

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

USEFUL KNOWLEDGE.

R I C

**RICHARDSON, SAMUEL**, the inventor of the modern English novel, was born in Derbyshire in 1689. His father had been a joiner in London, but had retired to the country, and fixed himself at Shrewsbury, after the execution of the duke of Monmouth, with whom it appears he had been in some way or other connected. It is stated that both his father and his mother had been born in a superior station to that in which they had come to move. At one time the joiner hoped to have been able to educate his son for the church; but a decline in his circumstances forced him to forego this ambition, and young Richardson was in his seventeenth year bound apprentice to Mr. John Wilde, a printer of London, after having had merely the education in reading and writing to be obtained at a common village school. He has informed us himself however, that long before this the peculiar talents which he afterwards displayed in his novels had begun to show themselves. He was noted while at school, he relates, for his flow of invention; his schoolfellows used to make him tell them stories, and were always most pleased with those he made out of his own head. 'All my stories,' he characteristically adds, 'carried with them, I am bold to say, a useful model.' But already, as throughout his life, his most delighted listeners, and the associates who best drew forth his powers, were of the other sex. 'As a bashful and not forward boy,' he says, 'I was an early favourite with all the young women of taste and reading in the neighbourhood. Half-a-dozen of them, when met to work with their needles, used, when they got a book they liked, and thought I should, to borrow me to read to them, their mothers sometimes with them; and both mothers and daughters used to be pleased with the observations they put me upon making. I was not more than thirteen when three of these young women, unknown to each other, having a high opinion of my taciturnity, revealed to me their love secrets, in order to induce me to give them copies to write after, or correct, for answers to their lovers' letters; nor did any one of them ever know that I was the secretary to the others.' This was an employment well suited to nourish and strengthen Richardson's wonderful faculty of entering into the feelings of other hearts, and giving them true and natural expression.

He was so punctual and industrious during the seven years of his apprenticeship, that Wilde used to call him the pillar of his house; yet he did not neglect his private studies, finding time, by stealing it from the hours of rest and relaxation, both for much reading and a good deal of letter-writing. He remained five or six years as foreman in Mr. Wilde's printing-office after his apprenticeship expired, and then set up for himself in Salisbury-court, Fleet-street. Soon finding himself in possession of a good business, he married Miss Allington Wilde, his old master's daughter, whom however he lost in 1731, after she had borne him five sons and a daughter, all of whom he likewise survived. He afterwards married Miss Leake, sister of Mr. James Leake, bookseller, by whom he had five daughters and a son: of these, four daughters, with their mother, survived him.

P. C., No. 1231.

R I C

ters and a son: of these, four daughters, with their mother, survived him.

Richardson first became an author in the year 1740. He had been in the habit of occasionally furnishing prefaces and dedications for the works which he printed, at the request of the publishers; and had been often importuned by his friends Mr. Rivington and Mr. Osborne to draw up for them a small collection of familiar letters on subjects of general interest in common life; a task, they conceived, well adapted to his style and turn of mind. Many years before, he had been greatly interested by a story of real life that had been told him, the same in its general outline with that of 'Pamela;' he now thought of making it the topic of a letter or two in the proposed little volume; but when he began to reflect on the subject, its capabilities gradually unfolded themselves to him, and 'I thought,' says he, 'the story, if written in an easy and natural manner suitable to the simplicity of it, might possibly introduce a new species of writing, that might possibly turn young people into a course of reading different from the pomp and parade of romance-writing, and, dismissing the improbable and marvellous, with which novels generally abound, might tend to promote the cause of religion and virtue.' The result was the composition of the first part of 'Pamela,' the two large volumes of which were written between the 10th of November, 1739, and the 10th of January, 1740. It was published in the latter year, and became immediately so popular that five editions of it were called for within the twelvemonth. So refreshing and exciting were mere nature, truth, and simplicity, even under many disadvantages and indeed positive offensivenesses of style and manner, found to be in a species of composition fitted above all others to amuse and interest the popular fancy, but which had hitherto been cultivated in our language only in a spirit and after a mode of working with which the taste of the most numerous class of readers was the least formed to sympathise.

The first part of 'Pamela' was soon followed by the second part, which was felt at the time by most people to be a great falling off, and which it has since been generally agreed is an attempt at improving the original story that might very well have been spared. The author was led to write it by the appearance of a sequel to his book by another hand, under the title of 'Pamela in High Life,' the wretched speculation of some needy scribbler to turn to his own profit the interest and curiosity which Richardson's work had excited. It ought to be mentioned that Richardson also completed and published the 'Collection of Familiar Letters' out of the project of which his novel had arisen: Mrs. Barbauld, his biographer, speaks of this performance in high terms, describing it as 'a work usually found in the servant's drawer, but which, when so found, has not unfrequently detained the eye of the mistress, wondering all the while by what secret charm she was induced to turn over a book apparently too low for her perusal.' Another incident connected with the publication of Richardson's

VOL. XX.—B

first novel is the circumstance of its having been the means of impelling his celebrated contemporary Fielding into the same line of writing; Fielding's first novel, properly so called, his 'Joseph Andrews,' which appeared in 1742, was an avowed burlesque of 'Pamela,' for which Richardson never forgave him.

It was not till after an interval of several years that 'Pamela' was followed by 'The History of Clarissa Harlowe.' The first four volumes of this greatest beyond all dispute of Richardson's novels appeared in 1748, and immediately raised his reputation as a master of fictitious narrative to the highest point. The admiration it excited was not confined to his own country; the work, translated into the French and German languages, soon acquired for him a European name. So strong was the hold which the story took of the imaginations of its readers, that, as if the events and characters had all been real, and the author's pen had had a power of actual creation and embodiment, many persons, during the progress of the work, wrote to him in the most urgent terms to gratify them by such a winding up of the plot as they had set their hearts upon, declaring that their own happiness depended upon the extrication of the heroine from the miseries in which he had involved her. But Richardson obeyed his own high genius, and was not to be persuaded to turn the deep and noble tragedy of unconquerable and triumphant endurance which he had so finely conceived, into a mere common-place stimulant for sentimentalism.

Richardson's next and last great work, his 'History of Sir Charles Grandison,' appeared in 1753. This is of all his works that in which he has most frequently deserted the true field of his genius, and ventured farthest upon ground on which he was not qualified to appear with advantage; and accordingly it contains much more that is tedious and uninteresting than either of his other novels; the plot too has little that excites curiosity or sympathy; and the conception of the principal personage sins against all the principles both of poetical art and of probability and the philosophy of human nature. Yet with all its faults this novel too is full of its author's most graphic and dramatic genius; the whole picture of Clementina, in particular, is perhaps surpassed by nothing in either 'Pamela' or 'Clarissa.'

The only publications of Richardson's that have not been mentioned are, a paper in the 'Rambler' (No. 97); an edition of 'Æsop's Fables, with Reflections'; a single printed sheet, entitled 'The Duties of Wives to Husbands' (a subject on which, with all his amenity of nature, he entertained somewhat strong notions); and his 'Case,' a statement of the piracy of his 'Sir Charles Grandison' by the Dublin booksellers. His works brought him a considerable harvest of profit as well as of fame; and his pen and a flourishing business together soon placed him not only in easy, but even, it may be said, in affluent circumstances. He early obtained, through the interest of Mr. Speaker Onslow, the lucrative employment of printing the Journals of the House of Commons; and in 1760 he purchased the moiety of the patent of king's printer. In 1754 he was elected to the post of master of the Stationer's Company. He continued to reside and carry on his business to the last in Salisbury-court; but he had also his country villa, first at North End, afterwards at Parson's Green. He died on the 4th July, 1761, and was buried beside his first wife, in the middle aisle of St. Bride's church.

No character could be freer from vice of every sort, or more perfectly irreproachable, than that of Richardson. In all the duties of morality and piety he was the most regular and exemplary of men. His principal weakness was a rather greater than usual share of literary vanity, not untinged with some disposition to underrate other writers of the day, more especially those who were fortunate enough to share the public favour with him in his own walk. These were failings naturally springing from the circumstances of his life, and the somewhat effeminate constitution of his nature both intellectual and moral; and they were further nourished by the habit of seclusion in a coterie of female idolaters—a sort of platonic harem—in which he indulged in his latter days.

RICHARDSONIA, the name of a genus of plants in the natural order Cinchonaceæ, given by Houston in honour of Richardson, an English botanist of the sixteenth century. This genus was called *Richardia* by Linnaeus, but that name has been given to another plant. Most of the species

of Richardsonia are natives of South America. They possess emetic properties, and under the name White Ipecacuanha, &c. are used extensively as a substitute for the true Ipecacuanha (*Cephaelis Ipecacuanha*).

RICHBOROUGH. [KENT.]

RICHELIEU, ARMAND JEAN DU PLESSIS, CARDINAL DE, a younger son of François du Plessis, Lord of Richelieu, was born at Paris, in 1585. He studied at the college of Navarre, and was at first intended for the military profession, but his elder brother Alphonse, bishop of Luçon, having resolved to withdraw from active life and retire into a Carthusian convent, young Armand was looked upon as his successor in his see. Accordingly he applied himself to the study of divinity, in which he took a doctor's degree at the age of twenty. The pope objected to his being consecrated bishop of Luçon on account of his youth; but Armand repaired to Rome, and succeeded in convincing the pope of his aptitude for the episcopal office, and he was consecrated in 1607. Having taken possession of his see, he applied himself sedulously to the discharge of his pastoral duties, and in preaching and converting the Calvinists. In 1614 he sat as deputy of the clergy of Poitou in the assembly of the States-General, on which occasion he harangued the young king Louis XIII., and so pleased the queen-mother Marie de' Medici, that she made him her almoner, which was the beginning of his fortune. He was soon made secretary of state, but in consequence of a quarrel between the king and his mother, Richelieu was banished to his diocese. He afterwards acted as mediator between those two personages, and acquired a permanent influence over both. In 1623 he was made a cardinal, soon after which the queen-mother obtained for him a seat in the council in 1624, when he became the chief minister of the crown, and continued such for the remaining eighteen years of his life. The history of his political career forms an important period in the history of the French monarchy. Richelieu had three great objects in view: 1, to render the power of the crown absolute, and to humble the feudal nobility; 2, to annihilate the Calvinists as a political party; 3, to reduce the power of the house of Austria, both in its German and Spanish branches, and to extend that of France. Unscrupulous about the means, he succeeded in breaking down the political influence of the nobles, many of whom he sent to the scaffold on various pretences. He put to death Marshal de Marillac, the duke of Montmorency, Cinq Mars, and De Thou, and many more in a cruel manner. Others were shut up in dungeons during the cardinal's life. His great political opponent was Gaston d'Orléans, the king's brother, who conspired against the cardinal. The conspiracy failed, and was the cause of the death of Gaston's friends. Gaston then openly revolted against the king, being assisted by the duke of Lorraine, whose sister he had married. He was not more successful in this attempt, was obliged to seek an asylum in the Spanish Netherlands, and the duke of Lorraine lost his dominions, which were seized by the French. The queen-mother, who had quarrelled with the cardinal and supported his enemies, was obliged to quit France. She retired to Cologne, where she died, in 1642, in great distress.

Richelieu accomplished the second object which he had in view, namely, the extirpation of the Calvinist party, by besieging in person and taking La Rochelle, the stronghold of the Calvinists, in 1628. But the motives of Richelieu appear to have been more political than religious: at all events he did not show himself after his victory a fanatic or a persecutor. He secured religious tolerance to the Calvinists by a royal edict in 1629; and when the faculty of theology of Montauban, which was then, as it is now, the Calvinist university of France, went to visit the cardinal, he told them courteously that he could not receive them as a body of divines, but that he should always be willing to see them as men of learning.

The third great object of Richelieu was that of humbling the House of Austria, which, since the time of Charles V., had been the preponderating power in Europe. For this purpose, setting aside all clerical scruples, he supported, first secretly and afterwards openly, the Protestants of Germany against the emperor. His almoner, a Capuchin friar named Père Joseph, was his confident and trusty agent in all his diplomatic intrigues. The history of this singular character has been published, 'Histoire du véritable Père Joseph,' and is a most curious biography. The friar repaired to Germany, to the camp of the Protestant princes and of Gustava,

and also to that of Wallenstein. After the death of the two great leaders, Gustavus and Wallenstein, the French troops carried on the war on the Rhine in concert with the Swedes against the emperor. At the same time Richelieu was assisting the Protestant Grisons against the Roman Catholic insurgents of Valtellina, who were supported by the Spaniards. He also allied himself with the States-General of the Netherlands to attack the Spanish dominions in Belgium, which he had in view to annex to France as far as Antwerp, a scheme in which however he failed. On the side of Spain the French took Roussillon, and supported the Catalonians in their revolt against Philip IV. Richelieu is also said to have meddled, by means of Père Joseph and the French ambassador in London, in the first stirring of the Covenanters and Puritans which led to the great Revolution. Charles I., ever wavering in his foreign policy, had disappointed Richelieu in his proposal of a defensive league between France and England, and seemed to lean towards a Spanish alliance. 'The king and queen of England,' said Richelieu, 'will repent the rejection of the treaty before the year is over.' (Père Orléans; D'Estrade; President Hénauld; *Biographie Universelle*, art. 'Richelieu.') In 1639 arms and ammunition were sent from France to Leith for the use of the distressed.

In Italy the French invaded Piedmont, which however they evacuated by a treaty with the princes of Savoy. The principal result of all these wars was to circumscribe the imperial power in Germany, and to weaken the influence of Spain in the general politics of Europe.

In 1642 Richelieu fell ill; and died in December, at his house at Paris, at the age of fifty-eight. The king repaired to his bed-side shortly before his death, when the cardinal recommended to him Mazarin and others, and told his majesty that he left the kingdom at the highest pitch of glory, and protested to him that all his doings as a minister had been for the good of religion and of the state, an assertion which starting from such a man, but which he may very possibly have believed. His funeral was magnificent, but the people of Paris made bonfires in token of rejoicing. He had become unpopular of late years on account of the fresh contributions which he had laid on the people. A splendid mausoleum, by Girardon, was raised to his memory in the church of La Sorbonne. He left a considerable property, which however had not been altogether accumulated at the expense of the state, but was in great part the proceeds of his great Church preferment.

Mary de' Medici had died at Cologne a few months before Richelieu, and Louis XIII. died five months after his minister.

Richelieu established the royal printing-presses; he was the founder of the French Academy; he built the Palais Royal, which was then called Palais Cardinal, and he rebuilt La Sorbonne. He was well informed for his age, and has left several works, some on religious and controversial subjects, and others on politics. His 'Testament Politique' has been considered by some as apocryphal; but Foncebague has defended its authenticity in the edition of 1764, by his Letters to Voltaire, and apparently upon sufficient grounds. The 'Mémoires du Cardinal de Richelieu,' written by himself, have been published in several volumes, in 1832-3; by Poitot, from a MS. corrected in the Cardinal's own hand, which existed in the archives of the department of Foreign Affairs at Paris. A Life of Richelieu, by Le Clerc, was published in two volumes, Cologne, 1696, without the author's name: it seems fairly written. Aubéry and others have also written biographies of Richelieu. His domain of Richelieu in Poitou was created a dukedom by Louis XIII., in 1631.

Cardinal Richelieu ranks among the greatest ministers of the old French monarchy; he had extended views, great perseverance and acuteness, and a lofty mind, but he was also revengeful, cruel, and unprincipled. He laboured strenuously to make the authority of the crown absolute, and by so doing he paved the way for the subsequent despotism of Louis XIV. Montesquieu says that Richelieu made his minister the second man in the monarchy, but the first in Europe that he depressed the king, but ennobled his reign.

His grand-nephew, Louis François du Plessis de Richelieu, marshal of France, figured under Louis XV., and earned a name for his bravery in war and some ability in negotiation; and also for his libertinism, court intrigue, and stubborn disposition. He died in 1788, at a very advanced age. A grandson of marshal Richelieu entered

the Russian service during the French revolution, was made governor of Odessa, a town which he greatly improved, and became, after the Restoration, minister of Louis XVIII. He was known by the title of duc de Richelieu. He died in 1821, with the reputation of an honourable and loyal statesman.

RICHMOND, an ancient borough, a market-town, and parish, and the capital of the extensive baronial liberty of Richmondshire, in West Gilling wapentake, the most north-western division of the North Riding of Yorkshire. The whole wapentake is in the liberty of Richmondshire, in the archdeaconry and deanery of Richmond, and in the diocese of Ripon. Richmond is 239 miles north-north-west of London, 44 miles north-west of York, and 52 miles north by west of Leeds. The municipal borough comprises only the parish of Richmond, and the corporate body consists of a mayor, four aldermen, and twelve councillors, with a commission of the peace of six magistrates besides the mayor and recorder. Richmond was deprived of its quarter-sessions by the Municipal Act, but they have since been restored. The parliamentary borough comprises the parishes of Richmond and Easby, and extends over 16,000 acres of land, and has a population of 4722. The population of Richmond alone, in 1831, was 3900. This borough returns two members to parliament, and is one of the polling-places for the North Riding.

Alan Rufus, son of Hoel, count of Bretagne, a kinsman of William the Conqueror, who accompanied him in his expedition to England, is generally stated to have been the founder of both the castle and town of Richmond. By some authorities the town is said to have been in existence prior to the Conquest. William conferred on Alan the title of earl of Richmond; and the estates of the Saxon earl Edwin, embracing nearly 200 manors and townships, and a jurisdiction over all Richmondshire, about a third of the North Riding. In the situation of his castle Earl Alan selected not only an eligible residence, but also a place of defence; its foundation was laid on an almost perpendicular rock on the left bank of the Swale, about a hundred feet above the bed of the river. The site contains about six acres, and commands an extensive view of the surrounding country. To the original buildings of the castle, additional walls, towers, and outworks were erected by the successors of the founder. The earls of Richmond enjoyed these possessions till they fell to the crown on Henry, earl of Richmond, becoming king of England by the title of Henry VII. Charles II. bestowed the title of duke of Richmond on his son Charles Lenox, in whose descendants the dignity continues. The walks round the castle present a succession of varied and romantic scenery. Swaledale is in many parts skirted with wild rocks almost covered with trees and shrubs. From the hills on the north-west side of the town, the castle and town seem to be situated in a valley. The ruins of the castle are still majestic. The bold Norman keep is almost entire; the walls are nearly one hundred feet high and eleven feet thick. It is the property of the duke of Richmond. The dilapidations seem to be solely owing to the neglect of repairs.

A small monastery, called the Grey Friary, was founded at Richmond in 1258, the sole remains of which are a steeple, which Rickman describes as 'a remarkably elegant specimen of good perpendicular work.' The extensive remains of St. Agatha's Abbey are about a mile below Richmond: many of the arches and columns of the finely pointed windows and doors are in good preservation. These ruins are in the parish of Easby; and are surrounded by well-wooded grounds and fine scenery.

Richmond is said to have been a place of good trade for three centuries after the Conquest, but many causes contributed to its decay; among these may be mentioned the charters granted for holding markets in neighbouring towns, and the want of water-communication, which is precluded by the rocky bed of the Swale and the sudden swells to which the river is subject. The market of Richmond is held on the Saturday, and it is well supplied with corn and other provisions. Many wealthy people reside in the town, and the country for several miles round is studded with the parks and mansions of numerous landed proprietors. The races are well attended, and are held in the first week of September, on the high moor about a mile from the town, where there is a commodious grand stand. Several of the resident gentry have training-stables near the race-ground. Three fairs are held at Richmond in the course of the year.

The chief manufactory is an extensive paper-mill. Gas-works were established in 1821, and waterworks in 1837. The town-hall is a convenient building, in which the public business of the town is transacted and the quarter-sessions held both for the town and Riding. It contains a spacious assembly-room.

A court of record is held once a fortnight before the mayor, recorder, and aldermen; it takes cognizance of all pleas, actions, and suits in which the debts or damages do not amount to more than 100*l.*; the recorder is the sole judge in this court. A court baron for the liberty of Richmondshire, of which the duke of Leeds is the chief bailiff, is held once in three weeks for the recovery of debts under forty shillings.

The parish church is a Gothic building, and consists of a nave, chancel, and aisles, with a tower at the west end. It has been enlarged several times, and exhibits several varieties of architecture. The rectory is in the patronage of the crown. Holy Trinity chapel stands in the market-place. The consistory court for the archdeaconry of Richmond is held in two rooms adjoining the north aisle. Some portions of this building are occupied as shops and dwellings. The upper part of the north aisle is fitted up for divine service. The other places of worship are a Catholic chapel, erected by Sir John Lawson, Bart., in 1811; an Independent chapel; and a Wesleyan chapel.

Richmond free grammar-school was founded and endowed by the burgesses, and incorporated by Queen Elizabeth, by which Act it was called 'The free grammar-school of the burgesses of the borough or town of Richmond, in the county of York, for the education and instruction of boys and youths in grammar.' The four bailiffs were to be the governors of the possessions of the school. The property now produces a yearly income of 337*l.* 7*s.* 4*d.* All natives and the sons of burgesses and other persons residing within the borough are entitled to admission as free scholars by the payment of seven shillings a year for fire, candles, and cleaning. The instruction in writing and arithmetic is also paid for.

The Corporation School is endowed with an annuity of 50*l.* from the borough funds and charties, for which fifty scholars are taught. The National School contains about one hundred boys and eighty girls. There are also an infant-school, a mechanics' library, a subscription library, and a news-room.

There are charities at Richmond for poor tradesmen and widows, for the distribution of coals, bread, and medicines, and various small bequests for education and apprentice fees. (Clarkson's *Richmond*; and Allen's *Yorkshire*.)

RICHMOND. [SURREY.]

RICHMOND. [VIRGINIA.]

RICHTER, JEAN PAUL FRIEDRICH, commonly called Jean Paul, was born on the 21st of March, 1763, at Wunsiedel, in the neighbourhood of Baireuth, where his father held the office of tertius or under-schoolmaster and organist. Shortly after the birth of his son, he was made pastor of the village of Joditz, whence he was transferred to Schwarzenbach on the Saale. Owing to the very limited circumstances of his parents, as well as to the want of a good schoolmaster, the boy had hitherto been educated and taught at home by his father. At Schwarzenbach however he was sent to school, and continued the study of Latin and Greek, to which Hebrew and some other branches of learning were added. His stay at this school was short, and he was sent to the gymnasium at Hof, where he continued his studies for two years, notwithstanding the death of his father, which happened shortly after his arrival there, and left his family almost in a state of destitution. The young scholar however was in some degree supported by his grandfather on his mother's side. In 1781 he went to the university of Leipzig, for his family wished that he should follow the example of his father and study theology. He hoped to obtain some support from the university, but he found the difficulties greater than he had anticipated; and he was thrown entirely on his own resources. He had to contend with extreme want, and was sometimes even unable to obtain necessary food and clothing. The circumstances of his mother likewise grew worse, and she was unable to supply him with any money. Notwithstanding this painful situation, he persevered in his studies, and he remained cheerful. Soon after his arrival at Leipzig he had given up the study of theology, which he found ill-suited to his taste, and now seeing no other possibility of satisfying his most urgent wants, he wrote a book called 'Grünländische Prozesse,' 2 vols., Berlin, 1783. The pittance which he received for his work, small as it was, determined him

henceforth to try to support himself by writing. A second book, 'Auswahl aus des Teufels Papieren,' was soon written, but no publisher could be found, as his first work had not met with a favourable reception. After many disappointments, he quitted Leipzig in 1785, and went to Hof to reside with his mother, who with her family inhabited a house containing one apartment. All that he possessed was a number of MSS. containing extracts from the various works which he had read. At Hof his poverty rather increased than diminished, but the unconquerable vigour of his mind and the benevolence of a few friends kept him up. He engaged himself as a tutor in a family, and in 1788 he succeeded in finding a publisher for his 'Auswahl aus des Teufels Papieren.' The little income which he thus gained was however not sufficient to support him and his family. In 1793 several families of Schwarzenbach united to invite him to come and undertake the education of their children, an offer which he gladly accepted. Here he tried and developed the principles of education which he afterwards (1807) published in his 'Levana.' His circumstances now began to improve, especially after 1793, when, through the mediation of a friend, he found a publisher for a new work called 'Die Unsichtbare Loge,' 2 vols., Berlin. This work attracted the attention of the public and brought the author into notice. A fair prospect of success as a writer being thus opened to him, he left Schwarzenbach (1794) and returned to Hof, where in the course of a few years he wrote some of his most admired works: 'Hesperus,' 4 vols., Berlin, 1794; 'Quintus Fixlein,' Baireuth, 1796 (this work was the first which appeared under his full name, for in the preceding ones he had only called himself Jean Paul); 'Biographische Belustigungen unter der Gehirnschale einer Riesin,' Berlin, 1796; 'Siebenkäs, oder Blumen-Frucht-und Dornen-stücken,' &c., 4 vols., Berlin, 1796-97, and 'Der Jubelsenoir,' *ibid.*, 1797. In this year his mother died, after having for a short time enjoyed the happiness of seeing her son appreciated, and Jean Paul now returned to Leipzig. His name was now favourably known, and the most distinguished among his countrymen, such as Gleim, Herder, Schiller, Wieland, and others, esteemed the man no less than his works. In 1798, in which year his work called 'Das Campanerthal, oder die Unsterblichkeit der Seele,' was published at Erfurt, he was induced by Herder, whom he revered more than any other of his friends, to take up his abode at Weimar. It was about this time that he became acquainted with the Duke of Saxe-Hildburghausen, who afterwards honoured him with the title of councillor of Legation (Legations-rath). In 1801 he married Charlotte Maier, the daughter of a distinguished physician of Berlin. He first settled at Meiningen, which in 1803 he exchanged for Coburg; but after a short stay in this town he took up his permanent residence at Baireuth. During this period of wandering he wrote 'Briefe und Bevorstehender Lebenslauf,' Gera, 1799; 'Titan,' 4 vols., Berlin, 1800-3; 'Die Flegeljahre,' 4 vols., Tübingen, 1804-5.

At Baireuth he enjoyed the well deserved fruits of his indefatigable zeal—the esteem and admiration of the most illustrious and best among his countrymen. In 1809 the Prince Primate, Carl von Dalberg, granted him a pension of 1000 florins per annum. In 1815 the prince was obliged to resign his secular sovereignty of Regensburg, Aschaffenburg, Frankfurt, Witzlar, &c., which he had before possessed, together with his archbishopric and primacy of Regensburg, but the pension was continued by Maximilian, king of Bavaria. In 1817 the university of Heidelberg honoured Jean Paul with the diploma of doctor of philosophy, and three years afterwards he was elected an ordinary member of the Academy of Sciences of Munich. From the time of his settlement at Baireuth, Jean Paul pursued his literary occupations as zealously as ever, and only now and then made either little excursions into the neighbouring country, or short journeys to Heidelberg, Munich, Berlin, and Dresden. Among the works which belong to this last and happiest period of his life, we shall only mention 'Vorschule der Aesthetik,' 3 vols., Hamburg, 1804; 'Katzbergers Badereise,' 2 vols., Heidelberg, 1809; 'Des Feldprediger Schmelzle Reise nach Flätz,' Tübingen, 1809; 'Der Komet, oder Nicolaus Markgraf,' 3 vols., Berlin, 1820-22.

During the last years of his life he was attacked by a complaint in the eyes, which at the beginning of the year 1823 terminated in complete blindness. His physical powers also began to decline, and he died on the 14th of November, 1825. Some time before his death he had made prepara-

tions for a complete edition of his works. This plan was executed by his friend Dr. Otto, who edited the works of Jean Paul in 60 small 8vo. volumes, Berlin, 1826-28. Another edition in 4 vols., imp. 8vo., appeared at Paris, 1836-38, which is disfigured by numerous typographical errors.

Whether we consider Jean Paul as a man or as an author, he is one of the most wonderful phenomena that Germany has ever produced. He was simple-hearted as a child, and his kindness, benevolence, and purity of conduct were unparalleled; yet with all this he had courage enough to struggle fearlessly with a world of adversity, without losing one particle of his cheerful and humorous temper. His works, which are all written in prose, and most of which may be called humorous novels, evince the deepest and most intense feeling, a most profound knowledge of human nature, and an intimate acquaintance with almost every department of science. His earliest writings are sometimes of a satirical nature, and show that he had not yet reached the height of pure humour which appears in his later works. Some of his works, such as the 'Levana' and 'Vorschule der Aesthetik,' are not novels, but philosophical discussions full of profound thought; but even here his humour sometimes gushes forth and enlivens the abstruseness of philosophical inquiry. Notwithstanding these great qualities of Jean Paul, there are some circumstances which prevent his writings from being as popular as they deserve to be. His ideas and conceptions are too profound to be understood and appreciated by the many, and his thoughts are expressed in a language which presents considerable difficulties even to a German. His sudden transitions, his associations of ideas, the frequent distortions of his sentences, in which parenthesis is put into parenthesis, cause such difficulties to the ordinary reader, as will at first deter him from undertaking the task of searching for the sterling matter which is concealed under such a disguise. Jean Paul moreover possessed an inexhaustible stock of knowledge on all subjects, and his works abound in allusions which can only be understood by those who have made such subjects their study. The number of those who fully appreciate the merits of Jean Paul is, even in Germany, comparatively few; but these few are the best and most enlightened of the nation, and the power which his works exercise over them is greater than that of any other writer. The time when Jean Paul shall be fully appreciated is yet to come. The best key to his writings is a work called 'Wahrheit aus Jean Paul's Leben,' in 8 vols., Breslau, 1826-33, which was commenced by Jean Paul himself, and after his death continued and completed by Dr. Otto. Another very useful work in this respect is, R. O. Spazier, 'Jean Paul Friedrich Richter, ein biographischer Commentar zu seinen Werken,' 5 vols., Leipzig, 1833; H. Döring's 'Leben und Charakteristik Richters,' in 2 vols., Gotha, 1826, is a very indifferent work.

English translations of some of the smaller and extracts from the larger works of Jean Paul have appeared in various magazines. But the choicest specimens, which are also most faithfully translated—are those given in *German Romance*, by T. Carlyle, who has also written some excellent essays on the life and writings of Jean Paul. (See Carlyle's *Miscellanies*, vol. i., p. 1-31; vol. ii., p. 295-377; comp. p. 467, &c.)

**RICINULA.** [ENTOMOSTOMATA, vol. ix., p. 457.]

**RICINUS**, the name of an apetalous genus of plants belonging to the natural order Euphorbiaceæ. This word is derived from *ricinus*, the Latin name for a species of insect which the fruit of this plant was supposed to resemble. (Plin., *Nat. Hist.*, xv. 7.) The common name of *Ricinus* is *Palma Christi*, a name applied to these plants by Brunfels, Matthioli, and other older botanists, on account of the form of its elegant lobate leaves. It was originally a native of Asia, but is now naturalized in Africa, America, and the south of Europe. The characters of this genus are:—Flowers monœcious; calyx 3-5-parted, valvate; no petals; filaments numerous, polyadelphous; style short; stigmas three, bipartite, feathery; ovary globose, three-celled, with an ovule in each cell; fruit capsular, tricocous; leaves alternate, stipulate, palmate, glands at apex of petiole; flowers in terminal panicles; trees, shrubs, or herbs, becoming arborescent. Of this genus the *Ricinus communis*, common *Palma Christi*, is best known as producing the castor-oil. It has peltate palmate leaves, with lanceolated serrated lobes; an herbaceous glaucous stem, of a purplish-red colour upwards,

and flowers in long green and glaucous spikes springing from the divisions of the branches, the males from the lower part of the spike, the females from the upper. The capsules are prickly. It varies in size; in Britain it is seen seldom more than three or four feet in height, but in India it is a tree; and Clusius mentions it as measuring from two to four feet round its stem in Spain. Lindley refers several species distinguished by Willdenow to this form, viz. *R. viridis*, *R. africanus*, *R. lividus*, and *R. inermis*. (*Flora Medica*, p. 183.)

*R. communis* will grow freely in this country, and when sown in pots or hotbeds early in the season, and transplanted in spring, it forms a very handsome border annual.

**RICINUS COMMUNIS**, the castor-oil plant, known from very ancient times both to the Egyptians and also to the Greeks. According to Herodotus (ii. 94), the Egyptians called the oil of the *silicyprion* (σικυπριον) by the name *Kiki* (κικι). The Greeks also called it *Croton* (κρότων), a name bestowed by modern botanists on a closely allied genus of euphorbiaceous plants, one species of which yields the purgative oil designated Croton oil, or Oleum Tiglii. [CROTON.] The native country of the *Ricinus communis* is unknown, though it is conjectured to be originally from Barbary. Like all plants which have been long in cultivation, numerous varieties of it are met with, differing not only in colour and the peculiar pruinose condition of the stem, but in stature and duration. In warm countries it is ligneous and perennial; in cold, annual and herbaceous. The entire plant is possessed of active properties, but the oil extracted from the seeds is only employed in Europe: the ancients administered the seeds entire, but their variable action, occasionally even producing fatal effects, led to their disuse, and the oil is of comparatively recent introduction. The seeds, of which three are found in each capsule, are about the size of a small bean, obtuse at both ends, surface smooth, shining, and beautifully marbled. They were formerly known in the shops as *semina Ricini*, or *Cataputiae majoris*. The skin consists of three tunics—1st, an outer brittle pellicle; 2nd, a hard testa consisting of two dissimilar layers, the external thick, dark brown, formed of transverse radiating cells; the internal thinner, paler, and formed of vertical cells; 3rd, a membrane investing the nucleus or kernel. 'The nucleus consists of oily albumen, and an embryo, the cotyledons of which are membranous or foliaceous.' The outer shell is devoid of taste; in the inner coat the acrimony or active principle resides, according to Dierbach; while others assert the embryo to be the seat of the purgative principle; and even Humboldt and Bancroft state that if this part be excised, the seeds may be eaten with impunity, or the oil thereafter expressed is as mild as olive-oil. The same statement has been made respecting the *Jatropha Curcas*, or *purging-nut* of the Philippine Islands. (See Bennet, in *Medical Gazette*, vol. ix., p. 7.) But this is by no means the case, as has been proved by Merat and De Lens (*Dictionnaire des Sciences Medicales*, t. xlix.) and Bennet (*l. c.*); who have shown that the active principle is diffused through the entire substance of the kernel, though it probably exists in greater intensity in the embryo. Various procedures have been adopted to extract the oil, and these have much influence on its qualities in respect of colour, acidity, and freedom from rancidity: there are also effects which result from the greater or less maturity of the seeds, the peculiar variety of the plant from which they have been obtained, and the occasionally accidental, but more frequently intentional admixture of other seeds, before the different processes of extraction have been begun. Both in India and America, whence the first supplies were brought, much heat was employed, and during the application of this agent a volatile principle was either liberated, or more probably formed, which was so irritating as to require the workmen to protect their faces by masks. Even in the present day some heat is used to obtain what is termed the *cold drawn* castor-oil, but it is quite unnecessary, and should always be avoided.

According to Sir Whitelaw Ainslie (*Materia Indica*, vol. i., p. 256), the following is the plan pursued in the East Indies:—'Take five seers of the small castor-oil nuts, and soak them for one night in cold water; next morning strain this water off and throw it away, and put the nuts into a second quantity of fresh water, and boil them in it for two hours; after which strain the water off and throw it away, as in the first instance: the nuts then are to be dried in the sun on a mat for three days; at the end of which time they

are to be well bruised in a mortar: add to the nuts thus bruised ten measures of water, and set the whole on the fire to boil, taking care to keep continually stirring the contents of the pot until all the oil appears at the top, when it is to be carefully strained off and bottled for use. The quantity of nuts mentioned in this formula ought to yield about one quart bottle of oil. The processes used in the United States and the West Indies are both objectionable, from employing not only heat but water, which last promotes the rancidity of the oil. The acrid property and the rancidity are owing to different causes, the former being always in proportion to the freshness of the oil, the latter to the imperfection of the means used in extracting it, or to its age. The plan adopted in France is the best; it is as follows:—The fresh seeds are bruised, and then put into a cold press (some persons improperly heat the plates of the press). The oil expressed is allowed to stand some time to permit the albumen; mucilage, and other matters to subside, or it is filtered to separate them more rapidly. (*Journal de Pharmacie*, tom. v., pp. 207, 306) The produce is equal to about a third of the seeds employed, and the oil possesses all its natural qualities. The American process yields only 25 per cent. of oil. In the French West Indian Islands, a peculiar variety of Ricinus, called *R. ruber*, more active, is used, which yields an oil called *carapat*, or *karahat*; but this is violent and unpleasant, and must not be confounded with or substituted for the fine oil procured in France. Both the French and Italian oils are much weaker than oil procured from tropical countries. Another mode of obtaining the oil is to macerate the bruised seeds in cold alcohol, by which six ounces of oil are procured from every pound of seeds. (*Journal de Pharmacie*, viii., 475.) The expense of this process is the objection to its general employment.

Oil of good quality is a thickish fluid, of a very pale yellow colour (the best now almost limpid), with a slightly nauseous odour, and an oily taste, mild at first, but causing a feeling in the back of the throat which is more or less intense in proportion to the freshness of the specimen. Old or badly prepared oil is rancid and disagreeable. The specific gravity is, at 55° Fahr., 0.969, according to Saussure, but according to Geiger it is only 0.954.

It can be solidified only by a very low temperature. It is distinguished among fixed oils by its complete or nearly complete solubility in pure sulphuric ether and in alcohol, thereby approaching the essential oils in its habitus, and its easy combination with alkaline leys, and consequently its ready saponification; two properties of much importance, the one furnishing a convenient test of its purity, the other facilitating its administration in a form less repulsive than its ordinary state. Its very moderate price (in the year ending 8th of January, 1841, it ranged, according to quality, from 4d. to 10d. per lb.) renders it scarcely worth adulterating, but its purity may be tested by mixing it with an equal quantity of absolute alcohol, in which it should be entirely dissolved; the adulterating oil, if there be any, will remain undissolved. Its ultimate composition seems to be—

	Saussure.	Ure.
Carbon	74.178	74.00
Hydrogen	11.034	10.29
Oxygen	14.788	15.71
	100.000	100.00

It thus appears to be one of the most highly oxygenated oils or fats, notwithstanding which, on exposure to the air, it very readily absorbs more oxygen, and quickly becomes rancid; it is however slow of drying. It is stated to consist of several proximate principles, but whether these are educts or products is uncertain. Bussy and Lecanu, who have paid great attention to the subject (*Journal de Pharmacie*, xiii. 57) incline to the latter opinion, which is the most probable. 'This oil,' they state, 'cannot be regarded as a simple immediate principle, but as a compound organic product resulting from the mixture of at least two different substances.' The other view is that it is a compound of three fatty acids saturated by glycerin, for in the process of saponification 100 parts of castor-oil yielded—

1. Fatty acids (viz. ricinic, elaidic, and margaritic acids)	94
2. Glycerin	8

The only analysis of the seeds is that of Geiger (*Handbuch der Pharmacie*, ii., p. 1671).

a. Seed-coats	Tasteless resin and extractive	1.91	} 23.82
	Brown gum	1.91	
	Ligneous fibre	20.00	
	Fatty oil	46.19	
b. Nucleus of the seeds	Gum	2.40	} 69.09
	Caseum (albumen)	0.50	
	Ligneous fibre, with starch, &c.	20.0	
Loss (moisture)			7.09
			100.00

For further details respecting the chemistry of castor-oil, see Pereira's *Mat. Med.*, ii., p. 770.

Castor-oil is a mild aperient or laxative when pure, operating without griping or other inconvenience, and commonly very soon after its administration. It is the most proper laxative for infants, and in many inflammatory states of the abdomen or of the kidneys, bladder, &c. It is also one of the best purgatives in rheumatism, especially in lumbago, and one of the best means of relieving habitual constipation, as, unlike other purgatives, the dose may be successively reduced without its power being impaired. It is also a most eligible medicine in piles or other affections of the rectum. Alone or with turpentine it is a very efficacious means of expelling worms. The chief obstacle to its extensive use is the repulsive taste which it often possesses. Many expedients have been adopted to remove or lessen this; but no artifice can make bad or old oil good or palatable. Rancid oil may be purified by calcined magnesia; but the careful exclusion of the air, which prevents the rancidity occurring, is preferable to any process for removing it when it has affected the oil. Mixing the oil, immediately before swallowing it, with milk, coffee, or broth, is sometimes a successful means of escaping the unpleasantness. Brandy and gin are improper in many cases, owing to their heating properties. Syrup of orange and lemon are beneficial adjuncts, especially if a portion of the orange-peel be masticated immediately after swallowing the mixture. An emulsion with yolk of egg is sometimes acceptable, if made immediately before it is administered. By far the best plan however is to take advantage of the tendency to combine with alkalis, and so form a soapy emulsion, which does not destroy the purgative power, while it completely alters the appearance, and prevents any one recognising the oily object of his aversion. To effect this however requires care and skill, especially as a variable quantity of alkaline ley is needed, according to the age of the oil, very old oil requiring more ley than fresh oil. In general from fifteen to twenty drops of pure liquor potassæ will saponify half an ounce of oil, to which one ounce of distilled water, and one drachm of spirit of pimento or of nutmeg are to be added.

1. Quantity of castor-oil on which duty was paid for home consumption in the United Kingdom, showing the average annual consumption in each of the following periods of five years each, with the net revenue annually received in each period.—

Periods of Five Years.	Average Annual	
	Home Consumption.	Net Revenue.
1820-4	170,820 lbs.	£10,655
1825-9	281,061	7,678
1830-4	409,541	2,423
1835-9	708,005	538

2. Rates of duty:—

Periods of Five Years.	British Possessions.		East India Company's Territories.		Foreign Countries.	
	s.	d.	s.	d.	s.	d.
1820-4	3	per lb.	1	3 per lb.	1	3 per lb.
1825	0	6 ..	0	9 ..	1	0 ..
1828	0	3 ..	0	3 ..	1	0 ..
1833	2	6 per cwt.	2	6 per cwt.	1	0 ..
1836 (Aug.)	1	3 ..	1	3 ..	1	3 per cwt.

The distinction formerly made in the rate of duty between castor-oil from British possessions and foreign countries was quite unnecessary, as nine-tenths of the quantity on which duty is paid comes from countries within the limits of the East India Company's territories, and nearly the whole of the remaining tenth is from the British West Indies. About one-fourth of the quantity imported is re-exported. In 1837-8-9 the importations averaged annually 905,726 lbs., and the home consumption 686,755 lbs.

Castor-oil is extensively used in the East, France, Italy, and elsewhere, for burning.

**RICKETS**, or *Rachitis* (from *ράχις*, the spine), is a disease in which the bones being of unnatural softness, some of them bend under the weight of the superincumbent parts of the body. Bones affected with rickets present such a softness of texture that they may be cut with a knife; their walls are remarkably thin, and their interior, instead of being filled with marrow deposited in their bony cells, is occupied by a semi-fluid jelly-like substance of a reddish colour, which fills a number of rounded cavities of irregular size. The quantity of earthy matter in such bones is reduced to considerably less than its natural proportion, and they lose much of their normal weight. All the bones may be thus affected, but it is only those which have to bear the weight of the body that give evidence of it by bending; the arms, for example, never change their form, but the thighs and legs become arched forwards under the weight of the trunk; the spine assumes a variety of curves from the pressure of the head; the breast-bone becomes prominent, and the ribs flattened; the haunch-bones grow outwards, and the pelvis is sometimes seriously deformed by an approximation of its anterior and posterior boundaries.

Rickets, as far as the softness of the bones is concerned, cannot be regarded as a dangerous disease; for this condition is generally recovered from, though not without deformity of the trunk and lower limbs. But the disease of the bones is commonly only a part of a general state of disease affecting many other organs of the body. The muscles are always pale and weak, and there are all the signs of general debility; and besides these, the brain and the organs contained in the chest and abdomen are peculiarly apt to suffer, and become the seat of fatal diseases, such as hydrocephalus, phthisis, obstruction of the mesenteric glands, &c.

In all these respects there is much resemblance between rickets and scrofula; each may be regarded rather as a general disease than as a disorder of any particular organ or system of organs. The similarity extends to the remedies beneficial to each, which consist mainly of such means as will best amend the original weakness of the constitution, including a good and carefully regulated diet, pure air, warm clothing, bathing, and as much of active exercise as can be borne without fatigue. To these it is not essential in all cases that medicines should be added: where any are necessary, they are usually mild aperients and tonics, especially those of the latter class which contain iron.

When rickets affects only or chiefly the bones, an attention to the means just mentioned will, with advancing age, usually lead to a termination of the disease. The bones will gradually become hard by the addition of their natural quantity of earthy matter. They retain indeed the curves which they acquired in their condition of softness, but the want of strength which might result from this change of form is compensated by the remarkable thickness and strength which they acquire in the concavities of the curves, upon which the chief stress from the weight of the body falls.

Young persons are exclusively subject to rickets. It occurs at the age of two or three years, and from that time to puberty, and as the curvatures begin to form as soon as the weight of the body is thrown on the limbs by assuming the erect posture, it is commonly proposed to support the upper part of the body and the limbs by *irons*. Such measures however are, in a large majority of cases, full of mischief; if they can ever accomplish their intention of supporting the head and trunk, it can only be by preventing entirely that active use of the limbs which is essential to the attainment of the proper hardness of the bones. It is constantly observed that the strength and density of bones are in direct proportion to the habitual exertion of the muscles attached to them; and as the latter are made inactive by irons, the application of any such modes of restraint cannot but be injurious to those affected with rickets.

When children first begin to walk, their legs not unfrequently become a little bent. This is especially the case with those that are large and have heavy bodies to bear; but it is not to be regarded as a sign of rickets, and when the muscles of the limbs become stronger, and the bones in their natural process of development grow harder, the curvatures will gradually disappear. The distinction between this kind of bending of the legs and that dependent on rickets may be made by the condition of the general health in each; in the former it is unaffected or may even

be more than usually good, in the latter it is always weak and disordered.

**RICKMANSWORTH.** [HERTFORDSHIRE.]

**RIICOCHET**, a word expressing the act of rebounding, is applied to that mode of firing ordnance in which (the axis of the piece being parallel, or inclined at a small angle to the horizon) the shot or shell, having described a curve in the air, descends to the ground, and, after striking or grazing it, rises upwards; when, by the force of the impulsion, and the power of gravity, it describes a second curve of small elevation: the shot, then descending as before, again grazes the ground, from whence it experiences a second reflection. This effect frequently takes place several times before the force of impulse is destroyed.

Ricochet firing is most generally employed in the attack of fortresses in order to enfilade or rake the faces of works, whose fire might be directed upon the ground on which the approaches are to be made: for that purpose a battery of the besiegers is placed with its front perpendicular to the prolonged direction of each rampart or parapet, and three or more guns are laid either horizontally or with slight elevations or depressions, according to the position of the battery, so that their shot may pass a little above the crest of the parapet which covers the line to be enfiladed. The same mode of firing is also occasionally employed by the besieged against the batteries of the enemy. In either case the intention is to dismount the artillery by causing the shot or shells to strike it obliquely behind the parapet or epaulement, or to destroy the traverses which cover it. It is also used to compel the troops to abandon the parapets, or to destroy the palisades of the covered-way or ditches, so as to facilitate the entrance into a work when an assault is to be made by main force.

The practice of firing à-ricochet was first tried by Vauban at the sieges of Philipsturg and Mannheim, in the war of 1688; and in a letter which that engineer wrote to Louvain, he states that at the former place it had succeeded so far as to dismount six or seven pieces of cannon, and oblige the defenders to abandon a long branch of a hornwork and a face of one of the bastions in front of the ground on which the chief attack took place. The success of ricochet firing appears to have been still greater at the siege of Ath, which was conducted by Vauban during the same war.

It is a remarkable circumstance that, soon after the invention of this method of firing, the changes which were made in the trace or plan of fortifications, though attended with many and great advantages, were such as to render the works more liable than those of former times to the destructive action of the ricochet. The great saliency then given to the ravelins, and the consequent acuteness of the salient angles, allow the prolongations of the faces to be easily observed by the besiegers while at a distance from the work; and thus the guns in the ricocheting batteries are enabled to enfilade the faces in their whole length with great accuracy. The faces of the bastions were also lengthened about the same time; and in fortifications constructed on the inferior polygons, or those of few sides, there is a like facility of dismounting the artillery on those faces. The latter evil ceases to exist when the works are formed on the superior polygons, because the prolongations of the faces of the bastions may then fall upon the intermediate ravelins, and thus be invisible to the enemy; but, for the damage to which the long faces of the ravelins are exposed, no other remedy can be found than in the construction of traverses or blindages on the terrepleins, or in covering the general direction of the faces by an advanced portion of the latter, about twenty yards long, on each side of the salient angle.

The French engineers divide ricochet firing into two kinds, of which one is designated *ricochet mou*, and the other *ricochet tendu* (short and long ricochet); the former comprehending all elevations of the piece, from the greatest which the charge and the gun-carriage will permit, to that which is but little above the horizon; and the latter term being applied to all other cases, down to that in which, from the height of the battery, the gun is depressed below the horizontal plane. When the crest of the parapet which covers the rampart or the ground to be ricocheted is above the level of the battery, the coincidence of that crest with the vertex of the trajectory forms the inferior limit to the elevation of the piece; for if the shot were to pass closely over that crest with a lower elevation, it would at that place be in the ascending branch of the curve, and then the ground

behind the covering parapet would not, to a considerable distance from thence, be struck. In proportion as the elevation of the piece is increased above the same limit, the vertex of the trajectory is nearer to the battery, and thus the shot is in the descending branch when it passes over the crest of the work.

When the parapet over which the shot is to pass has little elevation above the battery, it requires considerable charges to allow the vertex of the trajectory to coincide with the crest; but the charges diminish rapidly as the height of the parapet increases, or as the distance of the battery from thence diminishes: the effect of this is to produce the kind of ricochet first mentioned above, for the angle made by the descending branch with the horizontal ground being greater, the rebounds of the shot are more numerous within a given extent of ground, and between the successive grazes the curves are higher and shorter. In this case, and when the descending branch passes through the crest, the shot falls almost immediately behind the parapet, and no part of the ground to be ricocheted is free from its action: this is not always certain, when by great charges and low elevations the second kind of ricochet is used, since it may happen that the shot will pass above the objects which it should strike within the limits of the ground. In the modern system of fortification the greatest length of the faces of works which are liable to the ricochet is about 100 yards; therefore when there are no traverses on the terreplein, and it is merely required to strike an object somewhere between the crest of the covering parapet (supposed to be about 8 feet high) and the further extremity of any such face, the descending branch of the trajectory will make with the horizon an angle of about one degree, and the charge and elevation of the gun should be determined so that this condition may be fulfilled. From shot so fired a traverse near the covering parapet would entirely protect the ground, since the projectile would lodge in it, and do no harm to the defenders; and in order that the fire of shot may do execution, whether made in that manner or with an increased elevation of the piece so as to produce recochets, it is necessary previously to destroy the traverse by shells fired as above described. For such a purpose General Millar's 8-inch howitzers will probably be found to be the most serviceable; and if the large shot subsequently fired a ricochet to dismount the artillery should not succeed in clearing an enemy's work of the troops who defend the parapet, spherical case shot fired from 24-pounder guns might be advantageously employed. One gun in a ricochet battery should be exactly in the prolongation of the crest of the parapet on the face to be enfiladed, in order that its shot may graze, with the long ricochet, the interior slope of such parapet.

Experiments in ricochet firing were carried on at Woolwich, in the months of June and October, 1821, when a work 100 yards long, and resembling the face of a bastion or ravelin, was enfiladed in that manner with iron and brass ordnance of different natures; the covering face was eight feet high, and its crest was nearly on a level with the axes of the guns in the battery. The results were, that with a range equal to 400 yards, and a charge of powder equal to  $\frac{1}{2}$  of the weight of the shot, about two-thirds of the number of rounds took effect; at 600 yards, with charges varying from  $\frac{1}{4}$  to  $\frac{3}{10}$  of the weight, from one-third to one-half took effect; and at 800 yards, with charges from  $\frac{1}{4}$  to  $\frac{1}{3}$ , between one-third and two-thirds took effect. It was concluded therefore that ricochet batteries ought, if possible, to be at a distance varying from 400 to 600 yards from the nearest part of the line of rampart to be enfiladed; for beyond the latter distance the effect of the fire is uncertain. The long ricochet, with high charges and small elevations or depressions of the guns, may however be advantageously employed in firing from the ramparts of a fortress on the ground in front, or against extensive lines of works when the battery is at a much greater distance.

It appears from the experiments above-mentioned that the best elevations of ordnance for enfilading a work à-ricochet with shot or shells is that in which the axis of the piece is directed at an angle varying from 6 to 9 degrees above a line drawn from the chamber of the gun or howitzer to the crest of the parapet over which the projectile is to pass. It is stated that of 170 shells filled with powder which were fired, 58 took effect, but only 33 burst in the work. Before the traverses were constructed several guns on the work were struck and rendered useless; but afterwards,

though the traverses were much injured, none of the guns protected by them were disabled.

When employed against troops in the field, ricochet firing is found to be of essential service; for the shot making on the ground eight or ten grazes, it cannot fail at some of these to take effect. In 1757, the King of Prussia had several six-inch mortars mounted on travelling carriages; and from these he caused shells to be thrown à-ricochet, in an oblique direction, against the enemy's line, which it immediately put in great disorder.

Ricochet firing, when first employed in sieges, from the defenders not being prepared with means to diminish its destructive effects, produced immediately a strong impression of its power; and the opinion of its superiority to the direct mode of firing has continued to prevail from the time of Vauban to the present day, though the service of artillery is now so precise, that when the guns in an enemy's work can be seen, they can be as readily dismounted by the latter mode as by the ricochet. It ought also to be remembered that before the latter can be usefully employed, the parapets, traverses, or blindages which cover the artillery of a fortress must be ruined by other means; and it may reasonably be concluded that the rapid reduction, or the most protracted defence of a place, will always be owing to a judicious combination of the different modes in which, according to the circumstances, artillery can be used during the siege. [SIEGE.]

RIDEAU CANAL. [CANADA.]

RIDING. [YORKSHIRE.]

RIDINGER, JOHN ELIAS, was born in 1695, at Ulm in Suabia, and was instructed in drawing by his father, who was a schoolmaster, and in the rudiments of painting by Christopher Rasch. His genius led him to animal painting. 'He was,' says Fuseli, 'one of the greatest designers of animals of every denomination whom the annals of painting can produce. If he has been excelled by Ruggendas in horses, and by Rubens perhaps in the ideal dignity of the lion, he far surpassed them and the rest of his predecessors and contemporaries in the wide extent of his powers over every species of brute creation.' Bryan thinks this encomium exaggerated 'by the pardonable partiality of his countryman and biographer M. Fuseli' (but Fuseli was a Swiss, not a German). His biographer in the 'Conversations Lexicon' says, 'No painter ever represented with such truth the characters of wild animals. His delineations of them are, as it were, their natural history. They take the spectator into the recesses of the forest, amidst lions, tigers, and other wild beasts, whose figures, dens, and mode of life are represented by him with the accuracy of a naturalist. His landscapes are always suited to the animals. He was less happy in the representation of the human figure, and of tame animals, for instance horses. His paintings are rare, for he painted but little, his time being almost wholly taken up by his numerous drawings, which are executed with great accuracy and taste. The largest and most choice collection of them (about 1400) are in the possession of Mr. Weigel at Leipzig. His copper-plates or etchings are very numerous, of which the following are considered as the best:—eight plates of wild animals; forty plates of observations of wild animals; fables of animals, sixteen plates; hunting of animals of the chase by dogs, twenty-eight plates; Paradise, in twelve plates. The coppers are in the possession of Schkusan, repository of arts at Augsburg. Old impressions are scarce, and pretty high in price.' Ridinger was chosen, 1757, director of the Academy of Painting at Augsburg, where he died in 1767. His sons Martin Elias and John Jacob followed their father's profession. The first, and Ridinger's son-in-law John Gottfried Seuter, had some share in the execution of his copper-plates. The latter engraved in mezzotinto.

RIDLEY, NICHOLAS, was born in the county of Northumberland, near the beginning of the sixteenth century. He was educated first at Newcastle, and afterwards at Pembroke College, Cambridge. He received further instruction in France, and having gained some reputation for learning, returned to Cambridge, took orders, and became master of his college. His knowledge and power of preaching having attracted the attention of Cranmer, he was presented with clerical preferment, became one of the king's chaplains, and in 1547 was nominated bishop of Rochester. His denunciations from the pulpit of the use of images and of holy water soon showed him the strenuous supporter of

Protestant doctrines, and his abilities caused him to be associated with the principal reformers both in their chief undertakings and discussions. He frequently disputed on transubstantiation and other doctrines: and he sat as a member of the commission appointed to examine into charges brought against Bonner, bishop of London. The commission deprived Bonner of his dignities, and, after some time had elapsed, Ridley was appointed his successor in the see of London. Soon after his appointment he commenced a visitation of his diocese, actively endeavouring to diffuse Protestant doctrines, for the better understanding of which he assisted Cranmer in framing forty-one articles, which were subsequently promulgated. He was nominated bishop of Durham, but his appointment was never completed. Three instances are mentioned, in which he attempted great ends by the force and power of his preaching: he aimed at the conversion of the Princess Mary, went to her residence at Hunsdon, and requested permission to preach before her. This permission she peremptorily refused, and so offended Ridley, who afterwards showed considerable generosity and a ready sense of forgiveness, by interceding with Edward VI. on Mary's behalf, that she should be allowed the free exercise of her religion. Secondly, he endeavoured through his preaching to direct the young king's mind to works of charity, describing three sorts of poor—such as were so by infirmity, by accident, or by idleness. Edward, deeply impressed by this sermon, ordered Grey Friars' church, with its revenues, to be a house for orphans; St. Bartholomew's, near Smithfield, to be an hospital; and gave his own house of Bridewell to be a place of correction and work for such as were wilfully idle. (Burnet.) Thirdly, at the instigation of the supporters of Lady Jane Gray, whose case he espoused, he set forth her title in a sermon at St. Paul's, warning the people of the dangers they would be in, and the ruin that would befall the Protestant cause, if the Princess Mary should come to the throne.

