediately after his return Thomas Young was admitted a Fellow Commoner of Emmanuel College, Cambridge. Dr. Brocklesby died December 13, 1797. He had fostered the promising talents of his nephew, had provided for the completion of his general and professional education, and now left him by will about 10,000*l.*, and his house in London, with furniture, library, and a choice collection of pictures, mostly selected by Sir Joshua Reynolds. After this, Young resided sometimes at Cambridge, and sometimes at Bath, Worthing, and elsewhere.

Having, in 1799, completed his last term of residence at Cambridge, in 1800 he settled in London, and commenced the profession of medicine. His practice, however, was never large, so that he was enabled to devote much of his time to his favourite literary and scientific pursuits. Several years were then required to elapse between the date of admission of a student at Cambridge and the granting of his degrees in medicine, so that Young did not obtain his degree of M.B. till 1803, nor that of M.D. till 1807. As early as 1799 he had written his memoir, 'Outlines and Experiments respecting Sound and Light,' which was read before the Royal Society, and printed in their 'Transactions.' Other papers 'On the Theory of Light and Colours' followed, which the Council of the Royal Society selected for the Bakerian lectures.

In 1801 he accepted the office of Professor of Natural Philosophy at the Royal Institution, which had been established the year preceding. His first lecture was delivered January 20, 1802. His lectures were not popular. His matter was too much compressed and his style too laconic. In 1802 he was appointed Foreign Secretary to the Royal Society, an office which he held during the remainder of his life, and for which he was well qualified by his knowledge of the principal languages of Europe. He married June 14, 1804. After fulfilling for two years the duties of Professor of Natural Philosophy to the Royal Institution he resigned the appointment.

During his connection with the Royal Institution he delivered sixty lectures, which form the substance of his great work, which was published in 1807, and entitled 'A Course of Lectures on Natural Philosophy and Mechanical Arts,' 2 vols. 4to. This work includes also his optical and other memoirs, and a classed catalogue of scientific publications. A new edition was published in 1845, 'with References and Notes, by the Rev. P. Kelland, M.A., F.R.S., &c., illustrated by numerous Engravings on Copper,' 8vo. These lectures embody a complete system of natural and mechanical philosophy, drawn from original sources; and are distinguished not only by extent of learning and accuracy of statement, but by the beauty and originality of the theoretical principles. One of these is the principle of interferences in the undulatory theory of light. "This discovery alone," says Sir John Herschel, "would have sufficed to have placed its author in the highest rank of scientific immortality, even were his other almost innumerable claims to such a distinction disregarded." The first reception, however, of Dr. Young's investigations on light was very unfavourable. The novel theory of undulation especially was attacked in the 'Edinburgh Review,' and Dr. Young wrote a pamphlet in reply, of which only one copy was sold. He communicated frequently with the French philosopher Fresnel, who entertained views similar to his own on the nature of light. The undulatory theory is now generally received in place of the molecular or emanatory theory. Among the other difficult matters of investigation in which Dr. Young was engaged was that of the Egyptian Hieroglyphics, in which in fact he preceded Champollion. [CHAMPOLLION, J. F.]

In 1809 and 1810 Dr. Young delivered at the Middlesex Hospital a series of lectures on the elements of medical science and practice. In January 1811 he was elected one of the physicians of St. George's Hospital, a situation which he retained for the remainder of his life. His practice there, as elsewhere, is stated to have been eminently successful, but he never became popular. In 1813 he published 'An Introduction to Medical Literature, including a System of Practical Nosology, intended as a Guide to Students and an Assistant to Practitioners,' 8vo. In 1816 Dr. Young was appointed secretary to a commission for ascertaining the length of the seconds' pendulum, for comparing the French and English standards with each other, and for establishing in the British empire a more uniform system of weights and measures. He drew up the three reports, 1819, 1820, 1821. In 1818 Dr. Young was appointed secretary to the Board of Longitude, and on the dissolution of that body he became sole conductor of the 'Nautical Almanac.'

Dr. Young at various times contributed eighteen articles to the 'Quarterly Review,' of which nine were on scientific subjects—the rest on medicine, languages, and criticism. Between 1816 and 1823 he wrote sixty-three articles for the 'Supplement to the Encyclopædia Britannica,' of which forty-six were biographical. In 1821 he made a short tour in Italy in company with his wife. In August 1827 he was elected one of the eight foreign associates of the Academy of Sciences at Paris, in place of Volta, who died in 1826. Dr. Young died May 10, 1829, and was buried in the vault of his wife's family at Farnborough, Kent.

In 1855 was published a 'Life of Thomas Young, M.D. F.R.S., &c., by George Peacock, D.D., F.R.S., Dean of Ely,' 8vo. In the same year was published 'Miscellaneous Works of the late Thomas Young, M.D., F.R.S., &c.: vols. i. and ii. including his Scientific Memoirs, &c., edited by George Peacock, D.D., F.R.S., &c., Dean of Ely, 8vo. 1855: vol iii., Hieroglyphical Essays and Correspondence, &c., edited by John Leitch. These volumes contain all Dr. Young's contributions to the 'Transactions' of the Royal Society; the principal articles furnished for the 'Supplement to the Encyclopædia Britannica;' many essays from Nicholson's 'Journal' and Brande's 'Journal;' some reviews on scientific subjects from the 'Quarterly Review;' and several essays either separately published or dispersed in different publications.