On Mary's accession, Ridley was immediately imprisoned. Her detestation of his opinions was aggravated both by the services he had rendered to the Protestant cause and his opposition to her accession. She committed him to the Tower, in July, 1553, and did not suffer him to be removed until complaints were made that the most learned Protestants were restrained from attending the discussions maintained by the Catholics and the Reformers on different disputed points. In April, 1554, a convocation was appointed at Oxford, at which the doctrine of the real presence was to be discussed, and since Cranmer, Ridley, and Latimer were esteemed the most learned men of their persuasion, the queen granted a warrant for removing them from the Tower to the prisons at Oxford. Each disputed in his turn amidst great disorder, shoutings, tauntings, and reproaches; all were considered to be defeated, and all were adjudged obstinate heretics. Ridley never again left Oxford. He was reconducted to prison, and after resisting many efforts to induce him to recant, was led with Latimer to the stake on the 16th of October, 1555. The place of his execution was in front of Baliol College. Gunpowder was hung to his neck, but it was long before the flames penetrated the mass of fuel, and explosion did not terminate his miserable sufferings until his extremities were consumed; he bore his tortures with undaunted courage. Burnet says that for his piety, learning, and solid judgment, he was the ablest man of all that advanced the Reformation.

(Foxe's *Acts and Monuments*; Burnet; Rapin; Lingard; Hume; and Wood's *Athenæ Oxonienses*, in which a list of his writings is given.)

#### RIENZI. [PAPAL STATES.]

RIES, FERDINAND, an eminent composer of the German school, was born at Bonn on the Rhine, in 1785. He was at first educated under his father, afterwards received instructions from Bernhard Romberg, and finally had a few lessons in composition from Albrechtsberger, the celebrated theorist, to whom he was recommended by Beethoven, the great composer candidly confessing that he possessed not the talent for teaching, which he considered as a 'particular gift.' But the young musician was studious and industrious, and acquired from books more knowledge than he obtained from oral communication. His first professional attempts were made at Munich; his next at Vienna, where he remained till 1805, when he was drawn as a conscript for the French army, which then occupied the capital of Austria, but, having early lost the use of one eye, he was declared disqualified for military service. He after-

wards went to Paris, and composed much, but not successfully. The Beethoven school, to which he belonged, was then but little understood out of Germany. He afterwards proceeded, through Hamburg, Copenhagen, and Stockholm, to St. Petersburg, where fortune began to smile on his efforts, and was preparing to set out for Moscow, but the French army again deranged all his plans, and he finally determined to seek the English shores, where alone he could hope to pursue his peaceful art undisturbed. He arrived in London in 1813, and was immediately received by the liberal violinist Solomon, who procured his admission into the Philharmonic Society, where his symphonies were performed with great applause, and he exhibited his talents as a first-rate pianoforte player. He now was most actively engaged, both as a composer and teacher, and by his unwearied exertions amassed a handsome independence. In 1824 he returned to his native country, continuing however to exercise his talents as a composer, and, besides many works for the pianoforte, produced two German operas, and an oratorio, *David*, a work of more than ordinary merit. But his early efforts and privations, his unintermitting and exhausting labours, undermined his constitution, and to these he may be considered to have fallen a victim. He died at Frankfort in 1838.

#### RIESENBERG. [GERMANY.]

#### RIETI. [SPOLETO, PROVINCE OF.]

RIETI, the ancient *Reate*, once one of the principal towns of the Sabini, and now the chief town of a province of the Papal State, which has retained the name of Sabina to our own times, but is now annexed to the delegation or administrative division of Spoleto. Rieti stands on an elevated plain about one thousand feet above the sea, which is part of the western highlands of the Apennines, a large tract which projects out of the central chain of the Abruzzo. This tract begins at the ridge east of Antrodoco, which forms the boundary between the table-land of Aquila, 2500 feet above the sea, the waters of which run by the Pescara to the Adriatic, and the basin of the Velino, or of Rieti, the waters of which run into the Tiber. This mountain-region, which belongs partly to the Papal and partly to the Neapolitan territories, was the country of the ancient Sabini. Its length is about 70 miles from north to south, from the sources of the Nera at the foot of Mount Tetricus above Norcia, to the sources of the Anio above Subiaco. Its greatest breadth, from the defile east of Antrodoco, on the road from Aquila to Rieti, to the fall of the Velino near Terni, is about thirty miles on the map. The Nera forms the northern boundary of this mass of highlands, and drains the northern part of them by means of the river Corno, which rises near Leonessa, and flowing northwards through a narrow glen near Norcia, joins the Upper Nera near Cerreto. The Velino and its affluents drain the central and by far the largest part of the highland region. The Anio drains the southern part as far as the ridge which divides its waters from those which flow eastward by the Sacco into the Liris. The Anio falls by a cascade at Tivoli into the lowlands of the Campagna, and thence flows into the Tiber. The two waterfalls of the Velino and Anio are the only outlets by which the waters of the highlands of Sabina find their way westward to the Tiber.

A succession of mountain-ridges form the western boundary of the highlands of Sabina on the side of the Tiber, extending from the Anio at Tivoli to the Nera above Terni. The southern part of this range near the Anio is known by the ancient name of Lucretilis, now Monte Gennaro; and the northern part, which extends to the Nera, by the name of Mount Canterius, which is seen from the valley of the Tiber towering to the eastward above the towns of Magliano, Calvi, Otricoli, and Narni. The eastern boundary of the region of the Sabini is formed by the lofty ridge of the central Apennines, consisting of the groups of Monte Sibilla, 7200 feet; Mount Terminillo, north-east of Rieti, 7000 feet; and Mount Velino, 8180 feet. Between these two ridges lies the basin of the Velino, the lower part of which forms the plain of Rieti. The Velino has its source in the central Apennines, about fifteen miles north of Antrodoco, at the foot of Mount Cenatra, not far from the sources of the Tronto, which flows on the opposite or eastern slope to the Adriatic. [ASCOLI.] The Velino first flows southward through a narrow and deep glen until it reaches Antrodoco, where it turns to the west, passing by Civita Ducale and Rieti. Before it reaches the latter town, it receives the Salto or Imele from the south. The Salto rises near Tagliacozzo, not far from the lake Fucino, and flows north-west

through a secluded but interesting valley called Cicolano, belonging to the Neapolitan territory. This valley has been explored of late years by Dodwell and by Keppel Craven, for the purpose of examining the remains of Cyclopien constructions which are scattered all about this district, and which are supposed to belong to the towns of the aborigines mentioned by Dionysius (i. 14) as destroyed long before his time. Keppel Craven, *Excursions in the Abruzzi*, 1838, vol. i., chap. 7.) Others look for those towns, Palantium, Bafia, Tiora, and Lista, on the banks of the Velino above Rieti, where remains of Cyclopien walls are also found. (Review of Dr. Cramer's *Description of Ancient Italy*, in the 'Quarterly Journal of Education,' No. xiv.) Cutihæ, another town mentioned by Cato and Dionysius, is supposed to have been also in the valley of the Velino near Paterno, where there is a small but deep lake, which is still called Cutilia. The ruins of Trebula Mutusca are south of Rieti, near Osteria Nuova, on the Via Salaria, and in the same direction are the remains of Cures, near the village of Correse; at the foot of Mount Lucretilis are other remains, supposed to be those of Suna and Orvinium, also mentioned by Dionysius as cities of the aborigines.

In modern times, the district of Cicolano, in the valley of the Salto, has acquired a certain historical interest on account of the tragical end of the Cenci, a Roman baronial family of the middle ages, the head of which, Francesco Cenci, was murdered in the castle of Petrella, at the instigation of his wife and daughter, who were put to death after a long trial, which has been the subject of many compositions both in prose and verse.

The Velino, after its confluence with the Salto, passes through Rieti, dividing the city from the suburb, and then turning to the north-west receives the Turano also from the south. The Turano, the ancient Telonius, rises in the Neapolitan territory, not far from the Anio, in the mountains which border the basin of the Fucino to the westward, and on the opposite side of which the Liris has its source. The Turano runs in a north-west direction nearly parallel to the Salto, passes by Carseoli on the Via Tiburtina, which leads from Tivoli into the country of the Marsi, flows along the eastern base of Mount Lucretilis, and then enters the plain of Rieti, where it joins the Velino after a course of about 40 miles. In the valley of the Turano, the greater part of which lies in the Papal State, but which, like the rest of this region, is almost unknown to travellers, is the town of Rocca Sinibalda, near the site of the ancient Trebula Mutusca. It was on the banks of the Telonius that the consul P. Rutilius and 8000 men were defeated and killed during the Marsian or Social war.

The plain of Rieti is one of the most delightful spots in Italy. It is covered with plantations of mulberry-trees, vines twining round elms and maple trees, fields of wheat, Indian corn, beans, flax, hemp, wood, and vegetables of every kind. It is traversed by two clear streams, which unite their waters about three miles below the town of Rieti, whose churches, steeples, and other massive buildings make a fine contrast with the brilliant verdure of the surrounding country. Farther down the river, between the right bank and the base of the Apennines, is a succession of marshes and lakes, the largest of which, called *Piè di Luco*, is about 10 miles in circumference; the banks are very bold and picturesque, but are considered unwholesome. The waters of the lake have an outlet into the Velino. Near this place the two ridges, eastern and western, which bound the plain of Rieti, approach near each other, leaving only a narrow gorge through which the Velino flows on a rocky bed with a rapid declivity until it reaches the edge of the terrace, where it falls into the valley of the Nera amidst clouds of mist. According to the measurement taken by the engineer Brandolini, the whole perpendicular height from the edge of the rock to the level of the Nera below is 143 mètres, or about 455 English feet. The fall however is broken into two parts, the first of which is perpendicular, after which the water forms a succession of cascades or rapids, until it meets the Nera. A pavilion called 'la Specola,' erected by Pius VI. on a projecting shelf of rock which overhangs the precipice, commands a fine view of the fall and of the valley of the Nera below. The cascade, called *Della Marmora*, has been considered by many as the finest in Europe, the mass of water being superior to all the Alpine cascades, and the height far superior to the fall of the Rhine at Schaffhausen. A rainbow is often seen hovering on the mist produced by the spray:

A matchless cataract!  
Horribly beautiful! but on the verge,  
From side to side beneath the glittering moræ,  
An Iris sits, amidst the infernal surge.  
(*Childe Harold*, canto 17.)

The best view of the cascade is from the banks of the Nera below, about three miles distance from the village of Papigno, which is near Terni. (Tournon; Valery.) The name of Marmora has been given to the mountain from which the river falls, on account of the abundant incrustations, resembling marble, produced by the deposit of the waters of the Velino. The inhabitants of the neighbouring country are said to be subject to the gravel and the stone.

The valley of the Velino is said to have been in very remote times occupied by the Umbri, before that people descended from the highlands of the Apennines into the valley of the Upper Tiber, which has ever since retained the name of Umbria. [ETRURIA.] After the migration of the Umbri, another race of mountaineers from the central parts of the Apennines about Amiternum, near the sources of the Aternus or Pescara, became possessed of the valley of the Velinus; they were known by the name of Sabini, and they spread from thence into the country between the Nera, the Anio, and the Tiber, which they occupied almost as far as the gates of Rome. [OSCI.] The Sabini were a remarkable people; their manners were simple, and their habits austere; they had a reputation for good faith and domestic virtue. They were religious, and even superstitious, and their country was famed for omens and prodigies. Prodiges, such as monstrous births, showers of stones, &c., are mentioned by Livy (xxv. 7; xxvi. 23; xxxvii. 3; lx. 11; liii. 13) as being of frequent occurrence at Reate previous to some great event or calamity. The Sabini had adopted a periodical system of emigration. As their population increased beyond the means which the country afforded, they sent out colonies in the spring of the year, and the migration was attended with religious ceremonies. The Piceni and Samnites were colonies of the Sabini, anterior to the foundation of Rome. The subsequent history of the Sabini forms part of the history of Rome.

The principal towns of the Sabini were:—Amiternum, Tetrina, Reate, Cures, Nursia, Eretum, Trebula Suffena, Mutusca, and Nomentum; the last was in the lowlands of the Sabini, which extended on the side of Rome as far as the confluence of the Anio with the Tiber.

The name of Sabini has continued to be applied to the country of the ancient Sabini down to our own times. Previous to Napoleon's occupation of Rome, in 1809, Sabina was one of the provinces of the Papal State. After the restoration of 1814, it was styled the Delegation of Rieti, which has been since united to that of Spoleto. [SPOLITO & RIETI, PROVINCE OF.]

The plain of Rieti was almost entirely covered with water, when the consul M. Curius Dentatus, 240 B.C., made a cut through the rock, deepening and widening the outlet for the waters of the Velino, and drained thereby the fields of Reate. The outlet must have existed before, for the waters of the valley above could have no other issue, but the natural channel was probably not deep enough to prevent the country being overflowed, until Dentatus deepened it. The people of Interamna, or Terni, complained of the damage occasioned to their fields by the overflowings of the Nera, in consequence of the additional stream thus poured into it. The senate sent a consul and ten legates to the spot to decide the matter, and Cicero repaired thither to plead for the people of Reate. (*Ep. ad Atticum*, iv. 15.) The result was that the cut was maintained.

Under Tiberius the question was again agitated in the senate: this time it was the people of Rome, who, alarmed at the inundations of the Tiber, ascribed them to the Velinus, the Clanis, and other affluents of the Tiber. The Reatini made a sensible defence, and the opinion of Pius, who was for maintaining things as they were, was adopted. (*Tacit., Ann.*, i. 79.) In more modern times the bed of the Velino above the fall has repeatedly become obstructed by calcareous deposits, and the river has again overflowed the plain; to remedy which Pope Paul III. made a new cut, and Clement VIII. afterwards restored the old one made by Curius. (Angelotti, *Descrizione di Rieti*.)

Reate is said to have derived its name from Rhea or Cybele, the ancient patroness of the place. Like the rest of the Sabini, Reate was an early and constant ally of Rome, and is mentioned by Livy as having, together with Ami-

ternum, furnished soldiers for Scipio's expedition to Africa. Cicero, in various places, extols the fidelity of the Sabini, and particularly of the people of Reate. (*Pro Ligario*, 11, and the third *Catilinaria*, 2.) The Flavian Gens was originally from Reate. Vespasian was born at Falacrina, in the valley of the Upper Volturnus, above Reate, and he died there, and his son Titus after him. Remains of the baths built by those two emperors are still seen in the territory of Rieti. Near San Lorenzo, which is on the Via Salaria, on the summit of the ridge between the valley of the Tiber and the plain of Rieti, is a spot still called Titabanea, with considerable remains of Roman brick-work.

In more modern times the people of Rieti were among the first to pay voluntary allegiance to the see of Rome, as their temporal sovereign, in the time of Pope Adrian I., their deputies cutting their hair and beard in token of submission. Rieti was often an asylum for the popes in the middle ages, when driven away from Rome by faction or foreign invasion. In our own times, in March, 1821, the Neapolitan constitutionalists, under General Pepe, were defeated by the Austrians near Rieti. In 1831, the people of Rieti showed their devotedness to the papal see by repulsing the insurgents from Bologna and Romagna who were advancing towards Rome.

Rieti is built partly on the slope of a hill, and partly at the foot of it; it is a bishop's see; it has a college and a clerical seminary; it has also manufactures of coarse woollens, silks, glass, and leather. The population amounts to about 9000, among whom are many wealthy landed proprietors. The town-house, or governor's palace, is a massive building, in the highest part of the town, and enjoys a splendid view of the surrounding country. The cathedral was built in the twelfth century, but has been repeatedly restored. There are several other churches and convents, as well as the episcopal palace, which are worthy of notice.

(Angelotti, *Descrizione della Città di Rieti*, 1635; Maroni, *Commentarius de Ecclesia et Episcopis Reatinis*, 1763; Galotti, *Mémorie di Tré Antiche Chiese di Rieti*, 1765; Sperandio, *Sabina, Sacra e Profana, Antica e Moderna*, 1790.)

**RIFLE**, or **RIFLED**, a term applied to muskets or pieces of ordnance when their bores are furrowed with spiral grooves. It is probably derived from an Anglo-Saxon word signifying to *rive* or *tear*; the grooves or channels being formed by a machine which scrapes away the substance of the barrel interiorly in parallel and serpentine directions.

It is not precisely known at what time rifled barrels were first employed in warfare, but P. Daniel states (*Hist. de la Milice Française*, liv. vi.) that the carabiniers of the French cavalry were furnished with such arms; he also observes that they had been invented long before the time at which he wrote, and that he had seen them used before that class of troops was formed into a regiment. This circumstance took place in 1692, and we may therefore conclude that rifled arms were known on the Continent about the middle of the seventeenth century. The historian describes the *carabines rayées*, as he calls them, as being grooved in a circular manner along the whole of the barrel; and he asserts that the range of the balls fired from them was very considerable. Rifled arms do not appear to have been introduced in the British service till the time of the American Revolutionary war.

A bullet made of lead cast in a spherical form, according to the practice till lately followed, having unavoidably some irregularities on its surface, and, from unequal expansion in cooling, a void space being formed in the interior by which the density is caused to vary in different directions from the centre, it follows that, when such bullet is discharged from a common musket, the atmosphere, pressing unequally against its front on opposite sides of the line of flight, causes it to deviate continually from the direction which, when uniformly resisted, it would take by gravity and the impulse of the fired gunpowder. It will also happen that the bullet acquires, by friction in the barrel, a rotatory motion about some diameter as an axis; and this diameter not coinciding, except by an extraordinary chance, with the proper path of the ball, the pressure of the air, which, when that coincidence does not take place, will be greater on the side of the ball where the revolving motion conspires with the direct motion, than on the opposite side where the two motions are in contrary directions, will, even if there were no irregularity of surface, produce deviation. This will evidently be various, according to the position of the axis of rotation; and since

that position may change during the flight of the ball, the path of the latter may suffer several inflexions.

The intention therefore in forming spiral grooves within the barrel of a musket or piece of ordnance, is, to produce a rotatory motion of the shot about an axis which shall coincide with the line of its path, in order that the unequal pressure of the atmosphere in its front, on account of any irregularity in its form or density, may correct itself at every half-revolution of the shot on such axis; so that, on arriving at the object, the deviation may be only that which is due to some fraction of a rotation. The number of spiral channels in a rifle-musket has varied at different times; at first there were eight or sixteen, but the number was afterwards reduced to four, and at present the practice is to have but two. It has not been exactly determined what is the best form for the spiral; sometimes the curve-line makes, in the length of the barrel,  $1\frac{1}{2}$  revolutions about the axis of the latter, but in general one revolution in the whole length (=30 inches) is considered sufficient.

Different methods have been employed for the purpose of enabling the bullet to acquire, by means of the rifle-grooves in the barrel, the intended rotation on its axis. At first the leaden bullet was made spherical as usual, but a little larger than the bore of the musket, and being laid on the muzzle of the latter, it was forced down upon the powder by blows of a mallet applied at one end of a ramrod; thus, during the descent, the bullet being soft, there were formed on a zone of its surface projections which nearly fitted the grooves, and these projections, by moving along the grooves on the piece being fired, produced the required rotation. Some time since rifle-muskets were made so as to admit of being loaded at the opposite extremity of the barrel; a sort of chamber being formed by an enlargement of the bore at that place, the powder and bullet were introduced in it through a perforation made in the side of the barrel, and this, after the piece was loaded, was closed up by a screw which fitted it. Then, on firing the charge, the bullet, yielding to the compression in the bore, acquired projections where the grooves allowed it to expand, and thus it passed into the air with the rotatory motion on its axis. But neither of these methods is now used.

The most general practice of late has been to press the bullets (by means of the ramrod) into the barrel upon a piece of greased cloth or leather (called the *plaster*). This plaster is made of a circular form and greater in diameter than the bore, on the aperture of which it is laid with the greased side downwards; the bullet is then placed upon it, and both being forced down together, the cloth or leather which then covers the lower half of the bullet expands in the grooves, and this is found to be sufficient, when the piece is fired, to give the motion of rotation. At present rifle-bullets are made with a projecting zone which surrounds them on the circumference of what may be called a great circle, and has a breadth equal to about one-third of the diameter. The pieces are loaded at the muzzle, and the parts of the zone which are diametrically opposite to one another are those which pass along the two grooves in the barrel.

Captain Norton's rifle-bullets are nearly of a spheroidal form, and on a circumference perpendicular to the longer axis are two knobs which pass along the grooves when the bullet is pressed into or fired from the piece. The bullets are made hollow like small shells, in order to contain a small quantity of powder, and this, when the bullet strikes the object, is ignited by means of a detonating composition in a cap which covers an orifice in front of the bullet. It is proposed that these loaded bullets should be fired into an enemy's magazine or carriage conveying gunpowder, that by exploding there they may cause the destruction of the ammunition and of any objects which may be in its vicinity.

A bullet fired point-blanc from a rifle-barrel is found to strike an object at a much greater distance from the piece than when it is fired from an ordinary musket, and this was once ascribed to a superior velocity which the rifle was supposed to communicate to the ball. In fact, however, it is caused merely by the correction of the deviation, on which account the rifle-ball proceeds farther than the other in the direction of the line of aim; for Mr. Robins found by experiment that both the velocity and the range of the former were less than those of the latter, and he justly attributes the circumstance to the greater friction which the ball experiences in moving along the rifle-grooves than in

passing through a simple barrel. He also ascertained that the velocity and range of a rifle-ball were greater after the piece had been long in use than they were at first, probably on account of a diminution of friction consequent upon an enlargement of the breadth of the grooves.

Mr. Robins moreover proved by experiment that a rifle-ball in its flight presents always the same side to the front, or rather, that the axis of rotation continues nearly parallel to itself; and to this circumstance he ascribes the deviation which such a ball experiences when fired with an elevation of the piece so that its trajectory becomes greatly curved, for the axis of rotation not coinciding with the direction of the path, the inequality of the air's resistance on different parts of the bullet is no longer corrected by the revolution about that axis. Mr. Robins, in order to remedy the evil, proposed that bullets should be formed like eggs, the longer axis to be placed in the direction of the axis of the piece, and the larger end to be in front; for then, the centre of gravity being thrown forward, there will be a tendency of the axis of the bullet, at least in the descending branch of the curve, to keep in the direction of the line of flight. The suggestion has not however been adopted, and probably such balls would not be found to possess any practical advantages over those which are in common use.

In the year 1774, Captain Blair proposed the formation of rifled guns of iron to be used as field artillery. Agreeably to the old practice, they were to be made hollow in the act of being cast, and in the same operation the grooves were to be formed. The balls were to be of lead with knobs on them to fit the grooves, and they were to weigh not more than two pounds. During the late war, the French attempted to introduce into their service cannon-shot of a cylindro-spherical form, the cylindrical part being in contact with the charge of powder, and a ring of lead surrounding the shot near its middle, so as to render this part rather greater than the bore of the gun. The circumference of the ring, being scraped down by the edge of the muzzle when the shot was forced into the gun, became in close contact with the surface of the bore, and thus no windage was left: by this contrivance it was expected that most of the advantages of a rifled gun would be obtained, though no rotatory motion took place in the shot. The result of the trials was thought to be favourable with respect to the direction and range of the shot, but the labour and time required to load the gun were great, and this circumstance probably prevented the invention from being adopted. No kind of rifle ordnance has ever been used in warfare, and the spherical form has always been found preferable to any other for shot.

It may be mentioned here, that bullets for common muskets, as well as for rifle-barrels, are not now cast in their actual forms, but are made from lead which has been previously cast in cylindrical rods rather greater in diameter than the intended ball. Each rod is passed between two revolving cylinders, whose convex surfaces are indented, and, by the pressure, the rod becomes a series of rudely formed beads: the rod in this state is passed between two other revolving cylinders, on whose convex surfaces are several corresponding hemispherical cavities, and the pressure then reduces the beads to a spherical form, the whole series of balls being connected together by a thin portion of lead where the hemispheres of the balls unite; this portion being afterwards removed, the bullets are complete. The cavities for rifle-bullets allow, during the pressure, a projection to form itself about each in the manner above mentioned. The great pressure to which the lead is subject when passing between the cylinders, by forcing the particles together, fills up any vacuities which may form themselves in the rods during the cooling process, and probably renders the density of the ball nearly uniform.

**RIFLEMEN** (called by the French *tirailleurs*) are soldiers whose duties correspond nearly to those of light-infantry troops, but their muskets being rifled or grooved, the effect of their fire, within certain limits, is more certain.

In the preceding article we have stated what is known concerning the first use of rifled barrels on the Continent; and in the article **ARMS** it has been shown that the duty of riflemen is indicated in the 'Observations' compiled by the earl of Albemarle in 1646. The Anglo-American people are however believed to have been the first who organised corps of infantry armed with rifle-muskets, and during their struggle for independence the fire from those pieces too

often took effect with fatal precision against the officers and in the ranks of the British forces. From that time the incorporation of bodies of riflemen with the armies began to take place among the nations of Europe, and it is now become a general practice. In the British service, the 60th, formerly called the Royal American regiment, is a rifle corps; and Manningham's rifle corps appears in the 'Army List' for 1801, but this became, in 1803, the 95th regiment. In 1816 it was formed into the present rifle-brigade, and placed under the command of Sir David Dundas, who had before been colonel of the 60th regiment. Subsequently to that year, a regiment of native riflemen has been raised in Ceylon, and a rifle corps of cavalry at the Cape of Good Hope.

When a company or corps of riflemen act with closed ranks and files, the manner of performing the exercises differs but little from that which is practised by other troops of infantry; the men however are instructed to be careful that the rifle do not fall to the ground, as it is easily damaged, and on service it may happen that it cannot be repaired or replaced.

If a corps of riflemen is detached from a main body of troops in order to skirmish with the enemy, one-half advances with trailed arms about 100 paces towards the front, when it extends its files so as to cover the whole body from which it was detached, while the other half advances only 50 paces, and remains at close order for the purpose of supporting the former party. On a signal for alarm being given, the skirmishers retire quickly through their respective intervals in the main body, and re-form themselves in its rear. When a body of troops retreats across a plain, the riflemen on the right and left flanks of each division remain fronted, while the main body faces to the right-about and retires; those men then extend themselves so as to cover the retreating troops, whom they follow at the distance of a few paces, keeping off the enemy's flankers at the same time by their fire.

On firing at close order, the two right-hand files of each section step three paces to the front, and the rear-rank men step to the right of their file-leaders. Each man fires as soon as he gets proper aim; then, resuming his place in the company, he reloads. When the two first files have fired, the two next advance, and so on through the whole company. Rifle-firing in extended order is performed by sound of bugle, and the regulation is, that the whole body of men should not have their pieces unloaded at the same time. For this purpose, on the signal being given, each man of the front rank selects his object and fires; then, as soon as each rear-rank man sees his file-leader put another ball in his piece, he fires through the interval between two front-rank men. Afterwards, when the rear-rank men are putting other balls into their pieces, they give notice to their file-leaders that they may fire; and this is continued, the men either standing or lying on the ground, till the signal is given to cease.

On a signal being made to fire advancing, each rear-rank man moves briskly six paces before the front rank and fires; then, after reloading, he trails his arms. When the sergeant of the front rank sees the other rank reloading, he steps forward and gives a signal with his whistle, on which the front-rank men pass six paces before the rear-rank and fire, and so on alternately. If the signal be made to fire retreating, the rank which happens to be in front fires and then goes twelve paces to the rear of the second rank; there each man faces to the front and reloads. As soon as the sergeant on the flank of the second rank sees the first-rank men loading, he gives a signal with his whistle, on which the second rank fires and goes twelve paces to the rear of the former men; and so on. The ranks thus support one another by their fire, till the signal is made to halt.

**RIFLE BIRD.** [PTILORIS.]

**RIGA.** [LIVONIA.]

**RIGA** (in the language of Livonia, *Righa*; in that of Esthonia, *Riolin*), the capital of the government of Livonia, is situated in 56° 55' N. lat. and 24° 12' E. long., on the right bank of the Dūna about seven miles above its entrance into the Gulf of Riga. The width of the river and the distance of the town from the sea make the port very spacious and secure, and the merchantmen come up to the quays. In summer a bridge of pontoons, loosely attached to piles, and rising and falling with the tide, is laid across the river; this bridge is 40 feet wide and 2600 feet long, and is a pleasant and fashionable promenade in the summer time. The

town is surrounded with ramparts and bastions. It has a strong citadel, and is otherwise well fortified, so that it is considered one of the most important bulwarks of the Russian empire. It consists of the town itself, of one suburb within the palisades, and of two more distant suburbs on the left bank of the Düna. There are three gates towards the country and four towards the Düna. About 1000 of the 4000 houses are of stone, many of which are large and handsome, but the streets are narrow and crooked, and the town dark and gloomy. There is but one inconsiderable market-place, and a pretty spacious parade before the palace, in which the merchants erected, in 1817, a granite column, twenty-three feet high, surmounted by a bronze statue representing the goddess of Victory, nine feet high, in memory of the triumphs of the Russian arms in 1812-13. Of the 14 churches, 6 are Lutheran, 4 Greek, 1 Calvinist, 2 Livonian, and 1 Roman Catholic; of the Lutheran the most remarkable are the large and lofty cathedral, attached to which is a quadrangle surrounded with cloisters, and which contains the museum and the public library of 18,000 volumes, and St. Peter's church, which has a fine tower commanding an extensive view of the harbour. The other public buildings are, an imperial palace, with an observatory; the residence of the civil governor; an ancient palace, partly used as the residence of the military governor, partly serving for barracks; the town-house, containing the Exchange; the assembly-house of the estates of Livonia; the arsenal, the hospital of St. George, the Catherinenhof, a bomb-proof warehouse 445 feet in length, and a theatre. There are numerous literary and useful institutions, as the gymnasium, the economical society, the society for the study of the history and literature of the Baltic provinces, the cathedral school, and the commercial bank.

The town of Riga was founded about the year 1200, by Albert, the third bishop of Livonia, Christianity having been introduced in the middle of the century, by Meinhard, a monk of Bremen, who was ordained by the pope as first bishop of Livonia. The founder granted it several privileges and a considerable extent of territory. The city, which was at that time a colony of Germans, soon became rich and powerful, and in the thirteenth century joined the Hanseatic league, and its commerce was the source of such great wealth that the power of the city and the pride and luxury of the inhabitants became proverbial. At the beginning of the sixteenth century it belonged to the Teutonic knights, who were obliged to submit to Poland in 1561; but Riga, which had embraced the Reformed religion, fearing a Popish master, refused to recognise the sovereignty of the kings of Poland till 1581, when it obtained the guarantee of its ancient privileges. From that time its prosperity declined. In 1621 it was besieged and taken by Gustavus Adolphus. In 1710, after a vigorous defence, it was taken by Peter the Great, when half the town was in ruins, many hundreds of the inhabitants had perished by the enemy's fire, and 20,000 had been carried off by the plague during the siege. In the siege of 1812, the suburbs, with nearly 800 large houses, besides the smaller houses and outbuildings, and four churches, were burnt, and also 200 houses in the town itself, and 1500 inhabitants perished. The suburbs have been rebuilt, and are much handsomer than before. It has likewise suffered several times by fires and inundations, to which latter it is much exposed by the banks of the river being very low. Thus at the breaking up of the ice in 1814, 400 houses were swept away with their inhabitants, immense quantities of timber, and eighty vessels laden with hemp. The loss was above thirty millions of rubles. Before the rapid rise of Odessa, Riga was the third city in point of population in the empire: it is now the fourth, the population being nearly 60,000, of whom above 30,000 are Protestants, chiefly Germans and their descendants; the remainder are mostly Livonians, the Russians being comparatively few. The numerous ships in the river, the bustle in the streets, and the well-stocked warehouses and shops, are indications of the extensive trade of which Riga is the centre: it is in fact, next to St. Petersburg, the greatest emporium of foreign commerce in the empire. The exports consist of the great staple articles of Russian produce, corn, timber, flax, hemp, linseed, tallow, Russia leather, and sail-cloth. It appears from the official accounts, that the quantity of corn exported has considerably decreased of late years; that of hemp has remained nearly stationary; on the other hand, a remarkable increase has taken place in the exports of flax, linseed, and timber.

The number of ships annually arriving at and leaving the port may be stated at between 1200 and 1300. In 1831, the arrivals were 1522, the departures 1483. Of these ships nearly one half are English. The value of the exports is about two millions sterling; that of the imports, consisting of colonial produce, manufactures of woollen, cotton, and silk, wine, &c., is not above one-third of that sum; about two-thirds of the ships arriving at the port are in ballast. It is not only the commerce of Riga that is increasing; it has now considerable manufactories of woollen, cotton, tobacco, starch, looking-glasses, and iron-wares, besides sugar-refining houses, which produce annually five million pounds of refined sugar. (Stein's *Lexicon*; Hörschelmann; Cannabich; Hassel; *Russian Official Journals*)

RIGAUD, HYACINTHE, a portrait painter, called the Vandyck of France, was born at Perpignan on the 25th of July, 1659. He was the son of Matthias Rigaud, an artist, from whom he learned the rudiments of painting, and upon whose death he was sent by his mother to Montpellier, and placed under various masters, among whom was one Ranc, a painter of portraits in the manner of Vandyck. In 1681 he returned to Paris, and in the following year gained the chief prize given by the Academy. He intended to follow historical composition, but was advised by Charles le Brun to practise portrait, and the same artist dissuaded him from visiting Italy. In 1700 he was admitted a member of the Academy of Paris, and presented as his admission picture a portrait of the sculptor Desjardins, a performance which gained him the highest reputation. His success as an artist was now most brilliant; he frequently painted the portrait of Louis XIV., those of the royal family, the principal nobility of the court, and many of the most illustrious personages of Europe. In 1727 he was pensioned and decorated with the order of St. Michael. He was successively professor, rector, and director of the Academy. Grief for the loss of his wife, who died in 1742, coupled with his advanced age, hastened his own death, which happened on the 19th of December in the following year. He left no issue, and no pupil of note except Jean Ranc, who married his niece, and who became principal painter to the king of Spain. Works by Rigaud are contained in most of the collections of Europe. In the Louvre, besides others, are the portraits of Le Brun, Mignard, and Bossuet. His pictures have been engraved by Edelinck, the Drevets, J. Audran, and other eminent artists, and consist of two hundred historical portraits.

Rigaud is considered one of the best portrait painters of the French school; his heads are full of character and expression, his touch bold and free, yet exquisitely delicate, and his colouring, though brilliant, generally speaking free from gaudiness. In his draperies however he was too apt to express a fluttering effect wholly inconsistent with the repose of the other parts of his work, and in many instances the attitudes of his figures exhibit an unnecessary violence of action. With regard to the title given him of the French Vandyck, it seems difficult to reconcile it with truth, for the charming simplicity of that exquisite painter, one of his most prominent merits, is entirely wanting in the works of Rigaud; nor do the two less resemble each other in their style of colouring and in their management of the chiaro-scuro. Where the tints of Rigaud are brilliant and dazzling, those of Vandyck are harmonious and chaste; and where the lights of the former are relieved by positive and forcible colour, those of the latter are brought to their proper degree of projection by the gradual depth of the accessories and backgrounds.

(*Biographie Universelle*; Pilkington's *Dictionary of Painters*.)

RIGEL. [ORION.]

RIGHI'NI, VINCENZO, a composer of great merit, whose works deserve to be better known, and will probably ere long be rescued from the ill-deserved neglect into which they have fallen, was born at Bologna, about the year 1758, and received his musical education under the celebrated Padre Martini, but completed it at Prague, where he acquired a vigour which was not then the attribute of the Italian school. Righini composed many operas for different theatres, among which his *Armida*, *Tigrane*, *Enea nel Lazio*, and *Alcido al Birio* are well worth the notice of the true amateur. He died in his native city, in 1812.

RIGHT. It has been shown in LAW [vol. xiii., p. 301] that the word *right* occurs under some form in all the Teutonic languages; and that it bears a double meaning equi-

valent to the significations of the Latin word *ius*, namely, *law* and *faculty*. The Anglo-Saxon word bore this double meaning, but *right*, in modern English, has lost the signification of *law*, and has retained only its other meaning.

Right, in its strict sense, means a legal claim; in other words, a claim which can be enforced by legal remedies, or a claim the infringement of which can be punished by a legal sanction. It follows from this definition that every right presupposes the existence of positive law.

The causes of rights, or the modes of acquiring them, are various, and can only be explained in a system of jurisprudence; for example, a person may acquire a right by contract, by gift, by succession, by the non-fulfilment of a condition.

Every right correlates with a legal duty, either in a determinate person or persons, or in the world at large. Thus a right arising from a contract (for example, a contract to perform a service, or to pay a sum of money) is a right against a determinate person or persons; a right of property (or dominion) in a field or house is a right to deal with the field or house, availing against the world at large. On the other hand, every legal duty does not correlate with a right; for there are certain absolute duties which do not correlate with a right in any determinate person. Such are the duties which are included in the idea of police; as the duties of cleanliness, order, quiet at certain times and places.

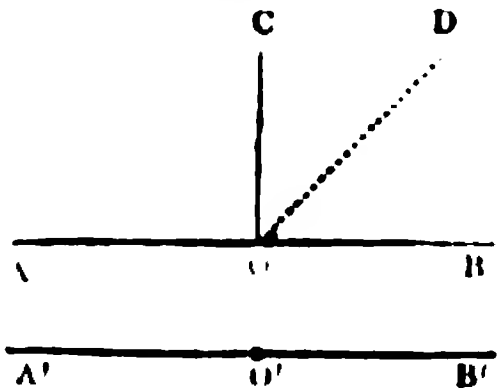

The word right is sometimes used, improperly and secondarily, to signify not legal but moral claims; that is to say, claims which are enforced merely by public opinion, and not by the legal sanction.

In this sense the right of a slave against his master, or of a subject against his sovereign, may be spoken of; although a slave has rarely any legal right against his master, and a subject never has a legal right against his sovereign. It is in the same sense that a sovereign government is sometimes said to have rights against its subjects, although in strictness a sovereign government creates rights, and does not possess them. In like manner, one sovereign government is said to have rights against another sovereign government; that is to say, moral rights, derived from the positive morality prevailing between independent nations, which is called *international law*.

We likewise sometimes hear of certain rights, styled natural rights, which are supposed to be anterior to civil government, and to be paramount to it. Hence these supposed natural rights sometimes receive also the additional epithets of indefeasible, indestructible, inalienable, and the like. This theory of natural rights is closely connected with the fiction of a social compact made between persons living in a state of nature; which theory, though recommended by the deservedly high authority of Locke, has now been abandoned by nearly all political speculators.

**RIGHT.** (Mathematics.) This term is applied in mathematical language to anything which is imagined to be the most simple of its kind, to distinguish it from others. Thus a right line is a **STRAIGHT** line; a right angle is the most simple and well known of the angles used by Euclid; a right cone is one in which the axis is at right angles to the base; and so on.

**RIGHT ANGLE.** When two lines, at first coincident, are made to separate so that one of them revolves about their common extremity, the revolving line will in time become the continuation of the other. This angle or opening, made by a line and its continuation, would, we might suppose, be one of the principal angles considered in geometry, and should, according to the previously defined meaning of **RIGHT**, be called a right angle. But in the geometry of Euclid the word angle seems to have been essentially connected with the idea of a pointed corner, and we have no means of finding out that he considered a line and its continuation as making any angle at all. Instead of this an-

gle, made by AO and OB, or the angle of opposite directions, he introduces its half, and calls it a right angle. Let

AOC and COB be equal angles, that is, let OC bisect the angle AOB, and each half is called a right angle. When the angle AOB is mentioned, it is as two right angles. All that is necessary as to the magnitude of a right angle has been given under **ANGLE**: we propose here to point out the effects of the forced manner in which Euclid avoids the angle AOB.

It is sufficiently evident that nothing can lose its right to be considered as a magnitude by augmentation: so that the opening of AO and OB, which is double that of AO and OC, must really be a magnitude of the same kind as the angle AOC. Now the consequences of preferring AOC to AOB, as a fundamental angle of reference, are as follows:—

1. The introduction of the apparently very arbitrary axiom, that 'all right angles are equal,' instead of the more simple and natural one that 'two straight lines which coincide in any two points coincide beyond those points.' It is as evident as that 'two straight lines cannot inclose a space,' or 'two straight lines which coincide in two points, coincide between those points,' that the same also takes place beyond those points. A moment's examination will show that this axiom immediately gives as a consequence that the angle AOB in any one straight line is equal to the angle A'O'B' in any other; or, as Euclid would express it, the doubles of all right angles are equal, whence all right angles are equal. And it is one consequence of leaving the natural route, that Euclid himself has assumed both the more complicated axiom which he has expressed, and also the more simple one by which he might have avoided it: for he nowhere shows that if OA be made to coincide with O'A', then OB coincides with O'B'. Some of his editors have supplied the defect by making it a consequence of 'all right angles are equal,' that 'no two lines can have a common segment.'

2. The necessity of proving a particular case of a proposition which is taken as self-evident in all other cases. Thus Euclid never proves that COD and DOB are together equal to COB; while he has to spend a proposition in proving that AOD and DOB are together equal to AOB.

3. The necessity of proving a particular case after the general case has been proved. Thus to bisect a given angle is the general proposition, of which to draw a line perpendicular to a given line from a given point within it, is the particular case. The construction of the latter is precisely that of the former: but the two results are obliged to be obtained in two distinct propositions: it would be right enough to make them cases of one proposition.

4. The habituation of the student to neglect the angles greater than two right angles, by his never meeting with one *as great*. Two lines which end at the same point make two openings, one greater and the other less than two right angles; except in the intermediate case when both are equal to two right angles. Now Euclid does not positively reject the angle greater than two right angles, nor does he say that of two lines which meet, the angle which they make shall be always taken to be that which is less than two right angles. Had he had such intention, one of his propositions would have been positively false, to wit, that in any segment of a circle, the angle at the centre is double of the angle of the circumference. Had such been his intention, he would have said, 'in every segment which contains an angle less than a right angle, the angle at the centre is double of that at the circumference.' It is true that his proposition is, 'In a circle, the angle at the centre is double of the angle at the circumference when they have the same circumference for a base:' and some may think that the words in italics exclude (as in one sense they certainly do) the segment which has an angle greater than a right angle; since this angle, and its central angle, that namely which is less than two right angles, do not stand on the same circumference as a base. Let this be so, then we throw the difficulty on another proposition, the 27th. It is there shown that 'in equal circles, the angles which stand upon equal circumferences are equal whether they stand at the centre or at the circumference.' If no mention of angles greater than two right angles be intended in the previous proposition, then the one before us is not completely proved, but only when the angle at the circumference is less than a right angle. At the same time there seems to be, in some of the subsequent propositions, proof of a desire to avoid the angle greater than two right angles, and to subdivide proofs into particular cases in order to avoid the difficulty.

But are we not in fact to assume, without particular inspection, from the general tone of the first six books, that the angle equal to or greater than two right angles was never really meant, and that all propositions are to be taken with such limitations as the above restriction would render necessary? Let those who think so, look at the last proposition of the sixth book, in which it is shown that in equal circles angles are to one another as their subtending arcs. Now the criterion of PROPORTION, as given by Euclid, requires that, in this proposition, any multiple, however great, of the angles may be taken. Now a multiple of an angle may not only be greater than two right angles, but greater than a thousand right angles; and every such multiple must not only be really included in the demonstration, but considered as a magnitude, and compared with other magnitudes of the same kind. It is impossible that the writer of the fifth book should have been unable to bear in mind that the establishment of proportion demands that every possible multiple of the quantities asserted to be proportional should be admitted and compared with every other: and thus it is certain that Euclid must have meant to consider angles not only greater than two right angles, but even greater than four, or any other number. Some commentators have supposed that Euclid meant to omit all pairs of right angles from such multiples, and all semicircumferences from the multiples of the arcs; but this would only be a use of the axiom, that if equals be taken from unequals, the remainders are unequal, which admits the greater of the quantities mentioned to be comparable magnitudes: and that Euclid does consider them as such, is all that is contended for.

RIGHT, PETITION OF. [PETITION OF RIGHT.]

RIGHTS, BILL OF. [BILL OF RIGHTS.]

RILEY, JOHN, born in London, 1646, was the first Englishman that attained any excellence in portrait, unless perhaps Dobson may be considered as an exception, and in that department he remained unrivalled by any native artist until the appearance of Sir Joshua Reynolds. He was instructed in his art by Fuller and Zoust, but he adopted Vandyck as his model, and painted much in the style of Lely; his draperies were admirable. Riley was a modest and unassuming man, and excessively diffident and distrustful of his powers. 'With a quarter of Sir Godfrey's vanity,' says Walpole, 'he might have persuaded the world he was as great a master.' And the same writer observes, that his 'talents while living were obscured by the fame rather than by the merit of Kneller, and depressed since by being confounded with Lely, an honour unlucky to his reputation.'

Upon the death of Sir Peter Lely, Riley came into general notice, and obtained the patronage that he merited. He was introduced to Charles II., and painted his portrait, who said, upon seeing it, 'Is this like me? Then, odd's fish, I am an ugly fellow,' which greatly disconcerted the modest painter. He painted also the portraits of James II. and his queen, Mary of Modena; and after the Revolution in 1688, he was appointed state painter to William and Mary, whose portraits he also painted.

Riley's master-piece is reckoned the portrait of the lord-keeper North, at Wroxton; and amongst his most successful performances are mentioned also the portraits of Bishop Burnet and the celebrated Dr. Busby, master of Westminster school. Riley died in London, of the gout, 1691, in the forty-sixth year of his age. His property, which, according to Walpole, amounted to only 800*l.*, came to his scholar Richardson, who had married his niece.

RIMINI. [FORLI, PROVINCE OF.]

RIMULA, the name given by DeFrance to a genus of testaceous mollusks founded on a minute species of the genus *Emarginula* of authors, which has a fissure approximating to the margin, but not arriving at it. [CERVICOBRANCHIATA, vol. vi., p. 444.]

RIMULINA. [FORAMINIFERA, vol. x., p. 347.]

RING. [ANNULUS.]

RING DOVE, one of the English names of the *Ring Pigeon*, *Wood Pigeon*, *Cushat* or *Queest*, *Columba Pulumbus*, Linn.; *Ramier* of the French; *Colombaccio*, *Palombo*, *Piccione da Ghianda* of the Italians; *Ringeltaube* of the Germans; *Ysguthan* of the Antient British. The term *Ring Dove* is also applied to the *Collared Turtle*, *Columba risoria*, Linn.: *Tourterelle à collier* of the French; *Lachtaube* of the Germans. [COLUMBIDÆ, vol. vii., pp. 370, 373.]

RING OUZEL. [BLACKBIRDS, vol. iv., p. 478.]

RINGENT, a form of the corolla of plants, so named

from the supposed resemblance to the snout and mouth of some animal. The petals are irregular and gaping. The natural order Lamiaceæ possess this form of corolla.

RINGTAIL, the English name of the female of the *Hen Harrier*, *Circus cyaneus*. [FALCONIDÆ, vol. x., p. 183; HARRIER (Ornithology).]

RINGTAILED EAGLE, a *Golden Eagle* in its youthful plumage. [FALCONIDÆ, vol. x., p. 173.]

RINGWORM is the term applied to many cutaneous eruptions, and more particularly to those on the head. It is not now possible to determine to which of these the name was first applied; but it is probable that the species of herpes which appear in the form of rings were thus designated, especially that which nosologists call herpes circinatus. This disease is still often called ringworm, when it appears upon the forehead or scalp; but the same name is still more generally applied to the different forms of porrigo, especially *P. larvalis* and *P. scutulata*. The descriptions of the diseases thus confounded under this name will be found in the articles HERPES and PORRIGO.

RINGS, COLOURED. Sir Isaac Newton, in his 'Treatise on Optics,' first supplied a careful examination of the coloured bands which are familiarly seen in soap-bubbles of sufficient tenuity, in thin plates of mica, and generally in any transparent plate of small width, whether bounded by denser or by rarer media. In explanation of these phenomena he invented his ingenious theory of 'Fits of easy transmission and of easy reflexion of light.' The explanation given by the undulatory theory is founded on the doctrine of the interference of the luminous waves.

Newton adopted an accurate method for discovering the relation between the thickness of the medium and the colours of the bands produced. Thus, by geometry, the distance of any point B of a circular arc from a tangent AC, is

equal to the square of the chord AB divided by the diameter of the circle. When the latter is great in comparison of the arc AB, we may then substitute the tangent AC for the chord. Now, if we place together a convex lens and a plane glass, the perpendicular section taken through the point of contact of this system is evidently that in our figure. The point of contact A is the centre of the coloured rings; AC, being the radius of one of them, is easily measurable, and hence BC (the thickness of the interposed stratum of air) becomes known.

From the above it is evident that a convex lens of considerable focal length (about ten feet will answer) is to be preferred, inasmuch as the diameters of the rings enlarge, for a constant value of the thickness BC, in proportion to the square of the radius of the lens; the bands, being then greatly enlarged, may be more accurately examined and measured.

Suppose white light to be incident, the point of contact A will transmit it, and consequently appear black, but the light which passes through the small interval between the glasses will be decomposed, and form coloured rings having A for centre, each band having a gradation of colours from its interior to its exterior border, in the following order, viz.:—

	First.	Second.	Third.	Fourth.
Rings.	Black	Parplish Violet	Purple	Dull Green
	Faint Blue	Blue	Blue	Pale Pink
	Bright White	Green	Bright Green	Red
	Yellow	Strong Yellow	Yellow	
	Orange	Crimson-Red	Pink	
	Red		Crimson	

In the fifth, sixth, and seventh, the colours are green and pink, with a middle white in the fifth, but they are now faint colours, and gradually become invisible.

By the calculation above explained Newton found the intervals BC between the plates in the succession of the darkest parts of the several rings to be as the numbers 0, 2, 4, 6, &c., and those corresponding to the brightest parts, as the odd numbers 1, 3, 5, &c., that corresponding to the brightest part of the first ring being only 178,000th part of an inch. Hence conversely the interval may be computed by observing the colour and the number of the band, for these intervals are constant whatever may be the curvature of the

glass or glasses (if two lenses are used). The contact should be made as perfect as possible by pressure. Fringes may be similarly formed by laying a prism on a plane glass. The rings enlarge when seen obliquely, the interval for a given colour varying as the cosine of the angle of incidence. The constant co-efficient of this cosine (as compared with perpendicular incidences) is  $\frac{1+106\mu}{107\mu}$ ,  $\mu$  being the index of refraction.

If homogeneous light of any colour be used, the rings of light then produced are all of that colour, intercepted by bands absolutely black. The colours, as given in the above table, when the light is white, being the result of superposing the different systems of rings, belong to the various homogeneous rays of the prismatic spectrum which constitute white light.

If we place the glasses between the eye and the source of light, so that the rings may be viewed by that portion of it which is transmitted, we find, as might be expected, that the colours are now complementary to those visible by reflected light. Colours are said to be complementary when their mixture produces white light.

The colours of soap or other liquid bubbles are produced in the same way, and at the same thickness as those in the case detailed above. In that case we had the rarer medium between the denser; here the denser is between the rarer. The rings commence at the top of the bubble, because there it first grows sufficiently thin.

The undulatory theory, upon admitting the loss or gain of half an undulation in the interference producing these rings, gives a satisfactory explanation of all the phenomena of coloured rings, but which contains analytical investigations of an abstruse nature.

Rings or fringes, such as those denominated Grimaldi's fringes, are also formed by the interferences attendant on the inflexion of light by the edges of opaque bodies, for which see DIFFRACTION.

RINGS, FAIRY, is a name given to certain spots which are observed amongst grass in fields, and which are characterised by being more luxuriant than the surrounding herbage. They are of two kinds: either an entire knot of grass is more luxuriant than the rest, or the luxuriant grass grows in a circle or the segment of a circle around a comparatively barren spot. The name of fairy rings was originally given to these spots because they were supposed to be the places where the little fairies held their nightly revels. Recently a better cause has been assigned for their origin. They are now known to be those portions of the surface on which a species of fungus has grown, which by dying has afforded nutriment for the grass on the spot; and as the fungus grows in this particular place on account of something favourable to its development, it continues year after year to extend itself beyond the small circular space to which it was originally confined; but as the grass in the centre loses the stimulating influence of the decayed fungus, this part becomes comparatively barren, and thus the ring of luxuriant grass keeps on extending for many years, till the earth, no longer affording the circumstances necessary to the development of the fungus, it dies. There are several species of fungus that produce this effect. It was first noticed by Dr. Withering as occurring with the *Agaricus oreades*: but the common mushroom (*A. campestris*), the gigantic puff ball (*Bovista gigantea*), and many others may be seen in the act of forming these circles. It is very probable that most of the large fungi would form these rings during their growth, provided the entire surface of the earth by which they were surrounded afforded the circumstances necessary to their growth.

RIO DE JANEIRO. [JANEIRO.]

RIOBAMBA. [ECUADOR, p. 267.]

RIOM, a town in France, capital of an arrondissement in the department of Puy de Dôme, 225 miles south-south-east of Paris, by the road through Fontainebleau, Montargis, Nevers, and Moulins, and 7 miles north of Clermont-Ferrand.

This town was antiently the chief town of the duchy of Auvergne, erected by King Jean II. in 1360, in favour of his son the duke of Berri: its prosperity dates from this epoch.

Riom stands on a small elevation in the rich plain of the Limagne of Auvergne, near the little river Ambène, which flows by the Lachau and the Morges into the Allier. The town is surrounded by a boulevard planted with trees, and lined, toward the country, with houses of modern erection,

which shut out the beautiful view from the boulevard. The interior of the town consists of several streets; the two principal cross each other near the centre: these are wide and handsome, but not quite straight; the other streets are inferior all are very ill paved with lava and basalt, and some are adorned with fountains. The houses are almost universally built of lava from the quarries of Volvic, a small town three or four miles west of Riom: the dark colour of the stone gives to the place a sombre appearance. The principal public buildings are the church of Saint Amable, remarkable for its elegant dome; La Sainte Chapelle, a beautiful Gothic building; the court-house (palais), another fine Gothic building; the clock-tower, from the summit of which there is a charming prospect of the surrounding country; and the central prison or house of correction, large, lofty, secure, and well ventilated.

The population of the town in 1831 was 11,992 for the town, or 12,379 for the whole commune; in 1836 it was 11,473 for the commune, showing the serious diminution of 906 persons in five years. The trade of the place is not very considerable: the chief articles of manufacture are candles, and preserves of apricots, apples, &c. (which, together with the fruits of the neighbourhood, are sent to Paris), liver of antimony, some linens and cottons, brandy, and leather. The chief articles of trade, besides the above, are corn, hemp, coarse linens, walnut-oil, and hempseed-oil. There are four fairs in the year.

The importance of Riom is chiefly derived from its tribunals, the business of which is augmented by the propensity of the people of Auvergne to litigation. It has a Cour Royale, the jurisdiction of which extends over the departments of Allier, Cantal, Haute Loire, and Puy de Dôme; a subordinate court of justice, and a tribunal of commerce; together with some fiscal government offices. There are also a high school, with a cabinet of natural philosophy; an hospital, two almshouses, a poorhouse, and a theatre.

The arrondissement of Riom has an area of 885 square miles, and is divided into thirteen cantons, or districts, each under a justice of the peace: it comprehends 130 communes. The population in 1831 was 146,495; in 1836, 151,456.

RIOT. A riot is a misdemeanour at common law. The definition of it given by Hawkins, and which appears to have been very generally adopted without much alteration by subsequent writers, is 'a tumultuous disturbance of the peace by three persons or more, assembling together of their own authority, with an intent mutually to assist one another against any who shall oppose them in the execution of some enterprise of a private nature, and afterwards executing the same in a violent and turbulent manner, to the terror of the people, whether the act intended were of itself lawful or unlawful.' The assembling together therefore in a case where the law authorises parties to meet and use force in concert, as for the purpose of suppressing rebellion or opposing the king's enemies, or as part of the posse comitatus, will not constitute a riot. Neither will a sudden quarrel occurring among a number of persons who have met together at a fair, or on similar occasions, constitute a riot. But if on the occasion of a meeting, lawful in itself, some act of violence in disturbance of the peace is afterwards proposed, and executed in concert by those who are assembled, they will be guilty of a riot. The enterprise must be of a private nature, not necessarily relating to an individual, but still having in view some minor and special, and not a general public object. Thus it may concern the interests or disputes either of some one person or of the inhabitants of some town or district. The object may be, for instance, to redress a grievance said to be suffered by such person, or to pull down inclosures on lands where the inhabitants claim a right of common. But if the enterprise is for the purpose of redressing grievances generally throughout the kingdom, or to pull down all inclosures, the offence is not a riot, but amounts to a levying of war against the king, and the parties engaged in it are guilty of high treason.

Hawkins asserts that there must be some circumstance of violence either to the person of a man or to his possessions; but it has been otherwise decided by Sir James Mansfield, C. J. (2 Camp., 368). Violence however, if not of actual force, yet in gesture or language, and of such a nature as to cause terror, is a necessary ingredient in the offence of riot. The lawfulness of the enterprise operates no further than as justifying a mitigation of the punishment. It does not in any way alter the legal character of the offence. All parties

present at a riot who instigate or encourage the rioters, are themselves also to be considered as principal rioters.

Two minor offences of rout and unlawful assembly, which are similar to riot, are generally treated on under that head.

A *rout* is where parties have commenced but not accomplished an enterprise, and in such a way that if the enterprise had been executed, they would have committed a riot.

It is an *unlawful assembly* when great numbers of people meet together with such circumstances of behaviour as to raise the fears of their fellow-subjects, and to endanger the public peace. An assembly therefore of a man's friends to defend his person against violence threatened to him if he appear in a public place is unlawful, as such conduct tends to produce a breach of the peace. But an assembly in a man's own house to protect him while there, or to defend the possession of it, is not considered an unlawful assembly. At common law the sheriff and all peace officers are bound themselves to make every effort and to command all others to assist them to suppress a riot. It seems also that where the emergency is great and immediate, private persons on their own authority may act, and even use arms for the same purpose. On such occasions it has not been usual for the military to take any part except in the presence and under the direction of a civil authority. They are not however by law disqualified for any duty or relieved from any responsibility which under the same circumstances attach to other classes of their fellow-subjects.

Various acts of parliament have been passed for the purpose of giving authority to magistrates and others for the purpose of suppressing riots, and restraining, arresting, and punishing rioters. These are collected and commented upon by Hawkins (1 P. C., b. i., c. 65) and Burn (5 vol., 'Riot,' &c.). The most important is 1 Geo. I., st. ii., c. 5, commonly called the Riot Act. By that statute it is provided that 'if any persons to the number of twelve or more, being unlawfully, riotously, and tumultuously assembled together to the disturbance of the public peace, shall continue so assembled for the space of an hour after a magistrate has commanded them by proclamation to disperse, they shall be considered felons.'

The form of proclamation is given in the Act, and is as follows:—'Our sovereign lady the queen chargeth and commandeth all persons, being assembled, immediately to disperse themselves, and peaceably to depart to their habitations or to their lawful business, upon the pains contained in the Act made in the first year of King George for preventing tumults and riotous assemblies.

'God save the Queen.'

This is directed to be read with a loud voice and as near as possible to the rioters; no word must be omitted. Persons who do not disperse within the hour may be seized and apprehended by any magistrate or peace-officer or any private person who has been commanded by a magistrate or an officer to assist. In case of resistance, those who are attempting to disperse or apprehend the rioters will be justified in wounding or killing them. It is felony also to oppose the reading of the proclamation; and if the reading should be prevented, those who do not disperse are still guilty of felony, if they know that the reading of the proclamation has been prevented.

A prosecution under this Act must be commenced within a year after the offence has been committed. By the 7 & 8 Geo. IV., c. 30, s. 8, rioters who demolish or begin to demolish a church or a chapel, a dwelling-house, or any other of the various buildings or machinery mentioned in that Act, are to be considered as felons. By 7 & 8 Geo. IV., c. 31, provision is made for remedies against the hundred in case of damage done by rioters.

By that Act compensation may be recovered by action against the hundred for any injury done to buildings, or furniture, &c. contained in them, to the amount of 30*l*. Where the damage done does not amount to 30*l*., inquiry may be made on oath of the claimant, or other witnesses, before justices at a petty sessions, who are authorised to make an order for payment of damages and costs. An inhabitant of the hundred is made a competent witness for the defendants. In order to recover in either of these proceedings, it is necessary to show that a riot has been committed; and in case the building, &c. has not been demolished, to show that the rioters had *begun to demolish* it; that is, that their intent was to demolish, although from some reason that intent has not been carried into execution. Unless this

P. C., No. 1233.

intent is proved, the party is not entitled to compensation, however great damage may have been done; and if the intent did exist in the minds of the rioters, compensation is still claimable, however slight the damage. If the rioters have been interrupted in their proceedings, it will be left to the jury, or it will be for the justices to say, whether, without such interruption, a demolition would have been effected. But if the rioters have voluntarily retired without effecting a demolition, or if, though disturbed, their intent, from other circumstances, appears to have been directed towards some other object, as for instance to compel persons to illuminate, &c., the parties injured will have no remedy under the statute, as it appears that there was no intent to demolish.

The action must be commenced within three months after commission of the offence; and to entitle the party injured to bring an action, he, if he had knowledge of the circumstances, or the party in charge of the property, must, within seven days after the injury done, go before a magistrate and give on oath all the information relative to the matter which he possessed, and also be bound over to prosecute the offenders.

With respect to unlawful assemblies of a seditious character, various provisions are enacted by 39 Geo. III., c. 79, and 57 Geo. III., c. 19; and in reference to those for the purpose of training to the use of arms, by 60 Geo. III., c. 1.

(Hawkins, P. C.; East, P. C.; Burn's Justice, vol. 5, 'Riot,' &c.; Russell, On Crimes.)

RIPON, an ancient borough, parish, market-town, township, and bishopric, is in the wapentake of Claro in the West Riding of the county of York. It gives its name to an extensive liberty which has its peculiar courts. It is 208 miles north-north-west of London, 27 miles north of Leeds, and 24 miles north-west by west of York.

The parliamentary borough comprises the township of Ripon and a part of the township of Aismunderby-cum-Bondgate, including a population of 5735. It returns two members to parliament. The municipal borough has the same extent: the corporate body consists of four aldermen and twelve councillors, with a commission of the peace. Till lately the liberty of Ripon contained 29 townships, parishes, and chapelries, 43,490 acres, and a population of 13,222; but by a statute of 1st Victoria, five parishes and townships situated in the North Riding, and comprising a population of 1293 and 8990 acres, were separated from this liberty. Besides extending over the liberty of Ripon, the parish is partly in the lower division of Claro wapentake, where it has 18,391 acres, and a population of 3252. The bishopric of Ripon was created, in 1836, out of the large dioceses of York and Chester; it extends over a great part of the more populous districts of the West Riding, and over the liberty of Richmondshire in the North Riding.

According to the first historical notice of Ripon, Eata, abbot of Melrose, founded a monastery here in 661. A few years after, Aldfrid, king of Northumbria, gave this monastery to Wilfred, archbishop of York. Under his auspices both the town and the church flourished, and received many marks of royal munificence. He died in the year 711, and was buried in his monastery. The town is said to have suffered much by the incursions of the Danes in the ninth century, but it was made a borough by Alfred the Great. King Athelstan granted the monastery various immunities, among which was the privilege of sanctuary, which it possessed till that privilege was wholly abolished in England. The town suffered reverses in the wars against the Northumbrian Danes, in the devastations of the Normans, and in the invasion of Robert Bruce. Henry IV. fixed his residence here when he was driven from London by the plague; and in the civil war under Charles I. the town was occupied by the parliamentarians under Sir Thomas Mauleverer, who was expelled by the royalists commanded by Sir John Mallory.

The collegiate church of Ripon, commonly called the Minster, now the Cathedral, is dedicated to St. Peter and St. Wilfred; it is parochial as well as collegiate. Rickman speaks of this edifice as 'containing various parts well worthy of attention, particularly its west front, which is a very fine specimen of bold early English, and, except the battlements and pinnacles, without alteration.' The first stone of the present building was laid in 1331, but the choir was probably not finished till 1494. It is said to be one of the best-proportioned churches in the kingdom. Its length from east to west is 266 feet 5 inches, the transept is 132 feet long, the nave and aisles 87 feet broad, and the choir and

aisles 66 feet 8 inches broad. It has two uniform towers at the west end, each 110 feet high, besides the great tower, called St. Wilfred's tower; each of these towers originally supported a spire of wood covered with lead. Under the chapter-house is a vaulted charnel-house, which is much visited by tourists; it contains an immense collection of human remains in good preservation, piled in regular order round the walls.

Trinity Church was built and endowed in 1826, at a cost of 13,000*l.*, by its first incumbent, the Rev. Edward Kilvington. The other places of worship are three Methodist chapels and an Independent chapel. St. Mary Magdalene's Hospital, founded by Archbishop Thurstan in 1144, is now divided into six dwellings for poor widows, who receive a small annual stipend. A chapel is attached to this building. In the hospital of St. Anne eight poor women are similarly maintained. The hospital of St. John the Baptist is occupied by two poor women, and the chapel formerly attached to it is now a national school with 200 boys. Jepson's Hospital is for the education and maintenance of poor orphan boys; the funds have been increased by a small bequest, and now amount to nearly 180*l.* a year, which supports and educates ten boys. There are also a few minor charities. The free grammar-school was founded in 1546 by Edward V., and afterwards endowed by Philip and Mary. Its income is at present 370*l.* per annum. The property is let at low rents on leases of 21 years, renewable every seven on payment of certain fines; these fines amounted in 1811 to 1069*l.*, and in 1818 to upwards of 1200*l.* The master is allowed to take boarders, and other boys not on the foundation. The school is free, for Latin, Greek, and English grammar, to the sons of all residents; a charge is made for writing and arithmetic. There is a girls' national school, which was built by Miss Lawrence of Studley; this and the boys' national school are supported by subscriptions. The Public Rooms at Ripon comprise a Dispensary, a Mechanics' Institute, a Subscription Library, and a News-room; the edifice thus occupied was erected in 1834, at a cost of 2500*l.*, in 200 proprietary shares; an extensive pleasure-ground and garden is attached.

Ripon was once celebrated for its manufacture of spurs, which were in such high repute, that 'as true steel as Ripon rowels' became a proverbial expression to denote honesty and courage; it was also noted for its woollen manufactures, which however left the banks of the Ure for those of the Aire and Calder some centuries ago. The present manufacture is chiefly saddle trees; it also produces linens and malt. The market-place is a spacious square, surrounded chiefly by shops and good houses; in the centre stands an obelisk 90 feet high, which is surmounted by the arms of Ripon, a bugle-horn and a spur-rowel. This obelisk was erected by William Aislaby of Studley, who represented the borough for sixty years in parliament. The fairs of Ripon are six in number, and are chiefly for leather, cattle, and cloth. On the south side of the market-place is the Town-hall, built in 1801, at the cost of Mrs. Allanson of Studley; it comprises a suite of rooms for the magistrates, assembly-rooms, and other commodious apartments. Four beautiful Ionic columns in front support a handsome pediment. The streets of Ripon are neither spacious nor regular, but they are generally clean. The Ure navigation was brought up to the town by means of a short canal in 1767. The fine domain of Studley is situated about three miles from Ripon, and includes the venerable monastic remains of Fountain's Abbey.

(Allen's *Yorkshire*; and White's *History and Gazetteer of the West Riding*.)

**RIPPERDA, JOHN WILLIAM.** Baron, afterwards **DUKE OF**, a descendant from an ancient and honourable Spanish family, which had settled at Groningen during the period that the Low Countries were attached to Spain, was born in that district in the latter part of the seventeenth century. His father being a Roman Catholic, young Ripperda was educated in the Jesuits' college at Cologne. After greatly distinguishing himself in the course of his education, Ripperda returned to the United Provinces, and having soon after entered the Dutch army, served during the whole of the war of the Succession, and rose to the rank of colonel. He then married the heiress of very considerable property, in order to obtain which he first renounced the faith of his fathers. Aspiring to political distinction, he eagerly sought a seat in the States-General, and was returned towards the end of the war as deputy for his own province. In 1715 the States

appointed him envoy extraordinary to the court of Spain, with instructions to arrange definitively a system of commercial intercourse between the two powers. On his arrival at Madrid, Ripperda immediately attached himself to Alberoni, the all-powerful minister of Philip V. [**ALBERONI**], whom he assisted with memorials and plans of improvement for the commerce and finance of Spain, and whose protection he secured. During his residence at Madrid, Ripperda carried on several intrigues by no means creditable to his character either as an ambassador or a man; for whilst conducting the negotiations of his native country, Holland, he maintained a secret correspondence with the emperor, and was also guilty of a most disgraceful transaction towards Mr. Doddington, the English minister, in whose pay he seems to have been, whilst he secretly informed Alberoni of all his projects.

In the meantime Ripperda rose high in favour both with Philip and his minister. By his exertions fifty master-workmen from Holland were induced to settle in Spain, and to establish extensive cloth manufactures, first at Azeca, and afterwards at Guadalaxara. Having some time after applied for some recompense for his services, he was answered that the king of Spain could never employ in any high or responsible office a person attached to the Protestant faith. Accordingly, in March, 1718, Ripperda quitted the Spanish capital and returned to Holland. Having rendered a full account of his mission, of which the States expressed their approbation, he then formally resigned the office which he held, and set out once more for Madrid, and proceeded thence to Aranjuez, where, soon after his arrival, he made his abjuration, receiving as a compensation for his losses the appointment of superintendent-general of the royal manufactories at Guadalaxara, with a considerable pension and extensive grants of land. The fall of Alberoni, which was hastened by Ripperda, opened to this ambitious man the way to power, and he was accordingly entrusted, in 1725, with the formation of a secret treaty with the emperor. To reward his services in that memorable transaction, he was soon after created duke, and raised to the dignity of grandee of Spain.

On his return to Madrid, Ripperda was appointed secretary of state in the place of the marquis of Grimaldi. Having succeeded shortly after in gaining the entire confidence of Philip, he was raised to the post of prime minister. His administration however was not of long duration. Unable to fulfil the secret engagements entered into with the house of Austria, or to accomplish the vast schemes laid down by the treaty of Vienna, such as the recovery of Gibraltar by force of arms, and the seating of the Pretender on the throne of England, schemes which the exhausted state of the Spanish treasury and the menacing attitude assumed by Great Britain compelled him to relinquish, Ripperda fell into disgrace with the Spanish monarch.

On the 25th of May, 1727, he was arrested at the house of Colonel Stanhope, where he had taken refuge, and was sent to the fortress of Segovia, where he remained in close confinement, until, having eluded the vigilance of his keepers, he made his escape, and arrived safely in Lisbon, where he embarked for Cork. After spending some time in England, he set sail for his native country in 1731, and settled at the Hague. Whilst there he became acquainted with an envoy from the court of Marocco, of the name of Perez, who was a Spanish renegade, and who, perceiving the violent hatred which Ripperda bore to the Spaniards, and his love of adventure, induced him to try his fortunes upon the shores of Africa. Ripperda accordingly set sail for Tangier, and was well received by the emperor of Marocco (Muley Abdallah), who gave him the command of an army destined to repel a threatened invasion from Spain. Ripperda was however defeated before Oran, which city fell into the hands of the Spaniards in 1732.

About this time Ripperda is said to have abandoned the Roman Catholic creed, and to have embraced the Mohammedan religion, taking the name of Othman Pasha. He lived for some time at Marocco, surrounded with all the gratifications and luxuries that wealth could supply, and then removed to Tetouan, where he remained until his death in 1737.

It is said that some time previous to his death he believed himself inspired, and endeavoured to propagate a new religion—a mixture of Christian, Jewish, and Mohammedan doctrines, which however had no followers. Shortly after the death of this extraordinary man there appeared at Am-

sterdam an account of his life and adventures, under this title: 'La Vie du Duc de Ripperda, par M. P. M. B.' 8vo., Amst., 1739. The same work was translated into English, by John Campbell, and published as 'Memoirs of the Basha Duke of Ripperda,' London, 1739, 8vo. There is also a Spanish translation of it, Madrid, 1748

**RIPPLE-MARK.** In geology, the undulations on the surface of many rocks, which resemble the ridges and hollows left on mud and sand by the small waves of water, are thus termed.

The progress of geological induction has given an unexpected importance to the study of these undulations; for it is now certain that the right understanding of their origin is a very necessary element in reasoning on the deposition of stratified rocks and the displacements of the antient bed of the sea.

The formation of small ridges and furrows, under the influence of water which ripples or undulates in small waves, may be conveniently witnessed and studied on the shores of comparatively quiet seas, on the margins of lakes, or along the sides and shallow beds of rivers. The 'ripple-mark' thus produced is more or less permanent, according to the nature of the sediments on which it is impressed, and the circumstances which accompany and succeed the withdrawal of the water which formed it.

Loose coarse sand easily receives impressions from the superfluctuating water, which momentarily change under the varying influences of the waves: muddy sediments are less easily moulded, but the forms are less fleeting. It happens often that on the gradual retreat of the tide from broad muddy surfaces like those in the bay of Morecambe, or along the shores of the Thames, the small rippling waves of the ebbing tide leave marks sufficiently durable to allow of being indefinitely preserved, if by any gradual operation some new sediments were gently overlaid.

A very small ripple leaves its mark on the subjacent sand or mud at only very small depths: larger waves are felt to a greater depth; and apparently the depth at which ripple-marks are formed may be judged of, within moderate limits of error, by the breadths of the ripple-marks. Wherever then we find among marine stratified rocks or sediments, of whatever date, undoubted ripple-marks such as shallow waters leave, those deposits contain clear proof of their having been formed at small depths; and when, as frequently happens, these are seen to be covered by other sediments hundreds or thousands of feet in thickness, the conclusion is just that in those situations the antient sea-shore underwent a great subsidence, or the ocean-level experienced a great rise, after the formation of those now buried ripple-marks. There has been in those situations a change of the level of land or sea. Now we find ripple-marked strata among the rocks of every geological age. As examples, we mention, among strata lower than the mountain limestone, the fossiliferous rocks ('grauwacke') near Kirby Lonsdale, and near Linton in North Devon; in the sandstones of the mountain limestone group, under Penyghent in Yorkshire; in the sandstone of the coal-formation at Elland in Yorkshire; in the sandstones of the new red-sandstone formation at Storeton near Liverpool; in the sandstones of the obolitic rocks near Scarborough and near Stamford; in the Wealden deposits at Horsted.

In most cases ripple-mark is found on sandstones or indurated clays of fine grain and frequent lamination, and it is most distinct on surfaces where a change of deposit happens, as where sandstones alternate with thin clay partings. Rarely, as in the Storeton quarries, impressions of quadrupeds accompany the ripple-mark; and it is even thought that marks of rain are preserved thereon.

It is unnecessary to lengthen this notice by pointing out the obvious importance of the careful study of a phenomenon which is frequent among the stratified deposits, and on which remarkable generalizations partly, if not principally, depend. By careful attention to the evidence which is left on the surfaces of rocks, we may learn the depth and some other circumstances of the water which covered them at the time of their deposition; and come to understand how, by successive steps or gradual depression, the sea-bed was lowered, in relation to the ocean-level, hundreds, or even thousands of feet, locally or extensively, so as to allow of the successive accumulation of new sediments containing the remains of new races of marine animals and land-plants, without requiring the aggregation of laminated clays, sands, and gravels, at depths beyond the reach of littoral agitation,

or the profuse abundance of mollusca and polypiaria, in regions of the sea where enormous pressure and deficient light seem to forbid their very existence.

See for a general view of the causes of ripple-mark made by water and wind, and examples of the latter circumstance, Mr. Babbage's *Ninth Bridgewater Treatise*. Further notices bearing on the subject will be found in Playfair's *Huttonian Theory*; Lyell's *Principles of Geology*, vol. iv.; and De la Beche's *Theoretical Researches*.

**RISCOLUS.** [PŒCILPODA, vol. xviii., p. 302.]

**RISK.** In the theory of PROBABILITIES the risk of loss or gain means such a fraction of the sum to be lost or gained as expresses the chance of losing or gaining it: thus an even chance of losing 40*l.* is considered as a positive loss of one-half of 40*l.*, or of 20*l.*; and 2 to 1 for gaining 60*l.* is counted as two-thirds of 60*l.*, or 40*l.* If both these risks were encountered at the same time, the whole transaction would be considered as a gain of 40*l.* - 20*l.*, or 20*l.*, since this is the sum which would be netted by every such transaction in the long run, and one with another.

The following is the method of ascertaining the effect of the division of risks. Let there be an adventure in which the chance of success is  $p$ , and that of failure  $1-p$ . Let failure produce the loss  $\mathcal{E}n$  and success the gain  $\mathcal{E}m$ : then  $pm - (1-p)n$  is the result of every such transaction one with another. Let this last be called  $M$ ; it is required to estimate the probability that in  $s$  transactions the average effect (gain or loss, according as  $M$  is positive or negative) shall lie between  $M+l$  and  $M-l$ . Calculate the square root of  $s$  divided by  $2p(1-p)$ ; multiply this square root by  $l$ , and divide the result by  $m+n$ . Take the table in MEAN (using it as in PROBABILITY, p. 27), let the last result be  $A$ , then the corresponding  $B$  is the probability required. [WAGER; WEIGHT OF OBSERVATIONS.]

**RISSOA.** M. de Fremenville's name for a genus of small testaceous trachelipods (gastropods of Cuvier), founded on some small shells observed by the well-known M. Risso of Nice, and described by M. Desmarest in 1814 in the 'Nouveau Bulletin de la Societ  Philomathique.'

Lamarck placed the few species known to him among the *Melania*, but without distinction. Delle Chiaje made known the animal structure of a Mediterranean species in his memoirs on the *Invertebrata* of the Neapolitan Sea; and Philippi recorded its generic characters in his 'Enumeratio Molluscorum Sicili ,' from observations made upon two other Mediterranean species.

**Generic Character.**—Animal with a subtriangular foot, truncated anteriorly, pointed posteriorly. Head proboscidi-form, with a subulate tentacle on each side, at the external base of which the eye is placed on a little convexity; mouth prolonged into a short and truncated proboscis.

**Shell** elongated, turriculate, sometimes short and sub-globular; aperture oval, semilunar, subcanaliculate, having the right lip thickened, and nearly always projecting forwards, and arched longitudinally; *operculum* horny, closing the aperture exactly.

M. Deshayes acknowledges the difficulty of fixing the relations of *Rissoa*; but, upon a comparison of the characters observed by Delle Chiaje and Philippi with those of *Cerithium*, he thinks it evident that *Rissoa* approaches the *Melania* as closely as the *Cerithia*, and that it may be considered as intermediate between those two genera. In the last edition of Lamarck, he has placed it between *Melania* and *Melanopsis*. M. de Blainville had previously placed the genus in his family *Ellipsostomata*, between *Melania* and *Phasianella*. M. Rang arranged it between *Melania* and *Littorina*, among the *Turbin s* of De F russac, observing that he does not think that *Rissoa* can be admitted as a genus, though it may well hold the rank of a sub-genus, in which case it may take its place at the side of the *Melania*, and near the genus *Paludina* of De F russac.

M. de Blainville divides the genus into the following sections:—

A.

Turriculated and Ribbed.

Example, *Rissoa acuta*.

B.

Subturriculated and Ribbed.

Example, *Rissoa costata*.

C.

Subturriculated; perfectly smooth.

Example, *Rissoa hyalina*.

D.  
Subglobular.

Example, *Rissoa cancellata*.

The same divisions are adopted by M. Rang.

Seven species only appear to have been known up to the time (1830) when M. Michaud published, in his illustrated memoir, sixteen new species; and to these are to be added the thirteen described and figured by Philippi. M. Deshayes, in his Tables, gives the number of recent species as twenty-three, and of fossil (tertiary) twenty-two, of which last two, *Rissoa lactea* and *cochlearella*, are recorded as both living and fossil (tertiary). In the last edition of Lamarck, the number of recent and fossil species published by M. Deshayes amounts to forty-four; but he states that there are other materials for this genus, and that his own collection alone contains more than eighty species, living and fossil.

M. Deshayes divides the *Rissoæ* into three groups: in the 1st he places the subglobular species which approach the *Turbipes* and *Littorinæ* (*The Turbiniform*); in the 2nd, those which are elongated, and whose aperture approaches that of the *Melanice* (*The Melanoids*); and 3rd, those whose semilunar aperture is subtruncated at the base, and which are approximated to the *Cerithia* (*The Cerithiform*).

*Localities*.—The Mediterranean Sea, principally; but species are recorded from the coasts of Great Britain and France, and from the East Indian Seas and Senegal.

Mr. Th. Müller (*Synopsis*) seems to be of opinion that *Fusithea nigra*, *Turbo minutus*, and *Acteon trifidus* of Totten, belong to this genus.

FOSSIL RISSOÆ.

M. Deshayes, in the last edition of Lamarck, observes that for a long time *Rissoæ* were found fossil in the tertiary strata only; but that Mr. James Sowerby, in his 'Mineral Conchology,' has published four species from the great oolite; whilst it is remarkable that no species of this genus have been found in the formations between the great oolite and the tertiary strata: it is to be presumed, he adds, that hereafter they will be found in those beds.

We have seen that the number of fossil *Rissoæ* (including two living species) found in the tertiary formations is given by M. Deshayes in his Tables as twenty-two. The two species recorded as both living and fossil are *Rissoa lactea* and *cochlearella*. In the last edition of Lamarck, *R. lactea* is not noted as occurring in a fossil state; nor do we find any mention of *R. cochlearella*, excepting under the head of *Rissoa striata*, where it is stated that this species, described by MM. Quoy and Gaimard, in the *Voyage of the Astrolabe*, bears much resemblance to living individuals of *R. cochlearella*; but *Rissoa cancellata*, *labiata*, *oblonga*, *costata*, *monodonta*, *pusilla*, *pulchella*, and *Brugueri*, are all recorded as both living and fossil (tertiary). The number of named species which are fossil only, including the species from the oolite and *R. decussata*, in the same work, is eleven.

RITSON, JOSEPH, a poetical critic and antiquary of the eighteenth century, was born at Stockton in Durham, and some of his pieces were published there before he came to settle in London. He was by profession a conveyancer, with chambers in Gray's Inn, but being appointed deputy high bailiff of the duchy of Lancaster, he did little in his profession, living on the income which his office yielded him, and spending his time in literary pursuits. During the twenty years between 1782 and 1802, he poured the results of his studies and researches on the public in books in quick succession; yet not so rapidly that it can be said that they are carelessly executed, or that their contents are worthless. On the contrary, he appears to us to have been a most valuable member of the literary fraternity, and to have done perhaps more than any man to introduce a spirit of curiosity respecting our early poets, and of critical exactness in editing their remains.

The trifling works which he printed before he became settled in London need not be particularised; and the first work which we need to mention, and indeed the first work which brought him into any notice, was his 'Observations on the three first volumes of the History of English Poetry,' in a familiar letter to the author (Warton), 4to., 1782. This was the first serious attempt to call the attention of the public to the many inaccuracies and faults of that celebrated work; a bold and useful service, but dangerous to him who

undertook it, as Warton had many and powerful friends, who could not bear to see him so roughly handled, even though they could not deny that almost every one of Ritson's strictures was just. However it must be owned that Ritson addressed himself to the work in a very unamiable spirit, and wrote like a man who was not much accustomed to the intercourse of refined society. The work has become, perhaps justly, a bye-word when men would speak of critical abuse. In the next year he published some 'Remarks on the Commentators on Shakspeare,' which is to be distinguished from a larger work published by him in 1792, entitled 'Cursory Criticisms on the Edition of Shakspeare published by Edmund Malone.' In 1783 he also published 'A Select Collection of English Songs, with an Historical Essay on the Origin and Progress of National Song,' of which a second edition was published by Mr. Park in 1813. In 1790 appeared his volume of 'Ancient Songs, from the time of King Henry III. to the Revolution,' reprinted in 1829. This is regarded as one of the most valuable of his works. In 1791 he published 'Pieces of Antient Popular Poetry,' from authentic manuscripts and old printed copies; in 1793, 'The English Anthology,' in three volumes; in 1794, a 'Collection of Scottish Songs,' and in 1795, the very remarkable poems of a forgotten poet, Minot, on events in the reign of Edward III., which have also been reprinted. In the same year he published his large collection of ballads on the exploits of 'Robin Hood,' with much prefatory matter, in which he cannot be said to appear to any great advantage. In 1802 he produced two works in this department of literature: the one, 'Antient English Metrical Romances,' in 3 vols. 8vo.; the other, 'Bibliographia Poetica,' a catalogue of English poets of the twelfth, thirteenth, fourteenth, fifteenth, and sixteenth centuries, with a short account of their writings, a work very imperfect, but to which succeeding writers in this department have been greatly indebted.

To enumerate however all the works produced by Mr. Ritson in his twenty years' literary career would carry out this article to an unreasonable extent. It may be sufficient to add that there are several small works of his under the denomination of Garlands, as the 'Bishopric Garland,' the 'Yorkshire Garland,' the 'Northumberland Garland,' and 'Gammer Gurton's Garland;' and also several tracts relating to his profession, and especially to the court with which he was more particularly connected. In 1802 he published 'An Essay on Abstinence from Animal Food as a Moral Duty.'

He died in September, 1803. Since his death several tracts have appeared attributed to him, and a collection of his correspondence has been published. Some account of his life was published by Mr. Hazlewood in 1824. He had through life the reputation of a surly critic, which his attack on Warton gained for him, and he was more shunned than courted by his literary contemporaries.

RITTENHOUSE, DAVID, was born on the 8th of April, 1732, near Germantown in Pennsylvania. His father, who was a farmer in that province, intended that he should follow the practice of husbandry, and being apparently in narrow circumstances, he could give him no other education than that which usually falls to the lot of persons who are engaged in such occupations.

But the elasticity of genius is often superior to the pressure of adverse fortune, and young Rittenhouse, before he was seventeen years of age, displayed a taste for mechanical and mathematical subjects; without books or instructors, he is said to have executed a wooden clock, and, similarly to what is related of Pascal, to have covered the ploughs and fences on his father's farm with geometrical figures. This exhibition of uncommon talent, joined to a conviction on the part of the elder Rittenhouse that the delicacy of his son's constitution would render him unfit for the labour of cultivating the ground, induced the father to procure for the youth the tools of a watch and mathematical instrument maker, and to dispense with his services in performing the duties of the farm. Grateful for this favour, the young man worked diligently with his hands during the day, and at night devoted a portion of the time which should have been passed in taking repose, to the prosecution of his studies. His success appears to have been extraordinarily great, for his biographers assert that, before the age of twenty, he was able to read the 'Principia,' and that he had discovered the method of fluxions, being aware that this had been already done by Leibnitz. He

also constructed two orreries exhibiting the movements of the planets and their satellites. These machines are said to be still in existence, one in the university of Pennsylvania, and the other in the college of Princeton.

In 1769, Mr. Rittenhouse was made one of a Committee appointed by the American Philosophical Society to observe the transit of Venus which was to take place in that year, and he was so fortunate as to witness the phenomenon in a temporary observatory which he built for the purpose. His observation and the calculations relating to it gained for him the approbation of the astronomers of Europe, and the title of Doctor in Laws was subsequently conferred on him. In 1779 he was named one of the commissioners for adjusting a territorial dispute between the states of Pennsylvania and Virginia; in 1786 he was employed in fixing the line which separates Pennsylvania from the state of New York, and in the following year he assisted in determining the boundary between New York and Massachusetts.

Dr. Rittenhouse was elected a member of the American Academy of Arts and Sciences at Boston, in 1782, and of the Royal Society of London, in 1795. In 1791 he succeeded Dr. Franklin as president of the American Philosophical Society, to whose 'Transactions' he contributed many papers, chiefly on astronomical subjects. In 1777 he was appointed treasurer of Pennsylvania, and this important office he held with incorruptible integrity till his resignation of it in 1789. During the American war, he is said to have fulfilled the duties of a patriot, and to have spoken and acted like a freeman; and in 1792 he received his last appointment, which was that of director of the mint of the United States. In this post his mechanical skill is said to have been highly useful; but in 1795 he was obliged to resign it from bad health, and, after a short but painful illness, he died on the 26th of June, 1796.

It is stated that, in private life, Dr. Rittenhouse exhibited every amiable virtue; that he was an excellent husband, father, and friend; and that, himself a stranger to high pretensions, he felt a strong attachment and esteem for those who cultivated and propagated science. A public eulogium was pronounced on him by Dr. Rush; and in 1813, a Memoir of his life was published by his relative, W. Barton, Esq., of Lancaster.

(*Encyclopædia Americana*; *Gent. Mag.*, Sept., 1796; *Monthly Mag.*, Oct., 1796.)

**RITUAL** (from *ritus*, in the sense of *consuetudo*), the book which directs the rites and ceremonies to be observed in celebrating divine service in any particular church.

**RIVE DE GIER.** [LOIRE.]

**RIVER.** In a legal sense rivers are divisible into fresh and salt-water rivers. Salt-water rivers are those rivers or parts of rivers in which the tide ebbs and flows. Rivers are also divisible into public or navigable rivers and private rivers.

The property in fresh-water rivers, whether public or private, is presumed to belong to the owners of the adjacent land; the owner on each side being entitled to the soil of the river and the right of fishing as far as the middle of the stream. But this presumption may be rebutted by evidence of special usage to the contrary. For instance, it may be shown that the property of the river is in one person, and of the adjacent land in another; or that one party owns the river and the soil of it, and another the free or several fishery of the river. If a fresh-water river between the lands of two owners gains on one side by insensibly shifting its course, each owner continues to retain half the river, and the insensible addition by alluvium belongs to the land to which it attaches itself; unless the lands of the proprietors on each side has been marked out by other known boundaries, such as stakes, &c. in the river. This part of the law as to the acquisition by alluvio, is stated by Bracton in the chapter 'De acquirendo rerum dominio' (fol. 9), and his statement both in substance and expression is taken from the *Digest* (41, tit. 1, s. 7), with which Gaius may be compared (ii. 70). But if the course of the river is changed suddenly and sensibly, then the boundaries of the lands will be, as they were before, in the midst of the deserted channel of the river. Special custom may also alter this general presumption of law. It is said that below Gloucester bridge the Severn is by common custom always held to be the boundary of certain manors, however suddenly or sensibly the course of it may be changed. Though fresh-water rivers are presumed to be the property of adjacent landowners, yet such owner can-

not set up a ferry and demand a toll unless by prescription or by charter from the king.

In early times also the king by his prerogative might prevent all persons from fishing or fowling in any river until he had first taken his pleasure there. This was effected by directing a precept to the sheriff commanding him to cause all persons to abstain from approaching the banks. By the 16th chapter of Magna Charta the enjoyment of this prerogative was restricted to such streams as it had been exercised upon in the time of Henry I. Subsequently the custom was to name the rivers in the precept to the sheriff; among these was the Avon, at least that part which flows through Worcestershire. Eventually the prerogative fell into disuse. In those rivers which are navigable, and in which the public have a common right to passage, the king is said to have 'an interest in jurisdiction,' and this is so not only in those parts of them which are the king's property, but also where they are come to be private property; such rivers are called 'fluvii regales,' 'haut streames le roy,' 'royal rivers'; not as indicating the property of the king in the river, but because of their being dedicated to the public use, and all things of public safety and convenience being under his care and protection. Thus a common highway on land is called the king's highway, and navigable rivers are in like manner the king's highway by water. Many of the incidents belonging to a highway on land attach to such rivers. Accordingly any nuisances or obstructions upon them may be indicted even though the nuisances be in the private soil of any person; or the nuisances and obstructions may be abated by individuals without process of law. It must not however be inferred that all the incidents of a land highway attach to such rivers. Thus, if the highway of the river is obstructed, a passenger will not be justified, as he would be in the case of a land highway, in passing over the adjacent land. Though a river is a public navigable river there is not therefore any right at common law for parties to use the banks of it as a towing-path. (*Ball v. Herbert*, 3 T. R. 253.)

If a river which is private in use as well as in property be made navigable by the owner, it does not therefore become a public river unless from some act it may be presumed that he has dedicated it to the public. The taking of toll is such an act. Callis says that the soil of the sea and of royal rivers belongs to the king. But the expression, if intended to apply to all parts of the rivers where the public have a right of passage, appears too comprehensive.

But there is no doubt that in some such rivers the property may be in the crown; as it was in the river Thames, the property in which, both as to the water and the soil, was conveyed by charter to the lord mayor and citizens of London. And in all rivers as far as the tide flows, the property of the soil is in the king, if no other claims it by prescription. In navigable rivers where the tide flows, the liberty of fishery is common and public to all persons. (*Hale, De Jure Maris et Brachiorum ejusdem*; *Callis, On Sewers*.)

The property in the mere running water is in no one; but the proprietor of adjoining land is entitled to the reasonable use of it as it runs by his land. 'And consequently no proprietor can have the right to use the water to the prejudice of any other proprietor. Without the consent of the other proprietors who may be affected by his operations, no proprietor can either diminish the quantity of water, which would otherwise descend to the proprietors below, or throw the water back upon the proprietors above. Every proprietor who claims a right either to throw the water back above, or to diminish the quantity of water which is to descend below, must, in order to maintain his claim, either prove an actual grant or license from the proprietors affected by his operations, or must prove an uninterrupted enjoyment of twenty years.'

(*Judgment of Sir J. Leach in Wright v. Howard*; *Sim. Stuart*, 109; *Gale, On Easements*.)

**RIVER HORSE.** Since the article HIPPOPOTAMUS was written, Dr. Andrew Smith has published his interesting account of the animal, in the *Illustrations of the Zoology of South Africa*, together with the most accurate figure hitherto engraved: of this we have endeavoured to give some idea below; but the reader should refer to the work itself, where, with all the advantages of size and colour, the portraits of the female hippopotamus and her young one have all the air of life.

As Dr. Smith has evidently paid very great attention to the characters and habits of this curious quadruped, we proceed to notice the result of his observations.

He describes the *Hippopotamus Capensis* of Desmoulins

as having the anterior and lateral parts of the head, and the upper parts of the neck and body brownish red, the former rather lightest. The brownish red of the back passes insensibly into a light brownish purple red, which is the colour of the sides and limbs; the belly, the sides of the lips, and the eye-lids, light wood-brown, with a faint flesh-coloured blush; the hinder parts of the body and the belly freely freckled with small spots of the same hue as the ground colours, only of darker tints; hairs of tail and ears black; pencils of hairs on lips, &c. yellowish brown; eyes a clear orange-coloured brown; hoofs dark horn-colour.

The male and female, as far as colours are concerned, are, he observes, nearly alike, but in regard to size they differ materially, the male being always considerably larger than the female.

Dr. Smith, who gives a most elaborate description of the form of the animal, to which we refer the reader, remarks that previously to the establishment of the Dutch colony at the Cape of Good Hope, *Hippopotami* existed in abundance in all the larger rivers of South Africa; but no sooner did the colonists direct their attention to hunting them, than their numbers began to diminish, partly from destruction by fire-arms, and partly by migration from the scene of danger. 'At present,' continues Dr. Smith, 'scarcely one exists in any of the rivers of the Cape Colony, and even but very few in streams within a moderate distance of it. On the expedition arriving in latitudes too remote to be readily reached by hunters furnished with fire-arms, every large river was found to abound in specimens, and in those the animals appeared, as they probably did some two hundred years ago, much nearer to the southern extremity of the continent, familiar, comparatively fearless of man, and generally prepared to survey with curiosity any intrusion upon their haunts. To convey some idea of the numbers in which they were found in several of the rivers towards the tropic of Capricorn, it may suffice to state that in the course of an hour and a half a few members of the expedition party killed seven within gun-shot of their encampment. Several other individuals were in the same pool, and might also have been killed, had it been desirable. One of the survivors was observed to make his escape to an adjoining pool, and in accomplishing that he walked with considerable rapidity along the bottom of the river, and with his back covered with about a foot of water.'

The hippopotami, according to Dr. Smith, feed chiefly on grass, resorting to situations near the banks of rivers which supply that food. 'In districts fully inhabited by man,' says Dr. Smith, 'they generally pass the day in the water, and seek their nourishment during the night; but in localities differently circumstanced, they often pass a portion of the day as well as the night upon dry land. In countries in which the night-time constitutes the only safe period for their leaving the water, they are generally to be seen effecting their escape from it immediately before dark, or are to be heard doing so soon after the day has closed, and according to the state of the surrounding country; they then either directly commence feeding, or begin a journey towards localities where food may exist. When, previous to nightfall, they may have been in pools or rivers, they are generally at once enabled to commence feeding on reaching the dry land; but when they may have passed the day in the sea, they require commonly to proceed some distance after leaving it, before they find the grass which appears congenial to their palate. It is not every description of grass that hippopotami seem to relish: they often pass over, in search of food, luxuriant green swards, which would strongly attract many other animals which feed upon grass. Besides having a peculiar relish for the grasses of certain situations, they appear to have a predilection for districts supporting brushwood; and owing to the latter peculiarity, they are often to be found wandering in localities on which but little grass exists, when they might have it in the neighbourhood in great abundance, but without the accompaniment of wood. The whole of the night is probably not more than is necessary to admit of the hippopotamus acquiring sufficient food for its wants; but if that be otherwise, it certainly prefers to pass what portion of the night may be necessary for procuring nourishment upon the dry land, rather than in the water, being generally only seen to retire to the latter upon light returning.'

Dr. Smith thinks it difficult to decide whether these animals prefer the pools of rivers or the waters of the ocean for their abode during the day. When an opportunity for

choice existed, he found that some individuals selected the one, and some the other. During a journey which he made some years ago to Port Natal and the country beyond it, he had many opportunities of observing the footsteps made by them while entering and leaving the sea; and on one occasion his party opposed unsuccessfully a female with her young one on their way to the sea.

The excrement, like that of the elephant and rhinoceros, is voided, according to the same accurate observer, in immense cylindrical masses; and those which came from the hippopotamus seemed principally to consist of comminuted grass, apparently but little altered by the process which it must have undergone, but in a drier condition than that in which it could have entered the stomach.

The disposition of this huge creature is described by Dr. Smith to be peaceable and inoffensive: not that when the animal is wounded, or happens in its excursions on dry land to be accompanied by its young, it does not manifest much ferocity, instantly giving chase, if in any way interrupted in its course. The mother which his party endeavoured to intercept immediately became the assailant on discovering the object of the party, and she rushed open-mouthed on the man nearest to her. 'The display of her enormous mouth, armed with formidable teeth, caused the most advanced of the hunters to retreat, and those in the rear to pause. The flight of the hunters seemed to encourage the animal in pursuit, and though the direction they took led her, in pursuing them, to retire from the sea which she had intended to enter, she persevered in giving chase, until one of the party, who from his situation had not had occasion to fly, fired a bullet into her mouth. Immediately after the wound was inflicted she for an instant stood still, and then retreated with precipitation to the sea, in which she was afterwards shot, having, contrary to the usual custom of her kind, manifested a disinclination to retire into deep water, a disinclination no doubt arising from sensations experienced from the wound she had received.'

Dr. Smith is of opinion that the sagacity of the hippopotamus, though doubtless inferior to that of the elephant, is nevertheless very considerable, and that its memory may be considered tenacious, certainly superior to that of the rhinoceros, and possibly equal to that of the elephant. After noticing its adroitness in guarding against assailants, and in avoiding pits dug to entrap it, the Doctor remarks that when once a hippopotamus has been assailed in its watery dwelling, and has been injured from incautiously exposing itself, it will rarely be guilty of the same indiscretion a second time; and though its haunts may not again be approached by hunters till after a long period has elapsed, it will survey such approaches, and perform the movements necessary for its respiration with a degree of caution, which clearly shows that it has not forgotten the misfortune to which an opposite course has exposed it.

Female Hippopotamus and Young. (Smith.)

RIVERS. (Geology.) [VALLEY.]

RIVERS are the flowing waters, which bring to the sea, and sometimes to a lake, the waters which are collected within a certain portion of the earth's surface. The country which is thus drained by a river is called its *basin*, as the river runs in the lowest part of it, and the country rises on all sides with greater or less steepness, in the fashion of the

sides of a basin. The margin of such a basin generally lies contiguous to the basin of another river, and thus constitutes the boundary-line of the two basins. From these margins the waters descend on both sides towards their respective basins, which are separated by them, and hence the whole line of these margins is called a *watershed*.

The basins of rivers vary greatly in size. A *brook* is the name commonly given to rivers of the smallest description. When such a river rises near the sea or near a large river, into one of which it flows after a short course, it consequently drains a very small surface. If the waters should be increased by those of another brook, the name of brook is changed for that of *rivulet*. The basin of a rivulet is therefore more complicated than that of a brook. One or more brooks descend from the margin of the basin, and by uniting their waters with those of the rivulet, increase its volume. When several rivulets unite and so produce a considerable volume of running water, this watercourse takes the name of *river*. But all such rivers do not reach the sea or even a lake; most of them join other rivers, and thus a large river is produced. This last-mentioned large river is called the *principal river*, and those which increase its waters are called, with respect to it, *affluents* or *tributaries*, and sometimes *feeders* or *branches*.

The first waters of a river are generally derived from a spring, which breaks out at the foot of a declivity, or on the side of some hill or mountain; and sometimes from a swamp or a lake. This is called the *source* of a river. From this source the river descends through the lowest part of its basin until it terminates its course in the sea, a lake, or another river, and this termination is called the *mouth* of the river. The cavity in which the running water flows is called the *bed* of the river, and the solid land which bounds this bed is called its *banks*.

It was formerly thought that the elevation at which a river originates must be in proportion to the length of its course, and accordingly geographers assumed that there are elevated mountain-ranges in those regions where large rivers take their rise; but modern researches have shown that this is not always the case. Thus the Volga, which is the largest river of Europe, and runs above two thousand miles, rises in a district the most elevated part of which does not exceed 1100 feet above the sea; and the Mississippi, which is still larger, originates in a tract which can hardly be called hilly, and at an elevation probably not much exceeding 1500 feet above the sea.

But still most large rivers have their origin in very elevated mountains or on high table-lands, in descending from which a great difference with respect to the rapidity of their course and the nature of the country through which they flow, is observed. Accordingly geographers divide the whole of the course of such rivers into three divisions, the *upper*, *middle*, and *lower* course.

The *upper* course of such a river lies within a mountain region, and its source is consequently at a great elevation above the sea. The waters run with greater or less velocity, according to the greater or less extent of the mountain-region, and the greater or less rapidity with which the whole region declines towards the country to which the course of the river is directed. When the elevation of the mountain-region decreases with great rapidity, the current of the river is extremely rapid, and presents a quick succession of cataracts and rapids. The force of the current is so great that pieces of rock of considerable size, which are frequently detached from the overhanging masses, cannot resist it, and are carried down by the current, until they reach a point where the rapidity of the descent begins to diminish. The mountains which constitute the banks of the river often rise several thousand feet above it, and their bases are united by slopes forming an angle, over which the water runs on bare rocks, without the least covering of earth. Thus the river does not flow in a valley, but in a cleft or ravine, which cuts deep into the mountain masses. Sometimes there is space enough for a path between the river and the mountains, but in many places this space is only obtained by artificial means, as by cutting away a projecting portion of the rock, or by making a tunnel through it. Where either of these means cannot be applied, the path is continued over the bed of the river by a wooden bridge of greater or less extent, until a place is reached which offers sufficient space for a path on the sides of the rocks. The course of the river is generally in a straight line, but sometimes it makes short and abrupt

bends which form acute angles. In the last-mentioned case it is, almost without exception, observed, that the mountains which enclose the river have on one side a projection, and on the other a receding, which correspond so exactly that if it were possible to unite both mountains, the projecting would exactly fit into the receding part. This peculiarity in the formation of the ravines of mountain streams was observed by the Spaniards in the Andes of South America, who called them *quebradas*, or broken; by this term tacitly assuming that the phenomenon had been caused by a violent disruption of the mountains. This description of mountain-streams and their ravines applies particularly to those of the western Alps along their southern declivity, to those rivers which constitute the upper branches of the rivers Doria and Sesia, to the valleys of Anzasca and Vedro on the southern side of the great road of the Simplon, and to the still larger valley of Aosta, through which the road leads from Switzerland to Italy over the mountain-pass of the St. Bernard. The military road of the Romans was made through the Val d'Aosta; but in these parts it was only practicable for beasts of burden. Such deep ravines not only occur between the gigantic elevations of a high range, but likewise in the elevated table-lands, Humboldt observes that the plain of Quito, which is nearly 10,000 feet above the sea, is intersected by ravines, which in some places sink so deep that their bottoms are hardly more than 2000 feet above the sea-level; and he adds that some of them are so narrow as not to contain the smallest cultivable space. Similar ravines intersect the table-lands of Guatemala and Anahuac, where they are called *cañadas*.

When the mountain-region through which the upper course of a river lies descends with less rapidity, and consequently occupies a much greater extent of country, the mountain-streams, as well as their banks, present very different features. Both the streams and the banks show that the descent of the whole mass is not by a regular slope, but is formed by an alternation of plains and declivities; in ascending such a mountain-stream, it is found that in certain places the rocky masses approach so near to the banks, as to leave hardly room enough for the river, and in these narrows the current is extremely swift, and generally a continual rapid, interrupted by falls of moderate height. These narrows however rarely extend more than a few miles. Above them the mountains recede to some distance from both sides of the river; and thus a basin is formed, in the middle of which the river flows with a comparatively slow current, not over bare rocks, but over a gravelly bed, and between low banks of earth. The bottom of the basin is level, or descends with a gentle slope, and may be cultivated or used as pasture-ground. In some of the rivers which descend from the central and eastern Alps, this alternation of narrow passes and basins occurs several times. Thus the Reuss, along which the great road runs which leads over the mountain-pass of St. Gothard, rushes with incredible velocity through the ravine of the Hospental, and falls 1800 feet before it reaches the basin of the valley of Ursern, which is nearly eight miles long and more than half a mile wide, and in which it runs with a gentle course. At the northern extremity of the valley of Ursern the river enters the second narrow at the Urnerloch. This narrow, which extends about three miles to Geshinen, is extremely contracted, and within these limits the river descends 1074 feet, forming a succession of small cataracts. Below this is the basin of the Krachenthal, which is not so wide as that of Ursern, and about six miles long. The course of the river within this basin is rapid, but there are no cataracts. From this valley the river escapes by the third narrow, which is about four miles long, and also very contracted; it terminates at the village of Am-Stäg, where the Reuss enters the valley of Uri, in which it flows until it mingles its waters with those of the lake of Uri (Urner-see), as the southern part of the Vierwaldstätter-see is named. The same conformation is observed in the southern declivity of the Alps, where the river Ticino descends from the mountain-pass of St. Gothard. This river runs in a ravine from the Hospental to Airolo, in which it descends about 2880 feet. It then enters the upper valley of Leventina, which is about seven miles long and half a mile wide, and in which the river is rapid, but has no cataracts. It issues from this valley by a narrow about two miles long, between Il Dazio and Faïdo, where a series of beautiful waterfalls occur, and the ravine is so narrow that an artificial road has been cut on the adjacent

mountain called the Platifer. At Faudo the Ticino enters the middle valley of Leventina, in which it flows with great rapidity to Giornico, a distance of about fifteen miles, but without forming any falls. The valley is less than half a mile wide, and often interrupted by rocks. Above Giornico the river enters a short narrow, at the outlet from which it forms cataracts, and then reaches the wide valley called the Lower Valley of Leventina, in which it flows with a comparatively gentle course to Lago Maggiore. The greater number of the rivers which originate in the Alps and Pyrenees are of this latter description. The basins which occur in these river-valleys may at some remote period have been filled with water, and this may have been drained off by the rivers forming an outlet for the waters by the narrows which now connect their basins with one another.

In some places the elevated mountain-regions border immediately on low plains. In such cases the rivers cannot be said to have a middle course; for as soon as they reach the plain their character is changed, and the rapid torrent is converted into a gentle stream. Thus the Marañon, after issuing from the Pongo de Manseriche, and entering the great plain, flows slowly through the alluvial level; and the Ganges, after leaving the Himalaya Mountains at Hurdwar, flows with great bends through the immense plains of Hindustan. All the rivers which descend from the southern declivity of the Alps to the plain which the river Po traverses are of the same description. In most cases however the mountain-regions are not in immediate contact with the plains, but are separated from them by hilly tracts, and that portion of the course of a river which lies through such a hilly region is called the *middle* course. The rocky masses rarely approach the bed of the river which has a middle course, but retire to some distance from them, so as to form between the higher grounds a wide valley, which the inundations of the river have covered with a thick layer of alluvial soil. It is remarkable that the highest ground of these valleys occurs, without exception, on the very banks of the rivers, and that the land slopes from them towards the base of the higher grounds. Accordingly the inundations generally cover the lower tracts, which are at some distance from the river, to the depth of several feet, while the banks are still above the surface of the water. The slopes of the higher grounds, which may be considered as the outer banks of the river, because they fix a limit to its inundations, are generally gradual, and covered with vegetation. The current of the river itself is gentle. This change, when compared with that of the mountain-stream, is partly due to the more gentle descent of the hilly region, and partly to the form of its course. The bed of the river rarely lies in a straight line, but continually forms bends, which are not acute angles, as in the case of the mountain-streams, but have only a small curvature, so that the river runs through the valley in a serpentine course. This circumstance renders the course of the river much longer than it would be, if it flowed in a straight line, and consequently diminishes the fall and the rapidity of the current.

It is observed that rivers form numerous small islands and sand banks a short distance below the place where they issue from the mountain-region. Thus the Rhine, between Basel and Kehl, opposite Strasburg, and the Amazonas below the Pongo de Manseriche, as far east as the mouth of the Yapurá, and the Mississippi, between the mouth of the St. Peter river and that of the Missouri, form islands and sand-banks. This is easily to be accounted for, by observing that the river, on issuing from the mountains, retains a large quantity of earthy matter in suspension, which subsides when the current decreases in rapidity. This sediment forms islets and sand-banks. Though it rarely happens, as already observed, that the rocky masses approach close to the banks in the middle course of a river, yet this generally occurs several times, and at such places the river usually forms rapids and whirlpools. A ledge of rocks traverses the bed of the river in some places. Such ledges occur in the Danube at Passau, near Neuburg above Vienna, near Presburg in Hungary, above Pesth, and at Orshova, or Orsava, on the boundary-line between Austria and Turkey. On the Rhine they occur only between Mainz and Bonn, where the river is traversed by three ledges, at Bingen, at St. Goar, and near Andernach respectively. Such ledges are found in nearly all the large rivers of Europe. The elevations by which they are produced are sometimes connected with ranges of hills.

Ledges of this description occur in many of the Atlantic rivers of the United States, as the Potomac, the James River, and others; and they mark with precision the passage of the rivers from the undulating or hilly region to the low plains along the coast. There are of course rapids where these ledges occur.

The *lower* course of rivers usually lies through a plain. In general there are no hills which constitute the outer margin of its course, and consequently there is no bottom or valley through which it runs. The banks are very little raised above the surface of the waters, and the level ground extends to a greater distance. The current is slow, the fall being very small. Thus it was observed by La Coudamine, that the Amazonas from the narrow at Obydos to its mouth, a distance of 700 miles, does not fall quite twelve feet, or little more than 0.2 of an inch per mile. It can hardly be conceived that a river with so small a fall could propel its waters, and as the current of the Amazonas is considerable it can only be accounted for by supposing that the enormous volume of water which the river brings down, drives on by its pressure that which is before it until it reaches the sea. The surface of the Elbe at Hamburg, about 70 miles from the North Sea, is not more than 6 feet above the sea, and the fall per mile very little exceeds an inch. The surface of the plain through which a river runs generally consists of an alluvium, which the river has deposited during the inundations. The matter of which this alluvium consists is soft and loosely bound together, and consequently the current, slow as it is, has power enough to remove a portion of the banks from one side, and to deposit the detached matter on the other. Thus great changes are produced in the course of rivers in the lapse of time. Major Rennell surveyed a large portion of the lower course of the Ganges about fifty years ago, and his maps were very exact at the time. He also observed the changes which the river had produced in its bed. A few years ago the course of the Ganges was again surveyed, for the purpose of establishing a steam navigation, and it was found that the course of the river hardly in any place agreed with the maps of Rennell. The most remarkable circumstance however is, that a river frequently divides into a number of arms, each of which runs to the sea, though some branches re-unite and again detach themselves from one another. Thus the Danube reaches the sea by seven arms, as the Nile formerly did, according to the antient accounts, though there are now only five arms in the Nile. Our best maps represent the number of the mouths of the Ganges as amounting to ten at least. This division of a river into several arms is easily understood when the soft nature of the alluvium is considered: and if we suppose that the river, in its operation of changing its bed, finds in its way a piece of rock or other matter harder than the alluvial soil, by setting against such an obstacle the current is divided, and flows on both sides of it: the following inundation removes still more of the alluvium, and thus, in course of time, a new arm is formed.

The country which is enclosed by the arms of a river is called its *delta*, from the form of the Greek letter  $\Delta$ , which the delta of the Nile, that which was best known to the antients, greatly resembles: but the term is generally appropriate, as most river deltas have that form. It is a common conjecture that the space which is now occupied by the delta of a river was once a part of the sea, which was filled up by the débris and earthy matter brought down by the river from the mountainous and hilly country through which its upper and middle course lie. This supposition is strongly supported by the nature of the soil, which evidently consists of matter brought down by rivers, and not of such as the sea leaves behind when, from any cause, it retires. It may be added, that this operation of rivers goes on during the inundations, for after the waters have subsided the surface of a delta is found to be covered with a very thin layer of mud, which soon becomes dry earth. The deltas of rivers which are annually swollen by rains, which is the case between the tropics, are generally much more extensive than those which are formed by rivers whose inundations are only produced by the melting of snow.

There is a river of first-rate magnitude which has no delta, though it seems to possess all those qualities which are supposed to be requisite to the formation of such an alluvial tract: the St. Lawrence in North America reaches the sea by a kind of bay, which extends upward of 300

miles, and gradually increases in width from three to above one hundred miles. One would suppose that the form of this bay would render it subject to be easily filled up by the earthy matter brought down by a river whose course exceeds 1800 miles; and yet we do not find that an alluvium of any extent has been formed along the banks of this wide estuary, except on the right bank below Quebec. This single instance might throw some doubt on the opinion that deltas are formed by rivers in the way above mentioned, if the peculiar nature of the St. Lawrence did not suggest an explanation of this deviation from the common course of things, which rather confirms than refutes the established principle. The St. Lawrence is the only large river which traverses a great number of lakes. Even after having left the five great Canadian lakes, it passes through those of St. Francis, St. Louis, and St. Peter's. In each of these lakes the current ceases, and it is only perceptible where the river again issues from the lake. All the earthy matter therefore which the river collects and keeps suspended in its course from one lake to the other is deposited in these lakes. Thus this large river brings no débris and earthy matter, or very little, to its wide estuary, which cannot therefore be changed into a delta by the accumulation of such matter.