Z

ZAGOSKIN, MIKHAIL NIKOLAEVICH, a Russian dramatist and novelist, was descended from a Tartar family, and was born on the 14th of July (o.s.) 1789, at the village of Ramzay, in the government of Penza. He remained in his native village till the age of fourteen, receiving but a slender education, and learning no language but Russian, but was early remarkable for his literary tastes, reading all he could obtain, and composing a tale at the age of eleven. At fourteen he was sent to St. Petersburg as a clerk in a government office, and continued in that kind of employment till the outbreak of the war of 1812, when he became an officer in the St. Petersburg Opolchenie or Militia, took part in the campaign against the French, was wounded at the battle of Polotzk, and before the close of the war rose to be adjutant to General Lewis at the siege of Danzig. By this time he had acquired some knowledge of French and German, his long dormant literary tastes revived, and not long after he had taken leave of a military life—he sent anonymously a comedy, called 'Prokaznik' or 'The Wag,' to Prince Shakhovsky [SHAKHOVSKY, *S.* 2], director of the St. Petersburg theatre, who had himself just returned to the duties of management, from the command of a regiment of Cossaks. The reply was so unexpectedly favourable, that Zagoskin at once made himself known, and Shakhovsky even procured for him a post connected with the theatre, and another as an honorary librarian at the Imperial library, where we are told that for his services in assisting to arrange the books and to catalogue the Russian ones, he received the Order of St. Anne of the third class. This was the commencement of his career as a dramatist, which he pursued first at St. Petersburg, and after 1820 at Moscow, to which city he was transferred as director of the theatre. He wrote altogether seventeen original comedies, some in verse and some in prose, several of which met with distinguished success, and none failed except the last. The best are 'Mr. Bogatonov, or the Country Gentleman in the Metropolis:' 'Bogatonov the Second, or the Metropolitan in the Country;' 'A Romance on the Highroad,' and 'The Journey Abroad.' It is worthy of remark that till beyond his thirtieth year Zagoskin had not written a line of verse, his ear being singularly insensible to cadence and metre, and that in 1821, on some of his friends laughing at him for pretending to give his opinion on poetry when he laboured under this deficiency, he was piqued into saying that he would show he could write verses after all; and setting doggedly to work, and making progress at the rate of four lines a day, correcting the metre on his fingers, he produced some verses that were not only rhythmically correct, but remarkable for their grace and freedom. After this he frequently wrote in verse, but detested the occupation; and when he determined to write a romance in imitation of Walter Scott, one chief inducement was to enjoy a double freedom from the trammels of rhyme and the rules of the drama. The tale he produced, 'Yurii Miloslavsky ili Ruskie v 1612 Godu' (George Miloslavsky, or the Russians in 1612), 3 vols., Moscow, 1829, delineates the state of Russia at the time that it was nearly conquered by the Poles. The success it met with was prodigious. "The appearance of this romance," says Zagoskin's biographer Aksakov, "made an epoch both in the literary and social career of Zagoskin. The enthusiasm was universal and unanimous; few indeed were there who did not fully share it. The public of both the capitals, and after them, or rather with them, the public of all the provincial towns, fell into raptures. Up to this day (in 1852) 'George Miloslavsky' is read by all Russia that can read, and not without cause; the Russian mind and soul, and even the Russian way of speaking, were for the first time represented in Russia in this Romance." An English translation of it appeared in London in 1834 under the title of 'The Young Muscovite, or the Poles in Russia, edited by Captain Frederic Chamier, R.N.,' and was said in the preface to be 'edited' from a manuscript translation of the book made into English "by a Russian lady of high rank and her two amiable daughters," to which the editors, for it appears that there were more than one, took the liberty of adding "an underplot by which the characters of the chief actors are further developed." Although of course these alterations detract from the value of the book as a picture of Russian life and character, stamped by native approbation as correct, they are not so extensive as to spoil it. Speaking of it from a full perusal of the original, we should say that 'George Miloslavsky' was an amusing third-rate tale, rather unequal in its progress, and falling off sadly towards the end. Zagoskin was hailed as the Russian Walter Scott. For his next tale 'Rostavlev,' a story of Russia in 1812, in which he introduced some of his own adventures, there was an unheard-of competition in the Russian publishing world, 4800 copies were printed, and an enormous price given for the copyright, but it was far from attaining the success of its predecessor. Zagoskin went on writing novels and romances, and in general founding a play on each after it appeared; but the merit and popularity of his works went on diminishing, and none of his subsequent productions was considered to rival 'Yurii Miloslavsky,' or even 'Rostavlev.' He continued to reside at Moscow, where he enjoyed the additional appointment of director of the Armoury of the Kremlin, and was a well-known and popular member of the best society, which his never-failing good humour and disposition to merriment qualified him both to enliven and to enjoy. Almost his only work besides his plays and novels was a collection of essays entitled 'Moskva i Moskvichi' (Moscow and the Moscowers), which ran to three or four volumes. After a tedious illness, originating in gout, which he combated by homœopathy, he suddenly expired at Moscow on the 23rd of June (o.s.)

1852. Soon after his death a life of him by Aksakov appeared in the 'Moskvitianin,' from which the foregoing particulars have chiefly been taken. His best works have an interest both to the native and foreigner from the purely Russian tone of their language and spirit, as indeed in every country the most popular national romance is a valuable clue to the knowledge of national character.

ZAHRTMANN, VICE-ADMIRAL CHRISTIAN CHRISTOPHER, Hydrographer to the Danish Admiralty, entered the naval service of his country as a cadet in the year 1805, and afterwards served as a lieutenant in many arduous and perilous undertakings during the war which terminated in 1815; acquiring the character of being one of the most able and accomplished officers of the Danish navy. At the general peace he betook himself entirely to geodetical and hydrographical labours; among which he assisted the late Professor Schumacher in the measurement of the Danish arc of the meridian. After a cruise to the West Indies, during which he made a chart of a portion of their seas, and set up an observatory on the island of St. Thomas, he was appointed successor to Admiral Lövernörn as director of the Hydrographic Office at Copenhagen. In this capacity, notwithstanding much prejudice respecting the publication of documents, he brought the labours of his department in an available form before the world, and with the highest degree of finish and exactness. The works, so important to the navigators of all nations, on which his fame rests, are the charts of the coast of Denmark, with accurate soundings between the numerous islands, accompanied by determinations of the currents and trigonometrical surveys of the coast. His chart of the North Sea (1843) was indeed the greatest boon to all seamen, and to those of Britain in particular; whilst the 'Danske Lods' (Danish Pilot), which is a complete description of all the seas surrounding Denmark, has been found so useful that it has been translated, under the direction of Admiral Sir Francis Beaufort, F.R.S., late Hydrographer to the British Admiralty, into both the English and French languages. He was also master-general of the naval ordnance of Denmark, inspector of the chronometer bureau of Copenhagen, and a chamberlain of his sovereign, as well as a knight grand cross of the order of Dannebrog and Dannebrogsman, and a knight of four foreign orders, Russian, Prussian, French, and Greek.

Admiral Zahrtmann died suddenly on the 15th of April, 1853, in the sixtieth year of his age. The estimation in which he was held by his countrymen was evinced by the attendance at his funeral of the princes of the royal family, the ministers of state, the corps diplomatique, and many officers of the naval, military, and civil services.

He was an honorary member of the Royal Geographical Society of London, and communicated to that Society, in 1830, shortly after its foundation, an account of Danish discoveries on the East Coast of Greenland in the preceding year: a translation of his official report on which, sent to the Geographical Society of Paris, appears in the first volume of the Journal of the former Society. In the same work, vol. v., is an elaborate paper by him entitled 'Remarks on the Voyages to the Northern Hemisphere, ascribed to the Zeni of Venice;' in which, communicated to the society in 1835, he arrives at the conclusion that these voyages, at least in the main points, are mere fabrications.

ZANTHORNIS. [STURNIDÆ.]

ZARAGOZA. [SARAGOSSA.]

ZEALAND, NEW, a British colony in the Pacific Ocean and in the southern hemisphere, consists principally of two large islands, separated from each other by a wide strait called Cook's Strait. There is also a much smaller island south of the two others, besides several islands, or rather islets, scattered along the shores. The more northern of the two large islands is called by the natives Te Ika a Maui, "The Fish of Maui," from a legend of its having been fished up out of the sea by Mani. It has been named New Ulster, but is generally called North Island. The native name of the other large island is Te Waki Pounamu, "The Place of Pounamu," that is, of jade, used by the natives in forming their instruments of war. This island has been named New Munster, but is generally called Middle Island. The small island has been named New Leinster, but is mostly called South Island, or Stewart Island. The islands lie between 34° 25′ and 47° 20′ S. lat., 166° and 178° 35′ E. long. The two large islands are about of equal length, and the entire length of the two is about 1000 miles. The width varies from a few miles to 250 miles. Stewart Island is about 60 miles in length and 60 in width. They are about 1200 miles eastward from Australia. The European population, according to the census taken in 1851, was 26,656, of whom 14,996 were males, and 11,660 females. The European population is now estimated at 40,000. The native population is estimated at from 80,000 to 100,000, of whom by far the largest number are inhabitants of North Island.

The British government in 1852 purchased the claims of the New Zealand Company for 268,370*l.*, to be paid out of the sale of waste lands in New Zealand. In the same year, by an Act of the British parliament (15 & 16 Vict. c. 72), a constitution was granted to the colony, the legislative and administrative powers being vested in a Governor, Legislative Council, and House of Representatives. The seat of government is at Auckland. The colony is now divided into six provinces—Auckland, Wellington, and New Plymouth, in North Island; Nelson, Canterbury, and Otago (or Otako) in Middle Island. Each province is placed under the management of a Superintendent and Provincial Council.

The colony has now four bishoprics—the bishopric of New Zealand, created in 1841, the bishopric of Christchurch, created in 1856, the bishopric of Nelson, created in 1857, and the bishopric of Wellington, created in 1858.

In 1849 the revenue was 48,589*l.*; in 1850 it was 57,743*l.*; it is now (1858) about 200,000*l.*, the customs' duties amounting to 100,000*l.*, and the land sales 80,000*l.* to 90,000*l.*

The greater part of the commerce of New Zealand is inter-colonial, but in 1856 the imports into Great Britain amounted to 100,000*l.*, and the exports from Great Britain to New Zealand, during the same year, were valued at 300,000*l.* The principal staple is wool, of which, in 1849, only 487 bales were imported from New Zealand into Great Britain, but in 1857 the import amounted to 8325 bales. Wheat is exported in large quantities to Australia, and also maize, but the maize-crop is not so certain as that of wheat. Potatoes are grown extensively, as well as kumeras (the native sweet potatoes). All the cereals and vegetables of temperate climes flourish. Water-melons, Cape gooseberries, figs, and oranges, thrive in the open air. Whale oil and whalebone are exported, but not so largely as formerly. A large quantity of kauri-gum is imported into Great Britain. It is a resinous exudation from the kauri-pine. The New Zealand flax (*Phormium tenax*) has not yet become a successful article of commerce. A better method of cleaning and dressing it remains yet to be discovered. Wood is abundant on North Island, but is very scarce on Middle Island. The mean annual temperature at Auckland is 58·43° Fahr., at London is 50·39°, at Naples is 61·40°. The mean temperature of the hottest month (January) is 67½° Fahr., and of the coldest month is 51¼° Fahr.; at London the mean temperature of the hottest month is 64°, and of the coldest month 37°. Little is known of the mineralogy of New Zealand. In October 1852 gold was discovered at Coromandel, about 40 miles E. from Auckland, on the peninsula forming the eastern side of Hauraki Gulf, between the harbours of Waihou on the western side and Mercury Bay on the eastern side. Gold has since been discovered in Nelson Province, and diggers are at work there. The whole quantity obtained has not hitherto been very large. Specimens of quartz-rock have been found exceedingly rich in gold. Copper has been found and wrought to some extent, but no lead or silver. Both islands contain coal, which is found at the surface, but mining for it has not yet been attempted.

The chief towns and villages in the colony of New Zealand are the following:—

Auckland, the seat of the government of the colony, is built on the southern shores of the harbour of Waitemata, which opens into the Gulf of Hauraki. The harbour has sufficient depth for vessels of considerable burden. The town stands on cliffs of sandstone of moderate elevation, backed by rising ground. Several volcanic cones rise in its immediate neighbourhood, at the base of which are hard scoriæ, fit for buildings and roads, and easily worked; the sandstone of the cliffs, though soft, hardens by exposure to the air, and is also a good building material. Some of the caves that occur in the cliffs have been used by the natives as places of sepulture, and the bottoms are covered with human bones. The houses in the town are mostly of wood. The town is situated in a part of the island where the soil, though light, is fertile and easily cultivated, and it has an easy communication with all the countries both to the north and to the south. Many of the English, who settled on the island before the foundation of the colony, reside in the harbours north of Auckland, and a great number of small coasting-vessels visit Auckland. Around Auckland are four pensioner-villages for discharged soldiers. Auckland was incorporated as a borough on July 29th, 1851, the district by which it is formed extending 16 miles in length, and from 5 to 7 miles in width. It is divided into 14 wards, of which three are in the town itself. The Tamaki Creek intersects the borough, is navigable for boats, and is made available for the commerce of the district. The borough is governed by a mayor, aldermen, and burgesses. The principal buildings in the town are—St. Paul's church, a handsome building; two sets of barracks built of scoriæ; a public hospital; a market-house; a native hostelry; public washing, bathing, and drying grounds; several chapels; and a bank. There are also several bridges, wharfs, and landing-places. The governor's residence and the bishop's are closely adjacent, and four miles from the town, on the banks of the Tamaki, is St. John's College. There is a church at each of the pensioner-villages mentioned above. The population of the town is about 4000; in the district in 1851 there were 8840, of whom 4921 were males, and 3919 females. The flag-staff of the barracks is in 31° 51′ 27″ S. lat., 174° 45′ 20″ E. long.