Most large rivers, as already observed, admit of this division of their course into three parts, an upper, middle, and lower course; but the exceptions are far from being rare. It sometimes happens that the characteristic features by which the middle course is distinguished, occur in the upper course. This takes place when a river originates on an elevated table-land, and traverses a considerable part of it. Thus the Indus, the Sutlej, an affluent of the Indus, and the Sampoo, rise on the elevated table-land of Tibet, and drain a portion of it: in this part of their course they resemble the middle course of the Rhine or Danube. But where they leave the plain and enter the mountain-region of the Himalaya, they resemble the mountain-streams of the Alps, except as to the volume of water. When the Indus and the Sutlej have descended into the plains of the Panjab, they assume the character of the lower Rhine and lower Danube. The Sampoo, after leaving the mountain-region, traverses a hilly tract of great extent, the valley of Asam, before it enters the alluvial plain of Bengal. There are other rivers, in which only the characteristic features of the middle and lower course can be recognised: the number of such is considerable, and some of them are of the first magnitude. Thus the Volga and the Mississippi, neither of which rises in a mountain-region, but in a hilly tract, in the greater part of their course present the characteristics of the middle course of the Rhine and Danube, but towards their mouths they traverse a large plain. The number of rivers whose whole course lies through a hilly or undulating country is still greater, as is the case with nearly all the rivers of England and Southern Scotland, except the Humber, whose course is partly through a low plain. There are also rivers which in their whole course traverse a mountain-region, but they are all small; such are some of the rivers in North Scotland and in Sweden, and nearly all the rivers of Norway, and those on the west coast of South America.

The number of rivers which do not reach the ocean is not great, if we except those which fall into the Caspian Sea and into the lake of Aral. The other rivers without an outlet always terminate their course in a lake. It was formerly supposed that the water of some of them was absorbed by a dry soil, and that they were lost in the sand; and this opinion still prevails as to some rivers which descend from Mount Atlas southward to the Sahara. But as none of these rivers have been visited by Europeans, the point remains doubtful. Among other rivers which have no communication with the sea, some few traverse elevated table-lands, consisting of plains surrounded by continuous mountain-ranges, through which the waters cannot find an outlet, and consequently collect in the lower part of the plains, and form lakes large enough to part with all their surplus water by evaporation. Such rivers occur in the valley of Tenochtitlan in Mexico. The most remarkable is the Desaguadero, in the valley of Titicaca in Bolivia, which runs about 300 miles, and is lost in a lake or in swamps. The Hyarkan or Yerkan, in Chinese Turkistan, is still larger, but its character is imperfectly known. Another kind of such lakes occurs in the plains of Mexico and of South America, and almost exclusively in those parts which have no rain or very little. On the table-land of

Mexico the greater number of rivers between 24° and 30° N. lat. terminate in lakes; and in the states which compose the Argentine Republic, rivers of this kind are numerous between 28° and 34° S. lat., west of 64° W. long. As very little rain falls in some of these countries, and in others none at all, the rivers are supplied with water by the rains which fall at certain seasons on the mountains in which they originate, and by the springs which exist there. But as the supply of water is very moderate, it does not give force sufficient to the currents to carry them through those extensive tracts which separate them from the sea. It is remarkable that some of these rivers and all the lakes in which they terminate, are salt in South America; and it is probable that this is also the case with most of those on the Mexican isthmus.

Most rivers overflow the low countries which are adjacent to their banks, either at regular seasons of the year or occasionally. This takes place when the supply of water is greater than the bed of the river can contain. In this respect rivers may be divided into three classes: the first comprehends the rivers whose inundations are produced by the melting of snow and ice; the second comprehends those which are annually swollen by regular rains; and the third those which only occasionally cause inundations.

All large rivers that drain countries of which the mean winter temperature is below 30°, are annually subject to great risings when the snow and ice melt. In such countries snow falls for several months, and as only a small part of it is dissolved, it accumulates to a great amount. As soon as the frost ceases, the snow begins to melt, and runs off by the smaller rivers, which suddenly swell and carry an unusual supply of water to the principal river, whose volume being thus increased to three or four times its ordinary magnitude, overflows the adjacent low country. These inundations, though they generally improve the soil, are very injurious to agriculture, by destroying the growing corn, and covering extensive tracts with sand, gravel, and other coarse earthy matter. Embankments are usually made to prevent these inundations, but after a very long winter, when the river is more than usually swollen, these embankments are often destroyed, and the injurious effects of the inundations are increased by the mass of earthy materials of which the embankments consist, and which are dispersed over the adjacent lands. In some rivers these inundations last only from two to four weeks; in others two or three months; and in some even five or six months. Where the inundations are long, they are less violent, and cause less damage than where they are short; in the latter case the whole mass of water suddenly deluges the country, while in the former the water rises slowly. This difference in the inundations of rivers is mainly to be attributed to the direction in which they flow. Let us take a river like the Mississippi, which flows from north to south through 17° or 18° of latitude. In winter the basin is covered with snow, and if the whole were melted in a few days, it would produce such a volume of water as would probably cover nearly half the basin. But the melting of the snow is gradual. Whilst the temperature in the northern districts is below the freezing-point, the spring has already made considerable progress in the southern districts, the snow which has there fallen has been dissolved, and the water thus produced has had the requisite time to run off and reach the sea. Thus with the progress of the sun towards the northern tropic, the line of the melting snow proceeds northward, and thus the supply of water runs off gradually, until the snow of the most northern region is dissolved. More than two months elapse between the melting of the snow in the northern region and the commencement of the melting in the lower part of the river. The inundations of the Mississippi therefore are not extensive, if the great length of that river and of its affluents are considered, but they last from three to four months. A considerable part of the delta of that river is indeed under water for six months, but this must be ascribed to the tract of elevated ground which extends not far from the sea between the Atchafalaya and the La Fourche, and prevents the enormous mass of water which collects in the lowlands near the first-mentioned branch from running off sooner. When a river situated in the northern hemisphere flows from south to north, the melting of the snow of course commences near the upper branches of the river, and proceeds northward. In this case the volume of water which collects at a certain period in the lower course, where the lowlands

are generally most extensive, is much greater, and the inundations are much more extensive and attended with more mischief. But still they cannot be compared with the inundations of those rivers which run from east to west or from west to east. In countries which are drained by such rivers, the whole mass of snow is dissolved in a few days, especially when a thaw is accompanied by rain, and all the waters thus produced pass through the principal channel in the course of a week or two. In such rivers the volume of water during the inundations is three or four times larger than it is in the middle of the summer or the beginning of autumn, and the inundations spread to a great distance, and frequently cause great loss of property, and sometimes also of life, especially when the winter has been unusually long and the falls of snow very heavy. [NIRKEN.] But the river St. Lawrence forms an exception here also. As its general course is from west to east, one would suppose that a large extent of country within its basin would be annually subject to inundation, but this does not appear to be the case in any part of its course. If any portion of it is swollen by the melting of the snow within the basin, the river soon enters one of the lakes through which its course lies, and thus the addition of a comparatively small volume is not sufficient to raise the surface of the lake to any large amount. Thus the same cause which prevents its filling up the wide estuary, prevents the river from overflowing the adjacent country.

Rivers whose inundations are produced by regular rains have the greater part of their course either within the tropics or at least between 30° N. lat. and 30° S. lat. It is a known fact, that in those regions heavy rain falls daily from three to six months in the year. These heavy rains commence when the sun in its progress from one tropic to the other approaches the zenith of a country, and they continue till it has passed a certain distance from it. In the beginning of the wet season, as this part of the year is called in those countries, the rains are sometimes so heavy that in the course of a day the level country is covered with water a foot deep. The rivers of course soon begin to increase in their volume of water, and after some time they rise to the level of the banks, and begin to run over. These inundations generally last from two to four months. They are more regular than those which are produced by the melting of the snow, and in general do not exceed a certain height. The rural economy of those countries in which they take place, is founded on the knowledge of this periodical event, and on the certainty that the inundations will fertilise the fields by depositing on them a fine mud, which enriches the soil more than the best manure. Whenever the inundations do not rise to the usual height, which is sometimes the case, a great part of the country which is not covered with water yields little or nothing, and the consequence is dearth and famine. When, on the other hand, the inundations rise higher than usual, they are also injurious to rural economy, by reaching those tracts which are set apart for the cultivation of plants, which cannot bear so much moisture as the districts that are regularly flooded. Thus, in 1831, the river Menam in Siam rose to an extraordinary height: the inundations reached the large orchards which for many miles in extent cover the more elevated tracts along the banks, and afford subsistence to a numerous population. Several kinds of fruit-trees were almost destroyed, and for some years the mangustans and durians were scarce.

All the rivers between the tropics which are swollen by periodical rains, lie only in one hemisphere, the northern or the southern. In the countries through which they flow the waters are low and the ground dry during part of the year, so as to admit of easy cultivation, and at another season the fields are fertilised by the inundations. The Amazonas alone is an exception. Though the course of this river is in the southern hemisphere, its affluents extend far to the north and south, into both hemispheres, and probably three-fourths of the tropical rains which descend upon South America find their way to that large river. To this circumstance are owing its immense volume of water and its great depth. The Amazonas, properly speaking, is never at its lowest level, in the sense in which that term is applied to other rivers. When the northern rivers cease to bring down the supply which is owing to the periodical rains, the southern begin to bring their contributions. This fact seems sufficiently to explain the immense tracts of alluvial soil which extend along the river to a great distance, but the same

circumstance also keeps the soil in a state of continual moisture, and makes it a perpetual swamp. Accordingly we find that the banks of that river, which admits of a more extensive navigation than any other river in the world, remain nearly destitute of agricultural settlements, and are still in possession of savage tribes.

The rivers which drain the countries between 30° N. latitude and those in which the mean temperature of the winter season does not rise above 30°, are subject to occasional inundations. But these overflowings occur only in those rivers whose upper course lies within mountain-ranges which are covered with snow for a considerable part of the year. In such cases, while the snow covers the more elevated portion of the mountain-ranges, a sudden change in the weather, which produces a warm wind, brings great volumes of vapours, which, falling in abundant rain, soon dissolve the snow, and the mountain-streams pour down their waters with increased volume and velocity. As soon as the waters reach a level tract, it is inundated. As these inundations often take place unexpectedly, they cause great damage. Thus we find that some valleys in the Ozark Mountains, in the United States of America, are almost uninhabitable, owing to the sudden inundations to which the rivers of that mountain-region are subject. Many rivers however never inundate the adjacent country, unless a heavy gale of wind should blow directly up the river, and drive the sea into it with great force. Such inundations are very sudden, and sometimes also extensive, but they are of short duration.

In adverting to the advantages which a country derives from its rivers, we must first observe that the water is extensively used for the purposes of domestic economy. It is much purer than that of wells; for, with the exception of a few which are salt or brackish, river water contains only earthy particles in suspension, which may easily be separated by filtration, and which are deposited as a sediment when the water is left to stand for a short time. The water of wells generally contains a small quantity of some mineral in chemical combination. The water of rivers is nearly equal to rain water for all domestic purposes. Rivers accordingly supply water for the consumption of large cities, as in the case of the New River [MIDDLETON, HUGH], which supplies a large part of London, and the Schuylkill, which supplies Philadelphia. Many rivers also supply abundance of food. The upper courses of rivers are generally inhabited by a small number of species of fish, and the whole amount is not great. But towards their mouths the number both of species and individuals increases. The importance of a river fishery may be estimated when we consider the quantity of salmon which is taken in the rivers of Britain, or of the beluga and sturgeon which are caught in the neighbourhood of Astrakhan. Many rivers, which are not adapted to the purposes of navigation, are converted into powerful instruments for assisting the industry of a country by the moving-power which they supply for mills and other heavy machinery. The advantage of such a natural moving-power primarily determines the seat of manufactures, as was the case in South Lancashire, where this advantage is combined with abundance of coal. The Atlantic States of North America are generally provided with abundance of streams, a circumstance which favours the establishment of manufactures.

The greatest advantages however which a country derives from its rivers are the facilities which they supply for conveying the produce of agriculture and of manufacturing industry to distant parts at a moderate expense. In this respect the rivers may be compared to the arteries and veins of the human body, which diffuse life and strength through all parts. Navigable rivers vivify, maintain, and excite the efforts of human industry. In many countries, where roads are neglected, it is estimated that the transport of goods by land is four times as expensive as that by means of navigable rivers, and thus many heavy and bulky commodities could not be brought to market but for the cheap conveyance of rivers. In considering the capacity of a river for navigation, two circumstances mainly require notice—how far seafaring vessels may ascend, and how far the river is navigable for river boats.

Seafaring vessels can ascend many rivers as far as the tides extend. Indeed some rivers, as the Amazonas, may be navigated by large vessels to a much greater distance than the tide ascends, but in others the waters become shallow long before the limit of tide-water is reached. In such cases the high tides facilitate the navigation of rivers not only by

producing a current contrary to that of the river, but also by temporarily increasing the depth of water so that vessels can pass over shallows and sandbanks, which at low tides are nearly or quite dry. This is frequently the case in rivers where the tides rise more than 12 feet. The tides in rivers are not of equal duration, as is the case in most parts of the sea; but the ebb tides frequently last twice as long as the flowing tides. At Rotterdam the tides flow for about 4 hours and 5 minutes, but the ebb lasts 7 hours and 35 minutes. The Meerwede at Dordrecht flows against the current of the river for 3 hours and 51 minutes, and with it 8 hours and 9 minutes. This difference is easily explained, when the force of the river current is taken into account. The same circumstance explains the difference in the velocity of the ebbing and flowing tide. Between the North Sea and Hamburg, the flowing tide takes five minutes to run up a mile, but the ebb tide performs the same distance in less than four minutes. But it is difficult to explain the well-established fact that the tides advance much farther into a river than might be expected. When the tide at the mouth of a river rises four feet, we might suppose that it would advance only to such a point in the river, where the surface is four feet above the sea, but it has been ascertained that it advances farther. It seems that the volume of water which is carried up by the tide is pushed onwards by the mass behind it, and carried to a greater distance than the inclination of the river bed would seem to allow. It has also been observed, that during the flowing of the tide the surface of the water in the river presents a somewhat convex form, the water along the banks being a little lower than in the middle of the river, and that during the ebb the contrary takes place. The flowing tide raises the water from below, and thus sooner affects the main body of the river, where it has more room to operate, than the water near the margin. In accordance with this explanation, it is observed that the flowing tide is perceptible in the middle, while it is still ebbing along the banks, and that vessels which are at anchor near the banks are turned round before the water on the surface of the river near the banks begins to flow upward.

In a few rivers the tide ascends to a great distance from the sea. In the Amazonas it is perceptible in the Narrow of Pauxis near Obydos, a distance of nearly 500 miles from the mouth of the river, measured along its course. If we suppose that the tide in this river advances at the rate at which it runs in the Elbe between the North Sea and Hamburg, namely, nearly a mile in five minutes, the tide can only reach the Narrow of Pauxis in 42 hours, or in a space of time during which the direction of the tides has changed seven times at its mouth. It is therefore evident that the current of the Amazonas between the sea and the Narrow of Pauxis must, at the same time, in three or four different parts of its course, follow the impulse given to it by the tide, and run against the stream. We are of opinion however that the tide in the Amazonas advances more slowly than in the Elbe, owing to the stronger current of the Amazonas, and that the number of high tides in the Amazonas, between the two above-mentioned points, will probably be found to be five or six. The tide rushes into some rivers with great impetuosity, and produces what is called a bore. [BORE.]

Human ingenuity, even in the lowest state of civilization, has perceived the use of rivers as means of conveyance. Perhaps all rivers which have water enough to carry the smallest boats of any shape or form are navigated, except where the nature of the current opposes insuperable obstacles. These obstacles consist of *cataracts* or of *rapids*. When the river descends from a rock which rises several feet perpendicularly, it rushes down in a broken sheet of water, and is said to form a cataract. When the water descends with great velocity over an inclined plane of rock, it is said to form a rapid. A cataract may be descended when it is only a few feet high. Rapids may be ascended and descended in most cases with great labour and some danger, when they are not very long, and the bed of the river is free from projecting rocks, which however is rarely the case. The ascent of rapids is effected either by poling or by dragging the boats over the dangerous place by means of long ropes. Sometimes ropes are also used in the descent, as in the Rhine at Laufenburg in Switzerland. But generally either the whole cargo or a part of it must be taken out of the boat, and carried a certain distance by land. Such a tract, over which goods must be carried, is called a

*portage*. At long and dangerous rapids, the boats themselves must be carried or dragged over the portages.

River boats differ greatly in shape and construction, being always adapted to the nature of each river. Most rivers contain numerous shoals, on which the water is very shallow, and accordingly flat-bottomed boats are used, like the coal-barges in London. Keel-boats can only be used where the river has a depth of a few feet, and is free from shoals and sand-banks. When a river is shallow and rapid, but of considerable width, rafts are substituted for boats. Rafts generally consist of trees fastened together with ropes or the flexible branches of trees, or, in warm countries, by creeping plants; goods are placed upon the raft. When these rafts with their cargoes have arrived at their place of destination, the raft itself is sold, either as timber or as fire-wood, according to its dimensions and quality; and the crews return by land. When a river is too full of cataracts and rapids to allow either boats or rafts to descend, it may still be used for floating down timber or fire-wood. The trunks of trees, after being deprived of their branches, are thrown singly into the current, and towards the mouth chains are laid across the river, above which the trunks collect, and whence they are carried to their destination. This is frequently done in the rivers of the southern districts of Norway.

Rivers which traverse a mountain-region in some parts of their course, are either not navigable in this part or only in some places. Thus the Amazonas and Ganges, where they respectively flow within the ranges of the Andes and Himalaya Mountains, are not navigable, but the Rhine and the Danube are navigable even within the mountains, in some parts for a considerable distance. The most extensive system of internal navigation is presented by those rivers which have a long course, and whose sources are situated at a comparatively small elevation above the sea. The Volga is navigable in the whole length of its course, and the Mississippi up to the Falls of St. Anthony, a distance of about 1800 miles, measured along the river. Both these rivers, as already observed, have the greater part of their course between hills of small elevation, and they do not traverse a mountain-region.

The rivers of England supply the means of an extensive system of inland navigation, a circumstance partly due to their small fall, their sources being only a few hundred feet higher than their mouth, and partly to the abundant supply of water from rain, mists, and springs. Accordingly, if two rivulets unite, they generally form a small navigable river; and such as are not navigable, become useful as feeders to canals. The navigation of most of the rivers of England has been much improved by artificial means.

The Thames is navigable for large sea-vessels to London Bridge, a distance of 45 miles from the Nore, though the whole course of the river, measured along its windings, hardly exceeds 200 miles. No river in the world, perhaps the Amazonas excepted, is navigable for vessels of such dimensions for one-fourth of its course. This circumstance is not due solely to the height of the tides, which is about 19 feet at London Bridge, but mainly to the fact that there are no sand-banks at its mouth which prevent the access of large vessels. The river probably brings down sufficient earthy matter to form a bar, but owing to the direction of the tide, which is kept off from the mouth of the river by the projecting coast of Kent between the two Forelands, and there being consequently nothing to oppose the current of the river at its mouth, the earthy matter is carried farther from the coast, and deposited in deep water.

The advantages hitherto enumerated are common to rivers in all parts of the globe, but there are some countries in which the value of rivers is much increased by the use which is made of the water for irrigation. This occurs in those countries in which it either does not rain at all, or in which rain occurs only at a certain period of the year, and even then only for two or three months. The first class of such countries, for instance the western coast of South America between 5° and 28° S. lat., would be uninhabitable but for the rivers which descend from the western declivity of the Andes, and in their course to the sea have furrowed the surface with deep depressions or valleys, in which agriculture is carried on with success as far as the water of the river can be dispersed over the level part of the valleys by small canals. In those warm climates where the rains occur periodically, though only in two or three months of the year, the fields would certainly produce a crop, even without irrigation; but for more than half the year the soil would

produce nothing for want of water. By using the water of the rivers for irrigating their lands, the inhabitants of those countries are enabled to get two and in many cases three crops annually. Even in the southern countries of Europe, where rain is very scarce in summer, and not sufficient to maintain vegetation, whilst the heat is excessive, irrigation is practised, and two crops of Indian corn are thus annually obtained, or one crop of wheat and a green crop.

In those countries in which the temperature for three or four months is under the freezing-point, the rivers during that time are covered with ice, and in this state they afford to the inhabitants, in some degree, the advantages which other countries derive from railways. Travelling and the transport of goods on the smooth ice of the rivers are much less expensive, and are performed in a shorter time than in summer in the ordinary way. This is the case on some of the rivers of New Brunswick and Lower Canada.

It has been observed that the outer borders of river-basins are the most elevated parts which occur in some given places between their respective beds, though it is not always the case that the watershed is formed by mountain-ridges. Owing to such a disposition of the surface, the waters which are collected on or near the borders, run to one or the other of the two rivers. Up to the commencement of this century it was thought improbable, if not impossible, that two different river systems or basins could be united by a natural water communication. But it is now ascertained that a low tract of country or a deep depression of the surface may occur, by which a portion of the water of a river, after being diverted from its own channel, may join a river which otherwise is not connected with that river from which the water branches off. The instances in which this occurs are very few, and we shall therefore enumerate those whose existence is beyond all doubt. The river Arno in Tuscany, in that part where it runs between the high ridges of the Apennines and approaches the town of Arezzo, sends an arm southwards through a narrow valley, under the name of Chiann, which falls into the Chiare, an affluent of the Tiber. The Chiana had been filled up with sand, but its course has been re-established by artificial means. Another case occurs in the kingdom of Hanover, a few miles east of the town of Osnabrück, where the river Haase divides into two branches, of which one, running west to Osnabrück, preserves its name, and after a course of many miles joins the Ems; the other, running east under the name of Elz, falls after a short course into the Werre, an affluent of the Weser. In Sweden, two large rivers fall into the northern extremity of the Gulf of Bothnia, the Tornea Elf and the Calix Elf. About 100 miles from the sea, the last-mentioned river sends off an arm to the south east, which after a course of about twelve or fifteen miles falls into the Tornea Elf: this arm is called Tarenda Elf. In these cases the rivers thus united by a natural water communication flow in the same direction or nearly so. But in South America two large rivers, the Orinoco and the Amazonas, are united in this way in a part of their extensive courses, where the Orinoco runs west and the Amazonas east. The branch of the Orinoco by which this natural water communication is effected, is called Cassiquiare. [CASSIQUIARE.]

It is a kind of established rule that the whole course of a river should bear the same name, and that this name should be continued to that branch whose sources are furthest from the mouth. But practice is frequently at variance with this rule, and it may easily be accounted for. The inhabitants of a country preserve the name of that river which does not undergo any deflection of its course. At the confluence of the Mississippi and the Missouri, the latter is the larger river, and has had a course of above 1000 miles more than the former, but it does not deflect the course of the Mississippi by its junction, and the name of the last-mentioned river is preserved. The same occurs in South America as to the Amazonas and Madeira, where we find that the last-mentioned river changes the direction of its course to meet the Amazonas, whose name is preserved. In Europe, the Rhine is joined by the Aar in Switzerland, above Laufenburg. The Aar is the larger river and brings down a greater volume of water, but the Rhine, where it is joined by it, continues its westerly course, and its name is preserved.

The extent of a few river basins is here given in round numbers, but they must only be considered as rough approximations:—

Rivers.	Square Miles.
Thames . . . . .	5,500
Rhine . . . . .	89,000
Euphrates, including the Tigris	243,000
Brahmapootra . . . . .	270,000
Danube . . . . .	312,500
Indus . . . . .	410,000
Ganges . . . . .	443,000
Volga . . . . .	653,000
Nile . . . . .	707,500
Yan-tse-kiang . . . . .	742,000
Mississippi . . . . .	1,100,000
Plata . . . . .	1,560,000
Amazonas . . . . .	1,920,000

RIVESALTES. [PYRENEAN ORIENTALES.]

RIVIERA, a name given by the Italians to certain long narrow strips of land extending between mountains and the sea-coast. The most familiar instance is that of the coast of Genoa, which is divided into Riviera di Levante, or Eastern Riviera, which extends from the city of Genoa to the Gulf of La Spezia, and Riviera di Ponente, or Western Riviera, which extends from Genoa to Nizza. The Western Riviera is the more fertile and populous; but in the Eastern Riviera, which is generally more rugged and barren, there are some delightful spots, especially about Nervi, Rapallo, and Chiavari, sheltered by the mountains from the north winds, and where the orange, lemon, and other southern plants thrive in the open air. [SARDINIAN STATES.] There is also a tract along the western shore of the lake of Garda which is called Riviera di Salò, from the town of that name. [GARDA, LAKE OF.]

RIVOLI, in Piedmont, a town situated about ten miles west of Turin, on the road to Mont Cenis. A wide and straight avenue, lined with fine elm-trees, leads from Rivoli to the capital, through a rich plain irrigated by canals. Rivoli has 5000 inhabitants, and a royal palace situated upon a height.

There is another small town or village called Rivoli in the province of Verona, situated at the southern entrance of a defile through which the Adige coming from the Tyrol makes its way into the plain of Lombardy. Rivoli is on the right bank of the Adige, at the foot of a lofty ridge called Monte Baldo, which extends between the river and the lake of Garda. A hard-fought battle took place at Rivoli between the French under Bonaparte and the Austrians under General Alvinzi, on the 14th of January, 1797. The village was several times taken and re-taken by the two armies. At last General Massena, coming up with his division, carried the day, and Alvinzi was obliged to retire with great loss. Massena obtained afterwards, under the empire, the title of Duke of Rivoli.

ROACH. [LEUCISCUS.]

ROAD. Under this head it is proposed to embrace road-making, with a brief sketch of the history of roads, referring for more detailed statistical information to the geographical articles in this work, and to WAY and TURNPIKE TRUSTS for an explanation of the laws respecting the formation and maintenance of the highways in this country.

The importance attached to roads by the great nations of antiquity is abundantly testified by historians, though, except in the case of the Roman roads, there are few remains existing. The Carthaginians are said to have been the inventors of paved roads, which were much used by the Romans, who were distinguished by the vast extent and solid construction of their highways, of which several thousand miles were made in Italy alone, while every country which was brought under their sway was more or less intersected by these channels of communication. Though formed mainly to facilitate military movements, the Roman roads were productive of the greatest civil benefits. Being made by a power whose resources were almost unlimited, these military roads were usually laid out in straight lines from one station to another, with little regard to natural obstacles, which were frequently passed by means of very extensive works, as excavations, bridges, and, in some instances, tunnels of considerable length. The solidity of their construction was fully equal to the boldness of their design; a fact proved by the existence of many that have borne the traffic of near two thousand years without material injury. The Roman engineers were very particular in securing a firm bottom, which was done when necessary by raising the ground with small stones, fragments of brick, &c. &c. with great care.

fully prepared foundation a pavement of large stones was firmly set in cement, the stones being occasionally squared, but more commonly of irregular shapes, though always accurately fitted to each other. For this purpose many varieties of stone were used, but the preference seems to have been given to basalt, where it could be had, it being used in many situations in which other suitable materials might have been procured with less labour and expense. Where large blocks could not be conveniently obtained, small stones of hard quality were sometimes cemented together with lime, forming a kind of concrete, of which masses extending to a depth of several feet are still in existence. The strength of their pavements is illustrated by a fact, related by a modern traveller, who states that the substratum of one still in use has been so completely washed away by a current of water without the surface being at all disturbed, that a man may creep under the road from side to side, and carriages pass over the pavement as over a bridge. The Roman roads were generally raised above the ordinary surface of the ground, and frequently had two carriage tracks separated by a raised footpath in the centre.

In some parts of the continent of Europe, especially in Italy, the Roman system of road-making has been imitated, particularly in city pavements; but in Britain the attempts to follow the Roman model appear to have been very limited, and road-making has been very imperfectly practised till within a few years. Many of the existing highways were originally mere paths or tracks from place to place, their course having been determined more by accidental circumstances than by a due attention to the properties of a good road. Thus deviations were made from the direct course in order to cross rivers at fordable points, and the road was conducted over a hill in preference to a more level course round its base, to take advantage of natural drainage. As improvements have been introduced in the systems of construction and repair, the direction and levels have been frequently left unaltered, to avoid the temporary inconvenience and expense attending a deviation from the established course. The scanty information we possess as to the state of the roads in early times indicates that it was very bad; and after the introduction of turnpikes, and even down to the commencement of the present century, the greater part of the roads were, owing to injudicious modes of construction and repair, in a state very unfit for traffic.

The inefficiency of the system of maintenance by parish and statute labour was proved before the passing of the first Turnpike Act in 1653; yet the necessity of improvement, and the obvious justice of maintaining roads by the produce of tolls, did not lead to the extensive adoption of the turnpike system for about a century after that time. In the latter half of the last century turnpike-roads multiplied rapidly, and superior principles of construction also made some progress.

During the last forty years the attention of government has been repeatedly directed to the importance of this class of public works, and the Highland and Holyhead roads, formed by Telford and others, have done much in improving and extending the science of road-making. The Highland roads alluded to were made under the commission of 1803, and originated in the military roads formed in consequence of the rebellions of 1715 and 1745, which had been found very beneficial to the districts to which they afforded the means of access. The roads made and improved under the management of the Highland-Road Commissioners extend to more than 900 miles, the whole being in a mountainous district, but so well laid out that their inclinations are always moderate. The works executed in the formation of these roads are very extensive, and comprise upwards of 1100 bridges. The Holyhead road improvements were commenced in 1815, and in these Telford and his able assistants had the opportunity of carrying into effect, under a government commission, a plan of road-making suitable to a great traffic, on principles generally considered to be nearly perfect. The principles on which these important works have been executed are very fully detailed by Sir Henry Parnell, in his valuable 'Treatise on Roads,' to which work the writer of this article is indebted for much of the following information. The name of Mr. Adam must not be passed over without notice in this place, as his exertions have done much towards attracting public attention to the improvement of roads, even where his peculiar principles have not been acted upon.

Though much remains to be accomplished, and the philosophy of road-making is yet very imperfectly understood by a large proportion of those to whom the care of the highways is committed, it is impossible to compare the past and present state of roads without feeling grateful for their improvement, and observing in how great a degree that improvement has benefited the agricultural, commercial, and moral interests of the community.

*Designing a Line of Road; Earth-works, &c.*—Though formerly little attended to, the design of a line of road is a subject which requires extensive knowledge and mature deliberation. It is often advisable to survey several different lines, in order to the selection of that which, on careful comparison, appears to have the preponderance of desirable qualities. To be theoretically perfect, a road should combine the qualities of straightness and level, and its surface should be smooth and hard; and the best road, practically, will be that which makes the best compromise between unavoidable deviations from this theoretical perfection. It may be observed however that although some writers speak of the absolute perfection of each of these qualities as essential to the idea of a good road, it may be questioned whether it is desirable of any, excepting the first. Of these qualifications the two first belong to the design or laying out of the line, and the last two to the execution of the road and the materials made use of.

The qualities of straightness and level, or the *line of direction* and *line of draught*, should be very carefully adjusted to each other. Some remarks on this subject will be found in the article RAILWAY, p. 250, which apply equally to the laying out of common roads, though the proportionate retardation due to a given ascent is very different, owing to the great comparative resistance of a common road. Among the circumstances that may authorise a deviation from the straight line, are the power of obtaining suitable materials for the road, avoiding valuable property or difficult ground, and including towns or villages in the route.

It seems to be a prevailing opinion with modern engineers, that the line of direction has not generally been made as subordinate as it should be to the line of draught; and it will be well to remember, in laying out a new road, that while the effect of gravity must ever remain the same, the resistance occasioned by imperfections in the road and carriages will be reduced by every prospective improvement in their construction; thereby increasing the *proportionate* effect of gravity, and making the line of direction still more subordinate to that of draught, or, in other words, increasing the length of level road that may be traversed with the same expenditure of power as would raise the load up a given elevation. Curves increase the resistance to the motion of carriages, and add to the risk of accident; but if slight, they increase the length of the road much less than might be supposed. Edgeworth, in his 'Essay on the Construction of Roads and Carriages,' says, 'A road ten miles long, and perfectly straight, can scarcely be found anywhere; but if such a road could be found, and if it were curved, so as to prevent the eye from seeing farther than a quarter of a mile of it, in any one place, the whole road would not be lengthened more than one hundred and fifty yards.'

The principle explained in p. 250 of the article RAILWAY, of so arranging the inclinations on each side of the summit, or highest point unavoidably passed over, that there may be no unnecessary rise and fall, is equally deserving of attention in the design of a common road, although it has been much neglected. The following statement respecting an old road in the Isle of Anglesey, which was altered by Telford, shows how very much a road may be improved by judicious alterations; not only by shortening the line and lowering the summits, but also by diminishing the minor undulations:—

	Summit above high water.	Total rise and fall.	Length.	
			Miles.	Yards.
Old road .	339 feet	3,540 feet	24	428
New road .	193 "	2,257 "	21	1,596
Difference .	146 feet	1,283 feet	2	592

However desirable a perfect level may be in theory, a road with moderate inclinations, as of 1 in 100, is found to be preferable in practice, because without such a slope it is difficult to get rid of water fast enough, unless the road be

raised a few feet above the surrounding land, and thereby exposed to the free action of sun and wind. Slight undulations are also considered, by most authors, to be desirable in all cases where animal power is employed; frequent changes in the amount of exertion being considered favourable to the horses. On this principle it is recommended that where an undulating road is reduced to a uniform gradient, occasional levels should be introduced to ease the draught. Any inclination exceeding the angle of repose, or that beyond which a carriage would roll down by its own gravity, occasions a loss of power; but all below it are attended with a compensating effect when the traffic in both directions is taken into account; the advantage gained by descending carriages being equal to the additional labour required in the ascent. This angle has been stated by Lardner to be about 1 in 40, with a good carriage on a broken stone road of the best quality; but the inclination allowed on the Holyhead road is 1 in 35, a slope which may be ascended at a good rate of speed, and descended at twelve miles an hour without risk. A greater slope not only occasions much additional resistance in the ascent, but, by rendering it unsafe to drive down at full speed, causes a loss of time in the descent also. Modern engineers consider it inadvisable in any case to exceed an inclination of 1 in 24, though there are hills at least twice as steep on some turnpike roads. The following table shows the effect of various inclinations in increasing the draught of a stage-coach at different velocities on the same description of road, as indicated by a dynamometer contrived by Mr. Macneil for experiments on the draught of carriages:—\*

Inclination.	Force required of		
	6 m. p. hour.	8 m. p. hour.	10 m. p. hour.
1 in 20	268 lbs.	296 lbs.	318 lbs.
1 .. 26	213 ..	219 ..	225 ..
1 .. 30	165 ..	196 ..	200 ..
1 .. 40	150 ..	166 ..	172 ..
1 .. 600	111 ..	120 ..	128 ..

It should always be borne in mind that the occurrence of one steep hill on a line of road affects the working of the whole line, as the number of horses required for ascending it must be used, although a portion of their power may be unemployed on the greater part of the road. The inconvenience of a steep inclination may be diminished by laying a stone tramway for the use of ascending vehicles; a measure which has been adopted with success on the Holyhead road, where, on a slope of about 1 in 20, the power required to draw a ton has been reduced by this means from 294 lbs. to 132 lbs.

In arranging the works necessary for obtaining the required level, the preference should be given to embankments; and, wherever it is practicable, the bed of the road should be elevated two feet above the natural level, for the sake of efficient drainage. Tunnels are very rarely introduced on common roads, being very costly, and, when of considerable length, inconvenient from their darkness. When the road is in an excavation, the side-slopes should never be steeper than two horizontal to one vertical, and it is desirable to have those on the south side three to one; because, though many materials will stand at steeper inclinations, it is essential to the preservation of the road, and the comfort of horses travelling upon it, that the sun and air should have free access to its surface. Where stone can be readily procured, the erection of walls at the bottom of the slopes gives a neat and finished appearance to the road, and prevents earth, which may be loosened from the sides, from falling into the side channels or drains. The Highbgate Archway road affords an example of the great difficulties that occasionally attend a deep excavation, owing to the accumulation of water; the remedy for which is described hereafter. Where embankments are required, strong fencing is especially necessary, to guard against the occurrence of accidents. Some of the roads formed by Telford are conducted across deep valleys by bridges or viaducts of great magnitude, in order to maintain the desired level without the inconvenience and expense of large earth embankments.

In old roads the bridges erected for the passage of rivers are frequently made much smaller than is advisable, so that

\* This useful instrument, which its ingenious inventor denominates a *Road Indicator*, is mounted in a light partition, and besides marking the draught at every ten or twenty yards, points out the distance ran, and the rates of acclivity or declivity on every part of the road. A full description of it is given in Parnell's 'Treatise on Roads.'

the level of the road is made too low, and the water is impeded by the contracted arches to such a degree as to occasion much damage during floods. Modern engineers, by adopting bolder dimensions for the bridges, and forming raised approaches, avoid these inconveniences, and secure their roads from the risk of obstruction by floods. The raising of the road wherever it passes through marshy or low land is a very necessary measure. Many old roads still in use are sunk several feet below the surface of the ground, because they have originally been exposed to the destructive action of water, and the materials thus softened have been ground into mud and cleared away, until, by the repetition of these operations, the roads have been converted into deep trenches, which are frequently flooded in winter. Of the extent to which this process has been occasionally suffered to go on, an idea may be formed from the statement of Edgeworth, that 'the stag, the hounds, and the horsemen have been known to leap over a loaded waggon in a hollow way, without any obstruction from the vehicle.'

In conducting a road through a mountainous district, in addition to numerous bridges for the purpose of crossing ravines (for which purpose suspension bridges have been occasionally applied, as in the passage of the Menai strait), embankments between retaining walls of stone, and walls to support the road along the face of a precipice, are frequently necessary. Some works of the latter character have excited much admiration. If the slope of a precipice be only six inches horizontal to a foot vertical, such a road may be formed by building a wall thirty feet high, based on steps cut into the rock, and cutting into the rock to the depth of ten feet on a level with the top of the wall, the space between which and the face of the precipice is filled in with earth or stone. By this means a platform twenty-five feet wide is obtained. Many works of this character have been executed by Telford and other engineers, in various parts of Scotland, in the Highland roads, and those forming the communication between Edinburgh and London; and others, the boldness of which commands universal admiration, occur in the great mountain-passes of the Simplon and Mont Cenis, which form imperishable monuments of the talent and energy of the engineers of Napoleon, by whom they were executed.

When the works are completed to the proper level for receiving the hard materials that form the surface of the road, the earth should be formed into the intended width and a nearly level surface, the footpath or paths being elevated a few inches above the bed of the carriage-way. Thirty feet is the ordinary width of the carriage-way, exclusive of footpaths, of the Holyhead road; but owing to the diminution of traffic since the opening of the London and Birmingham railway, a recent Report suggested the propriety of reducing the width, in most places, to twenty-four or twenty-five feet. This width may be more or less exceeded in the vicinity of large towns, according to the amount of traffic, but should be exactly adhered to in other situations, as uniformity in this particular greatly improves the appearance of a road, and also contributes to economy, both as to the land and materials, and the cost of maintenance. Some engineers recommend that the bed should be made convex, in the same degree as the finished surface of the road; but it is quite flat in the Holyhead road, by which means a greater depth of materials is allowed in the centre than at the sides of the road. Much has been said on the subject of the best form for the transverse section of a road. Formerly it was common to make it very convex, often to a degree that was highly dangerous, with the idea of throwing off water; but this notion is very fallacious, because if a road be allowed to wear into ruts, no degree of convexity that can be given is sufficient to keep it dry; while, if the surface be good, a very moderate slope is sufficient to carry off water, and a steep inclination will cause it to run with such velocity as to wear away the road materials. Another disadvantage of too great an inclination is, that, by throwing the weight of a carriage on one side, the vehicle itself is injured, and the overloaded wheels cut up the road more than necessary. Some have gone so far in opposition to this practice as to advocate perfectly flat or even concave roads, in favour of both of which much may be said; but the general practice of modern roadmakers is to make the surface slightly convex. In Telford's roads the convexity is such that the fall being half an inch at four feet from the sides, the fall being inches at nine

the metal by a pair of scales and a six-ounce weight; but a more usual test is an iron ring two inches and a half in diameter, attached to a handle, through which every stone should be small enough to pass. Some writers have recommended that one inch should be the maximum diameter, but it is only the hardest and toughest materials that will bear breaking so small without much waste. The pieces should be as nearly cubical as may be, and should on no account be broken on the surface of the road; nor is it well to do it on the heap, the best method being to break one or two pieces at once on a large block of hard stone, the pieces being held steady by the iron ring that serves as a gauge. A sitting posture is considered best for those engaged in breaking road-metal, an operation which, under the modern system of road-making, gives employment to a great number of hands. Attempts have been made to perform this operation by machinery, but mechanical contrivances have not been found equal to manual labour. Pronged shovels are made use of in lifting the broken stone into barrows and carts, as they save labour by entering the heap with less resistance than ordinary shovels, and also prevent the admixture of earth with the metal.

The depth of metal on a paved foundation should be not less than six inches, and it should be laid on in two or three distinct layers, carefully spread with broad shovels, and carriages should work on each till it is in some degree consolidated before another is laid over it. While the metalling is fresh, men should attend to rake in the ruts as fast as they are formed, and to pick off any large stones that may have previously escaped notice, as they are sure to work up to the surface. The sides of the road may be covered with the smaller portion of the metal, separated by a sieve with meshes of an inch square; and a layer of about an inch and a half of clean gravel is occasionally added over the whole surface in order to ease the draught while the road is new, though its effect on the road is rather injurious than otherwise, nothing being needed to bind the metal together. Rolling a road on which fresh materials have been laid is a measure of doubtful utility, the most effectual consolidation being produced by the working of carriages which are compelled to vary their tracks, and to run on the new metal, by placing wooden trestles across the road, and altering their position when necessary; the road is frequently raked as long as any loose stones remain.

Where the traffic is not sufficient to justify so expensive a mode of formation as that which has been described, good roads may be formed with broken stone only, increasing in thickness from six inches at the sides to twelve inches in the centre. If nothing better than gravel can be procured, Parnell recommends that a coat of four inches be laid on the prepared bed, and worked over till pretty firm; then a layer three inches thick, once screened, and finally three distinct layers of the gravel well riddled, and free from earth, clay, or stones exceeding an inch and a half diameter; the road, when completed, to be ten inches thick at the sides, and sixteen in the centre, where the strongest and best part of the gravel should be laid. The drainage must be particularly attended to in a gravel road. Among the inferior materials occasionally used is limestone burnt to a vitreous state; but, though formerly often used in districts where coal is abundant, it is not approved for carriage-ways by modern road-makers.

In completing a road it is necessary to form the side channels with care, and to provide against their being interfered with by branch or field roads. The footpath, which is usually about five feet wide, may be made of gravel or broken sandstone, and is required in the Holyhead-road specifications to be level with the centre of the road, which is six inches above the sides. For fencing, walls are preferred where stone is plentiful, as they occupy less space than hedges, and have a neat appearance. If the stone is of favourable shape, such walls may be built without mortar, except in the coping; but if on the side of an embankment, the walls should always be strongly built with mortar. A hedge-bank and ditch occupy a width of about eight feet in ordinary cases, and the young quicks are protected by post and rail fencing; but where timber is scarce, it is sometimes well to make the ditch and bank rather larger, so that the wooden railing may be dispensed with. In cuttings and some other situations a mound or bank without a hedge forms a convenient fence, and these, as well as hedge-banks, may be improved in appearance and durability by being swarded. All fences should be kept low, that they may not

exclude sun and wind; and for the same reason trees or buildings that overshadow the road should be removed when practicable. The situation of toll-gates must be regulated by circumstances, but it is very desirable to avoid placing them either on or at the bottom of a hill, an arrangement very liable to cause accidents. The gates, which, when single, may be fifteen feet, or, when double, without a centre-post, twenty-four to thirty feet wide, are usually painted white, that they may be readily seen at night. They should be well lighted, and supplied with comfortable toll-houses, which, on some of the modern roads, are erected in an ornamental style. Parnell advises the use of milestones of light-coloured stone, and of larger dimensions than usual; but cast-iron posts have been extensively used, and on some roads cast-iron tablets mounted on stone. A convenient arrangement is a stone or post with two tablets inclined towards the road, so that persons travelling in either direction see the distance of the town which they are approaching.

However well a metalled road may be made in the first instance, its preservation in a good state depends greatly on prompt and judicious repair. The mud that forms on the surface in wet weather should be scraped off and formed into heaps at the side (avoiding the side channels), until it is sufficiently dry for carting away; because, if left on the surface, it would while moist soften the road and cause it to break up, and after drying impede the running off of water from a subsequent shower. This operation has been usually performed by hand, but scraping-machines, patented by Messrs. Bourne and Harris, have been recently introduced with success, they being found to diminish the labour fully one-half. The winter season, from October to April, is considered the best time for the addition of fresh materials, which are laid on in thin coats, and should always be applied as soon as any hollow capable of retaining water is observed. For the purpose of keeping a supply of broken stone always at hand, depôts for holding about twenty-four cubic yards of metal are formed by the road-side, at intervals of a quarter of a mile or less, from which the stone is taken to the required spot in barrows. When laid on the road, according to Parnell, it is not necessary to pick up the old surface, as the new metal keeps the part under it wet and soft, and soon works in. Mc. Adam, however, recommends breaking up the surface of the road in every case where fresh stone is added.

*Stone and Iron Tramways.*—Though an improvement on ordinary pavement, this description of road may be considered as a link between metalled and paved roads, stone tracks having been occasionally applied to common roads, and with great benefit. Stone tramways consist of wheel-tracks formed of large blocks of stone, usually granite, the surface of which is made so smooth as to offer very little resistance to the rolling of the wheels, while the space between the tracks, being composed of broken stone, gravel, or rough pavement, affords secure footing for the horses. Iron tramways, in which cast or wrought iron plates are used instead of blocks of stone, have hitherto been very little used on ordinary roads, though their superior smoothness gives them a decided advantage, while their expense does not, as stated by Macneill, at all exceed that of granite. Iron tracks are sometimes made with a flat surface, but a slight concavity, as shown in the section of Woodhouse's rail in the article RAILWAY (p. 246), tends to keep the carriages more accurately in the right course, and is therefore an advantage when all the vehicles used on the tramway are nearly uniform in width. The granite blocks used for stone tramways are generally from three to six feet long, twelve to eighteen inches wide, and eight to twelve inches deep. Great care is necessary in bedding such large blocks, and the joints require nice adjustment. They are frequently laid end to end without any fitting into each other, but it has been proposed to dovetail the ends together, to insert a small stone as a dowel between two blocks, to use iron clamps, or to join the stones with oak tree-nails. The granite tracks used on some steep ascents in the Holyhead road are bedded on a pavement eight inches thick, packed and grouted, and a layer of three inches of broken stones not exceeding an inch and a half diameter; a thin stratum of gravel, well rolled, being placed last of all to receive the blocks. When they are laid, the centre and side spaces are filled up with ordinary road material to the level of the tracks; a row of common granite paving-stones, about six inches deep, five wide, and nine long, being laid along each side of the tracks to prevent loose materials working on to

them. Mr. Stevenson, in the 'Edinburgh Encyclopædia,' recommends the use of smaller stones, as being cheaper and less liable to injury from vibration than those of the usual size. The dimensions recommended by him are fourteen inches deep, eighteen inches wide at the base, twelve inches wide at the top, and six to nine inches long. The increased accuracy required in the numerous joints might probably counterbalance any advantage gained by the adoption of small stones.

The great saving of power effected by the use of tramways for ordinary carriages is shown by numerous experiments, some of which, tried on the granite tracks of the Commercial Road in London, proved that a well-made waggon will run with increasing velocity, by the force of gravity alone, down a mean slope of 1 in 155. On this road a loaded waggon weighing ten tons has been drawn with apparent ease by a single horse, up an ascent of 1 in 274, for a distance of about two miles. On an iron tramway laid in 1816 by the Forth and Clyde canal company at Port Dundas, near Glasgow, a horse has taken a load of three tons on a cart weighing nine cwt., up an acclivity of 1 in 15, without difficulty, though he could not proceed with it on a common causeway with an easy line of draught; and the carters agree that the horses take up three tons on the iron tracks as easily as they did twenty-four cwt. on the common causeway previously used.

In order to ascertain the comparative durability of different kinds of stone for tramways, and for paving generally, Mr. Walker tried some experiments on blocks laid in a toll gateway on the Commercial Road tramway, the results of which were as follows:—The blocks were eighteen inches wide and twelve deep, and were laid down in March, 1830; and the loss given in the table was ascertained after they had been in use seventeen months, in August, 1831.—

Description of Stone.	Loss of depth.	
	Absolute.	Comparative.

Dartmoor . . . . .	·207	3·2·5
Blue Aberdeen . . . . .	·225	3·571

Stone tramways have been adopted in many street pavements where a great traffic is carried on, particularly in some of the narrow streets in the city of London, with much advantage; but their application to acclivities on ordinary roads has hitherto been more limited than their merits deserve. By their judicious introduction on a few steep inclinations, many hilly roads might, at a small expense, be made nearly equal to level lines; and it is probable that such a measure would tend, in an important degree, to enable turnpike-roads to meet the formidable rivalry of railways. In his report to the Holyhead-road Commissioners in 1839, Mr. Macneill strongly recommends the application of stone or iron tracks to several hills, and states that an iron tramway laid down along the whole length of the road would reduce the expense of horse labour fully one half. 'If,' he writes, 'a tramway were constructed of iron plates, the whole way from London to Birmingham, a coach carrying sixteen passengers might be drawn at the rate of ten miles an hour with only two horses, and one horse would be able to draw a post-chaise more easily than two now can, so that the expense of travelling might be reduced one half, and a similar reduction might be made in the charges for carrying goods. The expense of forming such a railway would be about 2500*l.* a mile, making the whole expense from London to Birmingham 271,000*l.*' In addition to the immediate advantages of such an improvement, it would remove one of the greatest obstacles to the successful use of steam locomotives on common roads.

**Pavements.**—The formation of paved roads on correct principles appears to have been well understood by the Romans, whose pavements show great care in their essential features, — a good foundation and accurate fitting of the stones. Some of the modern imitations of the Roman system in the street-pavements of Italy show the like attention to these important points, the paving stones being set in mortar on a concrete foundation with a degree of accuracy that has led some writers to designate these roads

\* Herm is an island adjoining Jersey.  
† A whinstone from Northumberland. All the rest are granites.

*horizontal walls.* In some instances the blocks of stone used are of considerable depth; but they are often thin, and, being of large dimensions, have more the character of flag-stones than of ordinary paving-blocks. At Naples and Florence, stones two feet square and six inches thick, laid diagonally across the road, and neatly set in Pozzolano mortar, are used; the surface being chipped where declivities or turnings occur, to prevent the slipping of horses, which become very sure-footed from habit. Occasionally, as at Milan, different kinds of paving are laid for the wheel-tracks and horse-path, so as to produce the effect of a stone tramway. These pavements have been recommended as models for imitation in paving the streets of London: but the durability with which they are constructed would form a disadvantage in a place where the pavement has to be frequently disturbed for the purpose of laying down or repairing water and gas-pipes, or cleansing the sewers; and it is probable that pavements which answer well for the light vehicles and limited traffic of many of the continental cities, would be found quite inadequate to bear the number of heavy carriages traversing the principal thoroughfares of the metropolis; of which some idea may be formed from the fact that upwards of 11,000 vehicles were observed to pass along King William Street, near London Bridge, on the 12th of August, 1840, between the hours of eight A.M. and eight P.M., being at the rate of more than fifteen per minute for twelve hours.

Another description of paved road, the origin of which is commonly referred to the Romans, is the *chaussée*, or roughly-paved causeway used in the principal highways of France and some other parts of the Continent. This kind of road has been much recommended for its durability when well made, but, unless laid with a degree of care that would render it too expensive for general adoption, it causes a very unpleasant and fatiguing jolting. In such roads the pavement usually covers only a part of the breadth of the road, leaving the sides available for the use of light carriages in dry weather; and it has been suggested, that where the width of the roadway would allow, it might prove advantageous to form, in all great roads, a track of pavement or hard broken stone for winter use, and another of inferior materials for the summer, both to save the wear of the hard road and increase the comfort of passengers. Such an arrangement is convenient in the principal approaches to great towns, where it is considered best to have the pavement at the sides, that carters may walk either on or near the footpaths, and that foot-passengers may not be incommoded by the dirt of the metalled road.

In Holland, pavements of brick, which are also probably derived from the practice of Roman engineers, are extensively used, not only for footpaths, but also for the passage of light vehicles, which run on them with great facility. The bricks used for this purpose are thin, and well bedded in lime.

Common stone pavements are, by most writers, divided into two classes: *rubble* causeway, in which the stones are of irregular shape, and very imperfectly dressed with the hammer; and *aisler* causeway, which is formed of stones of larger size accurately squared and dressed. In both kinds the excellence of the pavement depends greatly on the firmness and evenness of the bed, and the careful fitting of the stones to each other, which may be accomplished with very irregular stones by judicious selection. If one stone be left a little higher or lower than those adjoining it, or if it become so in consequence of defective bedding, the jolting of carriages in passing over the defective place will quickly damage the pavement; the wheels acting like a rammer in driving the depressed stones deeper into the earth, while the derangement of the lateral support that each stone should receive from those adjoining it, occasions the dislocation of the pavement to a considerable distance, and the consequent working up of the earth through the disturbed joints. Defective joints form another fruitful source of injury and inconvenience both to the pavement itself and to the vehicles jolted over it. If, as is often the case in inferior pavements, the edges of two adjoining stones do not meet with accuracy, narrow wheels will have a tendency to slip into the joint, and by doing so, to wear the edges of the stones, till, as may be frequently seen, the surface of each stone is worn into a convex form that renders the footing of horses insecure, and causes the motion of vehicles drawn rapidly over them to consist of a series of bounds or leaps from one stone to another, accompanied by a degree of

lateral slipping highly injurious to the carriage, while the irregular percussion produced tends greatly to the destruction of the pavement.

In order to procure a firm foundation, and to prevent earth from working up between the stones, it is advisable in the first instance to form a good carriage-way of gravel or broken stone, and to allow it to be used by carriages till consolidated, before laying the pavement. This plan is stated by Edgeworth, in his 'Essay on the Construction of Roads and Carriages,' 1817, to have been practised successfully by Major Taylor, of the Paving-Board, in some pavements in Dublin, and it is strongly advocated by more recent road-makers. Where broken stone is laid to a considerable depth, it should, as in the case of metalled roads, be applied in thin layers, each being separately worked into a compact state. The new pavement laid a few years since in Fleet Street affords an illustration of the necessity of this precaution, as the stones were well shaped, laid, and grouted, and the earth was removed to the depth of from twelve to eighteen inches, its place being supplied by broken stone; but the broken stone, being thrown in by cart-loads, and merely levelled, was not united into a compact mass, and therefore very soon gave way, causing the pavement to sink into hollows. In streets of very great traffic, it is a good plan to lay a sub-pavement of old or inferior stones, bedded on broken stone, as a foundation for the surface pavement, a measure which has been practised with advantage in Paris. The bed of the pavement should be formed into a slight convexity, the slopes being about two inches in ten feet. A thin coat of gravel or sand laid immediately under the paving blocks is of use in filling up slight irregularities in their shape, and enabling them to form a compact bed.

For the paving stones hard rectangular blocks of granite are preferred, though whinstone, limestone, and even freestone, may be used. Guernsey granite, as shown by the table in a previous column, appears to be the most durable, but it is more liable to become inconveniently smooth than some stones of inferior hardness. The stones may vary, according to the traffic, from six to ten inches deep, six to eighteen inches long, and four to eighteen inches wide; but it is very essential that the depth of all the blocks in one piece of pavement should be alike, and that where the width is unequal, the stones be so sorted that all used in one course are uniform in this particular. The accurate dressing of the stones is a point often too little attended to; and an injudicious mode of forming contracts for paving, in which the payment has been by the square yard of paving laid, has, in connection with the effect of competition in bringing prices below the remunerating point, led to the use of stones in which the base is smaller than the upper surface, and which, when laid, scarcely come in contact with each other except at their upper edges. In some pavements the stones are made smaller at the top than the bottom, the joints being filled up with stone-chips, concrete, or an asphaltic composition; and in those of the more common construction the sides of the stones are occasionally hollowed, so as to receive a small quantity of gravel or mortar, which serves as a kind of dowelling. Ramming the stones with a heavy wooden rammer is a practice that has been much recommended, and it is considered that a more efficient application of the process, by means of a ramming-machine, or *portable monkey*, would remove some of the defects arising from imperfect bedding; but when the stones are well laid, and bedded in strong mortar, as the best recent pavements are, a few blows with a wooden maul of about fourteen pounds weight are sufficient to fix them firmly in their place. Grouting with lime-water poured all over the pavement facilitates the binding of the whole together, and fills up the joints, so as to effectually prevent the working up of the substratum. The blocks are commonly laid in rows across the road, the joints in each row being different from those of the adjoining ones; but pavements of superior smoothness have been laid in courses stretching diagonally across the street, by which means all the joints are passed over by carriages with greater ease. This arrangement is particularly desirable at the intersection of streets, as it diminishes the risk of horses slipping. Longitudinal courses are objectionable on account of the tendency of narrow wheels to enter the joints. In paving steep inclinations, it is well to use narrow stones, on account of the number of cross joints; or, if large stones be used, to cut deep furrows across their surface, to afford secure footing. A plan of paving for such situations, which has been found

very effectual, is represented in the annexed diagram, in

which the stones are so inclined as to present a series of steps. The chief objection to this plan seems to be the jolting caused to carriages, which produces so deafening a noise that, in a recent instance, such a pavement was taken up at the request of the inhabitants of the street. Many patents have been procured for plans of forming stone pavements in which the pressure of carriages might be simultaneously distributed over several stones, by various contrivances for dovetailing and otherwise fitting the stones together; but such plans are generally too complicated, requiring an accuracy of formation that would be very expensive, owing to the hardness of the stone. Thin blocks of stone, bedded in asphalt, have been tried, and appear to make a good pavement.