Wellington, the principal settlement of the New Zealand Company, founded in 1840, is on the shores of Port Nicholson, in the island of New Ulster, but for government purposes the town and the whole of the district are comprised in the province of New Munster. Port Nicholson lies in 41° 15′ S. lat., 174° 47′ E. long.; it is surrounded by mountains, except at the alluvial tract through which the river Hutt, or Eritonga, reaches the sea. These mountains rise abruptly from the water's edge, except in the most south-western corner of the harbour, where a strip of flat land extends at their base, about one-third of a mile broad and two miles long, the soil of which is composed of sand, shells, shingle, and vegetable earth. On this flat ground, which surrounds that portion of Port Nicholson called Lambton Harbour, the town of Wellington has been built. It extends about three miles in the form of a semicircle round the harbour. The flat ground not being considered sufficient for the town, the hills south of it were included. As these hills are generally too steep to build on, only the more convenient parts were selected for that purpose, and thus the most distant points of the town are nearly four miles from the harbour. In 1848 there were 525 houses, of which 45 were of brick or stone, 303 of wood, and 177 of clay and wood, or other materials. Other houses, and large warehouses of brick have been constructed since, near the wharfs and jetties, which have been built so that vessels of 70 tons can unload alongside of them. There are two churches, and an Episcopal chapel, a Presbyterian chapel, five Wesleyan chapels, three other Dissenting chapels, and one Roman Catholic chapel, with a Roman Catholic bishop; there are also an hospital, a bank, a savings bank, a mechanics institute, a horticultural society, a custom-house, an exchange, a jail, two sets of barracks, and the residence of the lieutenant-governor. There are also 38 schools of various kinds. Most of the public buildings are of wood only. The population of the district in 1851 was 5722, of whom 3135 were males and 2587 females. The town is well supplied with water by streams which run through it; it is lighted at night by lamps, which every public-house is compelled by the terms of its licence to keep burning; the streets are not paved, but excellent roads have been made in several directions along the coast to the valley of the Hutt, and towards that of Wairarapa. Two newspapers are published in the town. Three cemeteries have been provided, all of them at some distance outside the town, one for the Jews, one for Roman Catholics, and the other, a large one, picturesquely situated, is used by all the Protestant sects, European and native. The harbour is safe and has good holding ground. In 1855, the vessels registered at Auckland, or belonging to it, consisted of 3 steamers, 41 foreign-going vessels (6618 tons total burthen), 75 coasters belonging to English owners, 49 coasters belonging to native owners, and 158 small craft averaging 10 tons, of which 34 belonged to native owners, besides innumerable canoes 10 to 70 feet in length.

Akaroa is a small settlement formed, in 1840, by the French, who had attempted to land in the Bay of Islands, but were prevented by Governor Hobson; and under his direction, and accompanied by an English magistrate under the British flag, they were settled at Akaroa. Akaroa is near the south-east point of Banks Peninsula in New Munster, in 43° 52′ S. lat., 173° E. long. The harbour is an inlet 7 miles in depth, with steep shores, and has a bar at the entrance, but it is perfectly landlocked within, though exposed to furious gusts from the highlands around it, and there is 14 fathoms water inside the harbour. The town contains a church, the residence of the magistrate, a jail, and the cottages of the inhabitants, who are chiefly agriculturists. *Bay of Islands*, at the northern end and east coast of New Ulster, was originally the seat of a whaling station, and was at first selected by Governor Hobson for the site of the capital, but was abandoned in favour of Auckland. Two towns however sprung up, Russell and Kororarika; the first was burnt down and the inhabitants expelled by Heki, and from the other they withdrew to Auckland. Still some Europeans have kept their position here, and the government returns state the population as 400. *Canterbury* is the name of a settlement in New Munster, first founded in 1849, upon strictly Church of England principles, and with a large ecclesiastical establishment. It comprises the whole of Banks Peninsula, and a large district running back westward to the range of mountains, and extending along the eastern coast for a direct length of about 100 miles. The population in 1850 was estimated in the government returns at 1600; but Mr. Fox, in his 'Six Colonies of New Zealand' (1852), gives the number at 3734; and two towns had been formed, Lyttelton, at Port Victoria, and Christchurch, on the plains, where temporary churches had been built, and a College and schools founded. *Kaitaia* is a native village, and a missionary settlement in New Ulster, in the valley of the Awaroa, a few miles S.W. from Doubtless Bay, and 8 miles from the western coast. The natives in the valley are estimated at 8000. The village is extremely picturesque, and much resembles an English one. There is a large church, with a wooden steeple, the work almost entirely of native builders; the houses are adorned with gardens in front, where roses and other flowers are cultivated; as are also various fruit-trees, the vine, vegetables, and some tobacco; they grow wheat and hops, and they have cut a road 32 miles long through the forest to Waimate on the Bay of Islands. *Monganui* is a small settlement on an excellent harbour within Doubtless Bay, on the eastern coast, towards the northern end of New Ulster. *Motueka* is a native village, with a slight admixture of Europeans, about 50 miles E.N.E. from Nelson. In this village, of which the population is about 1400, agriculture seems to be the chief pursuit, though lying close on the shore of Queen Charlotte Sound in Cook Strait. *Nelson*, situated on Nelson Harbour, in Blind Bay, New Munster, on the southern side of Cook Strait, in 41° 15′ S. lat., 173° 16′ E. long., was the second settlement of the New Zealand Company, and was made in 1843. The port is a good one, but the district is chiefly agricultural. The population of the whole district, which is extensive, amounted in 1851 to 4287, of whom 2317 were males, and 1970 females. There are in the town one church, one Wesleyan chapel, two other chapels for Dissenters, and one Roman Catholic chapel. There are three other churches and six chapels at various villages. We have noticed the great extent of sheep farming in this district, and as the pastures lie wide it has led to the construction of a great length of road; from 60 to 70 miles have been already formed, and a communication by land has been opened with Canterbury, a direct distance of about 170 miles, to Lyttelton. Coal exists in great abundance in the vicinity; one seam at Nelson and one at Waikati have been worked for some years, and in the latter end of 1852 a new seam of superior quality was discovered by a landslip at South Wanganui, at the north-west corner of the island, about 60 miles from Nelson in a direct line by land, but easily accessible by sea. Copper is also found near the Dun Mountain, about 8 miles from Nelson. *New Plymouth*, in New Ulster, is situated between two small streams, the Huatoki and the Henui, near their entrance into the sea, on the northern side of the peninsula of which Cape Egmont is the western termination, and in the midst of which stands the extinct volcano of Mount Egmont. There is no harbour properly so called, as the rivers are not navigable, and the mouths are small, nor is the roadstead a secure one. But this is the only drawback, for the country around has been called the garden of New Zealand. The land is so dry and so level that good roads are made with but little trouble, and the soil is the most fertile of any yet cultivated in New Zealand. The settlement was founded in 1841. In 1851 the population was 1532, of whom 845 were males, and 687 females. The town fronts the sea about half-a-mile from the beach, lying scattered on the slope of a hill, and contains two churches, one of them of stone, a Wesleyan chapel also of stone, two other Dissenting chapels; a jail, schools, and some other buildings, all constructed of wood; and there are a brewery and three flour-mills. Several bridges have been formed over the various small streams that descend from the sides of Mount Egmont and traverse the country. Iron and coal exist in the neighbourhood. Coal is found in abundance near the Mokau River, about 50 miles N. from New Plymouth. *Otago*, in New Mnnster, is the district in which a settlement has been made by members of the Free Church of Scotland. It is towards the southern end of the island, on the eastern coast. The town named *Dunedin* is on the Molyneux River, which has been re-named the Clutha. The harbour formed by the month of the river is an excellent one; it is 13 miles long, and averages 2 miles in width; but the channel had difficulties which have been guarded against by laying down guiding buoys. The settlement was made early in 1848; in 1851 the population was 1740, of whom 994 were males and 746 females. The chief town, Dunedin, stands at the head of the harbour, and another has been formed nearer the month, named *Port Chalmers*, which lies in 45° 46′ S. lat., 170° 43′ E. long. There was in 1848 only one place of worship, a Free Church chapel; but in 1850 the number of adherents to that doctrine barely reached a majority. The Clutha is a fine river, and, though difficult of entrance from a bar and consequent surf at its month, is said to be navigable for 60 miles for vessels of considerable bnrden. Coal is found at Coal Point, abont 10 miles N. from the mouth of the Clutha, and at a spot within a quarter of a mile of the left bank of the Clutha, about 4 miles inland; traces have also been found in other places. A kind of green serpentine or jade is found here. *Otaki* is an exclusively native village on the western shore of Cook Strait, about 50 miles N.N.E. from Wellington, and was the village where the celebrated Rauperaha lived, and where he died. The church missionaries have taken much interest in this village, and not without snccess. Mr. Tyrone Power ('Sketches in New Zealand') describes it in 1848 as consisting of "houses neatly built, in the midst of well-fenced gardens; and there is abnndant proof of prosperity in the number of pigs, cattle, and horses feeding about." The houses are of Maori architecture, with English doors, windows, &c. Mr. Power adds, that several of the chiefs kept a banking account at Wellington, and relates a story of one of them asking an English officer to cash a cheque for him, having immediate occasion for money, which was dene, and the cheque duly honoured. Rauperaha, after peace was restored, exerted himself greatly in forwarding the building of a church, which was done entirely by the Maories. It is only of timber, but it is the largest building they have evér yet erected, being 300 feet long, and in the churchyard attached to it Rauperaha was buried in 1849 with due Christian rites. His son is still the acknowledged chief, and is described as dressing in black, and looking like a clergyman. The population in 1850 was 664. *Petre* is a small but flourishing little place on the west coast of New Ulster, and on the right bank of the Wanganui River, 4 miles from its mouth, and about 100 miles N. from Wellington. The population in 1850 was 452, of whom 276 were males and 176 females. It consists of about 40 houses, a church, a school, a post-office, and a small jail, all of wood. It was founded in 1842, soon distinguished itself by its agriculture, and acquired a great local reputation for its hams and bacon. In 1847 however an unfortunate quarrel with the natives of the valley led to the destruction of the place. On peace being restored the colonists returned, and resumed their occupations successfully. A small detachment of military is stationed at Petre. *Putikiwaranui* is a native village on the Wanganui, opposite to the town of Petre. It has about 2000 inhabitants, but the whole number in the district probably amounts to 5000. The inhabitants have now applied themselves sedulously to industrial pursuits, bringing their produce down the Wanganui in canoes, which they manage with great dexterity down the rapids, with a cargo sometimes weighing a ton, and contrive even to ascend them with their canoes light. *Waikenae* is a native village abont 20 miles S. from Otaki, at the mouth of a small river of the same name. It is in the same style as Otaki, but smaller. In this village one of the natives set up an ordinary—an unlimited dinner for a shilling; but as his fellow-citizens prepared themselves for it by fasting the whole of the previous day he found it unprofitable, and restricted the meal to two pounds of pork, two pounds of potatoes, and a pint of coffee. It has a timber church—like a huge barn, says Colonel Mundy ('Our Antipodes')—and the military coast-road from Wellington passes through it. *Wangaroa Bay* (celebrated as being the scene of the massacre of the crew of the Boyd in 1809) is about 25 miles N. from the Bay of Islands in New Ulster. The entrance to the harbour is narrow, between steep rocks of great height; but the water is deep, and the inner harbour is very spacious, and sheltered from all winds. The country around is mountainous, and not adapted for cultivation; bnt the hills are covered with timber, among which the Kauri pine was particularly abundant, but has been much thinned. A few Europeans are settled here, and there is a native village of about 2000 persons, with Protestant and Roman Catholic missions, both persuasions having chapels. Timber is still occasionally exported, and some small craft have been built here.