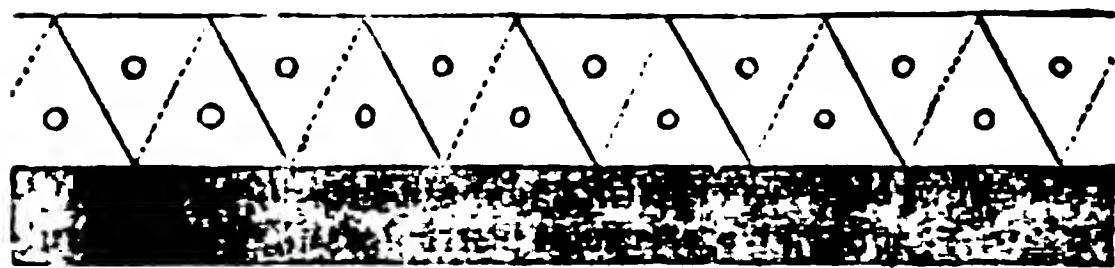

When completed, a thin coat of gravel spread over the surface is useful in diminishing the effect of the jolting of carriages on the new pavement. In case of taking up any part of a pavement to attend to water-pipes, &c., great care is necessary in relaying the part, in doing which it is well to apply some fresh broken stone to the bed, and to lay the paving stones without mortar, until the foundation is settled.

The serious defects of the common stone pavements have led to a variety of experiments on other methods of forming carriage-ways suitable for streets, of which the adoption of broken stone, or macadamised roads, has been the most general. Opinions differ widely as to the propriety of this measure, but an idea seems to be gaining ground that the comparative quietness of such a road, and its superior ease to passengers, are insufficient to counterbalance the increased draught of carriages, the dust of summer, the mud rapidly formed in wet weather, and the great expense of keeping in repair a metalled road when subjected to the constant wear of a busy town. The first cost of forming the broken-stone roads of Regent Street, Whitehall, and Palace Yard, extending to a total length of 2010 yards, and embracing 45,251 superficial square yards, was 6055*l.* 8*s.* 3*d.*, and the estimated value of the old pavement taken up and broken for the purpose was 6787*l.* 7*s.*, making a total of 12,842*l.* 15*s.* 3*d.*; and the cost of keeping them in repair for the year ending January 5, 1827, was 4003*l.* 18*s.* 4*d.*, besides 628*l.* 11*s.* for watering, making the total expense for the year 4632*l.* 9*s.* 4*d.*, or rather more than two shillings per superficial yard.

The enormous expense of maintaining some of the metalled roads in London has recently led to much attention being given to the construction of superior pavements, and various plans of paving with wood have been tried, with great promise of success. A very coarse kind of wooden road, consisting of rough logs laid close together across the track, is much used in North America, under the name of *corduroy roads*, but the wooden pavement, properly so called, seems to have been first used in Russia, and tried on a limited scale at Vienna, New York, and some other places within a few years. One of the earliest kinds used consists of blocks of fir or other wood cut into hexagonal cylinders, of six or eight inches diameter, and from eight to twelve or fifteen inches deep, and placed close together, with the grain vertically. The blocks are sometimes tarred, or may be kyanised; but even where no such precaution is used, the wear is very trifling, as the swelling of the wood from moisture makes the joints very tight and impervious to water. Such a pavement is very smooth when first laid, but, unless the foundation be very carefully prepared, it is liable to sink into hollows like the common stone pavement, owing to the want of cohesion between the individual blocks, a deficiency which it has been proposed to remedy by pegging or dowelling the pieces together, though their form is not very suitable for the purpose. Some specimens have been laid on a flooring of planks, to avoid this inconvenience. Of the numerous other plans proposed, but one has yet been tried on an extensive scale, and it appears likely, in point of smoothness, quietness, cleanliness, and

use of draught, to prove the best of metropolitan pavements. In it the blocks are sawn into a rhomboidal shape, the upper surface forming an angle of about  $63^\circ$  with the direction of the grain, by which the durability of an end section is in a great degree preserved, while the inclination of the sides causes each block to receive support from those adjoining it, and affords facilities for pinning the whole pavement together by pegs. The following diagram may serve to illustrate this ingenious arrangement, which is the invention of the Comte de Lisle.

The solid lines represent part of one course or transverse row of blocks, which all incline in one direction, each block having on one side two projecting pegs, and on the other two holes. The adjoining course is laid in like manner, but sloping in the opposite direction, as indicated by the dotted lines, by which disposition the two pegs on one side of a block enter two distinct blocks in the adjoining row, while the holes on the other side receive in like manner the pegs of two other blocks; so that each block is pinned to four others, besides receiving support from the adjoining blocks of its own course. Where this principle of construction is fully carried out, the whole pavement of a street becomes, as it were, one mass, being so pinned together that no block could be raised without breaking the dowels; but as it is necessary sometimes to disturb the pavement in order to get at the gas and water pipes, some specimens have been laid down in masses of twenty-four or thirty-six blocks, so united by iron clamps that the blocks thus connected together may be laid down and taken up, when necessary, at once. The pavement laid down on this plan in Oxford Street is all pinned together in the manner first described, and consists of blocks six inches deep laid on a well-formed concrete foundation.

As far as a judgment can be formed at present, wood pavements appear likely to prove exceedingly durable; and it is stated by Mr. Finlayson, who in 1825 suggested the adoption of wood for paving the streets of London, that a few blocks of wood placed vertically in a granite pavement were less reduced by twenty-five years' wear than the stone itself. The principal disadvantage of wood appears to be its becoming slippery in wet weather, to obviate which, in some instances, the upper edges of the hexagonal blocks have been bevelled, so as to form zigzag grooves when laid down; but the most effectual plan seems to be to cut straight grooves along the centre of each block, by which the stability of the joints is not at all affected.

Another description of road that has lately attracted much attention is that consisting of an asphaltic composition. Many attempts have been made to form roads of gravel and other materials united by animal oleaginous or gelatinous substances, or coal-tar, into a kind of concrete; but such attempts have seldom proved successful on a large scale. Mineral substances of similar character have been found more advantageous, and the native asphaltic procured near Seyssel, in the department of l'Ain, and some other places, has been found to produce, when mixed with a small portion of native bitumen, a substance admirably adapted for the formation of smooth roads, and a variety of other important purposes. Its application to carriage-ways has been in this country chiefly confined to court-yards, for which, as well as for terraces and footpaths, it is very suitable. The asphaltic mastic of Seyssel, as prepared for use, consists of ninety-three parts of native asphaltic reduced to powder, and seven parts of bitumen; the two being melted together, and a little fine gravel or sand stirred in with the mixture. The composition is ready for use when it simmers with a consistency similar to that of treacle, and it is spread while hot so as to form a coating about an inch thick upon a levelled foundation of concrete. The thickness of the asphaltic is regulated by slips of wood or iron, which are often so disposed as to divide the pavement into ornamental compartments, the asphaltic being made of various colours by the admixture of different kinds of sand or other substances. Where the ornamental character of the pavement forms a distinguishing feature, beautiful imitations of mosaic work

may be executed with asphaltic. The genuine asphaltic possesses a degree of elasticity that renders it exceedingly durable; but artificial compounds in imitation of it generally require too much bitumen, and are injuriously affected by great changes of temperature. Some experiments have been made, but, as far as the writer is aware, with very indifferent success, on the formation of carriage-ways with large blocks of asphaltic composition containing a considerable quantity of gravel or broken stone.

Foot-pavements of flagstones require very little remark. The curb-stones should be very hard, and firmly set in cement on a bed of gravel. They usually rise about six inches above the surface of the carriage-way, which may be made to abut immediately upon them, without the intervention of a gutter. Where gutters are introduced, those of cast-iron are to be preferred. The flagstones, which should never be less than two inches and a half thick, are commonly bedded in mortar on a layer of gravel; but sometimes, when there are no cellars underneath, are laid dry. The appearance of many of the new streets of London is greatly improved by the use of flagstones of extraordinary dimensions, extending the whole width of the pavement; and a similar appearance at much less cost may be obtained by the use of asphaltic. A slight degree of slope should be given to the pavement, to conduct water to the gutters, for which purpose a fall of one inch in ten feet is sufficient, while a steep inclination is objectionable from its danger in slippery weather.

Among the substitutes for common flagstones that have been recommended, may be mentioned slate, which appears to be very durable. Some pavements or floors of this material have been laid at the London Docks, where, among other advantages, it is found preferable to wood in point of cleanliness. Trackways of slate two inches thick are found strong enough to bear waggons or carts with four or five tons of goods; and some are laid of only half that thickness on an old wooden floor.

(A 'Treatise on Roads,' &c., by Sir Henry Parnell, of which a second edition was published in 1838, may be consulted with advantage by those desirous of obtaining further information on the theory and practice of road-making. The works of Mr. Adam, Edgeworth, and several others; and the various Parliamentary Reports relating to roads from the commencement of the present century, as well as those of the Holyhead-road Commissioners, also contain much valuable matter on this subject.)

It may be interesting to add a concise statement of the extent of turnpike and other roads in each of the counties of England and Wales, condensed from the Appendix to the 'Report of the Commissioners for inquiring into the State of the Roads in England and Wales,' 1840. Owing to the difficulty of obtaining complete returns from some districts, the statement can only be received as an approximation to accuracy; and this circumstance, combined with some difference in the kinds of road embraced in the returns of different years, must account for some discrepancies. The returns being given for two periods, with an interval of about twenty-five years, afford data for calculating the extension of the roads in each county; and the addition of a column, stating the area of the county in square miles, tends to show the proportion borne by the extent of the highways to that of the district. The columns giving the mileage for 1812-13-14 show the average of the returns for those years, a circumstance which must account for a want of agreement between the items and the totals. It must be observed also that paved streets are embraced with turnpikes in this statement, and not in that for 1839.

From the same document it appears that the average cost of maintaining the turnpike-roads, amounting to about 22,000 miles, has been, for the last five years, 959,544. per annum, or 45. per mile per annum, including the estimated value of the statute duty performed on them. Of this sum about 36. per mile has been expended on mere repairs and 9. per mile on improvements. The money expended on management is about 129,124. annually, being nearly 6. per mile, and raising the total annual expense to nearly 51. per mile. The number of trusts is about 1116, averaging 19 miles, 5 furlongs, 28 poles, and 1 yard each; the number of gates and side-bars about 7796, and of surveyors 1300. Of the parish highways, extending rather more than 104,770 miles, the average annual cost of maintenance, by highway rates, is about 117. 3s. per mile; and the number of parochial surveyors or waywardens about 20,000.

Table showing the number of miles of turnpike roads and other highways in England and Wales:—

ROANNE, a town in France, capital of an arrondissement in the department of Loire, 238 miles south-south-east from Paris by the road through Fontainebleau, Montargis, Nevers, and Moulins.

It is mentioned by Ptolemy, and in the Peutinger Table; its Latin name appears to have been variously written Rodumna and Roidumna; it belonged to the Segusiani. In the middle ages it gave name to a district, Roannais, but had sunk into insignificance at the beginning of the last century, from which commerce has since revived it.

The town stands in a tolerably fertile district on the left or west bank of the Loire, which here begins to be navigable up and down the stream; boats can descend from St. Rambert, more than 40 miles above Roanne, but they cannot ascend. The town has never been walled; the houses extend in every direction into the country, becoming less crowded as they diverge, and as they are not very lofty the place presents the aspect of a large village rather than of a town. The interior is well laid out, with wide and straight streets and well-built houses. Several of the genteel families of the surrounding district have fixed their residence at Roanne. There is a fine wooden bridge over the Loire, and a good quay along the river. The church is a very inferior building, but the college is handsome; and there are good inns, a fine hospital, a handsome theatre, and public baths.

The population, in 1831, was 8890 for the town, or 9260 for the whole commune; in 1836 it was 9910 for the commune. There are manufactures of woollen, cotton, and linen yarn or thread, woollen cloths, muslins, calicos, and other cottons, leather, glue, and earthenware; there are some dye-houses. The trade is considerable, being carried on not only by the Loire, but by the lateral canal to that river, which extends from Roanne to Digoin; it comprehends the manufactured goods of Lyon, which are sent here on their way to Paris, the coals of the coal field of St. Etienne, the wines and other produce of the neighbourhood and of other parts of the south of France, and the imports from the Levant. Some of the wines grown round the town are of fair quality, but the greater part are ordinary. Many boats are built here for carrying on this traffic.

The town has a college or high school, with a cabinet of natural philosophy attached to it, a public library, a subordinate court of justice, and some fiscal government offices.

The arrondissement has an area of 688 square miles, and comprehends 108 communes; it is divided into ten cantons or districts, each under a justice of the peace. The population, in 1831, was 121,817; in 1836 it was 124,871.

ROBBERY is theft aggravated by the circumstance of the property stolen being taken from the person, or whilst it is under the protection of the person, of the owner or other lawful possessor, either by violence or putting in fear. This offence appears to have been formerly confined to cases of actual violence to the person, but in later times it has been extended to constructive violence by putting in fear, and not only to cases where property has been taken or delivered under a threat of bodily violence to the party robbed or to some other person, but also where the fear has resulted from apprehension of violence to his habitation or to his property, or where it has been occasioned by threats of accusing the party of the commission of an infamous crime.

Robbery was formerly regarded not as an aggravation of the crime of theft, but as a distinct and substantial crime. Latterly however robbery has been treated as an aggravation of theft, and it has been held that if, upon the trial of an indictment for larceny, it appear that the taking

Respecting the roads of Scotland and Ireland there do not appear to be published data for an equally minute statement. The following account of the number of miles of turnpike roads in each county in Scotland, given on the authority of a paper presented to a Committee of the House of Lords in 1833, shows their total length to be 3666 miles, which, divided by 190 the number of trusts, indicates the

amounted to a robbery, the party may nevertheless be convicted of the larceny charged.

The stealing is said to be by violence when it is effected by doing any injury, however slight, to the person of the party robbed, or when the act of taking is accompanied by any degree of force for the purpose of overcoming resistance. A snatching or taking of property suddenly or unawares from the person without some actual injury to the person does not amount to robbery. If violence be used, it is sufficient to constitute robbery, although resorted to under the colour of executing legal process or of the exercise of some other lawful authority. It is not essential to the offence of robbery that the violence should have been at first used for the purpose of obtaining the property, provided the violence be unlawful and the property is yielded up, or permitted to be taken, in order to prevent further violence.

Stealing is considered to be effected by threat of violence to the person, when possession of the thing stolen is obtained by any threat, menace, or other act calculated to excite fear or apprehension of violence, present or future, to the person of the party threatened or of any other party in whose welfare the party to whom the threat is addressed may feel interested. It is immaterial whether the threat, &c. be direct or indirect, or whether conveyed by words, gestures, or signs, or whether made under pretence of lawful claim or of acting under legal process or other lawful authority, or of asking charity, or of making a purchase, or under any other pretence. The existence of actual fear in the mind of the party robbed is not material, provided the act of stealing be accompanied by such threats or other acts as are calculated to create the expectation that force will be used in case of resistance. Where no actual violence is employed, and the threats, &c. used do not create any apprehension of violence or expectation that force will be resorted to in case of resistance, or if such apprehension or expectation has ceased to exist at the time when the property is taken, the offence of robbery is not committed. If property be taken by violence or by threats, &c., it is robbery, although the owner may have voluntarily exposed himself to the attack for the purpose of apprehending the offender. (*Fourth Report of Commissioners on Criminal Law.*)

At common law, robbery was a felony punishable by death, without regard to the quantity or value of the property stolen. The offender however was entitled to benefit of clergy [BENEFIT OF CLERGY], until this advantage was taken away in cases of robbery, under different circumstances of aggravation, by several statutes.

The offender was liable to be punished at the suit of the king after a trial upon an indictment, and, in certain cases, when taken in the very act, upon a trial without indictment. The party robbed also was entitled to bring his criminal action or appeal [APPEAL] against the robber, for the purpose as well of punishing the offender as of obtaining restitution of the property stolen. If the appellee waged battle, the combat took place between the appellor and appellee in person, as no champions were allowed in appeals of robbery. Though the appellor was always bound to offer to prove the offence charged by his body, the appellee was not obliged to accept that mode of trial. Thus in the Pleas of gaol delivery at Shrewsbury, in October, 1224, we find this entry, 'Robert de Haddelég appeals Rogor de Hyberna, for that whereas on the day of St. James the apostle he was coming through Trumpeleg between Bruges (Bridgnorth) and Worcester, came the said Rogor and took him and bound him, and wickedly and in robbery, and against the king's peace, took from him 15 $\frac{1}{2}$ l of bread. And Rogor denies (defendit) the felony and robbery, and says that he did nothing against the king's peace, and he puts himself upon the township of Shrewsbury, where he resided two years, and upon the town of Bruges, and upon lawful men near Trumpeleg, for good and evil. And 16 men of Shrewsbury and 6 of Bruges with the men of the neighbourhood say upon their oath that they do not mistrust him of (non male credunt ei) of that robbery. Therefore let him be delivered; and let him go out of the lands of the lord the king unless he can find pledges. And he could not find them. Therefore let him go out. And he chose the port of Dover.' (*Placitorum Abbreviatio*, 104, b.)

The party robbed may without any formality retake his goods wherever he can find them, unless they have been waived or thrown away by the robber during his flight, or seized by the officer of the king or of the lord of the franchise, or sold in open market. [MARKET, p. 423.] But after

such waiver, seizure, or sale, the owner cannot retake them of his own authority. Where there has been no improper neglect to prosecute, the party will in general be entitled to his writ of restitution. This at common law could be obtained only upon the successful prosecution of a writ of appeal. But by 21 Hen. VIII., c. 11, the court before which a party is convicted of robbery or of larceny upon an indictment, is authorised to award writs of restitution for the money, goods, or chattels stolen, in like manner as though the felon or felons were attainted at the suit of the party in an appeal. Restitution of stolen goods, whether taken by robbery or by larceny, is now regulated by 7th and 8th Geo. IV., cap. 29, sect. 57. [RESTITUTION.] The party robbed cannot sue for the goods stolen or their value against the robber or any person who may have acquired the goods stolen from the robber, unless he has done all in his power to bring the offender to justice.

By the statute of Winton, passed in 1284, the inhabitants of hundreds in which robberies take place are made answerable for the value of the property stolen, if they have not taken the offenders within a certain time after the offence.

To entitle the party to this remedy he must, in his action against the hundred, show that he was robbed in the daytime or while there was sufficient light to distinguish a man's countenance, that he was robbed openly, as on the highway, or in a lane or wood, or some other open place, and not in a dwelling-house, which a man is expected to defend at his own peril, that he was robbed in the hundred named in the declaration, but whether in the vill or parish named, or in some other vill or parish, is not material, and, if robbed on a Sunday, that he was not travelling at the time. The statute passed in the reign of Char. II. for the better observance of that day having expressly enacted 'that if any person who shall travel on the Lord's day shall be then robbed, the hundred shall not be answerable for the robbery so committed.' The plaintiff is also bound to show that he has given certain notices, and has submitted himself to examination before a justice of the peace, as required by different statutes. (2 Saunders's *Reports*, 374; 4 Mann. and Ryl. 130; 9 Barn. and Cress., 134.) And by 22 Geo. II., c. 24, the hundred is not to be liable beyond 200l., unless the person or persons robbed shall at the time of the robbery be together in company, and be in number two at the least, to attest the truth of the robbery.

Under 7 Wm. IV. and 1 Vict., c. 87, s. 5-10, robbery is punishable by transportation for life or for any term of years not less than seven, or by imprisonment for any term not exceeding three years, and for any period of solitary confinement during such imprisonment not exceeding one month at a time, or three months in the space of one year, at the discretion of the court or judge, by or before whom the offender may be tried; but by sect. 4, where the robbery is effected by threatening to accuse the party of a infamous crime, the period of transportation is for life or for a term not less than 15 years. By the same statute, sect. 6, assaulting with intent to rob, and, by sect. 7, demanding any property of any person by menaces or by force, is made felony punishable by imprisonment not exceeding three years.

By the same statute, sect. 2, the punishment of death is imposed upon the offence of robbing any person, and at the time of or immediately after such robbery stabbing, cutting, or wounding any person.

Upon an indictment for robbery, as well as for any other felony which includes an assault upon the person, the jury are authorised by 7 Wm. IV. and 1 Vict., c. 85, sec. 11, to acquit of the felony, and to find a verdict of guilty of assault against the party indicted, if the evidence will warrant such finding; for which assault the party may be sentenced to imprisonment for any term not exceeding three years.

ROBBERY, in the Roman law, was called *Rapina*, and the remedy of the injured person was the *actio vi bonorum raptorum* against the robber, which was given by the *edictum*. Robbery was, in fact, a species of *Furtum*; for the definition of *furtum* was, 'a fraudulent carrying-off (contractus) of a moveable thing against the owner's consent.' The word 'fraudulent' comprehended the notion of a person carrying off the thing for the purpose of making it his own. *Rapina* only differed from *Furtum* in being effected by force.

*Furtum* was committed in various ways, besides by taking another person's property. A debtor committed *furtum*, if he fraudulently carried off a thing which he had pledged

to his creditor. It was *furtum* to use a thing that had been lent, for a different purpose from that for which it had been lent. *Furtum* was either *manifestum* or *nec manifestum*. It was *furtum manifestum* beyond all doubt when the thief was caught in the act; but there was a difference of opinion as to whether it was *furtum manifestum* or *nec manifestum* in a variety of cases. According to some writers, it was *furtum manifestum* if the thief was taken with the thing before he had reached the place to which he intended to carry it. *Furtum* which was not *manifestum* was *nec manifestum*. The Twelve Tables made the punishment of *furtum manifestum* a capital offence, that is, an offence the penalty for which affected a person's caput or status. The edict changed this into an *actio quadrupli*. The remedy in the case of *furtum nec manifestum*, which the Twelve Tables gave, was an *actio dupli*, which the edict retained. All persons could have the *actio furti* who had an interest in the preservation of the stolen thing; consequently others besides the owner might bring the action, a bailee for instance: and sometimes the owner could not bring it, as in the case of bailment, provided the bailee was a responsible person. If he was a responsible person, he was bound to make good the loss to the owner, and consequently could bring the action, and the owner could not. Condemnation in an *actio furti* was followed by *infamia*.

The owner of the thing might also bring his action for the recovery of the thing itself or its value.

The law of the Twelve Tables permitted a person to kill a thief who was detected in the act of theft in the night; and a thief might be killed in the day-time, if he defended himself with any weapon (*telum*). But the severity of the old civil law was gradually mitigated by the edict, and the offence of theft was, as already observed, only punishable by an action of *furtum*, and the consequent pecuniary penalties.

The *actio vi bonorum raptorum* originated in the civil wars of the later republican period, and its object was not so much to repress robbery as all acts of violence committed by bands of armed men. Accordingly its terms comprehended those who carried off any thing (*quid rapuerint*), or committed any damage to property (*damnum*) in armed bodies (*armati coactique*). It appears that under the empire, when order was established, the provision against armed men was not wanted, and the word *armati* seems to have been dropped from the edict. Still the edict was directed against *assemblages* of men, and it became of comparatively little use in the peaceful times of the empire. Accordingly the jurists were led to make the discovery that the edict applied to individuals as well as to bodies of men, and thus ultimately an action might be maintained under the edict against a single person who committed *damnum* or *rapina*. Finally, *damnum*, against which the edict was originally mainly directed, disappeared from the edict, as we observe in the Institutes and the Code, and the action was reduced simply to an *actio vi bonorum raptorum*.

The Roman law of *furtum* is stated in Gaius, iii. 183-209. The following references will be useful: *Dig.*, 47. tit. 2: *Inst.*, 4, tit. 1; Savigny, *Zeitschrift*, &c., vol. v.; *Ueber Cicero pro Tullio*, &c.; Dirksen, *Uebersicht der Zwölf Tafeln Fragmente*.

ROBERT I. of Normandie. [NORMANDIE.]

ROBERT II. of Normandie. [NORMANDIE.]

ROBERT, king of France, was elected king on the death of his brother Eudes, by that party of the French who rejected the claims of Charles le Simple. [CHARLES III.] He was recognised as king in an assembly of his partizans, held at Soissons (A.D. 922), and consecrated in the church of St. Remi, at Reims, by the archbishop of Sens. He fell in battle against his competitor Charles le Simple, near Soissons, 15th of June, 923, having reigned scarcely a year. He was grandfather to Hugues Capet, founder of the third or Capetian race of French kings.

ROBERT, king of France, surnamed *le Sage* (the wise), and *le Dévot* (the devout), was son of Hugues Capet, whom he succeeded on the throne, A.D. 996. He was born about A.D. 970, and had been twice crowned in the lifetime of his father; at Orléans, A.D. 988, and at Reims, A.D. 991. The character of Robert was devoid of shining qualities, but he was a prince of upright and peaceable disposition. Early in his reign France was afflicted by a scarcity of four years continuance, arising from the failure of the harvests, and the scarcity was followed by a pestilence, which again appeared in 1010, and a third time in 1030-33. These calamities are said to have reduced the population of France a third.

Robert was early embroiled with the church; he had married (A.D. 995) Berthe or Bertha, widow of Eudes, count of Blois, but there were some difficulties as to the lawfulness of the marriage, for which Pope Gregory V. refused a dispensation, and declared the marriage void. The king refused obedience, in consequence of which he was excommunicated; and it is said that under this terrible sentence his palace was deserted by all except two menials, who after every meal purified by fire the utensils employed at the royal table. Robert at length yielded; he put away Bertha (A.D. 998), and married Constance, daughter of the count of Toulouse, an imperious and vindictive woman, but one of the greatest beauties of her time. Robert and Constance may be compared in point of character to Henry VI. of England and his consort Margaret of Anjou.

In A.D. 1002, Robert engaged in a war to secure the succession of the duchy of Bourgogne, of which he was lawful heir; and, being supported by Richard, duke of Normandie, succeeded, after a struggle of thirteen years (A.D. 1002-15), in gaining possession of it. He bestowed it on his son Henry. In A.D. 1006 he marched to the assistance of the count of Flanders, one of his great vassals, attacked by the emperor Henry II., who was obliged to retire. Peace was concluded next year between the two princes.

Robert possessed a taste for music, and, prompted by this, as well as his devotional temper, frequently led the choir of St. Denis, and composed hymns for monastic use. He is charged with lavishing his treasure upon mendicants, conniving at thefts from his own person, and truckling to the fierce and cruel temper of his queen, who presumed so far on his tameness as to procure his favourite, Hugues de Beauvais, to be murdered in his presence.

Robert visited all the shrines in France, and went to Rome (A.D. 1019) to visit the tombs of the Apostles; perhaps also, as some have supposed, with the view of inducing the pope to annul his marriage with Constance, and to sanction his reunion with his first wife, Bertha.

He persecuted the Jews, and procured, in a council held, A.D. 1022, at Orléans, the condemnation of some priests charged with heresy, which was described as 'Gnosticism,' or 'Manicheism,' but the true character of which it is not easy now to ascertain. They were brought to the stake at Orléans, and Constance, with characteristic ferocity, struck out the eye of one of the sufferers, formerly her own confessor, as he passed her in the way to execution.

However Robert may have been led astray by the superstitious and persecuting spirit of the age, his moderation and love of peace were exemplary. He mediated between the duke of Normandie and the count of Chartres, who were engaged in hostilities, and obtained the confidence of the emperor Henry II., who visited him in his camp (A.D. 1023). On the death of this emperor, he refused, both for himself and his son, the crown of Italy, which was offered him by the malcontents of that country.

His eldest son, Hugues, to whom he had given the title of king (A.D. 1022), provoked by the cruelty of his mother, broke out into rebellion, but being taken and delivered up to the king, was pardoned. He died however soon after (A.D. 1026). Henry, his next son, was then associated with him in the royal title, in spite of the endeavours of Constance, who espoused the interest of Robert, the third son. Robert took up arms against his father, but his rebellion was suppressed. Shortly after quiet was restored King Robert died, at Melun (A.D. 1031), sincerely regretted, as it appears, by his subjects. 'While Robert was king,' said they, 'while he governed us, we have lived in security and have feared nobody.' He was buried at St. Denis.

ROBERT I., king of Scotland. [BRUCE, ROBERT; BANNOCKBURN.]

ROBERT II., king of Scotland, the first of the House of Stewart who reigned in that country, was born 2nd of March, 1316, and was the only child of Walter, the Stewart of Scotland, and his wife Marjory, daughter of King Robert Bruce, to whom he had been married the preceding year. All that is known of the House of Stewart previous to this date is, that a Walter, son of Alan, was Stewart or *Dupisfer* of Scotland in the reigns of David I. and Malcolm IV.; that he was succeeded in that high office by his son Alan; this Alan by his son Walter; Walter by his son Alexander, who was one of the regents appointed during the minority of Alexander III., and who, in 1263, commanded the Scottish army at the battle of Largs; Alexander, by his son James, who was regent after the death of Alexander III.

and died in 1309 at the age of sixty-six; and he, by his son Walter, the father of Robert II. This Walter was one of the commanders of the Scottish army at the battle of Bannockburn; and early in the following year, 1315, Bruce gave him in marriage his daughter and then only child Marjory, upon whom, provided she should marry with the consent of her father, or, after his death, with the consent of the majority of the community (or states) of the kingdom, the crown had been settled, failing the heirs male of her father and of his brother Edward, in a parliament held at Ayr on the 26th of April in that same year. Robert was the only issue of this marriage. Lord Hailes (*Annals of Scotland*, vol. ii., Appendix i.) has sufficiently refuted the tradition that Marjory was killed by being thrown from her horse when big with child, and that Robert was brought into the world by the Cæsarean operation; but it appears that she died either in giving birth to the infant or soon after her delivery. Her husband died 9th April, 1326, after having had another son, Sir John Stewart of Railstone, by a second marriage with a sister of Graham of Abercorn.

Bruce was succeeded by his son David II., born of a second marriage, 5th March, 1324; and his unfortunate reign—marked by a long minority and a succession of regencies, during which the kingdom was overrun by Edward Balliol and his ally Edward III., and David was obliged to make his escape to France, and after that by the defeat of Neville's Cross, when David was taken prisoner by the English—fills up the interval from 1329 to 1371. Robert, the Stewart, acted a principal part throughout this reign, and was as much distinguished by his personal merits and conduct as by his high rank. While yet only a youth of sixteen, he commanded the second division of the Scottish army at the decisive battle of Halidon, fought, and lost by the Scots, 19th July, 1333; and after that fatal day he was one of the first to uplift again the standard of the national independence. In 1334, he and the earl of Moray assumed the regency of the kingdom, and, although not formally invested with the government by any assembly of the states, were recognised by the people as entitled, in the infancy and exile of the king, to wield all the authority of the crown. Fordun's description of the Stewart at this time, as Lord Hailes translates the passage, is as follows:—'He was a comely youth, tall and robust, modest, liberal, gay, and courteous; and, for the innate sweetness of his disposition, generally beloved by true-hearted Scotsmen.' In a subsequent passage however he hints that his conduct as yet was not always regulated by absolute wisdom,—'qui tunc non magna regebatur sapientia.' On the earl of Moray being taken prisoner by the English the following year, the Stewart, in concert with the earl of Athol, concluded with Edward III., on the 18th of August, 1335, the treaty of Perth, which was in fact a submission, though upon honourable conditions, to the English king. After this we hear no more of the Stewart till 1338, when, upon the death of the regent, Sir Andrew Moray, we find him again appointed to that supreme office. His resumption of the government was soon followed by the expulsion of the English from all their strongholds to the north of the Forth, and his regency was terminated by the return of the king, on the 4th of May, 1341. In 1346, after the capture of the king at the battle of Neville's Cross, where he commanded the left wing of the Scottish army, in conjunction with the earl of March, the Stewart was again elected regent, or 'locum tenens serenissimi principis David,' &c., and he held this post till the release of David, in 1357, governing the country, it is affirmed, with remarkable prudence and ability in the difficult circumstances in which he was placed. In 1359 the earldom of Strathearn was conferred upon him by the king. When David, in 1363, astonished the nation by proposing to a parliament, held at Scone, that in the event of his dying without issue, Lionel, duke of Clarence, son of Edward III., should be chosen king, the Stewart, whose interests, as well as his patriotic prejudices, this project so nearly touched, was one of the foremost of those who adopted instant measures to defeat it. He entered into an association with the earls of March and Douglas, and with his own sons, and he even appears to have taken up arms with the avowed determination of driving the king from the throne, if he persisted in his purpose. David however found means, without making any formal concession, to put down this threatened resistance; and, upon a general amnesty being granted, the Stewart, on the 14th of May, 1363, renewed his oath of fealty, and entered into a bond to abstain from all such con-

federacies in time coming, on pain of forfeiting for ever all right and title to the crown, as well as to his private inheritances. Soon after this David, who had lost his first wife, Joanna, a daughter of Edward II., in the preceding year, contracted a second marriage with Margaret Logan; but she also bore him no children; indeed he had separated from her some time before his death, which took place on the 22nd of February, 1371.

Upon this event the states of the kingdom immediately assembled at Linlithgow; and after a slight opposition on the part of the earl of Douglas, who conceived that he had himself a claim to the vacant dignity, as representing the families both of Comyn and Balliol, the Stewart was unanimously declared king, by the title of Robert II. He was crowned at Scone, on the 26th of March, and next day, according to custom, received the homage of the bishops and barons, seated on the moot-hill there.

Robert II., when he thus succeeded to the throne, was somewhat peculiarly situated in regard to his domestic relations; and the point demands particular notice, inasmuch as a controversy has thence arisen on the question of the legitimacy of the Stuarts, which continued to be agitated, both among antiquaries and political writers, down to the middle of the last century. His first wife was Elizabeth, daughter of Sir Adam Mure, of Rowallan; but the family he had by her, consisting of four sons and six daughters, had all been born before their marriage. In ordinary circumstances a subsequent marriage might probably, in Scotland, even at this early date, have legitimized these children, at least in the eye of the church, although their right of civil succession, and especially of succession to the crown, might not have been in that way so certainly established, but there was a very awkward speciality in the present case. Robert and Elizabeth Mure had been living not only in concubinage, but in what the church considered incest, for they were related, it seems, in the fourth degree. Nay, to make matters worse, the Stewart, before his acquaintance with Elizabeth Mure, had been connected in the same way with Isabella Boutelier, who was related to her in the third degree; and this, according to the canonical doctrine, placed him in a relationship by affinity of the same, that is, of the third degree, to Elizabeth Mure. His marriage in any circumstances therefore with that lady, would have demanded a papal dispensation; but it was far from being universally admitted that even the authority of the pope could establish the legitimacy of children born in a connection which thus openly violated and set at defiance what was believed to be the divine law. It is obvious that a dispensation to persons within the prohibited degrees to marry is an exercise of prerogative on the part of the head of the church much inferior to the legitimization of the children already produced from an incestuous connection. So strongly in the present case does this appear to have been felt, that the pope's dispensation actually proceeds upon the monstrous supposition that Robert and his wife Elizabeth Mure, long as they had lived together, had been all the while ignorant of their relationship, and on that manifestly fictitious ground alone does his holiness profess to sanction their marriage, and to pronounce the legitimacy of their children. But the dispensation by no means satisfied the popular feeling of the time; and there is reason to believe that the supposed defect in the right of the reigning family materially contributed in exciting and sustaining some of the most formidable of the insurrectionary attempts which convulsed the Scottish kingdom in the course of the succeeding century. Robert, after the death of Elizabeth Mure, had married Euphemia Ross, a daughter of the earl of Ross, by whom he had two more sons and four daughters, also all born when he came to the crown. Thus circumstanced, in 1371, immediately after his accession, he got the states to pass an act recognising John, earl of Carrick, his eldest son by Elizabeth Mure, as his successor; and, still better to secure the rights of his first family, he procured, in 1373, another act expressly entailing the crown upon his heirs male of both families, and after them upon *his heirs whatsoever*. It is obvious that, whatever might be the force of this parliamentary settlement in securing the crown to Robert's heirs male by the sons of Elizabeth Mure, who were named in it, as soon as such heirs failed, the question would legally arise, who were his heirs whatsoever, or general? and if the papal legitimization of the first family should be set aside, then his heir whatsoever would have to be looked for among the descendants of one of his sons. — Writers by Euphe-

main Ross. Now, it so happened that such was the case on the death of James V., leaving only a daughter, Mary, in 1542. At this moment the heir-general of Robert II., on the supposition of his family by Elizabeth Mure being illegitimate, was the earl of Menteith, the lineal descendant of Euphemia Ross's eldest son, David earl of Strathearn; and it is a remarkable fact that in the early part of the seventeenth century the pretensions put forward on this ground by the then earl of Menteith, who was justice-general, and president of the Scottish privy council, occasioned no small uneasiness to Charles I., and brought down ruin upon himself. For the latest and also the most learned and acute discussion of this question, the reader is referred to 'Tracts, Legal and Historical, with other Antiquarian Matter, chiefly relative to Scotland,' by John Riddell, Esq., Advocate, 8vo., Edinburgh, 1835; dissertation iii., entitled 'Remarks upon the Law of Legitimation per Subsequens Matrimonium, the Nature of our Antient Canons, and the Question of the Legitimacy of the Stewarts,' pp. 156-211. Mr. Riddell, we may add, states that the undoubted representative of the earls of Menteith, and of the eldest son of Robert II. by his second wife, is the present Mr. Barclay Allanlyce of Ury, the head, we suppose, of the once famous Quaker family: a singular enough destination for the truest hereditary right to the sceptre of Robert Bruce.

A truce for fourteen years had been concluded with England two years before the death of the late king; and as long as Edward III. lived, the two countries remained at peace. In 1377 however, immediately after the accession of Richard II., a war arose out of what appears to have been at first a private quarrel between the English garrison at Roxburgh and the earl of March. Hostilities continued, with a few short interruptions, till November, 1380, when a truce for twelve months was arranged, which was afterwards extended to the summer of 1383. In 1384 however, the war broke out again with more violence than ever, the Scots being now assisted by a body of French auxiliaries, who arrived in May, 1385, under the command of Jean de Vienne, admiral of France. In the summer of that year, while the young English king led his army in person into the north, laying waste the country and burning every town and village he came to in his progress [RICHARD II.], a force of Scots and French, entering England by the western marches, ravaged Cumberland and laid siege to Carlisle, but withdrew when the enemy returned southwards, without having effected an entry into that town. Soon after this, the French, who had found the Scots and everything in Scotland very little to their mind, and had also made themselves cordially disliked by the people they came to assist, or more truly to make use of for their own purposes, returned home, though not till they had agreed to pay the expense of their maintenance, and had been forced to leave their leader Vienne as a hostage for the performance of that engagement—a conclusion of the business which has drawn much obloquy upon the Scots from those who have not considered the real object of the French in this expedition, which was certainly much more to annoy the English than to benefit the Scots. A truce for another year followed the departure of the foreigners; but the fighting was renewed in 1387. That year the town of Carlingford in Ireland was plundered and burned by a force under the command of William Douglas, recently created Lord Nithsdale, and married to one of the king's daughters; and in 1388 the famous battle of Otterbourne, or Chevy Chase, was gained from the Percies, though at the expense of his own life, by the earl of Douglas. [RICHARD II.] By this time however the reins of government had nearly dropped from the hands of king Robert. Froissart tells us that, being unfitted by his years and broken health for going out any more to war, he was no longer consulted in public affairs by the nobles, by whom and also by the nation in general the king's second surviving son, Robert, earl of Fife (afterwards duke of Albany), was now looked upon as the true ruler of the country. In 1389 indeed, the earl of Fife was formally recognised as governor of the kingdom by an assembly of the estates held at Edinburgh. After this the old king appears to have lived almost entirely on his ancestral estate in Ayrshire, where indeed he had been much in the habit of secluding himself for some years previous. It was probably now, in his old age, that his originally engaging personal appearance was deformed by the breaking out of an inflammation in his eyelids, from which he derived his popular designation of *Blear-eye*. The fable about

his birth makes him to have been wounded in one of his eyes by the surgeon who cut him from his mother's side.

The war with England was prosecuted by the regent for some months with considerable vigour; but before any action of importance had taken place, hostilities were terminated for the present, in June, 1389, by a truce concluded between France and England for three years, in which the allies of both powers were comprehended. The country was therefore at peace when Robert II. died, after a short illness, at his castle of Dundonald in Kyle, on the 19th of April, 1390.

Besides his six sons and ten daughters by his two wives, this first of the royal Stewarts had a numerous illegitimate progeny by various other women. His six lawfully begotten daughters married into the families of the earl of March, Lyon of Glamis (now earls of Strathmore), Hay of Errol (now earls of Errol and earls of Kinnoull), Macdonald of the Isles, Douglas of Nithsdale, Lindsay of Glenesk, the earl of Douglas, Keith earl Marischal, Logan, and Swinton. From six of his illegitimate sons the Stuarts of Bute, Cairney, and other families of that name deduce their descent. Robert II. was succeeded by his eldest son Robert III.

ROBERT III., king of Scotland, the eldest son of Robert II., relinquished his original name of John on succeeding to the crown, on account, it is said, of a popular superstition of his countrymen which regarded that name as unlucky or ominous. But if so, it is rather strange that the heir apparent should have ever been so christened. He was known throughout the preceding reign by the title of the earl of Carriek, a dignity which had been bestowed upon him by King David II. Before acquiring that dignity he appears to have been designated the lord of Kyle. He was probably born before the year 1340, so that he was past fifty when he came to the throne, on the death of his father, in 1390. It is known that he had been married at least since the year 1367, to Annabella Drummond, a daughter of Sir John Drummond of Stobhall. He had been lamed in his youth by a kick from a horse; and this accident, combined with his mild and pacific disposition, of which perhaps it was in part the cause, made him be regarded, both before he became king and afterwards, with feelings of something very like contempt by the generality of his countrymen.

The coronation of Robert III. took place at Scone on the 14th of August, 1390. No events of any note mark the first eight or nine years of the reign, during the whole of which the king's brother, the Earl of Fife (who was in 1398 created Duke of Albany), continued to retain the management of public affairs, and even, according to some authorities, the title of governor or regent. [ROBERT II.] The truce which had been made with England in 1389, was kept up by various continuations throughout the reign of the English king Richard II. But war broke out again on the accession of Henry IV., in 1399; France, as usual, exciting the Scots to harass England by predatory expeditions across the borders, which could only end in drawing down signal vengeance upon themselves. In August of the following year, accordingly, Henry entered Scotland at the head of a powerful army, and advanced as far as Edinburgh, which was however successfully defended by the king's eldest son, the duke of Rothsay; and Henry returned home after having received the submission of various towns and villages through which he passed, but without having given the country cause to remember his visit further than by this mere demonstration of his power. In the following year however Henry Percy (Hotspur) made a more destructive inroad as far as to Preston in East Lothian. On this occasion Percy was joined by the Scottish Earl of March, who had recently thrown up his allegiance and gone over to the English king, in a fury of revenge provoked by the ill usage he held himself to have received from the Duke of Rothsay, who, after having been affianced to his daughter, had actually married a daughter of the Earl of Douglas. The following year, 1402, is memorable for the tragical catastrophe of Rothsay, who, at the instigation of his uncle Albany, the friend of March, was, on the pretence of restraining or punishing his dissoluteness, seized under an order professing to be signed by his father, and confined first in the castle of St. Andrews, and then in that of Falkland, where he is believed to have been left to perish of famine. He was only in his twenty-fourth year when he thus fell a victim, in all probability, to the dark ambition of his kinsman. A few weeks after the prince's death, a pardon or remission in very ample terms for any concern

he might have had in this affair was granted by the king to Albany; and has been published by Lord Hailes in chapter vi of his 'Remarks on the History of Scotland,' Edinburgh, 1772. In this remarkable paper it is stated that Albany admitted the capture and arrest of the prince, but justified what he had done by reasons which the king did not then hold it expedient to publish to the world. No express denial of the fact of the murder is ventured upon; it is merely recited that the prince departed this life in his prison at Falkland, through divine providence, and not otherwise—'ubi ab hac luce, divina providentia, et non aliter, migrasse dignoscitur.' 'The reader,' observes Hailes, 'will determine as to the import of this phrase. If by it a natural death was intended, the circumlocution seems strange and affected.' It ought to be added that Archibald, the young earl of Douglas, the brother-in-law of Rothsay, who had acted throughout the affair along with Albany, was equally charged by the voice of common fame with the murder, and was included in the same acquittal or indemnity. It is conjectured that Rothsay had made the proud baron his enemy by his infidelity to or neglect of his sister.

This same year, on the 22nd of June, the Scots, commanded by Patrick Hepburn of Hales, were defeated with great loss, at West Nisbet in the Merse, by the English under the conduct of the Earl of Northumberland and the renegade Earl of March; and on the 14th of September following the Earl of Douglas received a still more disastrous discomfiture from the Lord Henry Percy at Homilton Hill in Northumberland. When immediately after this the Percies rose in rebellion, the Duke of Albany put himself at the head of a numerous force and set out for the south with the design of taking advantage of the embarrassing circumstances of the English king; but the news of Henry's victory at Shrewsbury turned him back before he had got across the border. In the course of the two following years several attempts were made to arrange a peace, or long truce, between the two countries, but without success. Hostilities however had been for a considerable time suspended by these negociations, when King Robert, now awakened to a strong suspicion of the designs of his brother Albany, resolved to send his only surviving son James, styled earl of Carrick, to France for safety; and the prince, then in his eleventh year, was on the 30th of March, 1405, captured at sea by an English vessel on his way to that country. [JAMES I.] His detention by King Henry is believed to have broken the heart of his father, who expired at the castle of Rothsay in Bute, on the 4th of April, 1406. He was succeeded by his son, James I.

ROBERT, King of Naples. [SICILIES, Two.]

ROBERT GUISCARD. [NAPLES.]

ROBERT OF GLOUCESTER is supposed to have been a monk in the abbey there, but of his personal history nothing whatever is certainly known. It may however be collected, from a passage in his work, that he was living at the time of the battle of Evesham, and he seems to have lived not very long after that event, as the history of English affairs which he has left us ends before the beginning of the reign of Edward I.

This history is the only writing that is attributed to him, and is, in more points of view than one, among the most curious and valuable writings of the middle period that have come down to us. It is a history of English affairs from the beginning, including the pictures of Geoffrey of Monmouth, and ending with the death of Sir Henry of Almaine, valuable in the latter portions for the facts which it contains, whether peculiar to itself or correlative with the statements of other chroniclers; and abounding throughout with anecdotes or minor historical circumstances peculiar to itself, and sometimes of an interesting if not useful nature.

It is in the vernacular language of the time; that is, in the language in which we find the Anglo-Saxon passing into the language of Chaucer and Wicliffe, this work and the similar work of Robert of Bonne being the best specimens which remain of the language. It is in verse, and may stand therefore as a specimen of the poetry of the time. It consists of more than ten thousand lines.

The work was popular in the middle ages, as appears by the number of manuscripts that still exist of it. The principal are the Bodleian, the Cottonian, and the Harleian. There is one in the library of the Herald's College. There are slight variations in the text of each, and that at the Herald's

College appears to have had the language modernized by some early copyist. Little regard was paid to Robert by the persons who, in the reign of Elizabeth, collected and printed the manuscripts of the best English chroniclers, though Camden, in his 'Britannia,' and still more frequently in his 'Remains,' has citations from him. Weever, in his 'Antient Funeral Monuments,' has many quotations from him; and Selden quotes him on several occasions. The work was given at large to the public in 1724, by Hearne, in two octavo volumes, of which there was a reprint in 1810.

ROBERT (GROSSETESTE), bishop of Lincoln, a very eminent scholar and prelate in the early years of the reign of Henry III. The exact time and the place of his birth and the family from which he sprung, are alike lost in the obscurity of those remote times; but it may be calculated from the dates ascertained of other events in his life, that he was born about the year 1175. He studied at Oxford, and like most of the very eminent of the English theologians of that period, he went from thence to Paris. He there applied himself to the study of the Hebrew and Greek languages, each of which he attained the mastery, and distinguished himself by his attainments in the whole course of study presented to the students in that learned university. He returned to England skilled not only in the five languages, English, French, Latin, Greek, and Hebrew, but skilled also in logic and philosophy, divinity and the Scriptures, and possessed also a knowledge of medicine and ecclesiastical law. There is no exaggeration in this, for many of his writings have descended to our time, which prove the statement, to a considerable extent at least. We may refer particularly to his numerous treatises in natural philosophy, which it will not be expected of us to describe individually, as the titles, with little more respecting them, fill four quarto pages of Dr. Pegge's Life of him (4to., 1793, p. 278-283).

When he returned to England, he settled at Oxford, where he delivered lectures. There is extant a letter of Giraldus Cambrensis to the bishop of Hereford, recommending Grosseteste to his notice, but the bishop died soon after, that little advantage can have arisen from it. He found however a very efficient patron in another prelate, namely, Hugh de Wells, bishop of Lincoln, who, as a first mark of his favour, gave him the prebend of Clifton in the church of Lincoln. He had also several archdeaconries, and Chester, Northampton, and Leicester, and in 1235 he succeeded his patron in the bishopric of Lincoln, then a diocese of immense extent. This dignity he held for eighteen years, dying in 1253.

Bishop Grosseteste made the power which his acknowledged and extraordinary attainments gave him, subservient to the accomplishment of important public objects. He was a great reformer of his diocese, a vigilant superintendent of his clergy, a maintainer of order among them and in all ecclesiastical affairs. If one of the great earls or barons offended, he did not scruple to assert at once the right he possessed to correct the abuse, of which an instance is related in his calling the earl of Warren to account for irregular religious solemnizations. He stood up against the king when he would interfere with the rights of the clergy, who formed in those times the strongest part of the opposition to the will of kings, who, if there had been no clergy, would have been almost absolute; and he opposed with equal firmness and success the pope, when he would support antient abuses or introduce new to the injury of the English clergy or people. In short he can hardly be regarded in any other light than one of the great benefactors to the English church and nation in the discharge of his political duties as a bishop, and he was one of the lights of his age by the lectures which he delivered and the books which he wrote.

His attainments in natural science gained for him the reputation of being a magician and a sorcerer, and many fables gathered about his name.

Many of his writings have been printed, and many remain in manuscript, and are found in most of the great libraries of Europe. An ample list of these is given in Dr. Pegge's work before referred to; in which work may be found critical inquiries into all the particulars of his life, and a great mass of curious information respecting the state of ecclesiastical affairs in England in the first half of the thirteenth century.

ROBERT, LEOPOLD, a modern French artist of great and deserved celebrity, was born at Chaux-le-Fonds, in the canton of Neuchâtel, in 1787. He intended to bring him up to his own trade, but he was prevented by the death of a watch-

maker, but yielding to the boy's decided inclination for the arts, sent him to Paris to study engraving under Girardet, an artist known by his print of the Transfiguration, after Raphael. His progress was so rapid, that in 1812 he obtained the second grand prize at the Ecole des Beaux-Arts, after which he began to study painting in the school of David. He then proceeded to Italy, and, renouncing engraving altogether, devoted himself entirely to his pencil, leading a life of solitude and privation, without either patrons or friends. But though his enthusiasm for his art was great, it was marked rather by severe application than by that promptitude which is generally supposed to characterise genius. Though he did much, he executed few productions, being not only remarkably slow with his pencil, but in the habit of destroying or laying aside picture after picture until he could satisfy himself with the subject that he had commenced. He is said to have thus spent between three and four years on a single picture; for instance, that of the 'Reapers,' which excited so much admiration when first exhibited at Paris in 1831. In that piece, in the 'Neapolitan Improvisatore,' the 'Madonna dell' Arco,' and similar subjects, he succeeded in delineating Italian life and character in the happiest manner, with perfect fidelity, but also with a touching refinement and grace, at the same time without any of that affectation which the French schools are apt to mistake for refinement. His last work was his 'Venetian Fishermen,' a picture that has served to raise his name as that of the greatest artist of his age in the peculiar walk which he had chosen. The general admiration which it excited when exhibited at Paris, was however mingled with mournful regret at the fate of the artist himself; for he had previously put an end to his life at Venice, where he had resided several years, and where he drowned himself, March 20th, 1835, in his 38th year.

**ROBERT, HUBERT**, an artist, celebrated for his admirable architectural compositions and subjects of that class, was born at Paris, in 1733.

On quitting school, Robert applied himself assiduously to his studies. In 1753 he set out for Rome, and spent twelve years in that city, occupied not merely in making drawings and views of nearly all the numerous architectural monuments, but studying their character completely. Thoroughly impressed with the poetry of such subjects, he enabled others to feel it likewise, by the peculiar charm with which he invested them and by his felicitous treatment, so different from that whose chief merit consists in literal exactness and cold correctness. On his return to Paris, he was immediately elected by the Academy, and his reputation became established as a master-genius, — one whose productions formed an epoch in that department of the art which he had selected.

Among his numerous works are many chefs-d'œuvre of first-rate excellence. Two of the most remarkable for the singularity of the idea are those representing the *Muse Napoleon*, the one in all its pride and pomp, and the other, an architectural wreck, as it may perhaps present itself to the eye after the lapse of centuries.

Robert was a true artist, an enthusiast in his profession. He was indeed one of those fortunate persons whose existence seems to form an exception from the common lot of mortals; happy in himself, happy in his union with a most amiable woman, possessing a source of constant enjoyment in his art, his life passed in one uninterrupted tenor; in a calm, undisturbed even by the stormy period of the Revolution. Nor was he less happy at its close, for he died almost without a struggle, and with pencil in his hand, April 15, 1808, at the age of seventy-six.

**ROBERTSON, WILLIAM**, was the son of a clergyman who for some time had the congregation in the old chapel of London Wall, and afterwards was one of the ministers of Edinburgh, where Dr. Robertson was born in 1721. His mother was daughter of Pitcairn of Dregban. In 1743 he was presented to the living of Gladmuir in East Lothian. He distinguished himself as a preacher, and also as one of the most powerful speakers and most eminent leaders in the General Assembly of the Church of Scotland. In addition to his professional pursuits, he applied himself to historical studies, and in 1759 published his 'History of Scotland during the reigns of Mary and of King James VI. till his accession to the crown of England, with a Review of the Scottish History previous to that period, and an Appendix containing original Papers,' 2 vols. 4to., 1759. The work was very well received,

and went through numerous editions in the author's lifetime. In 1761 Dr. Robertson was made one of the king's chaplains, and in 1762 he was appointed Principal of the university of Edinburgh. Two years after he was made historiographer to his majesty for Scotland, with a salary of 200*l.* In 1769 he published his 'History of Charles V.,' in 3 vols. 4to., a work which raised his reputation still higher, and which, from the general interest belonging to the subject, was very popular; it was immediately translated into several languages. The introductory part consists of an able sketch of the political and social state of Europe at the time of the accession of Charles V., a most important period which forms the connection between the middle ages and the history of modern European society and politics. This part of the work has been deservedly admired for the comprehensiveness of its views, for clearness of exposition, and graphic power; but the narrative of the reign and age of Charles is his master-piece. For his 'History of America,' 2 vols. 4to., 1777, Robertson obtained, through several friends, much valuable information from the Spanish and other archives. In 1785 he published some valuable 'Additions and Corrections to the former Editions of the History of Scotland.' In one of these additions, after saying that the licentious conduct of the clergy previous to the Reformation, a conduct so much in opposition to their vows of celibacy and their assumption of superior holiness, was perhaps the first thing that excited suspicion as to the truth of the doctrines which they taught, he justly observes that when the Reformation had gained the ascendancy in various states, 'the form of ecclesiastical polity which was introduced in those states was modelled in some measure upon that of the civil government, as it had already happened on the first establishment of Christianity in the Roman empire. Thus the episcopal form was retained in England, in the kingdoms of Sweden and Denmark, and in some parts of Germany, as most consistent with the spirit of monarchy; whilst in Switzerland and the Netherlands the principle of equality was established, as being more suitable to the spirit of a republic.'

His celebrity as an author, and the powers which he displayed as a party chief in the church, where his influence was unbounded, gave rise to a proposition from the court, at the end of George II.'s reign, having for its object his promotion to the dignities of the English church. This (says his biographer, *Dugald Stewart*) met with such a repulse as effectually prevented a repetition of the attempt.

In 1791 Dr. Robertson published an 'Historical Disquisition concerning the Knowledge which the Antients had of India, and the progress of Trade with that country previous to the Discovery of the Cape of Good Hope.' This agreeable and well written essay is now nearly superseded by more recent works.

Dr. Robertson died at Grange House, near Edinburgh, in June, 1793. He is justly reckoned among the best British historical writers. His style is easy and flowing, his language correct, his opinions enlightened and sober; his investigation most diligent, and his expressions temperate. Hume, who was his intimate friend notwithstanding the difference of their opinions, greatly extolled Robertson's 'History of Scotland,' and Gibbon has borne ample testimony both to his accuracy and his style.

The works of Robertson have been lately published together in French, 'Œuvres complètes de W. Robertson, précédées d'une Notice par J. A. C. Buchot,' 2 vols. large 8vo., Paris, 1837.

**ROBERVAL**, a French mathematician, whose proper name was **GILES PERSONIER**. He was born in 1602, at a place called Roberval in the diocese of Beauvais, and having completed an extensive course of study, he came, in 1627, to Paris, where he connected himself with Père Mersenne and other learned men of the age, among whom his talents soon acquired for him considerable reputation. He was chosen professor of mathematics in the college of Gervais, which had been founded by Ramus at Paris, and, together with this appointment, he was allowed to hold, after the death of Morin, the chair of mathematics at the college of France.

The *Method of Indivisibles*, which forms a link between the antient geometry and the fluxionary or differential calculus, had been (1635) made public in Italy by Cavalleri, who is always considered as its inventor. In a letter to Torricelli however (1644), Roberval states that he himself had long before that time discovered a similar method of investigating propositions; and he adds, that he kept his

processes to himself, in order that he might have a superiority over his rivals in solving such problems as were proposed to them. The statement may be correct, but if so, it happened that the French mathematician, by his reserve, like many others in similar circumstances, lost the honour which he might have obtained; a just punishment, observes Montucla, for those who, from such unworthy motives, make a mystery of their discoveries. At the end of the treatise of Roberval on this subject, there is explained a method of finding the areas of spaces comprehended between curve-lines of indefinite length, and it may be that the credit of the discovery is due to him, though it is right to observe that the investigation of such areas had been made in England by James Gregory and Dr. Barrow before the publication of Roberval's work. Curves with infinite branches, and which admit of an expression for the area between them, were called Robervallian lines by Torricelli.

Roberval discovered an ingenious method of determining the direction of a tangent at any point of a curve-line by the rule for the composition of forces or motions; but he applied it only to the conic sections in which the component forces are supposed to act in the directions of lines drawn from the point in the curve to the foci. It appears that Torricelli laid claim to the first discovery of the method, which he asserts that he had made in 1644, but Roberval states, in a letter to the Italian philosopher, that he was acquainted with it in 1636, and that in 1640 he had communicated it to Fermat.

As early as the year 1616, P. Mersenne suggested the idea of the cycloid, and having made some fruitless attempts to find its area, he proposed the subject to Roberval in 1628; the latter, not succeeding immediately, abandoned the research, and apparently thought nothing of it during about ten years. At the end of that time, the question being revived, he resumed the inquiry with the advantage of greater experience, and fortunately discovered a method by which the area might be determined. Descartes afterwards proposed to Roberval and Fermat to determine the position of a tangent to the cycloid, and the latter soon resolved the problem, but the former appears to have failed, or to have succeeded with difficulty, and only after many trials. He subsequently however discovered the rules for finding the volumes of the solids formed by the revolution of a cycloid about its base and about its axis.

In 1646, Descartes, Roberval, and Huyghens attempted at the same time to investigate the duration of the oscillations made by planes and solids moving about an axis; and here Roberval appears to have been more successful than his competitors, though the state of science was not then sufficiently advanced to allow any of them to attain a solution which should be applicable to every kind of vibrating body.

None of Roberval's works were printed during his life, except a treatise on Statics, which was inserted by Mersenne in his 'Harmonie Universelle.' The others were published by his friend the Abbé Galois, in 1693, among the mathematical and physical works in the old 'Mémoires' of the Academy of Sciences. These relate chiefly to the subjects above mentioned, and include a treatise on the 'Recognition and Construction of Equations,' a work of little utility, since it is formed agreeably to the ideas of Descartes and Fermat, and is expressed in the language and notation of Vieta. Among them also is an account of a new kind of balance (a sort of steelyard) which Roberval had invented, and which was thought to be useful in finding the weight or pressure of the air.

Roberval, unfortunately for his fame, appears among the opponents of Descartes in matters relating to algebra: he is said to have made some objections to the theorems of his countryman in the construction of equations and concerning the nature of the roots; but the objections are without foundation, and serve only to expose his own jealousy and obstinacy.

To Roberval is ascribed the reply, 'Qu'est ce que cela prouve?' when, having been present at the representation of a tragedy, some one asked what impression it had made on him. The story is perhaps untrue, but such a circumstance is not improbable, since, in those days, science was profoundly studied, and the mathematicians were so completely absorbed in their pursuits, that they had little time to spare for other subjects. It is said that Roberval could never express his ideas with clearness and precision, and certainly readers well acquainted with the ancient methods

of investigation can with difficulty follow him in his tedious demonstrations.

He was elected a member of the Academy of Sciences when the latter was formed (1665), and he died in the year 1675.

**ROBES, MASTER OF THE**, an officer of the household who has the ordering of the king's robes. By statute 51 Henry III., the 'Gardein de la Garderobe de Roi,' the warden of the king's wardrobe, was to make account yearly in the Exchequer, on the feast of St. Margaret. Under a queen, the designation of the office is changed to that of a mistress of the robes. The office has always been one of great dignity. High privileges were conferred upon it by King Henry VI., and others by King James I., who erected the office of master of the robes into a corporation.

**ROBESPIERRE, FRANÇOIS MAXIMILIEN JOSEPH ISIDORE**, was born at Arras in 1759. His father, a provincial advocate of no reputation, quitted France during the infancy of his children, who were not long afterwards left in a desolate condition by the death of their mother. François Maximilien was the eldest, and Augustin Bon Joseph the second son: the third child was a daughter. Augustin imitated his brother, and perished with him; the daughter lived in quiet respectability, and became a pensioner of the state.

Through the kindness of the bishop of Arras, Robespierre was well educated at Paris. He studied jurisprudence; and having returned to his native town, followed his father's profession, in which he gained some reputation. By his legal talents, and his situation as president of the academy at Arras, he obtained an influence, through which, on the summoning of the States-General in 1789, he was elected a deputy of the tiers-état. No sooner was he elected, than he went to Versailles to enter on his duties. Within the Assembly, for several months after its meeting, he was of little importance; without its doors he gradually gained authority by gathering idlers and adventurers round him in the coffee-houses, and haranguing them on liberty and equality. It was by dexterity of address, and the coincidence or adaptation of the opinions which he expressed, to those of his low, discontented, and excited hearers, that this authority was raised. He had no physical advantages to assist him: he was a short insignificant-looking man; his features small, his complexion pale, his face deeply marked with the small-pox, and his voice harsh, shrill, and disagreeable. Notwithstanding these disadvantages, he increased in popular estimation. It was on the 17th of June, 1789, that he delivered his first speech in the Assembly. From that time he daily threw aside more and more of the backwardness and reserve that he had hitherto maintained: he clearly saw that the weakness and want of energy in the government were so great, that he might with safety assert in the National Assembly the most violent democratic opinions, and throw the populace into excitement. His importance in the Assembly was in a great measure attributable to the prominent part which he played in the Jacobin Club. [JACOBINS.] This club already contained so many members, that the large church in which its meetings were held was continually filled, and it had corresponding affiliated societies throughout the provinces, which disseminated its revolutionary views and projects, and rendered its power most formidable. Here was Robespierre's principal scene of action; here he decried every attribute of monarchy, and denounced those who would control the people as conspirators against their country, knowing that the pikemen of the suburbs, bloodthirsty and ungovernable, took the speeches of the Jacobins for their word of command. Robespierre laid down this principle, 'that France must be revolutionised;' and for this object he laboured with a determination which his opponents could find no means of diminishing. It was certain that he could not be tampered with; and the Jacobin newspapers, daily overflowing with his praises, surnamed him 'The Incorruptible.' His exclusion from the Legislative Assembly, to which he was rendered ineligible by a vote in which he himself had joined, enabled him to devote his whole time and energies to the direction of the Jacobin Club. Its violence had somewhat diminished, but its power was increased by the enrolment of many of the municipal officers, who could carry out its projects by their authority. (Thiers.) At this time he was named Public Accuser.

When the attack was made upon the Convention (Aug. 10, 1792), Robespierre was not present three days

afterwards he forsook the Club and remained in seclusion. It was his custom neither to take an active part in the great overt acts of massacre or rebellion, nor to appear immediately after their commission; but rather to pause awhile, that he might see by what means they might best be turned to the promotion of his political objects, and the increase of his own popularity. It was with joy that he saw the National Assembly suspend the royal authority and call upon the nation to elect a convention which should determine on a new form of government. He became a member of the Convention; and on its opening (Sep. 21, 1792), seated himself on the 'montagne,' or higher part of the room, occupied by the most violent, which was also rapidly becoming the most powerful party. It was now that Robespierre first appeared in the foremost rank, which comprised the most powerful men: until now, notwithstanding all his efforts, he had had superiors even in his own party;—in the days of the Constituent Assembly, the well-known leaders of the time; during the continuance of the Legislative Assembly, Brissot and Pétion; and, on the 10th of August, Danton. In the first assembly he could attract notice only by the profession of extravagant opinions; during the second he became more moderate, because his rivals were innovators; and he maintained peace before the Jacobins, because his rivals called for war. Now, as we have said, he was in the first rank, and his chief aim was to annihilate the Girondins, who hoped, on the other hand, that the eminence he had attained was insecure as well as high, and that he might be overthrown himself. Barbaroux, Rebecqui, and Louvet dared to accuse him of seeking to be dictator. But the time had not come for accusations to be successful; the tide of his popularity had not turned. He demanded time to prepare his defence, and absented himself for eight days both from the Convention and the Jacobin Club. During this absence the Jacobins protested his innocence and intimidated his accusers, the excitement in the Convention subsided, and on his re-appearance he was triumphantly exculpated.

At this time the king was in prison, but his days were drawing to a close. Robespierre vehemently combated those who either asserted the necessity of a trial or declared the king inviolable: he demanded that he should be beheaded at once, and promoted unscrupulously the execution of his whole family. The death of the king augmented both party strife and private bitterness; each faction and each leader had some rival to destroy. The Montagnards struggled with the Girondins for supremacy, gained their end, and massacred their opponents. The kingdom was chiefly governed by the Committee of Public Safety [COMMITTEE OF PUBLIC SAFETY], of which Robespierre, Couthon, and St. Just became the triumvirate. Their schemes for a moral regeneration will be found in all the histories of the time, and also an account of Robespierre's presidency at the great public acknowledgment of the existence of a Deity. This took place when his career was nearly run, when there were divisions in the Montagne, where he had lost the support of many who, though they had been rivals, had been likewise powerful allies, when Marat had been assassinated, when he had sanctioned the execution of Pétion and Danton and Desmoulins, when he had put a countless host of victims to death, and raised a proportionate number of enemies. In July, 1794, his adversaries became too strong for him: Billaud-Varennes, one of his own party, jointly with the remnant of the Dantonists, who still were furious because of the execution of their leader, accused Robespierre of seeking his own aggrandizement by the sacrifice of his colleagues. In vain Robespierre retired, in vain he took forty days to prepare his defence, in vain he strained every nerve to refute their charges. After a scene of frightful excitement, he was condemned to death, his brother, Couthon, St. Just, and Lebas being included in the same condemnation. Robespierre was separated from the other prisoners, and led to the gaol at the Luxembourg. Here accident gave him a chance of escape. The gaoler, who was his friend, released him; he marched against the Convention with a number of soldiers and partizans, and it is not impossible that he might have re-established his power, if he had possessed courage, and his allies dexterity. As it was, he was again seized, and having blown his jaw to pieces, in an unsuccessful attempt to destroy himself, was dragged groaning to the guillotine, amidst the taunts and acclamations of the people.

The characters of few men have been more deservedly despised than that of Robespierre. He was totally without

any great quality; he was cowardly, cruel, and vain; 'one of the most intimate compounds of self-esteem and circumspection that ever met in the same character.' His success, which was partly due to his egotism, 'his excessive caution not to commit himself, made him the safest guide and model for all that multitude of cautious egotists which form so large a portion of human society.' (*Edin. Rev.*, vol. lxxii., p. 428.) 'He had another great source of strength in being the very apostle and prolocutor of the populace, of that vague and indefinite religion which Rousseau had created, and which then enjoyed so immense a popularity—a religion of sentiment without belief.' He was honest in his efforts for the democratic cause, he never sought money, and he well deserved the name of 'Incorruptible.' He long depended on his sister for support, and died worth fifty francs. The powers of his mind, his judgment, and his oratory have been frequently underrated; he must have been at least plausibly eloquent: he chose with adroitness the topics upon which he spoke; he was acute, and had considerable foresight. But on the whole, his low and vile qualities so greatly predominated, that he was not only the terror of the monarchical and aristocratic party, but he likewise injured the democratic cause, for he was guilty of no small portion of that violence and cruelty which rendered a reaction inevitable.

#### ROBIN HOOD. [HOOD, ROBIN.]

ROBINIA, a name given to a genus of plants in commemoration of John Robin, a botanist in the time of Henry IV. of France. This genus is known by having an inferior perianth; teeth of calyx 5, lanceolate, two upper ones shorter and approximate; corolla papilionaceous; ovary with from 16 to 20 ovules; style bearded in front, and legume sessile and many-seeded. They are North American trees, bearing nodding racemes of white or rose-coloured flowers. The genus Robinia formerly comprehended the plants now included under *Caragana*, from which it is distinguished by its long gibbous legume and unequally pinnate leaves.

The best known species of Robinia is the *R. pseudo-acacia*, the Bastard or False Acacia, or *Locust-tree*. It has stipular prickles, with loose pendulous racemes of white sweet-smelling flowers, which, as well as the legumes, are smooth. This tree, which is now so well known, was first grown in Europe by Vespasien Robin, the son of the botanist, after whom the genus was named, in the Jardin des Plantes at Paris. It was named locust-tree by the missionaries, who supposed it to be the same tree as that which grows in Asia, and is supposed to have produced the locusts spoken of in the New Testament. It was one of the first trees received in Europe from North America, where it grows in great abundance. It grows in the Atlantic States of North America; but it is very abundant in the south-west, in the valleys of the Alleghany Mountains. It is also found in the Western states and in Upper and Lower Canada.

Since its first introduction into Europe, this tree has met with very different treatment, at one time being extolled as the most valuable of trees, at another time condemned as worthless. This has arisen in a great measure from the soils and situations in which it has been accidentally cultivated. It has always been known in America as affording an exceedingly hard and durable wood; hence it has been recommended to be cultivated on this account, but the great tendency which this tree possesses to branching and its seldom attaining a great size render it impossible to obtain from it timber of a useful kind. In America it is used for making posts, and occasionally trees are found large enough to be employed in ship-building; but its greatest consumption is for making trenails, by which the timbers of ships are fastened together, and for this purpose large quantities are used in the royal dock-yard at Plymouth, which are imported from America.

Cattle are fond of the young shoots, and on this account it has been recommended to be cultivated as forage. At one time it was thought to be an excellent tree for planting on the banks of rivers and canals, as the roots, being very large and spreading, would bind the soil together. In 1823, Cobbett wrote on this tree, recommending it strongly in his various publications. He imported immense quantities of the seeds from America for the purpose of growing the plants for sale. He stated that in this way he had distri-

buted in Great Britain more than a million of plants. His praises of the tree were extravagant in the extreme, and it has failed to answer most of the promises that he held out.

The tree is of rapid growth when young, and forms heart-wood at a very early age. In America it attains a height of 70 or 80 feet, but in this country it is seldom seen so high. Its tendency to form branches, even when young, prevents its being used for hop-poles as recommended by Cobbett.

The roots and other parts of the plant, like many of its order (Leguminosæ), contain a saccharine principle, which accounts for the nutritive properties of the leaves. In St. Domingo the flowers are used for making a distilled liquor, which is said to be very delicious. It folds up its leaves at the approach of night.

The tree grows best on a soil of sandy loam, rich rather than poor; a good garden soil is the best. It should not be planted in exposed situations, as, from the great brittleness of its branches, it is likely to be destroyed by winds. It may be propagated by cuttings from the roots or by planting large truncheons or suckers, but producing it from seeds is the best mode. The seeds should be sown in the spring, and in the summer of the following year they may be transplanted. The seeds will not retain their vitality more than two years. American seed should be always used, as it does not come to perfection in this country.

There are two other species frequently cultivated in this country, *R. viscosa*, Clammy Robinia, and *R. hispida*, Hairy Robinia, or Rose Acacia. The former is characterised by the sticky secretion with which it is covered, and which has been discovered to possess a peculiar vegetable principle; the latter, which is the smallest of the three species here mentioned, has very large flowers, and forms a very ornamental shrub when grown on an espalier rail or against a wall.

ROBINS, or ROBYNS, JOHN, an English astronomer and mathematician, who was born in Staffordshire, about the close of the fifteenth century or the beginning of the sixteenth, as it appears he was entered a student at Oxford in 1516, and educated for the church. In MS. Digby, 143, are preserved several inedited tracts by Robins, and from a note at the end it appears that he was of Merton College. It seems that, in common with many others of that college, he devoted himself to the study of the sciences, and he soon made such a progress, says Wood, in 'the pleasant studies of mathematics and astrology, that he became the ablest person in his time for those studies, not excepting his friend Recorde,' whose learning was more general. Having taken the degree of bachelor of divinity, in the year 1531; he was the year following made by King Henry VIII., to whom he was chaplain, one of the canons of his college in Oxford. In December, 1543, he was made a canon of Windsor, and afterwards one of the chaplains to Queen Mary, who highly esteemed him for his learning. He died on the 25th of August, 1558, and was buried in the chapel of St. George at Windsor. He left behind him several works in manuscript, of which two, 'De Culminatione Stellarum Fixarum,' and 'De Ortibus et Occasibus Stellarum Fixarum,' are preserved in MS. Digby, 143, in the Bodleian Library. According to Wood, Sir Kenelm Digby also possessed three other tracts by Robyns, viz.: 1, 'Annotationes Astrologice,' lib. 3; 2, 'Annotationes Edwardi VI.,' 3, 'Tractatus de Prognosticatione per Eclipsin;' and Wood adds that these were also in the Bodleian Library. We suspect Wood is here in error, for in the sale catalogue of the library of George, earl of Bristol, sold by auction in April, 1680, a copy of which is in the British Museum, we find an account of several manuscripts said formerly to have belonged to Sir Kenelm Digby, and among these (No. 49) is 'Johannis Robyns Annotationes Astrologice.' We are inclined to think that Wood may have taken the titles from the catalogue of Thomas Allen's library, in the Ashmolean Museum, nearly the whole of which came into the hands of Kenelm Digby, and that the two titles of 'Annotationes' do in reality belong to the same book. We are not aware that any copy of this work of Robyns's is now in existence, although there are some extracts from it in MS. Bodl. 3467, and the loss of it is perhaps not much to be regretted. Wood slightly refers to a book by Robyns under the title of 'De Portentosa Cometa,' but he says that he had never seen a copy. Bale however mentions having seen one in the Royal Library at Westminster, and this copy is now in the British Museum. Sherburne, in the appendix to his 'Mani-

lms,' mentions another in the possession of Gale, and this is now in the library of Trinity College,—O. i. 11. We find also that there is still another copy in the Ashmolean Museum, MS. No. 186. The preface to this latter work, which is partly plagiarised from Cicero, is printed in Halliwell's 'Rara Mathematica,' p. 48-54.

ROBINS, BENJAMIN, a celebrated mathematician and artilleryist, was born at Bath, in 1707, of parents who were members of the society of Friends, and in such humble circumstances as to be unable to give their son the benefits of a learned education. By the aid however of some occasional instruction and a mind by nature formed to comprehend readily the processes of mathematical investigation, he early attained to a considerable proficiency in the pure sciences; and, as the best means of being enabled to prosecute his favourite studies, he determined to establish himself in London as a private teacher. Some specimens of his skill in the solution of problems having been forwarded to Dr. Pemberton, this learned mathematician conceived as favourable an opinion of his abilities as to encourage him in his design; and accordingly, about the year 1725, Mr. Robins came to town, in the garb and professing the doctrines of a Quaker. The former, after a time, he exchanged for the ordinary dress of the country.

In the metropolis, and apparently in the intervals of leisure which his employment as a teacher afforded, Mr. Robins applied himself to the study of the modern languages, and diligently cultivated the higher departments of science by reading the works of the ancient and the best modern geometers; these he appears to have mastered without difficulty, and in 1727 he distinguished himself by writing a demonstration, which was inserted in the 'Philosophical Transactions' for that year, of the eleventh proposition in Newton's treatise on quadratures.

During the following year he published, in a work entitled the 'Present State of the Republic of Letters,' a refutation of John Bernoulli's treatise on the measure of the active forces of bodies in motion, a subject which had been proposed as a prize question by the Royal Academy of Sciences at Paris, and successfully answered by Maclaurin. The foreign mathematician had endeavoured to support the hypothesis of Leibnitz, that the forces are proportional to the squares of the velocities which they produce, while both Maclaurin and Robins were in favour of the original opinion of Descartes, that the forces are proportional to the velocities simply.

About this time Mr. Robins began to make those experiments for determining the resistance of the air against military projectiles, which have gained for him so much reputation. He is said also to have directed the energies of his mind to the construction of mills, the building of bridges, draining marshes, and making rivers navigable; but it does not appear that he was ever employed in carrying such works into execution. The methods of fortifying places became a favourite study with Mr. Robins, and, in company with some persons of distinction, probably his pupils, he made several excursions to Flanders, where he had opportunities of examining on the ground the works of the great masters in the art.

In 1734, the celebrated bishop of Cloyne, author of the 'Treatise on Human Knowledge,' published a small work called the 'Analyst,' in which, without intending to deny the accuracy of the results, it is attempted to be shown that the principles of fluxions, as they were delivered by Sir Isaac Newton, are not founded upon strictly correct reasoning, inasmuch as it is assumed that the ratio between two variable quantities may have a finite or infinite value when the quantities are nascent or evanescent; that is, as the objector supposes, when both quantities become zero. The objection is founded on a misunderstanding of the subject, for by the term nascent or evanescent is meant, not that each quantity is nothing, but that both are infinitely small, or that they are less than any thing assignable; in which case one of them may, notwithstanding, exceed the other in magnitude a finite or even an infinite number of times. The talents of both Maclaurin and Robins were employed in answering the objection; and for this purpose the latter published, in 1735, 'A Discourse concerning the Certainty of Sir I. Newton's Method of Fluxions, and of Prime and Ultimate Ratios.' It is easy to imagine however that great difficulty would at first be felt in admitting a principle so different from any which occurs in the ancient geometry; and, before the subject was at rest, Mr

Robins added to the first, two or three other discourses explanatory of the calculus.

In 1738 he wrote a defence of Newton against an objection on the subject of the sun's parallax which occurs in a note at the end of Baxter's 'Matho;' and, in the following year, he published some remarks on Euler's treatise of 'Motion,' on Smith's 'Optics,' and on Dr. Jurin's discourse concerning vision.

Mr. Robins's principal work, entitled 'New Principles of Gunnery,' was published in 1742. To this is prefixed an account of the rise and progress of modern fortification, and a history of the invention of gunpowder, with a statement of the steps which had been taken towards a knowledge of the theory of gunnery. Having then determined the value of the explosive force of fired gunpowder and the effect of the heat and moisture of the atmosphere on that force, he proceeds to describe the ballistic pendulum which he had invented, with the manner of employing it in determining the velocities of shot when the guns are charged with given quantities of powder; and he treats at length of the resistance of the air on shot and shells during their flight, a subject till then but little understood. This work had the honour of being translated into German, and commented on by the learned Euler. Some of the opinions advanced in it being questioned by the author of a paper in the 'Philosophical Transactions,' Mr. Robins was induced to reply to the objections, and to give several dissertations on the experiments made by order of the Royal Society in 1746 and 1747; for these he was presented with the annual gold medal. A number of experiments in gunnery subsequently made by Mr. Robins were, after his death, published with the rest of his mathematical works, by Dr. Wilson, and the collection, which makes two volumes 8vo., came out in 1761.

Besides the pursuits of science, Robins appears to have been occasionally occupied with subjects of a political nature. A convention which had been made with the king of Spain, in 1738, respecting the payment of certain claims made by British merchants in compensation for the seizure of their ships and the destruction of their property by the subjects of that monarch, not being considered satisfactory, the opponents of the minister, Sir Robert Walpole, made it the ground of an inquiry into his conduct, and Robins wrote three pamphlets on the occasion. These gained for him considerable reputation, and a committee of the House of Commons being appointed to manage the inquiry, he was chosen its secretary; he did not however hold the post long, as a compromise took place between the opposing parties. About ten years afterwards (1749) Mr. Robins wrote, as a preface to the 'Report of the Proceedings of the Board of Officers on their Inquiry into the Conduct of Sir John Cope,' an apology for the unsuccessful issue of the action at Preston Pans in 1745.

Great difference of opinion exists concerning the share which Mr. Robins had in writing the account of Lord Anson's 'Voyage round the World' (1740-1744). The work was certainly commenced by the Rev. W. Walter, the chaplain of the Centurion, who was in that ship during the greater part of the voyage; but, on the one hand, it is said that the account of the reverend gentleman consisted chiefly of matters taken verbatim from the journals of the naval officers; and that Robins, using the statement of courses, bearings, distances, &c. as materials, composed the introduction and many of the dissertations in the body of the work. On the other hand, we are told that Mr. Robins was consulted only concerning the disposition of the plates, and that he left England before the work was published. It is scarcely probable that a clergyman professing to write the history of such a voyage should have merely copied a sailor's journal, and it may be reasonably supposed that the greater part of the work as it stood in the first edition came from his pen; while, with equal reason, it may be allowed that Mr. Robins added the introduction and the scientific notices. The first edition appeared in 1748, and four were disposed of in the course of that year.

Mr. Robins was offered, in 1749, his choice between two good appointments; the first, to go to Paris as one of the commissioners for settling the boundaries of Acadia; and the other, to be engineer in general to the East India Company. He accepted the latter, and departed in December for Madras, where he arrived in July, 1750. His intentions were to put the fortifications in a good state of defence, and he had actually prepared plans for the purpose when he was

taken ill with a fever. He recovered from this attack, but soon afterwards fell into a declining state, and died on the 29th of July, 1751, at the age of forty-four years.

He left behind him the character of being one of the most accurate mathematicians of his age: and the interest which he took in astronomy may be inferred from his having availed himself of his interest with Lord Anson to procure a new mural quadrant for the Royal Observatory at Greenwich, and having taken with him to India a set of instruments for the purpose of making observations in that country.

Dr. Hutton relates that, in 1741, he was a competitor with Mr. Müller for the post of professor of fortification in the Royal Military Academy at Woolwich; and that the latter succeeded through some private interest in obtaining the appointment.

ROBISON, JOHN, was born in 1739, at Boghall in the county of Stirling. His father, who had been a merchant at Glasgow, but who then resided on his estate, intended that he should enter the clerical order, and accordingly he sent him, at eleven years of age, to the university of that city. Here the youth studied the classics under Dr. Moore, and moral philosophy under Dr. Adam Smith; and at the same time he received instructions in mathematics from Dr. Robert Simson. He took his degree of M.A. in 1756, but he declined the church as a profession.

Being thus compelled to seek an occupation in some other line, he went to London in 1758, with a recommendation from Dr. Simson to Dr. Blair, a prebendary of Westminster, who was then desirous of obtaining some person to instruct the young duke of York in navigation, and to accompany his royal highness in a voyage to sea, an intention being entertained that the prince should serve in the royal navy. The project was afterwards abandoned, but Mr. Robison consented to embark on board the Neptune with a son of Admiral Knowles, who had just then received his appointment as a midshipman. This ship was one of a fleet destined to co-operate with the land-forces under General Wolfe in the reduction of Quebec; and during the voyage Mr. Knowles being promoted to the rank of lieutenant on board the Royal William, Robison, who was then rated as a midshipman, accompanied him. In May, 1759, the fleet arrived in the St. Lawrence, and Mr. Robison was employed in surveying the river and the neighbouring country; at the same time he had an opportunity of making observations concerning the effects produced by the aurora borealis on the magnetic needle.

The success of the expedition is well known; and on the return of the Royal William to England, Mr. Robison accepted an invitation from Admiral Knowles to reside with him at his seat in the country.

In 1762, lieutenant Knowles being appointed to the command of a sloop of war, Robison accompanied him in a voyage to Spain and Portugal, but after being absent six months he returned to England, and quitted entirely the naval service. His great friend and patron the admiral however recommended him to Lord Anson as a person qualified to take charge of Harrison's timekeeper, which, after the labour of thirty-five years, was considered fit to be used for the important purpose of determining the longitude of a ship at sea, and which it was proposed by the Board of Longitude to try during a voyage to the West Indies. In consequence of this recommendation, Mr. Robison, accompanied by a son of Mr. Harrison, sailed to Jamaica, where, on January 26, 1763, the chronometer (whose rate had been determined at Portsmouth, November 6th, 1762) was found, after allowing for that rate, to indicate a time less by 5'' only than that which resulted from the known difference between the longitudes of the two places; and on his return to England, April 2nd, 1763, that is, after an absence of one hundred and forty-seven days, the whole error was found to be but 1' 54½''.

Mr. Robison, being disappointed in his expectations of promotion from the Admiralty, set out for Glasgow in order to resume his studies. Here, enjoying the friendship of Dr. Black and Mr. Watt, the former of whom was on the point of developing his theory of latent heat, and the latter of bringing forward his great improvements on the steam-engine, he felt himself irresistibly impelled towards the pursuit of the physical sciences.

On the removal of Dr. Black to Edinburgh, Mr. Robison was appointed to succeed him, and for four years he gave lectures on natural philosophy at Glasgow; but at the end

of that time he accepted (1770) the appointment of secretary to admiral Sir Charles Knowles, who had been invited by the empress of Russia to superintend the improvements which that sovereign contemplated making in her navy. Two years after his arrival at St. Petersburg, Sir Charles became president of the board of admiralty, and Robison was made inspector of the corps of maritime cadets at Cronstadt, with a liberal salary and the rank of lieutenant-colonel in the Russian service. He gave no instructions, but his duty was to receive the reports of the masters, and to class the cadets in the order of their merits; this he performed for four years, but finding Cronstadt a dreary place of residence during the winter, he accepted the professorship of natural philosophy at Edinburgh, which had become vacant by the death of Dr. Russel. He arrived in that city in June, 1774, bringing with him two or three of the Russian cadets, whose education he had undertaken to superintend; and in the same year he gave a series of lectures on mechanics, optics, electricity, astronomy, &c. This course he continued to deliver annually during the rest of his life, except when ill health obliged him to appoint a substitute for the purpose, improving each subject from time to time by the introduction of every important discovery which it received from the researches of his contemporaries. The lectures are said to have been distinguished by accuracy of definition and clearness as well as brevity of demonstration; and the experiments by which they were illustrated, to have been performed with neatness and precision. But it has been objected to them that they were delivered with a rapidity of utterance which made it difficult for the students to follow him; that he supposed his pupils to possess a higher degree of preparatory information than they had in general attained, even when they had gone through the university course of study, and that the experiments were too few in number to serve the purpose intended by them.

It may be thought that the second objection might have been obviated by merely requiring, in the pupils who were to attend the course of lectures, an adequate portion of mathematical knowledge previous to their admission; but it is probable that the ground of the complaint lay, partly, in the difficulties inseparable from the communication of scientific instruction by general lectures. The result attained after a geometrical investigation on paper may be admitted by a reader who can take the time necessary to satisfy himself of the truth of the several steps and of their dependence on each other; but this is seldom possible when the investigation is delivered from the mouth of a lecturer, who must go on with his subject without waiting for the slow operations of the judgment in the mind of his auditor, and the consequences too often are that, at the expiration of the hour, the latter carries away only a number of ideas in a state of inextricable confusion. In former ages, when books were scarce, there was no other method of conveying instruction to a number of persons than that of general lectures; but at present such lectures can only be useful as auxiliaries in teaching the physical sciences, and probably the chief advantage to be derived from them consists in the opportunities they afford for exhibiting experiments which it may not be in the power of students individually to make. It seems to follow that such exhibitions should not be omitted whenever they can be made conducive to the illustration of the subject.

On settling in Edinburgh, Mr. Robison became a member of the Philosophical Society of that city. In 1785 he was attacked by a disorder which was attended with pain and depression of spirits, but he was only occasionally prevented from performing his duties and following his literary avocations. In 1798 he was made doctor in laws by the University of New Jersey; and in the following year, by that of Glasgow; and in 1800 he was elected a foreign member of the Academy of Sciences at St. Petersburg. In 1785 he wrote a paper which was published in the first volume of the 'Philosophical Transactions of Edinburgh,' on the determination, from his own observations, of the orbit and motion of the Georgium Sidus; and he afterwards wrote one which appeared in the second volume of the same work, on the motion of light as affected by reflecting and refracting substances which are themselves in motion. But his most important works are the numerous articles which, in 1793 and the following years, he contributed to the third edition of the 'Encyclopædia Britannica' and its supplement: a series of treatises which may be considered as forming a complete body of physical sciences for that time.

Mr. Robison was prevailed upon to superintend the publication of Dr. Black's lectures on chemistry, and they came out in 1803, but that science had undergone so great a change since the death of the learned lecturer, that the work excited little interest. In the following year he published a portion, containing dynamics and astronomy, of a book entitled 'Elements of Mechanical Philosophy;' but the substance of it, together with that of some MSS. which had been intended by the author to form part of the second volume, and also the principal articles which had been written for the 'Encyclopædia Britannica,' were collected by Dr., now Sir David, Brewster, under the title of 'A System of Mechanical Philosophy,' and published in 1822, with notes, in 4 vols. 8vo. This work is considered by the late Professor Playfair as firmly establishing the character of Mr. Robison for scientific attainments.

While Mr. Robison was on his journey to Russia in 1770, he was hospitably entertained by the bishop of Liège, who, with all his chapter, constituted a lodge of freemasons; and into this society our traveller was induced to enter. It is unknown from what source he obtained his information respecting its proceedings, but twenty-nine years afterwards he published a remarkable work containing 'A History of the German Illuminati,' whom he describes as the agents in a plot formed by the freemasons to overturn all the religions and governments of Europe. The work met with little attention, and Robison was charged with a degree of credulity scarcely to be expected in a person so well acquainted with the laws of philosophical evidence.

Having taken a slight cold, and suffered an illness of only two days' duration, Mr. Robison died on the 30th of January, 1805, in the 66th year of his age, leaving a widow and four children. He is stated to have been a person of prepossessing countenance, a good linguist, a draughtsman, and an accomplished musician; and it is added that his conversation was both energetic and interesting.

ROBORTELLO, FRANCIS, was born of a noble family, September 9th, 1516. He was educated at Bologna under the celebrated Romulo Amaseo, and he began about 1538 to teach the belles-lettres at Lucca. Five years afterwards he went to Pisa, where he lived during the next five years, and laid the foundation of his fame, which was soon spread over the whole of Italy. In 1549 the senate of Venice elected him successor to Battista Egnazio, professor of rhetoric there, whose advanced age obliged him to retire from public duties. In 1552 Robortello was promoted to the chair of Greek and Latin literature in the university of Padua, in the place of Lazaro Buonamici, who died in that year. Thence he removed in 1557 to Bologna, in order to undertake a similar office in that city. Having been appointed to pronounce here the funeral oration in honour of the emperor Charles V., who died in 1558, he is said to have forgotten the exordium, and to have been incapable of proceeding, which brought him into some disrepute. About this time he had violent disputes with Sigonius, in which Robortello appears to have been the aggressor, and which did not terminate till the senate of Venice employed their authority in imposing silence upon both. Robortello died at Padua, March 18th, 1567, in the fifty-first year of his age, so poor that he did not leave enough to defray the expenses of his funeral, which however was celebrated by the University in a style of great magnificence.

Robortello seems to have been naturally pugnacious, and he was continually involving himself in disputes with men superior to himself. He could not refrain from attacking such writers as Erasmus, Paulo Manuzio, Muretus, and Henry Stephens. He was however a man of considerable talent and learning, and he published several books of great utility. The following are his principal works: 1, 'Variorum Locorum Annotationes tam in Græcis quam in Latinis Auctoribus,' Venice, 1543, 8vo.; 'De Historica Facultate,' &c., Florence, 1548, 8vo., being several treatises on Greek and Roman literature, all of which are inserted by Gruter in his 'Thesaurus Criticus.' 3, 'De Convenientiâ Supputationis Livianæ Annorum cum Marmoribus Romanis quæ in Capitolio sunt; De Arte sive Ratione corrigendi Veteres Auctores Disputatio,' Padua, 1557, folio; 4, 'De Vita et Vietu Populi Romani sub Imperatoribus Cæs. Augustis,' Bologna, 1559, folio. Besides these he published editions of Aristotle's 'Poetica,' the 'Tragedies' of Æschylus, the 'Tactics' of Ælian, and Longinus 'On the Sublime.'

ROBULINA. [FORAMI... p. 348.]

**ROBUSTI.** [TINTORETTO.]

**ROCCA**, in Italian, means a strong hold or fortified place, perched upon a rock or steep hill, a position common to many provincial towns in Italy. Rocca, properly speaking, means the castle or keep, but it has also become an appellative for the town or village which generally adjoins it. The appellative Rocca is most frequent in the Neapolitan and Papal states, and in Piedmont. The most notable places of this name are Rocca Morfina, in Campania, once the capital of the Aurunci; Rocca di Papa, on the Alban Mount, near Rome; Rocca Gorga, near Piperno; Rocca Rasa, and Rocca Vall' Oscura, two stations in the Abruzzo, on the high road from Naples to Sulmona, in the mountain tract which divides the valley of the Sangro from that of the Pescara; Roccabruna, in the province of Cuneo in Piedmont; Roccaforte, in the province of Mondovi; Roccabione, in the province of Cuneo, &c.

**ROCCELLA.** [ORCHIL.]

**ROCHDALE**, a parliamentary borough in the hundred of Salford, 12½ miles north-west of Manchester, and 202½ from the General Post-office, London, by the mail road through Dunstable, Northampton, Market Harborough, Leicester, Derby, Belper, Matlock, and Buxton to Manchester; in 53° 37' N. lat. and 2° 10' W. long.

The parish of Rochdale is one of the most extensive in the kingdom. It extends into Agbrigg wapentake, in the West Riding of Yorkshire, and comprises 58,620 statute acres; with a population, in 1831, of 74,427, of which 40,340 acres and 58,441 inhabitants are in Lancashire. The Lancashire part was formerly divided into four parts, now into ten townships, as follows:—

Former Division.	Present Division.	Pop. 1831.
Honorsfield or Hundersfeild .	Blatchinworth and Calderbrook .	4,221
	Todmorden and Walsden . .	6,054
	Wardleworth . .	9,360
	Whitworth and Brandwood .	*
	Wuerdale and Wardale . . . .	6,754
Spotland . . . .	Spotland, further side . . . .	15,325
	Spotland, nearer side . . . .

Chapelry of Saddleworth cum-Quick .		15,986
		74,427

Rochdale derives its name from the Roch (which flows into the Irwell, a tributary of the Mersey); it is called Redham in the Domesday Survey. In the time of Edward III. some Flemings introduced the woollen manufacture into the parish; and two centuries afterwards, viz. in the reign of Elizabeth, it was still famous for its woollens. In 1610 there were no fewer than five fulling-mills established on the Spodden or Spotland brook in this parish.

The town of Rochdale is situated on both sides of the river Roch, into which, on the north bank, two brooks flow, the Hee brook just above, and the Spodden or Spotland brook just below the town. That part of the town which is on the south side of the Roch is in the township of Castleton, and is connected by three bridges with the more extensive part on the north side of the Roch, which extends into the townships of Wardleworth and Spotland, and a small part into the township of Wuerdale and Wardale. The streets are irregularly laid out, and many of them are narrow and inconvenient. Within the last fifteen years however great improvements have taken place, several of the streets have been widened and otherwise improved, and a new market-house completed. The houses are chiefly of brick; some of the best are built of freestone quarried in the neighbourhood: the streets are well paved, and lighted with gas; and the town is supplied with water from four reservoirs in Castleton township. The old bridge over the Roch (a stone bridge of three arches) has been widened

and improved; about a quarter of a mile below it is another stone bridge of one arch, and just above it an iron bridge for foot passengers. There are several churches and chapels, episcopal and dissenting. The parish church was built within about a century of the time of Domesday Survey, and was dedicated to St. Cedd or St. Chad. It is partly in the early English style, with a few remains of Norman character in the interior. The nave and south aisle, and the tower, which is embattled and crowned with pinnacles, are of later date. The windows of the choir have rich tracery; and the font and many of the monuments are very antient. St. Mary's church was built in 1740 as a chapel-of-ease to the parish church; it is a plain brick building. St. James's, built in 1814, is a Gothic stone edifice, with a square embattled tower. There are other churches or episcopal chapels (some of them erected of late years) in the out-parts of the parish. There are in the town chapels for Presbyterians, Baptists (two), Methodists (Wesleyan, New and Primitive), Independents, the countess of Huntingdon's connexion, Unitarians, and Roman Catholics: all these, except the Presbyterian chapel, have been built or rebuilt in the present century.

The manufactures of this place are very important; they comprehend woollen goods, as baize, flannels, coatings, and friezes, and strong calicos and other goods in cottons; but the woollen fabrics form the staple. Hats are also made, and cotton yarn is spun. Coal is dug, and slates, flagstones, and freestone are abundantly quarried in the parish, and there are iron-works in Butterworth township. Steam-power is extensively employed by the manufacturers. There are two weekly markets; on Monday for manufactured goods, wool, oil, dye-stuffs, and grain; and on Saturday for provisions. There are three yearly fairs: on May 14th; on Whit-Tuesday; and on November 7th; all for cattle, horses, and pedlary. The Rochdale canal, which unites the duke of Bridgewater's canal at Manchester with the Calder and Ribble navigation near Halifax in Yorkshire, passes near the town on the south-east side of it.

The town is in the jurisdiction of the county magistrates. The lord of the manor holds a court baron every three weeks for the recovery of debts under 40s. There are a neat town-hall, used also as a news-room, and a commodious gaol called the New Bailey.

Rochdale was erected into a parliamentary borough by the Reform Act; and the boundary, as defined by the Boundary Act, coincides with the boundary laid down in a previous local police act, and is a circle drawn with a radius of three-quarters of a mile from the old market-place in the very heart of the town. Rochdale returns one member to parliament: the number of voters on the register for 1834-5 was 746; for 1835-6, 695.

The borough of Rochdale is a vicarage, one of the richest in the kingdom, at present in the archdeaconry and diocese of Chester; but to be transferred to Manchester when that see is erected. Its clear yearly value is estimated at 1730l., with a glebe-house: it is in the gift of the archbishop of Canterbury. The glebe comprehends 200 acres of land, a part of it built upon.

There were, in 1833, in the three townships of Castleton, Wardleworth, and Spotland, sixty-eight schools of all kinds for daily instruction, with 2289 scholars; and twenty-eight Sunday-schools, with 4036 scholars. Some of these schools are probably out of the town in the out-parts of the townships. We have not included Wuerdale and Wardale township, as only a very small part of the town is in it. Four of the day-schools are endowed; one is a national school, the children of which attend also on Sunday.

Littleborough, in the parish of Rochdale, was a Roman post, but the remains of it have nearly or quite disappeared. Roman coins, and part of a statue of Victory, of silver, have been dug up. The mound of an antient castle, said to be of Saxon original, to which the township of Castleton owes its name, is mentioned in the 'Beauties of England and Wales.' In the chapelry of Saddleworth, in the Yorkshire part of the parish, are some Druidical remains. (Baines's *Hist. of Lancashire; Parliamentary Papers.*)

**ROCHFORT**, a town and port of France, capital of an arrondissement in the department of Charente Inférieure, 300 miles south-west of Paris by the road through Orléans, Tours, Poitiers, and Niort; in 45° 56' N. lat., and 0° 59' W. long.

Rochfort was in the middle ages in the power of the English, from whom it was taken by Charles VII. Its

\* Not given in the Population Returns; probably included in one of the other divisions.

capabilities as a naval station having attracted notice, works were commenced, in the reign of Louis XIV., in A.D. 1666; since which time the immense works carried on have rendered it one of the most important naval stations of France. An expedition against Rochefort was sent out from England, A.D. 1757, but from cowardice or mismanagement it ended in a disgraceful failure.

The town stands in a low marshy district, which in the summer and autumn renders the town unhealthy: it is on the northern bank of the Charente, about ten or twelve miles from the sea; the river, though not very large, affords sufficient depth of water at all times to float the largest vessels. The town is regularly fortified, and the approach is defended by forts on the Isle of Aix, and at the mouth or on the banks of the river. The ramparts are planted with trees. The streets are well laid out, broad, and straight, and well lighted with lamps and reflectors; they are watered daily in the summer months by a forcing-pump from a large reservoir. Some of the streets are planted with poplars and acacias, and the principal of them terminate on the parade. The houses are well built, but low, so as less to impede the circulation of the air. The harbour is formed by the Charente. The arsenal is one of the most extensive and finest in the kingdom; it comprehends an armoury, a large dock for building, basins for repairing, and immense storehouses, extending more than 1300 feet, of every necessary for equipping vessels, a cannon-foundry, a ropewalk about 1250 feet long, a victualling-office, barracks, a dépôt for convicts, with a saw-mill, and a mill which cleans the harbour, moves the cylinders for rolling out sheet-metal, and performs other work; and a fine naval hospital, including eighteen wards, besides the officers' apartments, and containing 1240 iron beds. In the part of the harbour reserved for merchantmen, ships of 600 tons, fully laden, can come up to the quays. There is an Exchange.

The population of Rochefort, in 1831, was 10,332 for the town, or 14,040 for the whole commune; in 1836 it was 15,441 for the commune. Besides the business connected with the arsenal, vessels are fitted out for the cod fishery, and a considerable coasting-trade is carried on. The chief exports are wine, brandy, corn, and salt. There are three yearly fairs. Rochefort has two churches, three chapels, a general hospital, besides that for the navy, a foundling hospital, a high school, a school of navigation and hydrography, a school of naval medicine, schools of surgery and mathematics, schools on the monitorial system for drawing, singing, and music; a society of literature, science, and art; a public library of 1500 volumes, a library of 10,000 volumes for the navy, a cabinet of natural history, a botanic garden, and a theatre. A consistory of the Reformed (or Calvinistic) church is established here; and there is a Protestant Bible Society.

The arrondissement of Rochefort contained, in 1831, forty-seven communes, and was divided into four cantons or districts, each under a justice of the peace. Its population at that time was 48,836.

**ROCHEFOUCAULD, or ROCHEFOUCAULT, LA.**  
[CHARENTE.]

**ROCHEFOUCAULD, FRANÇOIS, DUC DE LA,** of a distinguished noble family of France, was born in 1613. He appeared early at the court of Louis XIII., and showed some talents and ambition, but was kept out of employment and favour by the jealousy of Cardinal Richelieu. In the early part of the subsequent reign of Louis XIV. he figured in the civil war of La Fronde. He attached himself to the party of the Duchess of Longueville, whose avowed admirer he was, and he was severely wounded at the siege of Bordeaux, and in the battle of St. Antoine at Paris. After Louis XIV. had firmly established the monarchical authority, La Rochefoucauld withdrew to private life. In this second part of his career he exhibited private virtues which atoned for the folly and violence of his younger years. He was intimate with Madame de la Fayette, and with Madame de Sévigné, who speaks of him, in her correspondence, in terms of real esteem. He died in 1680, with calm and christian-like resignation. The Cardinal de Retz, his contemporary and fellow-partizan, in his 'Memoirs,' says of him, that he was always irresolute in his temper; a good soldier, with no military talent; a bad courtier, though ambitious of figuring and meddling in intrigue; but at the same time he praises 'his natural good sense, the ease and mildness of his manners,' and says that 'he was a very upright man in private life.' La Rochefoucauld left several works, the prin-

cipal of which are, 'Mémoires de la Régence d'Anne d'Autriche,' and his 'Maximes,' or 'Pensées,' for which he is best known as an author. This book has made much noise in the world; it has been abused, criticised, controverted, and yet no one can deny that there is a great deal of truth in it, though it generalises too much. La Rochefoucauld attributes all the actions of men, good or bad, to the moving-spring of self-interest. Friendship is an exchange of good offices, generosity is the means of gaining good opinion, justice itself is derived from the fear of suffering from the oppression of others. This may be all true, but still there are actions in which men can have no self-interest in view, in which they act from enthusiasm, or a strong sense of duty, or from benevolence, or some motive other than self-interest; such are, for instance, the self-devotedness of the patriot, the perseverance of the upright man through good and evil report, the sacrifice made by pure love, and above all the calm resignation of the Christian martyr. These and other similar instances La Rochefoucauld has not taken into account, because probably he had seen no specimen of them. La Rochefoucauld has accounted for most actions of a great proportion of mankind, perhaps by far the greater, and for so doing he has been abused, because, as a French lady observed, he has told every body's secret. He has placed himself, with regard to private morality, in the same predicament as Machiavelli with regard to political morality. [MACHIAVELLI.] J. J. Rousseau, who was certainly not free from selfishness, has abused La Rochefoucauld's *Maximes*, and yet in his 'Emile' he observes that 'selfishness is the main spring of all our actions,' and that 'authors, while they are for ever talking of truth, which they care little about, think chiefly of their own interest, of which they do not talk.' La Fontaine, in his fable (b. i., 11) 'L'Homme et son Image,' has made an ingenious defence of La Rochefoucauld's book.

La Rochefoucauld's 'Maximes' have gone through many editions. The 'Œuvres de la Rochefoucauld,' 1818, contain, besides his already published works, several inedited letters and a biographical notice.

Several other individuals of the same family have acquired an historical name, among others, Louis Alexandre de la Rochefoucauld, Peer of France, who embraced the popular part at the beginning of the great French revolution, and displayed considerable violence in his sentiments, notwithstanding which, after the 10th of August, he was massacred by the Jacobins as an aristocrat.

**ROCHELLE, LA,** a town in France, capital of the department of Charente Inférieure, 301 miles south-west of Paris by the road through Orléans, Tours, Poitiers, and Niort; in 46° 8' N. lat. and 1° 8' W. long.

La Rochelle was antiently a small town and fort belonging to the lords of Mauléon, from whom it was taken by one of the counts of Poitou. On the marriage of Henry II. of England with Eléonore of Guienne, heiress of Poitou, it came into the hands of the kings of England, from whom it obtained considerable municipal privileges. It was taken from the English by Louis VIII., A.D. 1224, was again ceded to them by the treaty of Bretigny, A.D. 1360, but finally recovered, A.D. 1372, by Duguesclin. Under the French kings the privileges of the town were further augmented; the importance of the place increased, and upon the acquisition of it by the Huguenots, A.D. 1557, it became a sort of republic, and the stronghold of their party. It was besieged in 1574, by the duke of Anjou, but in vain: the garrison was commanded by La Noue. In 1627 it was again besieged by the royal forces under Louis XIII. and his minister Richelieu. By means of an immense barrier of piles carried across the entrance of the harbour, assistance from the sea was precluded, and the attempt of the English to succour the townsmen was defeated by the incapacity of the duke of Buckingham, the favourite of Charles I., who commanded the expedition. The townsmen, under the mayor Guitton, held out for thirteen months, but, after undergoing the most dreadful extremities from famine, were compelled to surrender, and the power of the Huguenot party was finally broken. Rochelle was fortified anew by Vauban, by order of Louis XIV., and is still maintained as a fortified town.

The town stands on the northern side of a small inlet of the Atlantic, which extends eastward about two miles into the land, and terminates, just above Rochelle, in a salt marsh. The entrance of this inlet, which serves as the roadstead or outer harbour of the town, is defended by forts;

and the approaches are further protected by the works on the Isle of Ré and the Isle of Aix. The fortifications on the land side, though extensive, including nineteen large bastions and eight half moons, are not reputed to be strong, but on the sea side the security of the place is regarded as complete. There are seven gates. The town is well laid out; the streets are for the most part straight, broad, clean, and lined with well-built houses adorned with porticos, but not of great elevation. There are several fountains, which contribute to the cleanliness of the place. The squares are tolerably numerous, but all of irregular form: the principal are the Place de la Préfecture and the Parade, both planted with trees. The promenade of Le Mail commands a fine prospect of the harbour and the sea. The principal public buildings are the cathedral, the seminary for the priesthood, the bishop's palace, the town-hall, a fine Gothic building, the courts of law, the Exchange, the post-office, the guard-house of the departmental guard, the theatre, the curious clock-tower, the general hospital (or hospital of St. Louis), the orphan hospital, the office of the prefecture, the mint, the markets, the abattoir, or public slaughter-house, the barracks, and the elegant sea-bathing rooms erected in 1827. There are four churches besides the cathedral, several chapels, four nunneries, a Protestant church, a house of correction, one military and two other prisons, and an hospital or almshouse, besides the two mentioned above.

The dock or inner harbour is in the south part of the town, by which it is surrounded on nearly every side, and comprehends two basins, one (Le Havre), adjacent to the roadstead, dry at low water, and bounded by a range of fine quays; the second is closed by flood gates, by means of which the shipping are kept constantly afloat; this basin also is surrounded by quays. The Canal Maubec, which runs from the north-eastern corner of this basin, divides the city into two parts, which communicate by three bridges over the canal. Ships of any burden can get up to La Rochelle at high water.

The population of La Rochelle in 1831 was 14,632; in 1836 it was 14,857. The exports from the port comprehend brandy and other spirits, wine, salt, flour, cheese, butter, oil, and linen cloth: the imports comprehend colonial produce and groceries. The townsmen refine sugar, spin cotton-yarn, make pitch, tar, catgut, and gloves, build ships, and engage in the Newfoundland cod fishery. There are two fairs in the year, each of five days. Besides the establishments already noticed, there are courts of law, a chamber of commerce and several administrative or fiscal government offices, an academy of belles-lettres, sciences, and arts; a high school or college, a school of navigation, a drawing-school, and a school of midwifery; a public library of 20,000 volumes, a museum of natural history, and a botanic garden; an agricultural society, a Protestant Bible society, and some charitable institutions.

Rochelle is the head-quarters of the twelfth military division, which comprehends the departments of Charente Inférieure, Deux Sèvres, and Vendée. The bishopric of Maillezay was transferred to Rochelle in 1665: the bishop is a suffragan of the archbishop of Bordeaux: his diocese comprehends the department of Charente Inférieure. The arrondissement of Rochelle comprehends fifty-five communes, and is divided into seven cantons or districts, each under a justice of the peace. The population in 1831 was 77,589.

Rochelle salt, a purgative medicine of some reputation, was discovered by M. Seignette, an apothecary of Rochelle, whence its name. It is sometimes called Seignette salt. Réaumur, well known from his graduation of the thermometer and in other respects, and Billaud-Varennes, the conventionalist, were natives of Rochelle.

ROCHESTER, an ancient city in the county of Kent, situated on the south or right bank of the Medway, immediately adjacent to the parliamentary borough of Chatham [CHATHAM], with which it forms one continuous town: it is 29 miles from the General Post-office, London, by the road through Dartford and Gravesend; and nearly the same distance in a direct line.

Rochester probably existed antecedently to the Roman invasion, at any rate antecedently to the conquest of the southern part of the island under Claudius, and its ancient name, which is of Celtic origin, denotes that it was at a passage over the river. Its Roman and Saxon names, from the latter of which by corruption the modern Rochester is derived, are given elsewhere. [KENT, vol. xiii., p. 192, col. 1.]

During the independence of the Saxon kingdom of Kent it was of importance both as the seat of a bishopric (established about A.D. 604) and as a place of strength situated at the passage of the Medway. It was destroyed by Ethelred, king of Mercia, A.D. 676, and by the Danes in the time of Ethelwulf, A.D. 839: it was besieged by the same enemies (A.D. 885), but relieved by Alfred, who drove the invaders to their ships. In the time of Ethelred II. (A.D. 986) it was besieged, but in vain, by that king, who had a quarrel with the bishop; and was sacked (A.D. 998 or 999) by the Danes. After the Conquest, William the Conqueror either built or more probably repaired and strengthened a castle here, and placed it under the command of his brother Odo, bishop of Bayeux. In the reign of William Rufus this castle was besieged and taken by the king; against whom Odo had rebelled. In the reign of Henry I. (A.D. 1130), and again in that of Stephen (A.D. 1137), and a third time in that of Henry II. (A.D. 1177 or 1179), the city was nearly destroyed by fire. In the civil war of John, the castle was taken by that prince from the insurgent barons (A.D. 1215), and retaken next year by the Dauphin Louis. In 1264 the town was taken, and the castle besieged and reduced to extremity, by the confederate barons under Simon de Montfort, Earl of Leicester, but he was obliged to raise the siege and march against the king. In the rising of the commons under Wat Tyler, the castle was assailed, with what success is not clear. Edward IV. was the last king who paid any attention to the repair of the castle. James II. embarked at Rochester when he fled to France after his abdication, A.D. 1688.

The town stands chiefly on a low narrow tract which borders the Medway, and is backed by the chalk hills, which rise from the river with a rather steep ascent. It consists of several streets irregularly laid out; the principal street leads from the bridge at the west end of the town into Chatham on the east side. On the western side of the Medway are Strood and Frindsbury, considerable portions of which two parishes have been added to the town both for parliamentary and municipal purposes. A part of Strood and also a small part of Chatham were previously in the city of Rochester. The streets are paved, and lighted with gas, and the houses commonly of respectable appearance. The environs are extremely pleasant, and in the outskirts of the town are a few handsome villas, and rows of neat modern houses built on the higher ground which rises from the low margin of the river.