Abont 20 newspapers are published in New Zealand, at Auckland, at Wellington, at Nelson, at Dunedin, and elsewhere. Several of them are issued twice a week.

ZETLAND, the ancient name of the SHETLAND ISLANDS, and still occasionally applied to them. Shetland was called by the Norwegian colonists Hjaltland and Healtland, which became changed into Yetland and Zetland. From this name the late Lord Dundas, one of the principal proprietors of Shetland, took the title of Earl of Zetland wheu elevated to that rank in the peerage in 1838. The name is also retained in the title of the lord-lieutenant and sheriff of Orkney and Zetland.

ZEUS, a genus of Fishes belonging to the family *Scomberidæ*. The Boar-Fish of English writers is referred by Jenyns and others to this genus, but Cuvier, Lacépèdo, and Yarrell, refer it to *Capros*. [CAPROS.]

ZEUZERA, a genus of nocturnal *Lepidoptera*. The male antennæ are furnished at the base with a double row of teeth, which are terminated by a thread: those of the female are single at the base.

Z. Æsculi, the Wood-Leopard, is a rare species, of a white colour, with numerous steel-blne spots. The larvæ are found in the interior of decaying trees.

ZHUKOVSKY, VASILY ANDREEVICH, a Russian poet of the first order of eminence, was born at the village of Mishensky, about two miles from the town of Bielev, in the government of Penza, on the 29th of January (O.S.), 1783. The year of his birth, which has often been differently stated, is given on his own authority as reported by Sneguirev. At a very early age he lost his father, and he was chiefly brought up by his mother, grandmother, and aunt, in a household which contained nine girls and three young women, and in which he was the only boy. At school he had at first the reputation of being lazy and very averse to dry studies, while at home his good looks and good nature made him a general favourite. He formed all the girls into a troop of actors, and at an early age got up a play of his own composition, 'Camillus, or Rome Preserved,' in which he acted the part of the hero with great applause from the neighbours who were invited to the performance. At the age of thirteen, on the subject of 'Hope' being given him for a theme at school, he produced an exercise of such excellence that it has been inserted as a classical piece in several Russian compilations of the nature of Enfield's 'Speaker.' At the age of fourteen he began to appear in print by contributing to one of the Moscow periodicals under the signature of the 'Hermit of the Mountain;' and it was remarked, that while gay and lively in society, he was disposed in composition to be mild and meditative. His time appears to have been divided for some years between different towns in winter and his native village in summer; and while at the schools of Tula and Moscow he gradually won his way into notice and distinction by proficiency in study, at the village of Mishensky, which was picturesquely situated on the banks of the Oka, he cultivated his talents for poetry, music, and drawing, for all of which he had a natural gift.

It was at a house within sight of the church and churchyard of Mishensky that he wrote his translation of Gray's 'Elegy in a Country Churchyard,' the first production of his pen which made an impression on the public. Gray's 'Elegy' is at this moment the most universally known and universally popular piece of poetry in existence. Bowring, in 1821, mentioned that he had seen a collection of more than one hundred and fifty different versions, and among them Zhukovsky's is undoubtedly one of the best. This fortunate translation, which was published in 1802, was, like Moore's 'Anacreon,' the foundation of a fame which encircled its author for a succeeding half century. It first appeared in the 'Viestnik Evropui,' or European Intelligencer, then the leading periodical of Russia, of which Karamzin, its most popular author, was at the time the editor, and it introduced him at once to the friendship of Karamzin and Dmitriev, and a position amid the best literary society of Moscow. A few years later, in 1808 and 1809, Zhukovsky became himself the editor of the same periodical, but he soon relinquished the employment, though he had now devoted himself to a literary career. In the war of 1812, both Karamzin and Zhukovsky were anxious to bear arms, but the bodily infirmities of Karamzin would not allow him to sit on horseback, and Zhukovsky took leave of him at Moscow at the house of Count Rostopchin, where he was residing, to hasten to the ranks of the army. As a lieutenant of the Moscow volunteers, Zhukovsky fought at the great battle of Borodino, and he took an effective part in the subsequent memorable campaign, both as a bard and a soldier. It was in the former capacity however that he most distinguished himself; his 'Minstrel in the Russian Camp,' a series of songs on the war, created unbounded enthusiasm among the soldiery, were struck off at a military printing-press, and circulated and sung throughout the army. The poet, however, unaccustomed to the fatigues of a military life, was attacked by fever, and obliged to quit the army early in 1813. The Empress mother, Maria Theodorovna, who had been delighted with his poems, was anxious to see and reward the 'Minstrel;' a splendid edition of the work was issued with a poetical epistle to herself, and Zhukovsky, who had been decorated with the order of St. Anne for his military services, received from the Emperor Alexander a pension for life of 4000 rubles. For some years afterwards his time was chiefly spent at court at St. Petersburg in the enjoyment of imperial favour, of great success in society, and till the rise of the Russian Byron, Pushkin, of the reputation of being the first poet of Russia.

His most popular productions in this his most productive period were a number of ballads, a species of composition which he was the first to introduce into Russian literature. His first poem of the class, 'Ziudmilla,' an imitation of Bürger's 'Lenore,' startled the Russian public into a burst of enthusiastic admiration. He afterwards treated the same subject with variations in a poem entitled 'Svietlana,' which is still considered his masterpiece, and finally he translated 'Lenore' itself simply from the German into Russian. Almost all his subsequent ballads are founded on foreign originals, and constitute what some of the Russian critics are fond of calling the "inimitable imitations" of Zhukovsky. But how far the imitation extends it is not always easy to ascertain, for in most cases he takes the liberty of suppressing the name of the original author. The reader who is acquainted with the poetical literature of England, France, and Germany, in looking through the ballads of Zhukovsky, is continually meeting with old faces and old favourites. From Southey alone, the Russian poet borrowed, without the mention of Southey's name, 'Queen Orraca and the Five Martyrs of Morocco,' 'Rudiger,' 'The Old Woman of Berkeley,' and 'Lord William,' the title of the last of which he altered to 'Varvik,' the nearest approach which the Russian alphabet allows to the English 'Warwick.' Still more strangely, while the ballad of 'Smailholm Tower' is acknowledged to be taken from Walter Scott, a tolerably close version of the condemnation of Constance, from the second canto of 'Marmion' is presented to the reader of Zhukovsky's works, as 'The Trial Underground, a fragment of an unfinished poem.' This mode of proceeding is not confined to Zhukovsky, and seems to be in accordance with the Russian code of literary ethics: as, though the native critics must be aware of the fact, we have never seen it mentioned with blame. How apt it is to mislead, may be shown from the example of Merimée, who, in his life of the false Demetrius, speaks of the beauty of the Polish ladies as being so remarkable as to have drawn from the Russian Byron, Pushkin, the very curious compliment paid to it in the ballad of 'The Three Sons of Bodrye,' quite unaware that the ballad in question has been transferred without acknowledgment from the Polish Byron, Mickiewicz.

Leaving their origin out of view, the ballads of Zhukovsky are beautiful specimens of animated narrative, and in his own poem of 'Svietlana' (which has been translated into English by Bowring) there is a power and force of what is now called 'word-painting,' which have rarely been equalled in any language. In his first romantic poem, 'Ruslan and Liudmilla,' Pushkin showed a similar power, and Zhukovsky sent a present of his works to him with the inscription, "From the conquered teacher to his conquering pupil." They became intimate friends, and around them were grouped for several years all the most eminent literary society of St. Petersburg, which was in the habit of meeting at Zhukovsky's house. All shades of opinion were represented. Zhukovsky, a favourite at court, was a contributor to 'The Polar Star,' edited by Bestuzev and Ruilyeev, who afterwards perished on the gallows and in exile for their conspiracy against the Emperor Nicolas. Zhukovsky became more and more connected with the imperial family. When the Grand-Duke Nicolas married a Prussian princess, he was selected to teach her the Russian language; and when Nicolas became emperor, and the offspring of the marriage, the hereditary prince, was of an age to require a preceptor, Zhukovsky was appointed to the office. This withdrew him for some years from the active pursuit of literature, but enabled him in various ways to act efficiently for the benefit of his literary brethren. It was by the influence of Zhukovsky that Hertzen was allowed to return from exile, and that Mickiewicz [MICKIEWICZ, *S.* 2], the Polish poet, obtained permission to quit Russia, which he had entered as a captive. He too had probably a hand in obtaining a pension for Pushkin's widow after the decease of her husband, whose death he witnessed and described, but in a letter singularly jejune and destitute of his usual fire. It was remarked that, by a singular coincidence, the death of Pushkin took place on Zhukovsky's birthday, the 29th of January (O.S.). When the hereditary prince, now (1858) the Emperor Alexander II., made extensive tours through the vast empire which was to fall under his sceptre, Zhukovsky acted as his Mentor, and he also accompanied him in his visit to Germany, Italy, and England. The poet had made tours in Germany and Italy before, but to England this was his first visit; and though some of his poems had been translated by Bowring, and noticed by Byron, it is probable that the "Minstrel in the Russian camp" was recognised by few under the disguise of the French appellation on his cards—"M. de Joukoffsky." On his visit to the British Museum however, one of the assistant-librarians, who was a student of Russian literature, had the satisfaction of showing him an edition of his works which had just been added to the national library. Shortly after the prince's return to Russia, his preceptor's functions ceased. Zhukovsky's health had for some time been indifferent, and he transferred his residence to Germany, a country of which it is said he was "passionately fond," to have the benefit of the waters. He had always been a panegyrist and an admirer of domestic life, but he had now attained his fifty-ninth year and was still a bachelor. The Hereditary Prince in his European tour had been in search of a wife, and on the 28th of April 1841 he married the present Empress of Russia, the daughter of the grand-duke of Hesse. Within a month the preceptor followed the pupil's example. On the 21st of May 1841, at a little Russian chapel on a hill near Canstadt, which was erected over the remains of a Russian princess who had been queen of Wirtemburg, he was married to a beautiful girl of the name of Reutern, the daughter of an old officer and native of one of the Baltic provinces. Six years afterwards he wrote to a friend in raptures at the domestic happiness which had fallen to his portion. He chiefly passed his time at a retreat in the neighbourhood of Düsseldorf, and amused himself with translating into Russian poems by