The cathedral is situated on the south side of the High-street within the ancient Priory gate. It consists of a nave with side aisles, a choir (the floor of which is raised ten steps above the floor of the nave), a principal transept, at the junction of the nave and choir, and a smaller transept at the east end of the choir. At the intersection of the principal transept is a central tower erected in 1825; at the western end of the church there appear to have been originally four low towers, two on each side the doorway and two at the extremities; of these only two now remain, which are of different style. On the north side of the choir, between the two transepts, but nearer to the principal one, is a low square tower, now in ruins, called Gundulph's tower. The dimensions of the building are as follows: length of the nave 150 feet; breadth with side aisles 66 feet; length of the choir 156 feet; making the total length of the church 306 feet; length of the principal transept 122 feet; of the smaller transept 90 feet; area of Gundulph's tower, inside, 24 feet square; walls of Gundulph's tower 6 feet thick. Extent of the west front of the cathedral 81 feet. The chapter-house is in ruins; a mean building, erected in the place of it, serves for chapter-house and library. The nave is part of the structure of Bishop Gundulph, who rebuilt the cathedral near the close of the eleventh century. The west front is a fine specimen of enriched Norman architecture; but the great west window is an insertion of perpendicular character, as are most of the other windows of the nave. The nave has Norman piers and arches, except in the part nearest the choir, where the arches are early English. The roof of the nave is now flat; but there are indications that it was intended at first to be vaulted. On the south side of the church are some other Norman portions, which appear to have been the cloisters, and some other of the usual monastic adjuncts. Most of the eastern part of the church is of plain early English architecture, of good composition, without much ornament: the details of the doors and of some other por-

tions are very good: the roof of the choir and of both transepts is vaulted and groined, except in one part, which was never finished. The pillars of the choir are of Petworth marble. The crypt is very spacious, extending under the buildings of the choir; its character is early English, scarcely differing, in one part, from Norman. There are a few antient monuments, singular rather than beautiful, and much mutilated. The old altar-piece, a painting by West, of the Angels appearing to the Shepherds, is now in Chatham church. There are several chapels, in one of which the bishop holds his consistory court. The architecture and masonry of Gundulph's tower give reason to think that it is improperly ascribed to him. The interior of the cathedral, has lately (1841) been repaired, and in many places restored to its original beauty, by the present dean and chapter, who have exhibited equal taste and liberality in the improvements which they have suggested or sanctioned. Arches and windows for a long time filled up have been opened, especially in the north transept, which now forms a valuable study for the architect and antiquary, as a specimen of early English, not excelled, if equalled, by any in the kingdom.

There are two parish churches in Rochester, St. Margaret and St. Nicholas; they are not remarkable for their architecture, but each has a very antient stone font, and St. Margaret's contains several antient monuments. Within the city is a commodious Wesleyan chapel, and a meeting-house belonging to the Society of Friends.

There was probably a bridge at Rochester at a very early period, but there is no distinct mention of it till the time of Henry I., when it appears to have been of wood, with ten arches or spaces between the piers, and a total length of about 431 feet. The frequent damage sustained by this wooden bridge and its continual need of repair led to the erection of the present one (a little above the site of the more antient structure), which was completed in the reign of Richard II. It is a stone bridge of eleven arches, 560 feet long, with a stone parapet and balustrades. The conservators of the bridge are an incorporated body under the title of the 'Wardens and Commonalty of the new Bridge of Rochester,' and have considerable funds appropriated to the repair of the bridge. The approach to Rochester from the London side of the bridge is very striking.

The castle is on the bank of the Medway, just above the bridge. The outer walls were 20 feet high above the ground, and 7 feet thick, strengthened with towers, square and round, and defended by a ditch on every side except the west side, where it was washed by the Medway. These walls enclosed a quadrangular area nearly 300 feet square, and are, with their towers, now in ruins. In the south-eastern angle of the court was the keep, a massive building yet standing, about 70 feet square on the outside, and rising about 104 feet from the ground, with a tower at each angle rising 12 feet above the rest of the building; three of these towers are square, that at the south-east angle is round. On the north side near the north-eastern angle is another tower, through which was the entrance; it joins the keep, and rises about two-thirds of its height. This smaller tower covers half the breadth of the northern side of the keep, and projects from it about 18 or 20 feet. The roof and floors have been destroyed: there were originally three stories besides the vaulted basements: each story was divided into two apartments by a partition wall rising to the top of the keep, with open arches or doorways on each floor, and having a well 2 feet 9 inches in diameter curiously built into it, to which well there was access from each floor. The walls of the castle are of great thickness, built of Kentish ragstone, cemented with a grouting or mortar equal to the stone itself in hardness. The coigns are of Caen stone. The architecture is Norman, except perhaps the round tower at the south-eastern angle, which was rebuilt in the place of the original square one destroyed when King John besieged and took the castle. The four towers at the angles rose one story above the keep, and, as well as the keep itself and the entrance tower, were surmounted with a platform, with parapet and embrasures.

The other public buildings are, a commodious town-hall, with a market-house beneath, and a small gaol adjacent; a clock-house, built by Sir Cloudesley Shovel on the site of a former town-hall; a neat theatre; and the bridge chamber or record-room, opposite the east end of the bridge. There are some remains of the city walls; and part of the fortifications of Chatham, especially Fort Pitt, are within the city.

Strood and Frindsbury, considerable portions of which

have been added to Rochester both by the Boundary and Municipal Reform Acts, are on the north-west side of the Medway; Strood on the London road, and Frindsbury a little to the north-east. Strood consists of one principal street of irregularly built houses; the place has improved considerably of late years; it has a neat church. Frindsbury consists chiefly of one long street. The church is on an eminence commanding a very fine prospect. There is a Methodist meeting-house. Upnor Castle on the Medway is in Frindsbury parish: it consists of an oblong central building, with a round tower at each end, and is surrounded by a moat; it was used during the late war as a powder-magazine.

The population of the borough, as enlarged by the above acts, was as follows, according to the census of 1831:—

Rochester old borough:

St. Margaret's	.	.	5,025
St. Nicholas	.	.	3,050
Cathedral precincts	.	.	138
Strood intra	.	.	1,173
Chatham intra	.	.	505

9,891

Addition—Strood extra and Frindsbury

2,167

12,058

There are no manufactures in Rochester. Trading vessels come up to the bridge, where they discharge their cargoes, chiefly coals, which are conveyed up the river in small craft. The oyster fishery is carried on with great activity under the direction of the corporation, who have jurisdiction over the fisheries in the creeks and branches of the Medway. Considerable quantities of oysters are sent to London or exported to Holland; a considerable quantity of shrimps also are sent to London. There are two weekly markets, one, lately established, on Tuesday for corn, and one on Friday for provisions; and there is a monthly cattle-market. The fairs are almost disused. A canal was cut some years ago from the Medway to the Thames at Gravesend Reach, but the undertaking has not been profitable. This canal is carried through the chalk hills by a tunnel two miles and one furlong in length, which commences near Rochester bridge.

The corporation of Rochester, under the Municipal Reform Act, consists of six aldermen and eighteen councillors: the city is divided into three wards. The corporation have exclusive jurisdiction over all offences committed within the city and liberties. There are no quarter sessions; but petty sessions are held twice a week; and there is a court of requests having jurisdiction over several neighbouring parishes. Some other courts connected with the corporate jurisdiction are held. Rochester has returned members to parliament since the reign of Edward I. The number of voters on the register for 1834-5 was 967; for 1835-6, 1002.

The livings of St. Nicholas and St. Margaret are vicarages of the value of 389*l.* and 136*l.* respectively; there are glebe-houses to both. Strood is a perpetual curacy, of the clear yearly value of 238*l.*, and Frindsbury a vicarage, of the clear yearly value of 449*l.* They are all in the diocese and archdeaconry of Rochester.

There were in the city of Rochester and in the parishes of Frindsbury and Strood, in 1833, forty schools, in which 1219 children, viz. 567 boys and 574 girls, and 78 of sex not specified, were receiving daily instruction; and five Sunday schools, with 761 scholars, viz. 369 boys and 392 girls. One of these schools is a proprietary school; and another, called the King's School, is governed by the dean and chapter. An endowed mathematical free-school was established in 1701. Among the schools enumerated were two large national schools. There is an almshouse and dormitory for poor travellers in the town, where they receive entertainment and a night's lodging.

ROCHESTER DIOCESE.—The diocese of Rochester is one of the smallest in the kingdom, and one of the most slenderly endowed. It contains but one archdeaconry, that of Rochester, divided into the three deaneries of Rochester, Dartford, and Malling, all in the western part of the county of Kent. The deanery of Shoreham, though nearly on every side enclosed within the diocese of Rochester, and frequently reckoned as a part of it, is in the peculiar jurisdiction of the archbishop of Canterbury. The number of parishes in the diocese (not including the deanery of Shoreham) is given by Hasted (*Hist. of Kent*, vol. ii., Canterbury, 1782) at ninety-nine; in Lewis's 'Topographical Dict.' it is given at

ninety-one. We believe the latter account to be nearly correct as to the number of parishes, but the additions of dependent chapelries will swell the number to that given by Hasted, and by including ecclesiastical divisions lately formed, to a greater number still. The clear yearly revenue of the bishopric is estimated at 1459*l.* The gross yearly revenue of the cathedral is estimated at 7178*l.*; but the payment of stipends, the maintenance of the fabric, and the support of the grammar-school, cause a deduction of 2072*l.*; leaving 5106*l.* to be divided among the corporation, which consists of the dean and six prebendaries. (*Report of the Ecclesiastical Revenue Commissioners, 1835.*) There were formerly six minor canons, but now there are only three, who all in succession the offices of sacrist and precentor, and a master and usher of the King's School.

It is recommended by the Church Commissioners to make great alterations in this diocese. They propose to transfer to the diocese of London those parishes of the deanery of Dartford which are nearest the metropolis; and to the diocese of Canterbury the remainder of the deanery of Dartford and the whole of that of Malling: these additions, with that of the deanery of Shoreham, will place nearly the whole of Kent under the see of Canterbury. In return it is proposed to add to Rochester nearly the whole of the archdeaconry of Essex (including the deaneries of Rochford, Dengey, Chelmsford, Barstaple, Chafford, Ongar, and part of Barking) and the whole of the archdeaconries of Middlesex (containing the deaneries of Hedningham, Dunmow, Harlow, and Braughing), Colchester (containing the deaneries of Tendering, Colchester, Lexden, Witham, Sampford, Newport, and the jurisdiction of Waltham), and Saint Alban's; all taken from the diocese of London; and the four deaneries of Baldock, Hitchin, Berkhamsted, and Hertford, in the archdeaconry of Huntingdon, taken from Lincoln. By these changes nearly the whole of Essex and the whole of Hertfordshire will be placed under the see of Rochester, which will retain only the deanery of Rochester of its more ancient diocese.

The diocese of Rochester was founded A.D. 604. Justus, one of the companions of Augustin, the apostle of the Anglo-Saxons, was the first bishop; but on the relapse of Eadbald, king of Kent, into paganism, he fled to the Continent. On the reconversion of Eadbald, he returned. He was translated to Canterbury, A.D. 624. Gundulph, who was bishop from A.D. 1077 to 1107, rebuilt the cathedral: part of his building remains in the nave of the present edifice. Walter de Merton, who was bishop from A.D. 1274 to 1277, was chancellor of England and founder of Merton College, Oxford. John Fisher, bishop from A.D. 1504 to 1535, was beheaded by Henry VIII. for denying the king's supremacy, in the 80th year of his age. Thomas Sprat, bishop from A.D. 1684 to 1713, was a writer of considerable note; and his successor, Francis Atterbury (bishop from 1713 to 1723), is celebrated both as an eminent writer and a leading Jacobite. Zachary Pearce, bishop from A.D. 1756 to 1774, is well known as a commentator and critic.

ROCHESTER, LORD. [WILMOT.]

ROCHFORD. [ESSEX.]

ROCK ALUM. [ALUM.]

ROCK CRYSTAL [QUARTZ]

ROCK MANAKIN. [RUPICOLINÆ.]

ROCK-PLANTS are those plants which are distinguished by growing on or among naked rocks, and are confined to no particular region or latitude. De Candolle (*Dictionnaire des Sciences Naturelles*, vol. xviii) observes that they pass by insensible gradations into the plants that inhabit walls, rocky and stony places, and even gravelly places, from which they pass into those that are found particularly on sands and barren soils. Most of the plants growing on rocks have but a small development of root, as they derive their nutriment principally from the air, through the medium of their leaves and stems. A large number of the Cryptogamia, especially mosses and lichens, belong to this class. Many of these plants present a remarkable diversity, according to the nature of the rocks on which they grow. This is a subject which has not received the attention that it deserves.

Rock-plants are often introduced into gardens for the purposes of ornament, for which the size and beauty of the flowers of many of them peculiarly adapt them. [ROCK-WORK.]

ROCK RIVER. [MISSISSIPPI, River.]

ROCK SALT. [SODIUM.]

ROCK-WORK, in gardening, an elevation, composed of

earth and other loose materials, and covered with stones and fragments of rock, &c., amongst which plants adapted for such a situation are grown. When the rock-work is managed skilfully, and in accordance with surrounding objects, it may be made to add much to the beauty and interest of the garden. In the first place a proper situation should be selected, and the character of the rocks should harmonise with the situation. Simple outlines and surfaces not broken into fantastic shapes, are best suited to show off the plants; in this respect hints should be taken from the natural rock-work that often meets us by the mountain side. Cones and peaks of unnatural shape and size should be avoided. A ground-plan in the form of a crescent or of an irregular figure is best; the middle portions should be the broadest and most elevated. When large portions are thus laid out, steps may be formed leading to basins of water on the sides or summits of the rock-work. These basins of water have two advantages: first, in permitting the growth of various aquatic plants; and secondly, in keeping the great mass of earth in the rock-work moist and cool. The best stones for rock-work are those which resist the action of the air, and they may be selected according to convenience from the rocks of the neighbourhood in which they are used. The most irregular ought to be chosen, especially those with cavities in them, which may be filled with earth for the growth of mosses, ferns, and small plants. Frequently stones are met with covered with lichens, which, from their picturesque colours, have a pleasing effect. Of these, the *Lichen atroflavus*, *geographicus*, *ventosus*, *perellus*, and *stellaris*, are most common. Such stones are mostly large, and are best adapted for the base of the rock-work. Portions of ruins, antiquities, corals, petrefactions, idols, shells, and Chinese garden-ornaments are often introduced into rock-work, but they give too much of an artificial character to the work, and it is questionable whether they can ever be introduced among plants with good effect.

Although the rock-work is intended to present a mountainous or rocky vegetation in a small space, yet there are many circumstances that prevent the growth of true mountain and rock plants in such a situation; but the dry ridges of earth and stones of which it is composed afford a favourable situation for the plants that chiefly occupy the dry soil of plains. On this account, small shrubs and creeping plants of any kind that will grow in a dry soil are selected for rock-work. We shall here point out those which may with advantage be cultivated for this purpose.

The natural order Leguminosæ affords a great number of plants fitted for rock-work. The triangular *Genista* (*Genista triquetra*) is a trailing shrub, evergreen in winter. From its winged triangular green shoots it produces a vast profusion of flowers of a golden colour from April to July. Anxantic *Genista* (*Genista anxantica*) is a diffuse plant producing an abundance of yellow flowers from June to July. The dwarf *Cytisus* (*Cytisus nanus*) is a pretty procumbent shrub, flowering in July. It should be planted in a dry soil, which should be covered over with broad flat stones. The Rest-harrows (*Ononis*) are suffruticose plants, with purple and red flowers. Most of the woody Leguminosæ have yellow flowers; hence the Rest-harrows form an agreeable variety. *Astragalus altaicus*, *aristatus*, and *brevifolius*, are all suffruticose plants, the last with purple flowers, which would form good plants for rock-work. To these may be added *Hedysarum coronarium* and *pallidum*; *Astragalus tragacantha*, *campestris*, *hypoglottis*, and *uralensis*.

Almost all the Rock-rose tribe (Cistaceæ) may be grown with success on rock-work. The procumbent and Fumana Sun roses (*Helianthemum procumbens et fumana*) have both procumbent branches, small beak-like leaves, and yellow flowers, which appear in June and July. *H. Rodantha* has bright red flowers inclining to crimson. It is quite hardy, of easy culture, and produces its flowers in abundance.

Several of the hardier species of the natural order Mesembryaceæ will bear exposure; and as they require little nutriment and soil, are well adapted for growth on rock-work. Many of the species also of the order Crassulaceæ will grow under the same circumstances. Cotyledon umbilicus requires nothing more than a little sand. Several species of Stone-crop (*Sedum*), as *S. anglicum*, *Forsteri*, *glaucum*, *hybridum*, *rupestre*, *sexangulare*, and *villosum*, will flourish in very dry situations.

Many of the Cruciferous plants are naturally rock-plants. The common stock (*Matthiola incana*) and wall-

flower (*Cheiranthus Cheiri*) are well known on walls and rocky situations. *Alyssum calycinum*, *montanum*, *murale*, *sexutile*, *Iberis Tenoreana*, *Cochlearia saxatilis*, *Aubrietia alpina*, *Arabis alpina*, *bellidifolia*, *petraea*, *Draba aizoides*, *Aizoon*, *stellata*, *tomentosa*, *Thlaspi alpestris*, &c., will all grow on rock-work, and many of them bloom all the summer round. The False Cytisus (*Vella pseudo-cytisus*) is a shrub with yellow petals and purple claws, which may be prettily associated with the dwarf furze and the Nitraria.

Of the Labiate plants, the species and varieties of the thyme claim the first place. They grow well amongst rocks, especially of a calcareous kind; and patches of the various species, especially *Thymus vulgaris* and *grandiflora*, should form a part of every rock-work. They are not only beautiful in flower, but are exceedingly fragrant, and are a source of attraction to bees. *Betonica alopecurus*, and *Ajuga alpina* and *pyramidalis* may be also cultivated.

Many of the species of the order Caryophyllæ may be grown. One of the most prolific of these is the *Cerastium repens*, which grows very rapidly, and is consequently adapted to cover parts that do not look well exposed. It is for this purpose often used to cover heaps of rubbish. Various species of Dianthus will grow well, and are very ornamental, as *D. deltoides*, *armeria*, *collinus*, *hyssofolius*, *plumarius*, *virginicus*; also *Cerastium latifolium*, *alpinum*, *Silene atocion*, and *rubella*.

Many of the Saxifrages are true rock-plants: they mostly blossom early in the year. The following species may be grown amongst rocks:—*S. oppositifolia*, *paniculata*, *aizoides*, *nivalis*, *petraea*, *densa*, *retusa*, *elongella*.

Many of the Campanulas may be grown successfully. *C. carpatica*, *collina*, *alba*, and *saxatilis* blossom nearly all the summer: the latter is a very ornamental plant. Many other plants have been recommended for cultivation in rock-work: of these we shall add the names of a few that are deserving of attention on account of the continuance of their flowers during the greater part of the summer:—*Oxalis violacea*, *Rubus arcticus*, *Chamæmoris saxatilis*, *Illecebrum Puronychia*, *Linaria alpina*, *Epimedium alpinum*, *Arnica montana*, *Achillæa Clavenæ*.

ROCKET is a cylindrical vessel or case, of pasteboard or iron, attached to one end of a light rod of wood, and containing a composition which, being fired, the vessel and rod are projected through the air by a force arising from the combustion.

Rockets have long been used as a means of making signals for the purpose of communication when the parties have been invisible from distance or darkness, or otherwise inaccessible to each other; and they have occasionally served the important purpose of determining the difference of longitude between two places. In the latter case the rocket is fired at some convenient spot between the stations, from both of which the explosion must be visible; and the latter being instantaneous, the difference between the times at which it is observed, as indicated by chronometers regulated so as to show the mean times at the places, is the required difference of longitude. Rockets have also been constructed for the purpose of being used in warfare, and such missiles were so employed for the first time at the siege of Copenhagen in 1807.

In signal rockets the part of the case which contains the composition, by whose combustion the projectile force is produced, is joined, at the upper extremity, to a conical case containing the composition for producing the explosions or stars of light which constitute the signal, and the length of this part is always rather greater than the diameter of the cylindrical part of the case. Such rockets are made to weigh half a pound, one pound, or two pounds. The exterior diameter of the one-pound rocket is  $1\frac{1}{2}$  inch; the length of the cylindrical case is  $12\frac{1}{2}$  inches, and the length of the conical head is  $3\frac{1}{2}$  inches. The rod is generally attached near the base and on one side of the rocket; its length is about 8 feet, or 60 diameters of the rocket, and its thickness is about half a diameter of the latter. The composition with which the cylinder is filled consists generally of saltpetre, sulphur, and charcoal or gunpowder; the whole is reduced to a mealed state, and well mixed together in the following proportions:—saltpetre, 4 lbs. 4 oz.; sulphur, 12 oz.; and charcoal or mealed powder, 2 lbs. The composition which produces what are called the stars consists of saltpetre, 8 lbs.; sulphur, 2 lbs.; antimony, 2 lbs.; mealed powder, 8 oz.; and isinglass,  $3\frac{1}{2}$  oz. The latter is dissolved in one quart of vinegar, after which one pint of spirit of wine is added, and then the mealed composition is mixed

with the liquid till the whole becomes of the same consistency as a stiff paste.

The composition for burning is rammed or driven into the rocket-case; but in the interior and about the axis, a void space of a conical form is left in order that a considerable surface of the composition may be at once in a state of combustion; and, at the *choke* or neck of the rocket (the part to which the rod is attached), there are several apertures, by one of which the fire is communicated to the composition. The combustion of the latter immediately takes place on all the concave conical surface about the void space just mentioned.

In order to understand the cause of the rocket's motion, let it be observed, that if the composition were to be fired within a vessel or case closed on all sides (combustion being supposed to be possible in such circumstances), the pressure of the flame would be equal in every direction, and the case would either burst in pieces, or, if sufficiently strong, would remain at rest while all the composition was being consumed. Now, the case having apertures at the choke or lower extremity of the cylinder, the pressure which would have taken place against that extremity is in great part annihilated by the flame escaping into the atmosphere; consequently the pressure exerted against the opposite extremity, being no longer counteracted, impels the rocket forward or upwards. This force of impulse acts in a manner similar to that by which a gun recoils when the charge is fired; but, in the latter case, the fluid escaping almost instantly from the bore, the force of impulse on the bottom of the chamber ceases nearly as soon as it is generated, whereas, in a rocket, the composition continuing to burn during several seconds, the force of impulse becomes a force of pressure, which continues to act till the material is consumed. Hence it follows that a rocket ascends, or moves forward, with an accelerated motion till the resistance of the air becomes equal to the accelerative force; and when the composition is burnt out, the rocket falls to the ground.

The rod serves to guide the rocket in its flight: for the common centre of gravity of the rocket and rod being a little below the top of the latter (in the one-pound rocket it is 2 feet from the upper extremity of the rocket, or 7 feet from the lower extremity of the rod); if we suppose the rocket to be fired vertically upwards, and a vibration should take place about the said centre of gravity by any excess of pressure on one side arising from an irregularity in the burning of the composition, the resistance of the air against the long portion of the rod below that centre, like a force acting on the longer arm of a lever, will exceed the force by which the vibration is produced, since the latter force acts on the rocket and the upper part of the rod which constitutes the shorter arm of the lever; and thus the vibration is checked, or prevented, and the rocket is enabled to ascend steadily. But, in proportion as the composition burns out, the common centre of gravity approaches nearer the middle of the whole length of the rocket and rod: and the resistance of the air acting at length nearly equally above and below that centre, it can no longer counteract any inequality in the burning of the composition. Thus, in falling, the top of the rocket, or the rocket end of the rod, is downwards.

The rod performs a similar service when the rocket is impelled horizontally or obliquely; for, while the force of projection is great enough to carry the rocket forward, and the centre of gravity of the whole is near the rocket end of the rod, the resistance of the air against the tail of the latter will nearly prevent any vibration; but, when the centre of gravity has got near the middle of the length, the head of the rocket begins to droop, and at length the whole comes obliquely to the ground. It has happened however, from the rod being too short or too light, that the weight of the rocket, when the latter has been projected with a small elevation, has so much incurvated the line of its path before the composition has burnt out, that the rod has turned over it, and the whole has been driven to the ground in a direction tending towards the place from whence it was projected.

Rockets whose diameters vary from 1 to 2 inches, have been found to ascend vertically to the height of about 500 yards; and those whose diameters vary from 2 to 3 inches, have ascended to the height of 1200 yards. The distances at which rockets can be seen vary from 35 to 40 miles; and the times of ascent, from 7 to 10 seconds. (Robins's *Tracts*, vol. ii.)

Rockets, to be employed as military projectiles, were invented by Sir William Congreve, and, in the British artillery

service, a body of men, called the rocket troop, has been organised expressly for their management. Sir William caused the rockets to be made with strong iron cases of cylindrical forms, and terminating at the head with a paraboloid or cone; and he attached the rod so that its axis should coincide in direction with that of the rocket. They serve either as shells or carcasses, and their weights are 3, 6, 12, 24, and 32 pounds. Military rockets are, in general, fired from tubes in order that the direction of their flight may be more certain; and the proper elevation, at least for the smaller rockets, is about one degree for each hundred yards in the required range. From their form they penetrate to a considerable depth when fired against timber or earth: 12 pounder rockets, after a range of 1260 yards, have been found to enter the ground obliquely as far as 22 feet. The principal inconvenience attending the rocket practice is the powerful action of the wind when it blows in a direction perpendicular, and even oblique, to the intended line of flight.

Rockets, being much lighter than any other kind of ordnance, and capable of being used with or without carriages, are well adapted for conveyance in mountainous countries. When fired in volleys against troops, their effect is likely to create much disorder; and those which act as carcasses, when fired against buildings, will almost certainly cause their destruction. Besides being employed in the siege of Copenhagen, rockets were used at the bombardment of Flushing (1809); and in 1813 the British rocket-troop rendered considerable service at the battle of Leipzig. The advance of a French column against an inferior force of British troops was checked by a well directed fire of rockets at the passage of the Adour in the last-mentioned year; and it is said that the explosion of the powder-magazine which lately (1840) produced such disastrous effects at Acre, was caused by the fall of a rocket on the building.

**ROCKINGHAM.** [NORTHAMPTONSHIRE.]

**ROCKINGHAM, CHARLES WATSON WENTWORTH, MARQUESS OF,** was the only son of the first Marquess of Rockingham, and was born 13th May, 1730, two years after the title of Baron of Malton had been conferred upon his father, who, in 1734, was advanced to the dignity of Earl of Malton, and, having succeeded to his cousin in the barony of Rockingham in 1746, was created Marquess of Rockingham the same year. The Watsons, barons, and for some time earls of Rockingham, had originally acquired importance by the marriage of one of them with the sister of the great earl of Strafford, whose vast estates they in this way came to inherit.

In September, 1750, while his father was still alive, the subject of the present article was created earl of Malton in the Irish peerage; but before the end of the year his father's death left him in possession of the marquesate. Young as he was when he thus entered the House of Lords, he did not wait long before beginning to take a share in debate. Horace Walpole, in his 'Memoirs of the Last Ten Years of the Reign of George II.,' notices one or two of his earliest appearances in not very complimentary terms. When what was called the Scotch Bill (for planting colonies of foreign Protestants on the forfeited estates in Scotland) was under discussion in March, 1752, he says, 'The young marquess of Rockingham entered into a debate so much above his force, and partly applied the trite old apologue of Menenius Agrippa, and the sillier old story of the fellow of a college, who asked why we should do anything for posterity, who had never done anything for us!' Again, in his account of the debates in the following February, about the charge of Jacobitism brought against the solicitor-general Murray (Lord Mansfield) and other persons connected with the court, he notes, in the same sarcastic style:—'Lord Northumberland, perceiving it was a day for great men to stand forth, thought it a good opportunity to announce his own dignity; but he said little to the purpose. Still less was said by the young marquess of Rockingham, though he had prepared a long quotation from Tacitus about informers, and opened with it.'

But although never rated high as a man of talent, the mere wealth and independent position of the marquess necessarily secured him great influence, which was much strengthened by his upright and honourable character in private life, as well as by the moderation and consistency of his political conduct, although that was no doubt partly owing to the very narrowness of his understanding, which prevented him from ever looking beyond the particular set

of notions he had originally taken up. He had been educated in the principles of what was then considered constitutional Whiggism, and he evidently to the end of his life never entertained a doubt about the truth of his political opinions. In February, 1760, he was made a Knight of the Garter. His political career from this date forms part of the history of the next reign, and of the several persons of much greater mark than himself with whom he was brought into association or collision in the fluctuating contest of parties. [GEORGE III.; BURKE; PITT.] He was first lord of the treasury and prime minister from 10th July, 1765, to 12th July, 1766, and was again placed at the head of affairs with the same office on the resignation of Lord North, in March, 1782, but died the 1st of July of that year. The marquess of Rockingham married, in 1752, the daughter of Thomas Bright, Esq., of Badsworth, but had no children. His eldest sister was married in 1744 to the first Earl Fitzwilliam, whose son, having succeeded to the family estate on the death of the marquess, took the surname of Wentworth in 1807.

**ROCKS.** A knowledge of the various earthy and metallic substances which compose the parts of the globe near the surface, seems indispensable to the geologist, whose reasonings on the origin and changes of these substances form no inconsiderable portion of the science which he is cultivating. It is therefore with some surprise and disappointment that a student of geology finds the classifications of rocks used in works of reputation formed with no harmony in detail, and little agreement in principle. In many works on mineralogy, compound rocks, as basalt, are classed among simple minerals; and a place is assigned even to clays and slates. On the other hand geologists have not hesitated to employ names originally designed to express particular mineral constitution, in a vague and general sense as regards the *nature* of the rock, though strict and definite as relating to its *age*. Such writers, in fact, do not by the name which they use, as 'gneiss,' or 'grauwacke,' or 'trap,' mean, or wish to express, *what* the rock is which they thus designate, but *where* is its place on the scale of stratified rocks, or *how* its mineral aggregation is related to particular circumstances of melting or cooling. That this latter method, if carried to extremes, would be subversive of accurate notions concerning the origin of rocks, is not only probable on general grounds, but has been amply proved by experience. The terms 'gneiss,' 'grauwacke,' 'claystone,' &c., as given by Werner, or adopted by his followers, had a mineralogical meaning; but each of these terms has been freely employed by modern geologists to include a great variety of rocks but slightly related to, or even merely associated with, the typical compound signified. When we are told that 'there is no gneiss in Cornwall,' the assertion is true, or nearly so, even in a Wernerian sense; but it is equally true that some part of the vast and various rocks of Scotland, combined in the 'gneiss' of MacCulloch, may as well be ranked with claystone as much of the killas of Cornwall, and that other members of this gneiss series might be called mica slate, hornblende slate, or quartz rock. (See MacCulloch *On Rocks*.) To avoid this confusion of mineralogical and geological meanings in one term, several able attempts have been made upon one of the following plain principles:—

1. To assign to a series of rocks in which several mineral types (as sandstone, limestone, argillaceous beds) occur, and which therefore cannot be well described by a mineralogical term, a name depending on locality. Hence 'the Silurian system,' 'the Devonian system,' &c.

2. To give to such a series a title derived from its most characteristic member; as the 'Cretaceous group,' the 'Oolitic system,' the 'New Red-Sandstone series,' the 'Granitic formation.'

3. To avoid all such specially characteristic names, and to substitute terms expressive merely of relative place in the supposed or established series of geological events. Hence Mr. Conybeare's method of superior, suprasedial, medial, submedial, and inferior orders of strata. It is perhaps to be wondered at that this simple and expressive method has neither been fully developed nor followed.

4. A view almost equivalent in practice, and founded mainly on the same basis, but distinctly involving an important inference regarding the lapse of time, gives us such terms as Primary strata, Transition rocks, Secondary series, Tertiary formations; and, as a subdivision of these latter, Eocene, Miocene, Pleiocene deposits. It is somewhat strange, that while the use of Transition rocks is pro-

scribed as too hypothetical (it merely involves an inference seldom disputed), the equally hypothetical titles of Eocene, Miocene, and Pleiocene deposits, should be freely admitted even by those who think Lower, Middle, and Upper less objectionable in this particular instance, and more useful and applicable in regard to all the older stratified deposits. Brongniart classes rocks under the Saturnian (antient) and Jovian (actual or modern) periods. (*Tableau des Terrains.*)

Systematic views of rocks, considered as mineral aggregates without any reference to their geological history, have been seldom completed. M. Brongniart has presented a classification of 'mixed rocks' nearly conformed to this principle, which has been of service. Dr. MacCulloch's 'Treatise on Rocks' is a mixed method, mineralogical in detail, geological in the large features. This writer gives the following list of

'Minerals which enter into the composition of rocks:—

Indurated clay, from the softest substances found in trap to jasper and silicious schist. Clinkstone. Compact felspar, including the hornstone and petrosilex of some writers. Common and glassy felspar. Quartz. Carbonate of lime. Mica. Chlorite (foliated). Talc. Hornblende.	Actinolite. Augite. Hypersthene. Diallage. Tourmaline. Serpentine. Steatite. Noble Serpentine. Gypsum. Iron, in various states of oxidation, and combined with carbonic acid, water, &c. Bitumen. Pitchstone. Chert.
--	--

He then adds a list of minerals occasionally imbedded in rocks, so to modify their aspect, viz. :—

Garnet. Olivine. Cyanite. Pinite. Spodumene. Chiasolite. Staurotide Epidote. Mesotype. Zircon. Topaz. Beryl.	Chrysoberyl. Fluor Spar. Corundum. Oxydulous Iron. Pyrites. Chromate of Iron. Prehnite. Andalusite. Apatite. Sphene. Oxyde of Tin. Molybdena.
---	--

He then names the rocks in which the minerals of the first class occur. We extract the most important of these notices:—

Indurated clay occurs in claystone not schistose, some porphyries and amygdaloids, some basalts; also in argillaceous schist, shale, limestone.

Compact felspar occurs as a simple rock; also in gneiss, porphyries, amygdaloids, syenites, greenstones, augite rocks, hypersthene rocks, granite.

Quartz occurs in quartz rock, granite, gneiss, mica schist, chlorite schist, talcose schist, argillaceous schist, sandstone, porphyries, syenites, and greenstones.

Felspar occurs in granite, gneiss, chlorite schist, hornblende schist, actinolite schist, sandstone, quartz rock, greenstone, porphyry, syenite, pitchstone.

Mica occurs in granite, gneiss, mica schist, quartz rock, sandstone, shale, limestone, claystone, syenite, porphyry.

Chlorite occurs in chlorite schist, granite, gneiss, actinolite schist, argillaceous schist.

Talc occurs in talcose schist, primary limestone, granite, serpentine.

Hornblende occurs in granite, gneiss, hornblende schist, micaceous schist, argillaceous schist, primary limestone, serpentine, syenite, greenstone, basalt, porphyry, chloritic schist, actinolite schist.

M. Brongniart's general view of mixed rocks may be put in the following abbreviated form:—

A. Crystallized isomeric rocks (the parts equally mixed).

1. Felspathic rocks.

a. Granite. Laminated felspar, quartz, and mica, equally disseminated.

b. Protogine. Felspar, quartz, steatite, or talc, or chlorite.

c. Pegmatite (graphic granite). Laminated felspar, and quartz.

d. Mimose. Laminated felspar, and augite.

2. Hornblendic rocks.

a. Syenite. Laminated felspar, hornblende, and quartz.

b. Diallage. Hornblende, and compact felspar disseminated.

c. Hemithrene. Hornblende and limestone.

B. Crystallized Anisomeric Rocks (the parts unequally mixed).

1. Base of quartz.

a. Hyalomictic. Crystallized quartz, and disseminated mica.

2. Base of mica.

a. Gneiss. Mica abundant in plates, lamellar or granular felspar—a laminated rock.

b. Mica schist. Continuous mica and quartz.

3. Base of schist.

a. Phyllade. Clay slate containing various minerals.

b. Calcischist. Argillaceous schist and limestone variously mixed.

4. Base of talc.

a. Steaschist. Talcose base with disseminated minerals.

5. Base of serpentine.

a. Ophiolite. Serpentine, including various minerals, as chromate and oxide of iron, diallage, garnet, &c.

6. Base of limestone.

a. Cipolin. Granular limestone with mica.

b. Ophicalce. Limestone, with serpentine, talc, or chlorite, imbedded.

c. Calciphyre. Limestone enveloping crystals, as felspar, garnet, hornblende, &c.

7. Base of cornean (compact felspar of MacCulloch).

a. Variolite. Including nodules and veins of various kinds.

b. Vakite. Including mica, augite, &c.

8. Base of hornblende or basalt.

a. Amphibolite. Base of hornblende, with disseminated minerals.

b. Basanite. Base of compact basalt, with disseminated minerals.

c. Trappite. Base of hard compact dull cornean trap, with mica, felspar, &c.

d. Melaphyre (Trap porphyry). Black petrosilicious hornblende, with crystals of felspar.

9. Base of petrosilex, coloured by hornblende.

a. Porphyry. Paste of reddish petrosilex, with crystals of felspar.

b. Ophite. Paste of green petrosilex, with crystals of felspar.

c. Amygdaloid. Paste of petrosilex, with nodules of petrosilex of a different colour.

d. Euphotide. Enclosing crystals of diallage.

10. Base of petrosilex or compact felspar.

a. Eurite. With mica, &c. disseminated.

b. Leptenite. Base of granular felspar, with mica and quartz.

c. Trachyte. With crystals of glassy felspar.

11. Base of claystone.

a. Clay porphyry. Crystals of felspar.

b. Domite. Crystals of mica.

12. Base of pitchstone.

Stigmite. With crystals of felspar (commonly called porphyritic pitchstone).

13. Base undetermined.

Lava.

C. Aggregated rocks (uncrystallized; the parts irregularly mixed).

1. Cemented rocks.

a. Psammite. Grains of quartz, &c. united.

(This includes sandstones, grauwacke, &c.)

2. Imbedded rocks.

a. Mimophyre. Cement argillaceous, uniting distinct grains of felspar, &c.

b. Psefite. Cement argillaceous, including fragments of mica schist, slate, &c.

c. Pudding-stone. Cement including large rounded pieces of different kinds in different varieties of pudding-stone, as quartz, limestone, flints.

d. Breccia. The fragments angular.

The most prevalent classification of rocks in actual use is founded on one leading feature of their origin and history. Rocks are of igneous origin (pyrogenous rocks), or of aqueous origin (hydrogenous rocks), and thus make two great classes: the former being often considered, with reference to the

circumstances of their occurrence in two divisions, viz. hydrogenous or Plutonic rocks (as granite), and volcanic rocks (as obsidian); the latter being distinguished into freshwater and marine deposits, the result of chemical, vital, and mechanical agencies exerted in water. Many cases are known of an alteration of these hydrogenous rocks by contact with Plutonic or volcanic masses: by this change they acquire the name of metamorphic rocks. These clays and sandstones are hardened, and have their structure altered so as to resemble clay slate, quartz rock, or jasper; and chalk and limestone are rendered crystalline.

Adopting as the best and most applicable the fundamental distinction of pyrogenous and hydrogenous rocks, the student will find by experience that the best if not the only good way of describing and recognising rocks, is by attention to their elementary composition. The granitic, porphyritic, amygdaloidal, or other structures of igneous rocks, are so many variable circumstances due to particular accidents in the fusion or cooling of the masses, and belong more or less to all of them, as the compact, oolitic, arenaceous, and other characteristic textures of hydrogenous rocks mark peculiarities of their aggregation or solidification.

Mr. Scrope has successfully shown, in his 'Synopsis of Volcanic Rocks' (*Journal of Science*, vol. xxi.), that these various compounds may be easily and philosophically classed by consideration of the relative abundance of two minerals, seldom absent from any of them, viz. felspar and augite. (The felspar is sometimes replaced by leucite, hæüyne, olivine or mellite; the augite by hornblende or titaniferous iron.) Hence we have only three great groups:—

Felspathic . . . . . Trachyte.

Augito-felspathic . . . Graystone.

Augitic . . . . . Basalt.

To each of these belong many varieties, and many gradations of granitic, porphyritic, amygdaloidal, and other structures. [LAVA] By a similar method we may class the older or Plutonic rocks of fusion, as: Felspathic,—granite, porphyry, felspar rock, claystone, eurite, pitchstone; Augito-felspathic,—sienite, euphotide; Augitic,—sienite, hypersthene rock, greenstone, basalt, wacké, melaphyre.

The hydrogenous rocks of most importance may be classed according to their arenaceous, argillaceous, calcareous, or other basis, as—

Arenaceous, uniform, as sandstones, sands; aggregated as conglomerates, pudding-stones.

Argillaceous, uniform, as clay and shale; containing fragments, as some clay conglomerates.

Argillo-calcareous, as marls properly so called.

Calcareous, as chalk, limestone.

Calcareo-magnesian, as dolomite.

Haloid, as gypsum, rock salt.

Carbonaceous, as coal, lignite.

Ferruginous, as ironstone.

Cupriferous, as the kupferschiefer.

Finally, all these hydrogenous rocks are liable to local changes, by contact or proximity with the rocks of fusion. These metamorphic rocks may be classed according to the same form as those which are unaltered. We give below authentic examples of several cases of metamorphism:—

1. Arenaceous rocks, metamorphic by *induration*, as along greenstone dykes in Arran, and Salisbury Crags. Similar effects happen beneath iron-furnaces, and when the effect is in extreme the result is *quartz rock*.

2. Argillaceous rocks, metamorphic by *induration*, and a certain confluence of grains. In extreme cases the result is a kind of clay slate, or hone slate, or Lydian stone, with cubic pyrites, and rarely *garnets*, embedded. An example of the latter occurs at Plas Newydd.

3. Calcareous rocks, metamorphic by re-arrangement of particles. Thus granular or saccharoid limestone is found by the side of the basaltic dykes in Antrim, on the greenstone of Teesdale, near the hypersthene of Sky, &c. The limestone among primary strata is of similar appearance, though not in contact with igneous rocks.

4. Carbonaceous. Coal becomes coke or anthracite near basaltic dykes.

Examinations of this kind have shown that ordinary sedimentary rocks altered by heat acquire aspects and structures and compositions resembling almost exactly those most common among the earliest or primary strata, as quartz rock, clay slate, garnet mica slate, garnet gneiss, granular marble, &c.; and it is therefore a probable inference that in all such cases of strict resemblance those an-

cient rocks have undergone on a great scale, and under the general influence of the intense heat of the earth, the changes which are certainly proved to have happened locally, from limited agencies, on substances of similar chemical quality. Very careful investigations on these points are however still needed to fix limits and give precision and certainty to the inferences from phenomena.

The circumstances which accompany the appearance of pyrogenous rocks will often lead us to probable views as to the conditions under which they were fused and cooled. Thus from the granite masses of Arran and Cornwall, very coarse in their granulation, veins proceed into the adjoining slate rocks, and become more and more fine in grain, and porphyritic or merely felspathic in aspect; the coarse greenstone of Salisbury Crags acquires compactness where it touches the sandstone rocks; in a modern furnace the centre of masses of fused rock or melted metal is usually the most porous part; and all these facts are linked together in the more general proposition, that slow cooling allows of large and regular, while rapid refrigeration generally forces a minute, hasty, and confused structure, in which crystallization is sometimes quite destroyed. [See BASALT for some notice of Mr. Gregory Watt's experiments on this substance cooled from fusion.]

Considerations of this kind explain the generally greater compactness of Plutonic, as compared with the cellularity of volcanic rocks, and indeed there is little other difference between them than that which is intelligible as a consequence of the outpouring of one class at or near the surface and under air, and the solidification of the other under great depths of water, as some greenstones; inclosed in masses of preconsolidated rock, as some porphyries; or slowly cooled in enormous quantity, as granite, and hypersthene sienite.

Similarly, by attention to the texture and structure of the rocks deposited by water, we find marks of sedimentary accumulation in sandstones and clays, and proofs of chemical precipitation or vital arrangement in limestones. We may put some of the results on this subject in a very simple series, which can hardly fail to suggest important reflections.

*Littoral and Flood Deposits*, as conglomerates and sandstones: the latter showing often ripple-mark, sometimes impressions of littoral or terrestrial animals; the former, a confused aggregation resulting from local agitation.

*Sea and River Sediments*.—Shales and clays, often finely and regularly laminated, and of very uniform composition, the fruit of more tranquil deposition in deeper or calmer water.

*Pelagian Deposits*, as some limestone strata, the accumulation of dead shells, crinoidea, foraminifera, &c., and others which are in part the preserved structures of coral. Thus some beds of marble are really masses of crinoidea, others of coral, some of shells, some chalk is full of spiculæ of sponges, &c., and other calcareous beds are replete with foraminifera.

[BASALT; GRANITE; GRAUWACKE; GNEISS; LAVA; MICA SCHIST; PORPHYRY; STRATIFICATION.]

ROCROY, a fortified town in France, capital of an arrondissement in the department of Ardennes, 161 miles north-east of Paris by Soissons, Reims, and Mézières. Rocroy, then a village, was fortified by François I., A.D. 1537, to defend the frontier on that side: the fortifications were finished, and the place raised to the rank of a town, by his son Henri II. It was besieged, A.D. 1643, by the Spaniards under Don Francisco de Melos, who occupied a very strong position, covered by marshes and woods, and accessible only by a single causeway. The French under the duke of Enghien, afterwards better known as prince of Condé (*Le Grand Condé*), then only twenty-two years of age, advanced against the Spaniards, and obtained a splendid and decisive victory (19th May), which laid the foundation of his military renown. The town stands in an extensive plain, about five miles from the left bank of the Meuse. The fortifications are of no great importance at present, though it still ranks as a fortress. The population in 1831 was 3623: the townsmen make tin ware and carpenters' tools. There are four fairs in the year. The town has a society of agriculture, a military hospital, and some government offices.

The arrondissement comprehends sixty-eight communes, and is divided into five cantons or districts, each under a justice of the peace. The population in 1831 was 43,807.

ROCKY MOUNTAINS is a term usually applied to an extensive mountain-system in North America, but as this

term has too general a signification, and therefore cannot with propriety be applied to a particular system, geographers call the North American range the *Chippewyan Mountains*. These mountains occupy the central parts of that continent, but, like the Andes in South America, they are much nearer to the Pacific than to the Atlantic Ocean. The Chippewyan Mountains are far less known than the Andes in South America. Perhaps more than one-half of the eastern declivity has been seen by travellers, who have given some account of it, but, with the exception of a comparatively small part, the whole of the western declivity is almost entirely unknown.

It was formerly supposed that this mountain-system was only a continuation of the Andes of South America, and that these two mountain-regions were connected by a chain which traversed the Mexican Isthmus in its whole length. But it is now ascertained beyond doubt that a flat country of considerable extent intervenes between the Andes and the mountains of the Isthmus. [PANAMA.] It is also ascertained that the mountain-range which is known under the name of the Sierra Madre, in the northern of the Mexican States, is not connected with any of the southern offsets of the Chippewyan Mountains, but terminates about 150 miles south of the Sierra de Mogollon, or that branch of the Chippewyan Mountains which approaches nearest to it.

This mountain-system may be divided into three parts—the Southern, Central, and Northern Chippewyan Mountains. The first extends from 29° to 42° N. lat.; the Central Chippewyans from 42° to 49° N. lat.; and the Northern from 49° to nearly 70° N. lat. The whole length, from 29° to 70° N. lat., exceeds 3000 miles, and when the ridges, which probably traverse the north-western peninsula of North America from east to west, and apparently are only offsets of the great mountain range, are included, the whole length is about 4000 miles.

The *Southern Chippewyans* resemble the Northern Andes in being divided into three long ranges, which run off in diverging lines. The point from which they diverge is a mountain-knot, about 42° N. lat., and is called Sierra Verde. From this point the three ranges run southward. The most eastern range forms one elevated mass of rocks between 42° and 34° N. lat., and within these limits preserves the name of Chippewyan or Rocky Mountains. It runs nearly due south between 104° and 106° W. long. Between 35° and 34° N. lat. it divides into two ranges, both of which run southward and parallel to one another, including the narrow valley of the Rio Puerco, and terminate in the great bend of the Rio del Norte, between 29° and 30° N. lat. In the present state of geographical knowledge, these two ranges, which are called the Sierra de los Comanches, must be considered as the most southern extremity of the Chippewyan Mountains. It is hardly known on what authority these two ranges have been laid down on our maps, as the valley of the Rio Puerco and the countries east of it are in possession of the savage and warlike tribe of the Comanches, who do not allow strangers to enter their country. Only the western declivity of the western range has been seen by travellers, who describe the range as rising only to a moderate elevation, but having a very desolate and barren aspect, and being almost entirely without water and wood.

That part of the Southern Chippewyans which extends from 34° to 42° N. lat. is perhaps the best known part of the whole system, the eastern declivity having been examined for a considerable extent by Major Long. He says that the breadth varies from 50 to 100 miles. The mountains rise abruptly from the plains to the east of them, towering into peaks of great height, which are visible at the distance of more than 100 miles east of their base. They consist of ridges, knobs, and peaks variously disposed, among which there are many wide and fertile valleys. The more elevated parts of the mountains are covered with perpetual snow, which gives them a luminous, and at a great distance even a brilliant appearance, whence they have derived the name of the 'shining mountains.' The height of the James Peak has been ascertained to be about 8500 feet above its base, which is considered as between 2000 and 3000 feet above the sea-level. Though considered the highest summit in this part of the range, Major Long says, that judging from the position of the snow near the summit of other peaks and ridges at no great distance from it, it is apparent that they are much higher.

The western declivity of this range is not so steep as the eastern, and does not descend so deep, the upper valley of the Rio del Norte being considerably more elevated than the plains east of the mountains.

The central range of the Southern Chippewyans runs nearly parallel to the eastern along the meridian of 107° W. long., and terminates near 34° N. lat. with the Sierra de Mogollon, a name which is sometimes applied to the whole range, though others called it Sierra de los Mimbres. It appears not to attain the elevation of the eastern range. On the eastern side its slope is well defined, as no offsets branch off from it, but the width and the western declivities are not known. It was formerly supposed that the Sierra de Mogollon was united by a mountain-chain to the Sierra Madre in Mexico; but the last-mentioned range terminates near 32° N. lat., and a level plain about 150 miles in extent intervenes between the two ranges.

The western chain of the Southern Chippewyans is called the Sierra de los Guacaros, and it is supposed to join the principal chain at the Sierra Verde. But with the exception of a mountain tract, which occurs about 37° N. lat., and 112° W. long., and is properly called Sierra Guacaros, this range is unknown in its whole extent. It is not even known whether this range is connected with the snow-capped summit of the St. Bernardin, which occur near 34° N. lat. and 117° W. long. If a chain of high lands should be found to extend between the last-mentioned high summit and the Sierra de los Guacaros, which is not improbable, the mountainous and rocky peninsula of California would constitute the most southern extremity of the Chippewyan Mountains.

As the countries surrounding the Southern Chippewyans are almost entirely inhabited by savage tribes, which seem to have no intercourse with one another, the routes are unknown, with the exception of one over the eastern range, near 36° N. lat., which is used by the North American caravans, which start from the town of Franklin in the state of Missouri, for the town of Santa Fé in New Mexico, whence they proceed to Chihuahua. The elevation of the mountain-pass does not appear to be very great.

The *Central Chippewyans* between the Sierra Verde (42° N. lat.) and 49° N. lat. have been often crossed by American travellers, in passing from the United States to the river Colombia. In this part the mountain-region seems to contain two ranges of great elevation, running parallel to one another at the distance of 100 miles, and enclosing high valleys, which are generally filled up by the rocky masses, which protrude from the great chains to a considerable distance within the valleys. The two chains however do not subside either on the east or on the west into plains, being separated from the level ground, which only occurs at a great distance from them, by hilly regions of considerable extent.

Not far from the Sierra Verde, towards the north, between the Spanish River, supposed to be the Rio Colorado, which falls into the most northern recess of the Gulf of California, and the Big Horn River, an affluent of the Missouri, the eastern chain of the mountains contains a deep and wide depression, which presents an easy passage over the range, so easy indeed that it may be crossed by carriages. In these parts there is a plain between moderate heights, which is about ten miles in circumference, and the surface of which is encrusted with salt as white as snow to a depth of twelve or eighteen inches. North of this depression the mountains rise to a greater height; but they do not present a range of uniform elevation; they are rather extensive groups, here and there overtopped by high peaks, among which there is one which probably rises to 15,000 feet above the level of the sea. The eastern range is furrowed longitudinally by deep and narrow valleys drained by small and rapid streams. The higher parts of the ranges consist of granite, and are bleak and bare, being nearly destitute of vegetation, but many of the inferior ridges are scantily clothed with scrub pines, oaks, cedar, and furze. In some places these mountains have traces of volcanic action. Some of the interior valleys are strewn with scoria and broken stones, evidently of volcanic origin, and vestiges of extinct craters are seen on the highest points.

Farther north, between 45° and 47°, the eastern range appears to maintain a more equal elevation, and to rise to a great height. Their highest parts are covered with snow in the months of August and September, and in the lower parts, along the watercourses and in the ravines, snow does

monstrous. [BEAVER, vol. iv., p. 121.] The lower jaw is articulated by a longitudinal condyle, so as to have no horizontal movement except from behind forwards, and *vice versa*, convenient for the action of gnawing; the molars consequently have flat crowns, the enamelled eminences of which are always transversal, so as to be in opposition to the horizontal movements of the jaw, and to be better adapted for trituration.

The genera in which these eminences are simple lines, and which have the crown of the tooth very flat, are more exclusively frugivorous; those which have the eminences divided into blunt tubercles are omnivorous; and, finally, the small number of those which have points more willingly attack other animals, and approximate a little to the *Carnivora*.

The form of the body of the Rodents is in general such that their hinder parts exceed their anterior ones, so that they leap rather than walk; this disposition in some of them is as excessive as in the kangaroos.

The intestines of the animals of this order are very long; their stomach simple or slightly divided, and their cæcum often very voluminous, even more so than the stomach. The *Myoxi* (Dormice) want the cæcum.

Preparations illustrative of the male organs of the *Rodentia* will be found in the *Physiological Series* of the Museum of the College of Surgeons; Nos. 2483 to 2504, both inclusive: of these Nos. 2483 to 2487, exhibiting those of the Beaver with the preputial or castor-pouches, and Nos. 2492, 2492 A, those of the Acuchi with the penis armed on each side with a dentated horny ridge, are remarkable. Those of the other *Cavies*, Nos. 2493 to 2497 (both inclusive), exhibit similar peculiarities. The placenta is simple. Preparations Nos. 2742 to 2751, both inclusive, illustrate the female organs.

The brain of the Rodents is nearly smooth and without convolutions; the orbits are not separated from the temporal fossæ, which have but little depth; the eyes are entirely directed laterally; the zygomatic arches, delicate and curved below, announce the weakness of the jaws; the fore-arms have scarcely any rotatory motion, and their two bones are nearly united; in a word, the inferiority of these animals shows itself in the greater part of the details of their organization. Nevertheless, the genera which have the strongest clavicles enjoy a certain dexterity, and use their fore-feet for carrying their food to their mouth: others again (the squirrels) climb trees with facility. (*Règne Animal*.)

The following animals are arranged by Cuvier under the order *Rodentia*:—

The Squirrels (*Sciurus*, Linn.), viz.: the Squirrels properly so called (*Sciurus*, Cuv.); the Flying Squirrels (*Pteromys*); the Aye-Aye (*Cheiromys*).

The Rats (*Mus*, Linn.), viz.: the Marmots (*Arctomys*, *Spermophilus*); the Dormice (*Myoxus*, Gm.); the Spiny Rats (*Echimy*), *Hydromys*, *Capromys*; the Rats properly so called (*Mus*, Cuv.); the Jerbilles (*Gerbillus*, *Meriones*); the Hamsters (*Cricetus*); the Field Rats (*Arvicola*, Lácép.), subdivided into the Ondatras (*Fiber*, Cuv.), the ordinary Field-Rats (*Arvicola*, Cuv., *Hypudæus*, Ill.), and the Lemmings (*Georychus*, Ill.); *Otomys*, and the Jerboas (*Dipus*, Gm.).

The Jumping Hares (*Helamys*, F. Cuv.; *Pedetes*, Ill.).

The Rat-Moles (*Spalax*, Guld.).

*Bathyergus* (*Oryctères*, F. Cuv.).

*Geomys* (*Pseudostoma*, Say; *Ascomys*, Licht.)

*Diplostoma*, Raf.

The Beavers (*Castor*).

The Couias (*Myopotamus*, Com.).

The Porcupines (*Hystrix*, Linn.), viz.: the Porcupines properly so called (*Hystrix*, Cuv.); *Atherurus*, Cuv.; *Erethizon*, F. Cuv.; and the Coendous (*Synetheres*, F. Cuv., *Cercolabes*, Brandt).

The Hares (*Lepus*, Linn.), viz.: the True Hares (*Lepus*, Cuv.), and *Lagomys*, Cuv.

The Capybara (*Hydrochærus*, Erxl.).

The Guinea Pigs (*Anæma*, F. Cuv.; *Cavia*, Ill.).

The Mocos (*Kerodon*, F. Cuv.).

The Agoutis (*Chloromys*, F. Cuv.; *Dasyprocta*, Ill.), and

The Pacas (*Coslogeny*, F. Cuv.).