Ferdnci and Homer. Two ohildren, both boye, were the offspring of the marriage, and his ohief delight was in superintending their ednoation, which he wished that his life might be prolonged to his eightieth year to see completed. Neither this wish nor that of revisiting Russia was fulfilled. On the 12th of April 1852, Zhukovsky died, calm and reeigned, at Baden, in the bosom of his family. His remains were afterwards removed to his native country.

An edition of Zhnkovsky's works which appeared at St. Petershurg in 1835-37, fills eight octavo volumes, and three additional ones were published under the title of 'New Poems' in 1849. Only one of these eleven volumes consists of prose, the remainder are all either original or translated poetry. Among the prose the palm is generally given to a tale entitled 'Marina Roshcha' (Mary's Grove), the name of a favonrite resort of the inhabitants of Moscow, which ever since the tale appeared has been regarded in the light of a classic spot. There are some fragments of a diary kept by Zhukovsky on his tours in Italy and Germany, which are singularly vivid, but nothing apparently has been pnblished from his pen of his visit to England. Among the poems 'Svietlana' is the masterpiece, and he is often called by his admirers 'the poet of Svietlana.' One of the volumes is occupied with a poetic version of La Motte Fonqué's 'Undine,' and most of another with a version of Schiller's 'Maid of Orleans,' in both of which Zhukovsky is thonght by Russian critics to have surpassed the originale. His later works consist almost entirely of translations, one from the 'Shah-Nameh,' into a metre not in the least resembling that of Ferdnci, the other from the 'Odyssey' of Homer, into hexameters. Zhukovsky informs us in the preface that, not understanding a word of Greek, he had composed his version by means of an interlineary translation of the original which a German professor (Grashof) had been kind enough to make for his exolusive benefit, and candidly admits that to the question "if he has succeeded" he can make no answer, as he can be no fair jndge, not being able to make a comparison. Those who can make it are not likely to be satisfied with his success. Considering the genius of Zhukovsky, and the great reeemblance in many points of the Greek and Russian languagee, the difference between the exqnisite beauty of the original and the unpleasing abruptness in the copy is very striking. In addition to the translations from the English that have been already noticed, it may be mentioned that Zhukovsky also rendered into Russian the 'Alexander's Feast' of Dryden, Moore's 'Paradise and the Peri,' which he entitled 'The Angel and the Peri,' Byron's 'Prisoner of Chillon,' and numerous other pieces, some of which bear the namee of the original authors.

A critical essay on Zhukovsky by Sneguirev appeared in the 'Moskvitianin' for 1853, and has been separately pnblished. It is accompanied by a minute chronology of all his writings by Tikhonravov.

ZOARCES, a genus of Fishee belonging to the family *Gobiadæ*. It has an elongated body, covered with a mucous secretion; the head is smooth, muzzle blunt; ventral fins situated before the pectorals; dorsal, anal, and candal fins united; all the fine very thick; vent anterior to the middle of the body, its situation marked by a tubercle; teeth conical, placed in a single row; branchiostegous rays six in number.

Z. viviparus, the Viviparous Blenny, differs from the other British Blennies in the circumstance to which its name refers—that of bringing forth its young alive, which seem perfectly able to provide for themselvee the moment they are exclnded. The ventral fins of this fish assume the appearance and perform the functions of the legs of higher animals. It is said to use these limbs for the purpose of climbing on the rocks ont of the water, where it will remain exposed to the air for some time, thus forming an approach to the reptile forms of life. When boiled, the bones of this fish are green; hence its name of Greenbone.

ZOSTERACEÆ, *Sea Wracks*, a natural order of Endogenous Marine Plants, reeembling sea-weede, and living among them. The species have grassy thin leavee, sheathing at the base. The flowers are very minnte, absolntely naked, or surrounded by three scales. If we are to find anywhere a poeitive intercalation of flowering with flowerless plants, it is here, where, with naked flowers bnt distinct sexes, the pollen is in a condition that may be compared to the elaters of *Marchantia* and its alliee, and totally different from all that is known of other flowering plants. The habit too is quite that of sea-weeds. The manner in which fertilisation takee place among these plants is unknown. The bottom of the ocean is their locality, and they occur from the North Sea to the Mediterranean, the Indian Ocean, and the coasts of Arabia. One species only is seen on the shoree of Australia, and another in the West Indies.

Zostera marina, the Sea Wrack, is a British speciee, and is nsed as a common material for packing, and for stuffing cottager's cushions; it has also been used medicinally as a poultice.

ZOUGA, River. [AFRICA, *S.* 2.]

ZSCHOKKE, JOHANN HEINRICH DANIEL, was born at Magdeburg in Prussia on March 22, 1771, and received the earlier part of his education in the Klosterschule and in the gymnasium of that town. When only seventeen he quitted his school and family, and became play-writer to a troop of strolling-players. In a short time however he returned to his family, and was sent to the university of Frankfurt-on-the-Oder, where, withont any settled plan, he studied philosophy, theology, the fine arts, history, and finance. In 1792 he commenced private teaching in Frankfurt, bnt with little success; and he employed most of his time in writing for the stage, where his 'Abällino, the Bandit' (of which the story wae borrowed by Monk Lewis for his 'Bravo of Venice'), and 'Julius von Sassen,' produced at this period, were favourably received. But he also wrote against a government edict respecting religion, and therefore when, in 1796, he applied for a professorship it was refused him. He then left Frankfurt, travelled abont Germany and France, and at length settled at Reichenau in the Graubundten, where, in conjunction with Tscharner, he established a boarding-school for boys, which was so well condnoted that the canton presented him with its freedom as a burgher, and he evinced his gratitude by writing his 'Geschichte des Freistaats der drei Bünde in Rhäeten' (History of the Free State of the Three Leagues in Rhætia), which was published in 1790. This is an account of the early associations of the canton for the establishment of its liberties, and was the precursor of several other works on the history of Switzerland. In that year however the Canton of Graubundten declined to join the Helvetic repnblic eetablished under French influence; Zschokke was in favour of the union; he became unpopular, and his school was the sacrifice. Austrian troope entered the canton, and Zschokke withdrew to Aarau, where the central government of the Helvetic repnblic was then fixed. His repntation, his talents, and his political opinions, procured him employment under the government. He was made chief of the department of ednoation, and was sent in the capacity of a fully empowered government commissioner to settle the affairs of Unterwalden, then suffering from the devastations of a foreign enemy and the effects of party violence, where he acted as a true benefactor and a restorer of peace. A memorial of this remarkable period is given in his 'Historischen Denkwürdigkeiten der Schweitzerische Staatsumwälzung' (Historical Memoirs of the Swiss Revolution). His commission was subseqnently extended over the cantons of Uri, Schwytz, and Zug, and his appeals for the help of the miserable eufferers remain in proof of his powers of eloqnence. During this time he wrote his 'Geschichte vom Kämpfe und Untergange der Schweitzerische Berg- und Wald-cantone' (History of the Conflicts and Fall of the Swiss Mountain and Forest Cantons), an excellent sketch, pnblished in 1801. In 1801 the central government of Bern nominated him to the bailiwicks of Lugano and Bellinzona, where he exeonted his duties with the best reeults. On his retnrn to Bern he was loud in his complaints against the French ambassador Bernhard, and the General Dnmas, on account of their oppressive condnct and arbitrary proceedings; for Zschokke had opposed the desires of the Graubundten for independence rather from a conviction of their hopelessness than from any unpatriotic love of French domination, and he stated "that the Helvetic executive directory enjoyed no inflnence or consideration; it was in a manner foreign to the people it was appointed to govern;" but it was not cruel, and it avoided anarchy, so that he was contented to act under it. His remonstrances had produced no immediate effects, when he was created governor of Basel, where a commotion had arisen against the land-tax and tithes; he there threw himself into the midst of an armed assemblage of the people, and induced them to follow his advice and submit. When the central government at Bern, with the Landmann Aloys Reding at its head, prepared in 1801 to restore the ruptured federalism of the union, Zschokke resigned his office, as he doubted whether the attempt could be successful then, and he retired to Biberstein in Aargan, to devote himself to his favourite studies. Much civil contention arose, and a civil war seemed inevitable, when in October 1802, Bonaparte offered his mediation, and by it the federal union of Switzerland was established in 1803. The modification brought Zschokke again into political activity. He was presented with the citizenship of Aargan, and nominated by the government in 1804 a member of the council of mines and forests. In the same year he commenced his popular 'Schweizerboten' (Swiss Messenger), and in 1807 his 'Miscellen für die neueste Weltkunde' (Miscellany of the most recent Events), which was continued without interruption till 1813; it displayed a happy choice of subjects, a richness of contents, a conscientious liberalism, and in general a strong and correct judgment. In 1814, when the Swiss after the downfall of Bonaparte, again wished to reconstruct their constitution, Zschokke exerted himself to maintain peace in Aargau, while he strenuously defended its independence against the claims of Bern. In 1829, in consequence of some imputations against him as editor of the 'Schweizerboten,' he resigned his offices of church and forest inspector, but retained those of member of the council, of the school directory, and president of the directory of the school of education for artisans. In 1830 he was re-chosen a member of the church council, and he continued to exert himself actively and effectively in the promotion of education and all social reforms, though his time was now chiefly given to literary composition. With these duties and his literary works, which became extremely numerous, he continued to occupy himself until his death, which took place at Biberstein, on June 27, 1848. His published works are of very varied character. We have noticed some of his historical and political productions, but in this class the most valuable are his 'Geschichte des Baierischen Volks und seiner Fürsten' (History of the Bavarian People and their Princes), 1813-18; and 'Des Schweizerlandes Geschichte für das Schweizervolk' (History of Switzerland for the Swiss People), 1822; which are highly esteemed, have been frequently reprinted, and are distinguished by a lucidity of arrangement, clearness of perception, a keen insight into character, and warmth and strength of expression. His novels and tales exceed all other classes in number. Among the best are his 'Adventures of a New Year's Night,' which was translated in 'Blackwood's Magazine,' 'Jonathan Frock,' a serio-comic novel, 'The Dead Guest,' and 'The Goldmaker's Village.' His merits are a correct delineation of the nicer shades of character, a naturally simple pathos, a happy exposition of some of the weak points of our social institutions, a considerable amount of humour, and a constant maintenance of good principles and feelings. Some of these novels, like the 'Cottagers of Glenburnie,' aim at effecting the removal of social evils, national prejudices, or injurious customs, such as 'Die Branntweinpest' (The Brandy Pest); he is frequently tedious, and his plots are improbable, and the least happy of his attempts are of the historical class. His poetry seldom rises beyond mediocrity, nor are his dramatic attempts of a high character. He had much knowledge of a kind fitting him for his office of inspector of forests, and was acquainted with geology, particularly in reference to the country in which he resided, as is shown in his 'Gebirgsförster" and 'Die Alpenwälder.' By far the most popular of his works was his 'Stunden der Andacht' (Hours of Devotion), which was first published as a Sunday periodical, and which has gone through forty editions. It is one of the most complete expositions of modern rationalism, but its want of orthodoxy was held to be compensated by its fervid eloquence, and its zealous inculcation of every practical duty in all ranks. This work was not known to be his till the appearance of his 'Selbstchau,' a sort of autobiography of a somewhat singular character, which has been translated into English. He published a collected edition of his historical writings, in 1830, in 16 volumes, and a selection of his novels and poems in 10 volumes, in 1847; but an edition of his collected works, in 1825, occupied 40 volumes. Many of his works have been translated into French; and in English we have his 'Goldenthal,' a tale; 'Der Goldmachersdorf;' 'Love's Stratagem,' and other tales; 'The History of Switzerland;' a volume of select essays; and the 'Stunden der Andacht;' under the title of 'Hours of Meditation and Reflection.'

ZURLITE. [Mineralogy, *S.* 1.]

THE END.