Mr. G. R. Gray, who observes that the animals of this order are exceedingly difficult to arrange, gives the following as an attempt to classify the *Glires* according to their habits, in the tenth volume of the 'Annals of Philosophy,'

\* Fur, with scattered larger hairs or spines; tail spiny or scaly.

Family 1. *Muridæ*; 2. *Histicidæ*.

\*\* Fur nearly equally soft; tail none, or hairy.

Fam. 3. *Leporidae*; 4, *Jerboidae*; 5, *Aspalacidae*. For the further development of Mr. Gray's arrangement, see the articles *LEPORIDÆ*, *MURIDÆ*, and *PORCUPINÆ*.

Mr. Swainson (*Classification of Quadrupeds*) divides the *Glires*, or *Gnawing Quadrupeds*, into two main divisions, viz.: 1, Those with clavicles; 2, those with rudimentary, or no clavicles; and a third division, *Marsupial Rodentia*, 'situation uncertain.'

The first division consists of the genera *Castor*, *Fiber*, *Myopotamus*, *Rats* and *Mice*, and *Squirrels*. [*MURIDÆ*, vol. xv., pp. 496, 497.]

The second division embraces the genera *Hystrix* (with the subgenera *Acanthion*, *Erethizon*, *Synætheres*, and *Sphigurus*), *Lepus* (with the subgenus *Lagomys*), and *Cavia* (with the subgenera *Hydrochærus*, *Cobaya*, *Cavia*).

Under the Marsupial Rodents are placed the genera *Phascolumys* (with the subgenus *Amblyotes*), and *Phascolarctos*.

In the 'Magazine of Natural History,' New Series (1839), will be found Mr. Waterhouse's interesting 'Observations on the *Rodentia*, with a view to point out the groups as indicated by the structure of the *Crania* in this order of Mammals.' And in November, 1839, the same accurate observer laid before a meeting of the Zoological Society of London a tabular view of the distribution of this numerous order.

Mr. Waterhouse stated, that in the construction of the following table he had endeavoured to display the geographical distribution of the sections of the order *Rodentia*, and that to accomplish this, it of course became necessary to combine some system of classification, with an arrangement of the genera according to the countries in which they were found. The table is divided into five columns, one column being devoted to each of the following portions of the globe: 1st, Europe and North Asia; 2nd, North America; 3rd, Africa; 4th, India and the Indian islands; 5th, South America and the West Indian islands.

In these columns the names of the genera found in each province are inserted, and the number of known species belonging to each genus (as nearly as can be ascertained) is also indicated. Horizontal lines separate the genera according to the sections to which they are supposed to belong.

The few Rodents found in Australia all belong to the family *Muridæ*. About six species are known, and these appertain to the genera *Mus*, *Hapalotis*, Licht. (which is the *Conilurus* of Mr. Ogilby), *Hydromys* and *Pseudomys*.

'The first thing that strikes the attention,' observed Mr. Waterhouse, 'is, that the great mass of South American Rodents belong to a different section from those of the northern portions of the globe, and that they are of a lower grade of organization, as is also the case with respect to the Old and New World Monkeys.'

The next point to which Mr. Waterhouse drew attention was the relative number of species found in warm and in temperate climates. 'If the number of species found in the two provinces, Europe (including North Asia) and North America, be added together, the total is 180 species; whilst in all the rest of the world taken together the amount is only 206; and if from this last number those species which inhabit the temperate portions of South America and Australia (amounting to about 30) be deducted, and added to the first amount, it would appear that the Rodents are most abundant in temperate regions. In the Mammals of large size the case is reversed.

'The total number of species inhabiting each of the provinces pointed out in the table varies less than perhaps might be expected. The European province, North America, and South America, are nearly equal as to the number of species they contain; India and Africa are also nearly equal, but they contain fewer species than either of the other provinces.

'The Squirrels, Rats, Porcupines, and Hares (constituting the genera *Sciurus*, *Mus*, *Hystrix*, and *Lepus*) are the only groups which are found in all the provinces.

'The *Sciuridæ* abound most in North America and India, and are least abundant in Africa and South America. In the latter country they appear to be chiefly confined to the northern portions, and are totally wanting in the southern.

'The *Muridae* are about equally abundant in Europe, Africa, and South America; in North America and India they are much less numerous.

'The *Arvicolidae* appear to be confined to North America and the European province. In South America they are apparently replaced by the *Octodontidae*, *Chinchillidae*, and *Caviidae*.

'The family *Leporidae* is but feebly represented in each of the provinces above mentioned, excepting in North America, where the number of species already discovered is almost equal to all those found in other portions of the globe taken together. In earlier periods these Rodents, which are very low in the scale, appear to have been much

more numerous, judging from the fossil remains which have been found—at least in the European provinces.

'The remaining families of Rodents are almost entirely confined to South America. The genus *Aulacodus* of Western Africa, the genera *Petromys*, an inhabitant of the Cape of Good Hope, and *Bathyergus*, found both at the Cape and north-eastern portions of Africa, possess certain characters in which they approach the South American forms. *Petromys* analogically appears to represent the *Octodons* of South America, and *Bathyergus* may be compared to the genera *Poepthagomys* and *Ctenomys*; whilst in *Aulacodus* we possess a representative of the *Capromys* of the West Indies.'

	Europe and North Asia.	North America.	Africa.	India and Islands.	South America and West India Islands.

Mr. Waterhouse observed, 'that he had not yet been able to satisfy himself as to the precise situation, in a systematic classification, of the genera *Ctenodactylus* and *Helomys*, the former from North and the latter from South Africa. Four other genera are omitted in the above table for the same reason; they are *Otomys* of Dr. Smith, a genus found at the Cape of Good Hope; *Akodon*, Meyen, which inhabits Peru; *Heteromys*, Desmarest, founded on the *Mus anomalous* of Thompson, an animal found in the island of Trinidad; and lastly, *Sarcomys* of F. Cuvier, which is supposed to be from North America. These four genera in all probability belong to the family *Muridae*.

'The genus *Aplodontia* is placed with *Sciuridae*, but it must be observed that it differs much from the typical species of that group, there being no post-orbital process to the skull, and the molar teeth being rootless.' (*Zool. Proc.*)

The student should further consult *The Zoology of the Voyage of H.M.S. Beagle*, Nos. ii., iii., iv. of part ii. (*Mammalia*), where many Rodents are described and figured, and the characters of the *Octodontidae* (pp. 83, 84) clearly pointed out.

We have good reason for stating that besides the *Lepo-*

*ridae*, which differ considerably from all other groups of Rodents, there are only a few genera which Mr. Waterhouse has not yet sufficiently examined to determine satisfactorily to himself how many families they form. These genera are the South American forms *Capromys*, *Myopotamus*, *Echymys*, *Cercomys*, *Dasyprocta*, and *Calogonyx*; they are, in his opinion, certainly very nearly allied to each other, and may perhaps with propriety be collected into one family under the name of *Dasyproctidae*. There are moreover certain African genera which Mr. Waterhouse has not yet had an opportunity of thoroughly examining. Some observations by the same author on the families *Chinchillidae* and *Caviidae* will be found in the *Zoological Proceedings for 1839* (p. 61).

Brandt has admirably worked out the family *Hystriidae*, in his *Mammalium Exoticorum novorum, vel minus rite cognitorum, Musei Academici Zoologici Descriptiones et Icones*, &c. (Petropoli, 1835) 4to.

FOSSIL RODENTIA.

Dr. Lund, in his view of the Fauna of Brazil, previous to the last geological revolution,\* after noticing the living Rodents inhabiting that district, proceeds to notice the remains found in the limestone caves there.

\* This is a different genus from the *Otomys* of Cuvier, which is *Euryotis* of Brandt.

\* There is a good translation of this most interesting paper in the *Megasthenes of Natural History*, New Series, 1840.

He commences with the common Brazilian wood-rat, *Mus lasiurus*, observing that he knows of very few caves in which remains of this animal are not found, and that in many they occur in such prodigious quantities as to excite astonishment. He cites as an instance the numbers which he found in a cavern near Caxoero do Campo, which is 120 feet long, from 6 to 9 feet wide, and from 30 to 40 feet high. Its floor for a distance of 20 feet from the entrance was covered with a bed of earth perfectly identical with the soil outside, and which had evidently been washed in by rain-water. Farther in, this bed of earth disappeared, and was replaced by a layer of very loose brownish or black mould, about a foot thick, and completely full of small bones, more abundant in some places than in others. Dr. Lund filled a box, containing about half a cubic foot, with this mould; and counted in it about 2000 separate *rami* of the under-jaw of *Mus lasiurus* and about 400 of *Didelphis murinus*, besides a small number of the jaws of other animals. Most of the bones were broken; the smaller ones only, such as those of the feet, the vertebræ, and the strongest long bones being entire. All the skulls were fractured, so that a portion of each was usually wanting: those which lay deepest were brown, brittle, and adhered to the tongue; the uppermost bones were all very fresh. Upon the surface of the earth the *elytra* and legs of beetles were scattered. Dr. Lund is of opinion that the *Strix perlata*, which is met with abundantly in the caverns, is the predatory animal which collected these bones. The remains of the Paca and Gutia are frequently found unconnected with the heaps of bones cast up by the owls.

Dr. Lund further observes that the most numerous genus of the family of Rodents is the genus *Mus*, with six species of which, indigenous to the district, he is acquainted, besides two which have been introduced from Europe (*Mus musculus*), the other, as he suspects, from Asia (*Mus setosus*, Lund). The abundant remains of this genus collected by him from the caverns prove its existence in the antient world. The species, difficult to distinguish by external characters, are, he remarks, still more so when fragments only of their skeletons remain. He was however able to make out two or perhaps three extinct species. In several caverns he found remains of a fossil species of *Echimys* which approaches very nearly to *Echimys Apereoides*, Lund. He also found traces of a species belonging to the fossil period which agree very closely with *Echimys sulcidens*. A gigantic *Syntheres* (*Cercolabes*, Brandt) belonged to the antient Fauna of the district; for the fragments in the possession of Dr. Lund indicate a creature very little inferior in bulk to the wild hog. The fossil species moreover presents, he tells us, a nearer resemblance to the smaller existing species (*Syn. insidiosa*) than to the larger (*Syn. prehensilis*), so that, he observes, it would be classed, by those zoologists who make a generic division, between these two species, under the genus *Sphiggurus*. He discovered a small Rodent which did not agree with any of the genera at present existing in that country. The fossil remains of the genera *Lepus* and *Anæma* were abundant in the caves, and those of a species of *Dasyprocta* still more so: these more or less closely resemble the recent species of their respective genera. A second species of *Dasyprocta* was rare and of extraordinary size, the long bones of the hinder extremities being almost as large as those of the roebuck. Dr. Lund proposes the name of *Dasyprocta Capreolus* for this fossil animal. Of the *Capybar* or *Capybara* two fossil species were found; one identical with that now in existence, the other of great size. For this last Dr. Lund proposes the name of *Hydrochærus sulcidens*. It was nearly five feet in length, so as to stand, as Dr. Lund observes, midway between the existing species of this genus and the South American Tapir. The remains of the genus *Puca* (*Cælogenys*) were found fossil in most of the Brazilian caves, and were amassed to a great extent. Two extinct species are named by Dr. Lund—*Cælogenys laticeps* and *Cælogenys rugiceps*: a third, much larger, having been not inferior to the living *Capybara*, is named by him *Cælogenys major*.

Dr. Lund remarks that with reference to the numerical relations of this order in the present and former periods, we see that only one of the existing Brazilian genera is absent from the list of fossil genera, namely, that of the squirrels. Dr. Lund further observes that the total number of species at present existing in the district examined by him is 18: but he only discovered 16 belonging to the extinct Fauna. This however does not militate against his

opinion that the antient Fauna was numerically richer than the modern in animal forms.

Notices of the fossil animals belonging to this order will also be found under the articles which treat of the families and genera.

RÓDERIC, the thirty-fourth and last of the Visigothic line of kings who filled the throne of Spain from 411 to 711. The circumstances which attended the elevation and fall of this prince are as doubtful as most events of that dark period. He appears to have been the son of Theodofred, duke of Cordova, and the grandson of Chindaswind. Having been entrusted by Witiza with the command of the army, Roderic revolted against his sovereign in 708, deprived him of the crown, and banished him to Toledo. For some time after his usurpation, Roderic had to contend against the sons and partisans of the dethroned monarch, who had taken refuge in the northern provinces of Spain. At last the sons of Witiza, perceiving their inability to cope with the forces of the usurper, crossed over to Africa, where they were kindly received by Ilyan (the Count Don Julian of Spanish chronicle), lord of Ceuta and Tangiers, and a friend of Witiza, who offered, if assisted by the Arabs, whose tributary he was, to restore the princes to the dominions of their father. Having communicated his project to Músa Ibn Nosseyr, then governor of Africa for the Khalifs of Damascus [MUSA; MOORS], that general, who had long wished to carry his arms into Spain, gladly embraced the opportunity offered to him, and promised his powerful assistance. By his orders Tarif Abú Zorah, with four hundred Berbers, landed at Tartessus (since called Tarifa, in commemoration of this event), and after ravaging the adjoining country, returned to Africa laden with plunder and captives. This happened in Ramadhán, A. H. 91 (Oct., A. D. 710). The success of the enterprise filled the Arabian Amír with joy, and a second and more formidable expedition was, the ensuing year, directed against the shores of Spain, on Thursday the eighth of Rejeb, A. H. 92, answering to the 30th April, 711. Tárik Ibn Zeyyád, a freedman of Músa Ibn Nosseyr, landed with eight thousand men at the foot of the rock of Calpe, to which he gave his own name, *Jebal Tárik* (the mountain of Tárik), since corrupted into Gibraltar. Soon after their landing, Tárik and his followers were attacked by Theodomir, the governor of Andalusia. The Goths however were unable to force the positions taken up by Tárik, who, seeing his number daily increase by fresh reinforcements from Africa, descended into the plain, and advanced without opposition as far as Medina Sidonia. He was there met by Roderic, who, at the head of numerous but ill-disciplined forces, hastened to repel the invasion. After some sharp skirmishing, which lasted for six consecutive days, the two armies came to a general engagement on the 5th of Shawwál, A. H. 92 (26th July, 711). According to Ar-rázi and other historians, this memorable battle, which decided the fate of the Gothic monarchy, was fought on the banks of the river Barbate, not on those of the Guadalete, as the generality of the Christian historians have erroneously asserted. It was at first hardly contested on both sides, until the defection of Oppas and other partisans of Witiza, to whom Roderic had imprudently entrusted the command of the right wing of his army, gave the victory to the Arabs. The rout then became general, and the flower of Gothic chivalry fell by the sword of the Arabs, Roderic himself being in the number of the slain. This last fact has been brought into question by the generality of the Spanish historians, from Rodericus Toletanus down to Masdeu, on the ground that Sebastianus Salmanticensis, a monk and chronicler of the tenth century (in *Flores, Esp. Sag.*, vol. xiii.), speaks of a tomb being discovered in his time, at Viséo in Portugal, bearing this inscription, '*Hic requiescit Rodericus ultimus Rex Gothorum*;' from which they conclude that Roderic escaped the field of battle, and retired into Portugal, where he passed the remainder of his days in penance and prayer. The statement however is entitled to little credit; for not only have we the testimony to the contrary of the Arabian writers, who universally agree that Roderic perished in the action, though they are divided as to the manner of his death, some asserting that he was slain by Tárik, and others that he was drowned in attempting to cross the river; but the assertion is further corroborated by Isidorus Pacensis, and the anonymous continuator of the '*Chronicon Biolarensis*;'—two contemporary Christian writers, who positively declare that Roderic died in the action. Roderic's reign had lasted

nearly three years. There is a fabulous chronicle of this king, or rather a romance of chivalry, in which the popular traditions current among Moors and Christians respecting the invasion and conquest of Spain, as well as many ridiculous fables like that of Florinda, and the enchanted Tower of Toledo, have been embodied by an anonymous writer of the fourteenth century. It was printed for the first time at Toledo, 1549, and has since gone through several editions. Another fabulous history of Roderic and the events in which he was engaged, was written towards the middle of the sixteenth century, by a converted Moor of the name of Luna (Granada, 1592, 4to.). These, and other books of the same stamp, have furnished ample materials for some of the best works in English literature. (Scott, Southey, and Irving.)

(Al-makkari's *History of the Mohammedan Dynasties in Spain*, vol. i., chaps. 1 and 2.)

**RODNEY, ADMIRAL, LORD. GEORGE BRYDGES** RODNEY was born at Walton-upon-Thames, in the county of Surrey, February 19, 1718. He was taken from Harrow School, and sent to sea at twelve years of age. In 1739 he was made a lieutenant; in 1742, a captain; and in 1748 he was sent out as governor and commander-in-chief on the Newfoundland station, with the rank of commodore.

In October, 1752, Rodney returned to England, and was elected member of parliament for the borough of Saltash. He was appointed successively to the *Fougueux*, 64 guns; the *Prince George*, 90; and the *Dublin*, 74. After twenty-eight years of active service, he was raised to the rank of rear-admiral, May 19, 1759.

In 1761 Admiral Rodney was appointed commander-in-chief at Barbadoes and the Leeward Islands. Having captured the islands of Martinique, Santa Lucia, and Granada, he was recalled on the conclusion of peace in 1763. Soon after his return he was created a baronet, and by successive steps reached the rank of vice-admiral of the red. He was also appointed governor of Greenwich Hospital; but resigned this office on being sent out, in 1771, as commander-in-chief on the Jamaica station. In 1774 he was recalled.

Under the pressure of pecuniary difficulties, Sir George Rodney now retired to Paris, where he remained till May, 1778, when he was promoted to the rank of admiral of the white, and in the autumn of 1779 was again appointed commander-in-chief on the Barbadoes station, for which he sailed December 29, 1779. His fleet consisted of 22 sail of the line and 8 frigates. France and Spain were at this time united against England. Before he had been ten days at sea he had captured seven Spanish ships of war, and on the 16th of January, 1780, fell in with a Spanish fleet, under Admiral Langara, near Cape St. Vincent, consisting of 11 ships of the line, and 2 frigates. Of these five were taken and two destroyed; but the action being in the night, and the weather tempestuous, the rest escaped.

On the 17th of April, 1780, Rodney came in sight of the French fleet, under the Comte de Guichen, near Martinique. Rodney intended to attack the enemy, which was a little superior, with his fleet in close order; but the greater part of his captains disobeyed, and kept at a cautious distance. Only five or six ships supported him, while in his own, the *Sandwich*, he engaged a 74 and two 80-gun ships for an hour and a half, and compelled them to bear away, and broke through the enemy's line. In his dispatches Rodney censured the conduct of his captains, but the Admiralty suppressed the passage, and only one of them was brought to trial, who was dismissed from the service. The admiral was rewarded with the thanks of the House of Commons, and a pension of 2000*l.* a-year, to be continued after his death to his family in specified portions for their respective lives. In 1780, he was chosen, free of expense, to represent the city of Westminster, and was also made a Knight of the Bath. Soon afterwards war was declared against the states of Holland, and instructions were sent to Rodney to attack their possessions in the West Indies. The Dutch island of St. Eustatius surrendered, without a shot having been fired, Feb. 3, 1781; and in the course of the spring, the Dutch colonies of Demerara, Essequibo, and Berbice were taken. Rodney, having returned to Europe in the autumn of 1781 for the recovery of his health, was received with universal enthusiasm, was created vice-admiral of England in the place of Admiral Hawke, deceased, and was appointed to the command of the whole of the West Indies. Both the

French and Spanish fleets were at this time in the West Indies, and it was intended to form a junction, and attack Jamaica and the other British possessions. The French fleet was commanded by the Comte de Grasse, and consisted of 33 or 34 sail of the line, besides frigates. Intelligence having been brought to Rodney, on the 8th of April, 1782, of their having sailed from Fort Royal Bay, Martinique, he immediately followed them. A partial action took place on the 9th, when two of the French ships of the line were disabled, and a third was rendered useless by an accident in the night of the 11th, thus reducing the French fleet to 30 or 31 ships of the line. The British fleet was rather more in number, but much less in weight of metal. The general action commenced on the 12th of April, 1782, at seven o'clock in the morning, and lasted till half-past six in the evening. Rodney, in the *Formidable*, broke through the French line, and engaged the *Ville-de-Paris*, De Grasse's flag-ship, and compelled her to strike. The result was, that seven ships of the line and two frigates were taken by the British.

About this time the Whigs had come into office, and Rodney having been always opposed to them, an officer was appointed to succeed him, who had only just sailed when the news of this great victory reached England, and the Admiralty immediately sent an express to overtake and bring back the officer, but it was too late. Rodney reached England, September 21, 1782. He was raised to the peerage with the title of Baron Rodney, and received an additional pension of 2000*l.* a-year. He lived chiefly in the country, till May 23, 1792, when he died, in his 75th year. He was twice married, and left a numerous family. A monument was erected to his memory in St. Paul's cathedral, London, at the national expense. His portrait by Reynolds was in the royal collection at St. James's Palace, but has since been sent to Greenwich Hospital.

**RODOLPH. [GERMANY]**

**RODRIGUEZ, VENTURA**, the most eminent Spanish architect of the eighteenth century, was born at Cienpuecos, July 14, 1717, and commenced his first studies in his profession under Esteban Marchand, who was then employed on the works carrying on at Aranjuez. After the death of Marchand, in 1733, he still continued at Aranjuez, until Juvara engaged him as his assistant in making drawings for the design of the new palace at Madrid; and after the death of Juvara, he was similarly engaged by his successor Sachetti, with whom he was subsequently associated in the execution of that vast pile, as *aparejador*, or principal clerk of the works, 1741. In 1747 he was made honorary member of the Academy of St. Luke at Rome; and on that of St. Fernando being established at Madrid, in 1752, he was appointed chief director or professor of architecture in it, an office for which he was peculiarly fitted, not only by his talents, but by his zeal for his art, and his solicitude for the improvement of the pupils. Commissions poured in upon him from every quarter; for there was scarcely a work of any importance throughout the country on which he was not either engaged or consulted. He was employed on various cathedrals, churches, colleges, hospitals, and other structures at Zaragoza, Malaga, Toledo, Granada, Valladolid, and numerous other places; and a mere list of the works designed or executed by him would be one of considerable extent. We can here merely point out, as being among the more remarkable for their design, the sanctuary at Cobadonga, the church of San Felipe Neri at Malaga, that of the hospital at Oviedo, and the palace of the Duque de Liria at Madrid.

These multiplied engagements, and the frequent journeys which they occasioned him, prevented his visiting Italy; but he collected all works of engravings relative both to its ancient and modern buildings. He also carefully studied the various monuments of Roman, Moorish, and Gothic architecture in his own country. He died at Madrid, 1785, in his sixty-eighth year, and was buried in the church of San Marcos, the only one in that capital erected by himself. Rodriguez has been honoured with an Elogio by the celebrated Jovellanos, to which we must refer those who wish for a more detailed notice of his character and works. He is also repeatedly mentioned with high commendation by Ponz, in his *Viage de España*; and he doubtless deserves the title he received from his contemporaries, of the Restorer of Architecture in Spain; yet whether his merit lay chiefly in

the reform of a puerile and vitious taste, and in purifying Spanish architecture from the barbarisms that had crept into it, or whether his works display any high degree of positive talent, is what we ourselves have not the means of judging.

**ROEBUCK.** [DEER, vol. viii., p. 360.]

**ROGATION DAYS.** It was a general custom formerly, says Bourne, and it is still observed in many country parishes, to go round the bounds and limits of the parish on one of the three days preceding Holy Thursday; when the minister, accompanied by his churchwardens and parishioners, used to deprecate the vengeance of God, beg a blessing on the fruits of the earth, and preserve the rights and properties of the parish. Spelman considers this custom as an imitation of the Roman Terminalia. The primitive custom used by Christians on this occasion was, for the people to accompany the bishop or some of the clergy into the fields, where Litanies were made, and the mercy of God implored, that he would avert the evils of plague and pestilence, that he would send them good and seasonable weather, and give them in due season the fruits of the earth. The Litanies or Rogations then used gave the name of Rogation Week to this time. They occur as early as A.D. 550, when they were first observed by Mamertius, bishop of Vienna, on account of the frequent earthquakes that happened, and the incursions of wild beasts, which laid in ruins and depopulated the city. (Walfred, Stral., c. 28, *De Repub. Ecclesiast.*) In the canons of Cuthbert, archbishop of Canterbury, made at Cloveshoo, in the year 747, it was ordered that Litanies, that is Rogations, should be observed by the clergy and people, with great reverence, on the seventh of the calends of May, according to the rites of the church of Rome, which terms this the Greater Litany, and also, according to the custom of our forefathers, on the three days before the Ascension of our Lord, with fastings, &c. (Wilkins, *Concil. Brit.*, p. 249; Spelm., *Gloss.*, v. 'Litania.')

The continuance of this custom through later times is evidenced by old parish accounts, and by the various episcopal articles of inquiry. In the injunctions issued in Queen Elizabeth's reign, it is ordered that the curate, at certain and convenient places, shall admonish the people to give thanks to God, in the beholding of God's benefits, for the increase and abundance of his fruits, saying the 103rd Psalm, &c.; at which time the minister shall inculcate these or such sentences, 'Cursed be he which translateth the "bounds and doles of his neighbours," or such orders of prayers as shall be hereafter.'

Rogation Week, in the northern parts of England, is called Gang Week, from *to gang*, which in the north signifies to go. Gang-puca, gang-week, occurs in the rubric to John, c. 17, in the Saxon Gospels; and Gang-dagay are noticed in the laws both of Alfred and Athelstan.

(Brand's *Popular Antiq.*, 4to. edit., vol. i., p. 168-178; Brady's *Clavis Calendaria*, 8vo., 1812, vol. i., p. 321-326.)

**ROGER OF HOVEDEN.** [HOVEDEN.]

**ROGER OF SICILY.** [SICILIES, TWO—*History.*]

**ROGUE AND VAGABOND.** [VAGRANT.]

**ROHAULT, JAMES,** was the son of a merchant at Amiens, where he was born in 1620. He received the rudiments of a scientific education in that city, and was afterwards sent to Paris for the purpose of prosecuting his studies in philosophy.

In that age the physical works of Aristotle had begun to give place to those of Descartes, and most of the learned men in France received with complacency the explanation of the phenomena of Nature which were given in the 'Principia,' the 'Dioptrics,' and the 'Meteora' of their illustrious countryman. Among the persons alluded to, Rohault was one who diligently studied the writings of the Greek philosopher and of his numerous commentators, but who also applied himself with ardour to the productions of the new school, of which he professed to be a zealous disciple. This circumstance appears to have brought him to the notice of Clarselier, who, being himself a warm Cartesian, conceived so great a regard for the young philosopher, that he gave him his daughter in marriage, and engaged him to write a commentary on the works of the man who was the object of their common admiration. Rohault seems to have executed the task assigned to him in a manner which gratified the wishes of his patron and father-in-law, and in the spirit of an enthusiastic follower; for in the preface to his 'Traité de Physique' he designates Descartes as a man who, by his works, had shown that France was

capable of forming philosophers as illustrious as those of ancient Greece. This work was translated into Latin by Dr. Samuel Clarke, and published with notes, in which are given explanations of the principal phenomena agreeably to the philosophy of Newton, which, in a very few years, had entirely supplanted that of the French school.

After the above-mentioned work was finished, Rohault appears to have been occupied for several years in giving instructions in mathematics, and the subjects of his lessons were published after his death in two volumes. The course comprehends geometry, both plane and practical; trigonometry, plane and spherical; fortification, mechanics, perspective, and arithmetic.

Besides the 'Traité de Physique,' Rohault published also a work entitled 'Entretiens sur la Philosophie,' consisting of a series of dialogues, in which the subjects are treated according to the Cartesian principles. He died in 1675.

**ROHILCUND.** [HINDUSTAN, p. 218.]

**ROLAND, MANON.** Manon Philipon, for such was her maiden name, was born in Paris in 1756. Her father was an artist of moderate talent; her mother was a woman of superior understanding and of a singularly amiable temper. Manon learned to read so early and so easily as not to be able to recollect the process; and, having once learned to read, she read everything that came in her way. In her father's house she enjoyed, to a certain extent, the means of cultivating painting, music, and general literature. It is probable that her early devotion to these pursuits tended to exalt her imagination and to influence the whole of her future career. Whilst yet a girl, she was, at her own earnest request, placed for one year in a conventual school. At this age her religious enthusiasm was extreme; in after-years it subsided, and her opinions, she confesses, went through every change, until they rested in scepticism; a result in some degree due to her perusal of the writings of many celebrated authors. Her reading, under her father's roof, was of a most miscellaneous description. The works of the fathers and the free writings of the seventeenth and eighteenth centuries were equally accessible to her, and perused with equal avidity; but the most powerful and lasting impression was made on her by an early familiarity with Plutarch's 'Lives of Illustrious Men.' From this time, Greece and Rome were constantly present to her thoughts, and when she was fourteen years old, she is said to have wept to think that she was not a Roman or a Spartan woman.

At the age of five and twenty, she became the wife of M. Roland, a man twenty years her senior, of laborious habits, great ability and integrity, and manners described as of antique severity. A daughter was the fruit of this marriage, and Madame Roland's time became divided between the care of her child's education, and giving assistance to her husband, from whose knowledge she derived great advantage in return. He held the office of Inspector of Manufactures, of which he fulfilled the duties in a liberal spirit well according with the previous impressions of his enthusiastic partner. With him Madame Roland visited England, Switzerland, and other countries of Europe—everywhere industriously inquiring into the nature of the civil institutions, and manifesting the warmest sympathy with the advocates of political liberty. On witnessing the comforts enjoyed by the English cottagers, she is said to have observed, that in this country a handful of wealth did not constitute the nation, but that *man*, whatever his station, was reckoned as something.

The intense interest with which such a woman regarded the first movements of liberty in her own country, may easily be conceived. Her husband being appointed to represent the city of Lyon in the National Convention, left his residence near that city, and, accompanied by his wife, proceeded to Paris, where the curiosity of Madame Roland was gratified, and her zeal, if possible, increased, by the opportunity of observing some of the most distinguished actors on the political stage—as Mirabeau, Cazalés, Maury, Barnave, and others of less note. To the cause espoused by these notable persons Madame Roland and her husband were warmly attached: and, during the ministry of the party of the Gironde, Roland was appointed minister of the interior, for which his information, his assiduity, and his strict probity highly qualified him. It was, whilst holding this office, that he appeared at court with a round hat and strings to his shoes; and was regarded by the courtiers as a symbol of a monarchy about to fall. His sincere language

was as unwelcome to the court as his plain attire was displeasing to the courtiers. The talents of his wife were at this time applied to assist him in the composition of public papers. Without pretending to direct him, she avows her belief that by mingling with the severer accents of patriotism the expressions and feelings of a woman of sensibility, she rendered these documents more impressive and effectual. The famous letter of M. Roland to Louis XVI. (May, 1792) was drawn up by her: a letter designated, according to the political feelings of the readers, as an enlightened although a severe remonstrance, or as audacious and full of evil prophecy. This production occasioned M. Roland's dismissal by the court; for which he was compensated by the warm applauses of the Convention. He again became a minister after the events of the 10th of August; but his party had then passed the bounds prescribed by his judgment, and entered upon extremes repugnant to his high-minded and generous wife. Still they were apparently favoured by their party, to whom Roland's character and popularity were necessary. Amidst the real and affected grossness of dress, manners, and language of the republicans, society preserved its respectability in the circle assembled round the table of the minister of the interior.

The events of the reign of terror do not require to be detailed. The frightful massacres in the prisons of Paris on the 2nd and 3rd of September, were boldly denounced by Roland in his capacity as minister; but the Convention, which applauded him, wanted courage, or virtue, or power to act upon his advice; and from that hour his own doom and that of his wife became only more certain. Madame Roland had herself been already arraigned before that assembly, on an absurd charge of treasonable correspondence with England; and by her presence of mind, her acuteness, and her wit, had baffled and mortified her accusers. The recollection of this defeat is said to have so haunted the minds of Marat, Danton, and Robe-pierre, that in every subsequent difficulty, and in every attack made upon their proceedings, they imagined they recognised the boldness, sagacity, or sarcasm of Madame Roland. She and her husband began to receive warnings of their danger, and for a short time consented to take the precaution of not sleeping at the Hôtel of the Interior. The appearance of deception was little agreeable to Madame Roland. 'I am ashamed,' she said, on an occasion on which she had almost consented to leave her house in the dress of a peasant, 'of the part I am made to play. I will neither disguise myself nor leave the house. If they wish to assassinate me, it shall be in my own home. This courageous example is due from me, and I will afford it.' Her husband quitted Paris, and she might have done so, but she declared that the care of evading injustice cost her more than it would do to suffer from it.

The time arrived when the intellectual superiority hitherto maintained in the Convention by M. Roland's party, or the Girondists, was overcome by absolute force. Forty thousand men were marched against the Convention, by the Jacobins, on the 31st of May, 1793; and in the evening of the same day Madame Roland was arrested and thrown into the prison of the Abbaye. Here she displayed her usual firmness, and continued to exercise towards the poor and unfortunate a benevolence for which in her prosperous days she had been remarkable. Before her friends she appeared cheerful; she always maintained the language of a patriot when speaking of the aspect of affairs, flattering and fearing none; and she professed herself capable of overcoming her ill-fortune. In solitude the feelings of the wife and the mother overcame her, and the attendants remarked that she passed many hours in tears. Her sufferings were greatly aggravated by her being one day unexpectedly liberated, as if the danger was past. She drove home with extreme delight; sprung out of the coach, as she says it had always been her habit to do, but with more than usual vivacity; and was running gaily up stairs, when she was again arrested by an officer, and at once taken to Sainte Pelagie, a prison of a lower order than the Abbaye, where she was shut up with the worst of her sex. In this second prison she remained until her trial and execution. The only explanation given of this circumstance was that her first arrest had been illegal. The wretchedness of her situation at Sainte Pelagie was only alleviated by her literary occupations, and by the kindness of her gaolers or of their families, whom her fascinating manners and behaviour converted into friends. Well

knowing that her life would be sacrificed, she devoted all her hours to the composition of her Memoirs, writings full of lively description, entertaining anecdotes of her contemporaries, and remarks indicative of penetration and habitual reflection. A letter to her daughter, written in these circumstances, is one of the most affecting of farewells. But Madame Roland seldom gave way to melancholy emotions in her writings. Her pages detail the events of her childhood and youth with matchless sprightliness and grace, and, excepting in certain passages wherein candour is carried to an excess which modern delicacy would not permit to a female writer, her Memoirs are models of that kind of composition.

As the narrative advances, events of a deeper interest are related with great facility of expression, sometimes with mournful pathos, generally with great judgment, not always without satire, but always with easy eloquence. From a very early age we may discern in this relation the extraordinary decision of her character, her naturally commanding manners, her fervent but well-controlled temperament, her indefatigable love of improvement, and her unswerving adherence to truth.

Several unhappy prisoners delivered themselves from certain execution by taking poison; and Madame Roland had at one time resolved to do the same. But communicating her resolution to a friend, who represented to her that a nobler course would be to wait for death, and leave the memory of so great a sacrifice to the cause for which she had lived, she calmly determined to abide the result.

It was in the month of October (1793) that the Girondists were destroyed. On the 31st of that month she was sent to the Conciergerie. On the 10th of November she appeared before the Revolutionary tribunal. She had declined the proffered aid of M. Chauveau-Lagarde, the great advocate of the Girondists, of the unfortunate queen, and of Charlotte Corday; knowing that no talents could save her, since her innocence could not, and not wishing to expose him to useless danger. Part of the night was occupied by her in writing her eloquent defence. Her courage did not desert her during her trial or at her execution. She sustained the insults of the unmanly tribunal, not without womanly emotion, but also with a dignity worthy of the greatest women of the times with which her early reading of Plutarch had made her familiar. To the last moment she preserved her presence of mind, and even her gaiety. On the same day and at the same hour a man was also to be guillotined; and in such extremity, to die first being thought a privilege, she waived it in favour of her less courageous companion in misfortune; overcoming the scruples of the executioner, whose orders were to execute her first, by representing to him the impoliteness of refusing a woman's last request. It is said that bending herself before the statue of Liberty, close to this scene of death, she exclaimed, 'Oh! Liberty! what crimes are committed in thy name!'

She had often been heard to say that her husband would not survive her. As soon as he heard of her execution, he took leave of two attached female friends in whose house, at Rouen, he had found a refuge, and to whom his resolution was known; walked in the evening of the 15th of November as far as Baudouin, four leagues on the road to Paris; sat down by the side of a tree in an avenue leading to a private house, and passed his cane-sword through his chest. By his side was found a paper, in which these words were written:—'Whoever you are who find me lying here, respect my remains; they are those of a man who devoted his whole life to being useful, and who died, as he had lived, virtuous and honest.'

These particulars are principally taken from a very recent edition of the 'Memoirs of Madame Roland,' published in Paris, in two volumes, 8vo., with abundant notes, by M. M. Berville and Barrière.

ROLLE, MICHEL, a French mathematician, was born at Ambert in Auvergne, in 1652. He appears to have possessed from nature a remarkable facility in solving propositions relating to arithmetic and algebra, and to have acquired by practice a great proficiency in the calligraphic art. After having served during several years as an attorney's clerk, he came, in 1675, to Paris, where he obtained a subsistence as a writing-master, and where he spent his leisure time in cultivating the mathematical sciences. An accidental circumstance procured for him the notice of M. Colbert, Ozanam, who was himself a good analyst, hap

pening to propose to mathematicians a problem of the kind called indeterminate, which, he conceived, could be solved only by a process involving very high numbers, Rolle was so fortunate as to discover a neat solution; and the minister, being informed of it, was induced, in 1685, to recommend him for election as a member of the Academy of Sciences, then recently formed.

From this time Rolle devoted himself to analytical pursuits; and in 1690 he published a treatise on algebra, in 4to. This work contains, among other methods for the solution of equations, one which he calls the method of *cascades*, a name given to it because it consists in successively depressing the equation one degree lower at each operation. It has some analogy to a method given by Newton, in the 'Arithmetica Universalis;' but its want of generality has caused it ever since to be neglected. An affectation of peculiar modes of expression prevails throughout the whole work, which is otherwise very obscurely written: the author was however particularly skilful in the management of questions of the kind called diophantine, and he published a treatise on that subject in 1699.

Rolle, unfortunately for his fame, entered the lists as an opponent of the algebra of Descartes, and of the differential calculus which had been then recently discovered by Newton and Leibnitz; and he is accused of using towards those who endeavoured to point out his mistakes a tone of anger which is very unbecoming in a philosopher. He began in 1701 to attack the differential calculus, objecting both to its principles and its applications; and, with respect to the latter, he endeavoured to show that in particular examples the results are inconsistent with those which are brought out by the antient processes. The new calculus, as it was called, found however in France a zealous and temperate advocate in Varignon, who, in replying to the objections of Rolle, explained the true meaning of the differential symbols, and pointed out that the supposed discrepancies in the results of the examples arose entirely from the haste and inadvertency of the objector.

This dispute agitated the French Academy of Sciences for a long time. Rolle continuing to raise one objection after another; and though they were answered by Varignon, the former always pretended to have the victory. It is said that the Academy was then composed of men who had been long accustomed to the antient analysis, and therefore saw with pleasure an opposition raised against methods to which they were not yet reconciled. In 1705 however the Academy, without pronouncing a judgment on the subject, recommended that Rolle, in moderating his language, should conform to the rules of the institution; and the dispute was for a time terminated. This was twenty-nine years before Bishop Berkeley attempted to revive the subject in the 'Analyst.' [ROBINS.]

It appears that, subsequently, Rolle acknowledged his error, and thus he may be supposed to have deserved the pardon of posterity. He was admitted second geometrical pensioner of the Academy in 1699, and he died on the 5th of July, 1719, at sixty-seven years of age.

**ROLLER** (Ornithology), the name of an insessorial or perching bird, *Coracias garrula*, Linn.

Some difference of opinion has prevailed among ornithologists as to the place of the *Rollers* in the system.

Linnæus arranged the genus *Coracias* between *Corvus* and *Oriolus*. Pennant (*British Zoology*) gives it a position between the Nut-cracker and the Oriole; M. Duméril placed it between the Birds of Paradise and the Crows; and Meyer arranged it in his second order, *Coraces*, among which it stands in Illiger's method. Cuvier placed the *Rollers* (*Coracias*, Linn.) between the Crows (*Corvus*, Linn.) and the Birds of Paradise (*Paradisea*, Linn.), the position assigned to them by Lacépède, and includes under that title the *Rollers* properly so called (*Coracias garrula*, Linn., &c.), and the *Rolls* (*Colaris*).

M. Vieillot, like Meyer and Illiger, places the *Rollers* among the *Coraces*.

M. Temminck gives them a position between *Bombyciora* and *Oriolus*.

M. de Blainville's method presents them between the Trogons and Bee-eaters (*Merops*).

Mr. Vigors places them in his family *Corvidæ*. [CORVIDÆ, vol. viii., p. 67.]

M. Lesson's family *Eurystomidæ* (*Rolliers* of Cuv.) consists of the *Rollers* (*Galgulus*, Brisson, and *Coracias*, Linn.); the genus *Rolle* (*Eurystomus*, Vieill. [MEROPIDÆ, vol. xv.,

p. 118], *Colaris*, Cuv., and *Coracias*, Linn.); the genus *Mainatus* (*Eulabes*, Cuv., *Gracula*, Linn.); and the genus *Mino*, Less. M. Lesson rejects the term *Coracias*, because many authors have so dismembered it, according to their different views, that a confusion calculated to produce error is the result.

In the system of Mr. Swainson, who retains the generic name *Coracias*, the *Rollers* appear among the *Meropidæ*. [MEROPIDÆ, vol. xv., p. 118.]

The Prince of Canino (C. L. Bonaparte) arranges the genus *Coracias*, giving as an example the common Roller (*Coracias garrula*, Linn.) in the family *Ampelidæ* (*Birds of Europe and North America*).

In Mr. Gould's great work on 'The Birds of Europe,' the Roller (*Coracias garrula*) comes between the Bee-eater (*Merops apiaster*) and the Kingfisher (*Alcedo aspidia*).

Mr. Yarrell (*British Birds*) arranges the *Common Roller* under the family *Meropidæ*.

*Description*.—Bill black towards the point, becoming brown at the base with a few bristles; irides of two circles yellow and brown; head, neck, breast, and belly various shades of verditer blue changing to pale green; shoulders azure blue, back reddish brown, rump purple, wing-primaries dark bluish black, edged lighter, tail-feathers pale greenish blue, the outer ones tipped with black, those in the middle also much darker in colour; legs reddish brown; in old males the outer tail-feathers are somewhat elongated.

Adult females differ but little from the males; young birds do not attain their brilliant colour till the second year. (Gould, *Birds of Europe*.) Length about 13 inches.

This is the *Pica marina* and *Pica merdaria* of the Italians; *Rollier* of the French; *Birk-Heher*, *Blaue-Racke*, and *Mandelkrahe* of the Germans; *Spransk Kraka*, *Blakraka*, and *Allekraka* of the Swedes; *Ellekrage* of Brunnich; *y Rholydd* of the antient and *Roller* of the modern British.

*Geographical Distribution*.—This bird appears to have a wide range. In Europe, it is found in Denmark, Sweden (where it arrives with the Cuckoo), and the southern provinces of Russia; is more common in Germany than France, where however it has been found in Provence; and it has been taken at Gibraltar. In Italy, according to Prince C. L. Bonaparte, it is rather common, arriving in the spring and departing in September. In Malta and Sicily it is exposed for sale in the shops of poulterers, and is said to have the taste of a turtle-dove. In the Morea it is considered a delicacy in the autumn, when it is fat with its summer food. It has been captured at Aleppo, and at Trebizond and Erzeroum. It visits the countries between the Black and the Caspian seas; and Dr. von Siebold and M. Bürger include it among the birds of Japan. In North Africa it is found from Morocco to Egypt; flocks were seen by Adanson at Senegal, and he concluded that they passed the winter there. Dr. Andrew Smith records it among the birds of South Africa. In Great Britain it has been killed in Cornwall, in Suffolk and Norfolk, in Cambridgeshire, in Yorkshire, Northumberland, Perthshire, the east of Scotland, and Orkney. We can find no account of its occurrence in Ireland; but that it is known in Wales is evident from one of its names above given.

*Habits, Food, &c.*—Deep forests of oak and birch appear to be the favourite haunts of the Roller. In the 'Annals of Natural History' for 1839, it is stated by a traveller in Asia Minor, that the Roller, which was most common throughout the south and west parts of the country wherever the magpie was not found (for it was not seen in the same district with that bird), was observed to fall through the air like a Tumbler Pigeon. Temminck states that it makes its nest in the holes of trees, where it lays from four to seven eggs of a lustrous white. M. Vieillot states that in Malta, where trees are scarce, the bird builds on the ground. In Barbary it has been observed to form its nest in the banks of the Sheliff, Booberak, and other rivers; and Pennant remarks that where trees are wanting, it makes it in clayey banks. These last modes of nidification bring it very close to the Bee-eaters and Kingfishers, whose eggs quite resemble those of the Roller in colour and shape, and only vary in size. The male takes his turn to sit. The food is very varied, according to Temminck, who enumerates moles, crickets, cockchafers, grasshoppers, millipedes, and other insects, slugs and worms. Gould states that it feeds on

worms, slugs, and insects generally. Yarrell informs us that the food consists of worms, slugs, insects in their various stages, and berries.

Bechstein observes that till lately he had thought that the Roller was untameable; but Dr. Meyer of Offenbach had convinced him to the contrary, having himself reared them in his room by the following method:—The young ones must be taken from the nest when only half grown, and fed on little bits of cow's heart, or any other meat which is lean and tender, till they can feed alone; small frogs, worms, and insects may then be added. Its mode of killing and swallowing insects is thus described:—it commences by seizing and crushing them with its bill, and then throws them into the air several times, in order to receive them in its throat, which is very capacious. When the morsel is too large, or the insect is still alive, the bird strikes it hard against the ground, and begins again to throw it into the air till it falls not across, but so as to thread the throat, when it is easily swallowed. Bechstein says that he had never seen the bird drink. The translator of Bechstein's interesting little book states that he once saw a Roller drink after having swallowed dry ants' eggs; it then ate greedily of lettuce and endive. 'Another which I kept,' adds the translator, 'liked the outside of lottuces and spinach after having eaten insects, especially beetles, which are very heating. To judge from what I have observed, the Roller is by nature wild and solitary; it seldom changes its situation, except to seek its food or to hide itself from strangers. It is a good thing, whether kept in a cage or let range, always to have a box in its way, in which it may take refuge when frightened; it will not fail to hide itself there, and by this means will not be tempted to beat itself violently, which it does when it cannot fly from the object of its fright. It knows its mistress very well, lets her take it up, comes near her, and sits without any fear on her knees for whole hours without stirring. This is as far as it goes even when tamed. It is neither caressing nor familiar; when frightened it utters harsh cries, softer ones when its food is brought, but *crag, crag, craag*. at the same time raising its head, is the expression of its joy or triumph.'

*Coracias garrula.*

The Mino Bird, *Gracula religiosa*, Linn., *Bëo* and *Mencho* of the Javanese, *Teeong* of the Sumatrans, will find a more appropriate place among the *Sturnidæ*, according to Mr. Swainson. Mr. G. R. Gray arranges it under the family *Corvidæ*, in the subfamily *Graculinæ*. Mr. Swainson states that analysis has convinced him that neither the *Rollers* nor the bird in question belong to the *Corvidæ*; and he remarks that the little value that can be attached to speculations on the rank of the present genera founded upon mere synthesis, will best appear by looking to those artificial arrangements that place the short-legged *Rollers* close to the long-legged and powerfully constructed Grakle (*Gracula religiosa*).

M. Lesson, as we have seen, places this bird next to the *Rollers*, and among the *Eurystomidæ*, and though we are by no means satisfied that this is its proper position, we shall, in the present state of opinion, notice the form here.

The *Gracula religiosa* then, the type of Cuvier's genus *Eulabes*, formed, says M. Lesson, the genus *Marnatus* of Brisson, and was placed by Linnæus and Gmelin among the *Graculæ*, next after the *Orioles*. M. Temminck retained the genus *Gracula*, reduced to the Mino Bird alone, among his omnivorous birds, and M. Vieillot kept it also, arranging it in his family of *Carunculæ*.

**Generic Character.**—Bill short, stout, not so long as the head; entirely compressed. Frontal feathers advancing far upon the base, but not dividing the front. Culmen gradually curved from the base to the tip, which is distinctly notched. Commissure but slightly angulated. Under mandible with the base broad and dilated. Nostrils basal, naked, round, sunk in a depression. Frontal feathers short, velvety. Head with naked wattles. Wings as in *Putor*. Tail short, even. Feet rather short, very strong. Tarsus and middle toe equal; hinder toe shorter; inner toe almost equal to the outer toe. (Sw.)

Example, *Gracula religiosa*.

**Description.**—Deep velvety black; a white space in the middle of the wing; bill and feet yellow; behind the eye spring fleshy caruncles of a bright orange-colour, and extend beyond the occiput.

**Geographical Distribution.**—Java, Sumatra, and the great Eastern Islands.

**Habits, Food, &c.**—Insects and fruits form the food of the Mino-Bird, which is easily tamed, and learns to whistle and talk with great facility. With the natives it is a great favourite in consequence. Marsden says of it, that it has the faculty of imitating human speech in greater perfection than any other of the feathered tribe. Bontius, who terms it *Pica, seu potius Sturnus Indicus*, heads the chapter where he figures and describes it with the following lines:—

'Psittacus Eois quamvis tibi missus ab oris  
Jussa loquar: vincit me Sturnus garrulus Indus.'—

And tells the following story:—There was, when he was in Batavia, an old Javanese woman, the servant of a Chinese gardener, who kept one of these birds which was very loquacious. Bontius was very anxious to buy it: but this the old woman would not hear of. He then begged that she would at least lend it to him that its picture might be taken, a request which was at last granted with no very good grace, the ancient Mohammedan dame being under great apprehension that Bontius would offer that abomination, pork, to her beloved bird. This he promised not to do, and had the loan of the Mino, which kept continually saying *Orang Nasarawi Catjor Macan Babi*. This being interpreted, means 'Christian Dog, Eater of Pork:' and Bontius came to the conclusion that the unwillingness of the old woman arose not only from the fear of her bird being desecrated by an offer of swine's flesh, but also from the apprehension that he or his servants, irritated by its contumelies, would wring its neck. M. Lesson also saw one at Java which knew whole phrases of the Malay language.

The general opinion seems to be that there is but one species of Mino Bird.

*Gracula religiosa.* (*Eulabes Javana*, Vieill.)

Cuvier however states that Linnæus confounded two

species under the name of *Gracula religiosa*, viz. *Eulabes Indicus* and *Eulabes Javanus*.

M. Lesson, who states that only one species is known, viz. the *Mainate Religieux*, *Gracula religiosa*, Linn., *Béo* and *Mencho* of the Javanese, remarks afterwards that there is said to be a smaller variety: this is probably the *Eulabes Indicus* above noticed.

#### *Eulabes Indicus.*

The last-mentioned ornithologist applies the old Indian word *Mino* as a generic term for a very different bird, *Mino Dumontii*, described by him in *The Zoology of the Coquille*, and there figured at pl. 26. He is also of opinion that *Gracula calva*, Linn., should be added to this genus.

ROLLIN, CHARLES, born at Paris, January 30, 1661, was the second son of a master cutler, and was intended by his father for the same trade. Attracting the notice of a Benedictine monk, by the taste and aptitude for learning which he showed at a very early age, he was rescued from his obscure destiny, and placed at the college of Plessis with a pension. Here he pursued his studies with great zeal, industry, and docility, was much noticed by the Principal of the college, and was selected by the minister Le Peletier as the companion of his two sons, with whom he had disputed the prize of academic distinction in generous rivalry. After having been instructed in humanities and philosophy, he devoted three years to the study of theology at the Sorbonne. At the age of twenty-two he had distinguished himself so much in the college of Plessis, that Herson, the professor of rhetoric there, pointed him out as his own successor in the professorial chair, which he wished to vacate, and Rollin, in spite of his own diffidence, was made his assistant in 1683, and professor in his stead in 1687. The next year he received the additional honour of the professorship of eloquence in the Royal College. In both these capacities he did not disappoint expectation. The orations which he delivered in public were very correct and elegant Latin compositions; and the reforms and regulations introduced by him into the discipline of the university deserve much praise. He revived the study of Greek, which had been greatly neglected, gave more prominence to the cultivation of the French language in the course of general instruction, introduced the plan of learning by heart fine passages of different authors, as an exercise of taste and memory, and substituted exercises in the room of the dramatic representations which the scholars had been in the habit of performing. In 1694 he was appointed rector of the university, in which office he continued two years, and made himself remarkable not less for his constant attention to its internal management than for his zeal in maintaining its privileges against all attempts to impair them.

At the expiration of the rectorship, he was engaged by Cardinal Noailles to superintend the studies of his nephews, having resigned all his public employments, except the professorship of eloquence in the Royal College, in order that he might have more leisure for his private literary labours. Shortly after he was dragged from his retirement, and un-

willingly persuaded to become coadjutor in the college of Beauvais. In this situation he passed fifteen years, devoting himself with as much assiduity to the improvement of the system of education there, as he had before done in the college of Plessis. In consequence of the disputes between the Jesuits and Jansenists, which latter party he was thought to favour, and the intrigues thence arising in his college, Rollin was compelled to quit his office at Beauvais. In 1715 he published his edition of Quintilian, in two volumes, 12mo., with a preface and a popular outline of rhetoric, short notes, and summaries of the chapters. The text was not published entire, but selections were made according to the judgment of the editor.

In 1720 he was again chosen rector of the university, but in consequence of the religious feuds already mentioned, he was displaced very shortly by a *lettre-de-cachet*, the university being desired to choose a more moderate rector. From this period till his death he seems to have withdrawn from public life as much as possible, and devoted himself to study, the fruit of which was given to the world in several works. In 1726 appeared his '*Traité de la Manière d'Etudier et d'Enseigner les Belles-Lettres*,' a work which presents a popular view of such classical and French literature as he considered suited for the instruction of the young, and contains such a system of education as his own experience in teaching had suggested. This treatise, though deficient in philosophical principles, and inferior to subsequent writings of the same nature, was well adapted for the age in which it was published, and contributed probably very much to diffuse a general taste for literature throughout France. It was translated into English, in 1735, under the title of '*Thoughts concerning Education, translated from the French*.' There is extant a letter from Bishop Atterbury to Rollin, in which he speaks in high terms of it. Encouraged by the general approbation with which this publication was received, Rollin composed his '*Histoire Ancienne*,' an account of the chief nations of antiquity drawn from profane authors, and terminating with the establishment of the Roman empire under Augustus, in thirteen volumes, which appeared successively in the interval between 1730 and 1738. His last work was a history of Rome, which was afterwards continued by Crevier, from the end of the republic to the time of Constantine, in completion of the original plan.

Rollin's latter years were disturbed occasionally by the religious troubles which agitated his country. His friendship with many distinguished Jansenists drew upon him from time to time the suspicions of the government, and he was accused of joining in conspiracies, and his house searched in consequence, though his enemies could not succeed in criminating him. He died 14th September, 1741, having exceeded his eightieth year.

From the testimony of his contemporaries it appears that Rollin's character was a model of piety and virtue. He was remarkable for his liberality, modesty, integrity, and single-heartedness. This last quality is shown not less in the whole tenour of his actions than in his writings, which please more from a certain simplicity than from any other cause. The merits and defects of his '*Belles-Lettres*' are of the same kind as those observable in his '*Histoire Ancienne*.' There is the same want of profound thought, and the same absence of critical judgment, the same easy style, attractive to a young mind, and pleasing from its very carelessness, while the want of critical judgment is compensated by the love of truth and the morality which pervade the whole.

Great praise has been bestowed on Rollin by his contemporary admirers, among the most illustrious of whom were the duke of Cumberland and Frederic the Great, who was his frequent correspondent. Montesquieu styled him '*the bee of France*,' and Voltaire and Rousseau have confirmed this eulogium.

Modern readers will perhaps think that Rollin's merits as an author have been overrated by the zeal of personal friendship and esteem for his private character, and that his works are chiefly valuable as having contributed to form the taste and strengthen the moral feelings of his age. His '*Opuscles*' were collected and published, 2 vols. 12mo., in 1771; they contain orations and poems, written in very classical and graceful Latin, correspondence with Frederic the Great, Rousseau, and other distinguished persons, and other smaller compositions.

Extracts from his works, by M. l'Abbé Lucet, were pub-

lished in 8vo., Paris, 1780, under the title of 'Pensees sur plusieurs points importants de Littérature, de Politique, et de Religion.' He is said to have written a 'History of the Arts and Sciences of the Antients,' London, 1768, 3 vols. 8vo. His 'Histoire Ancienne' has frequently been reprinted. A new edition of all his works was commenced at Paris, 8vo., 1837. This history was edited by Emile Beres, with new maps and plates.

The materials for a biography of Rollin are contained in the 'Eloge de M. Rollin,' written by M. de Boye, secretary of the Académie des Inscriptions (of which Rollin was a member), and read before this Society, 14th November, 1741. It was printed, with additional matter in the form of notes, in the edition of the 'Opuscules,' in 1771, already referred to. See also Chauffepié's 'Dictionnaire Historique' and the 'Biographie Universelle.'

ROLLO. [NORMANDIE.]

ROLLS. [RECORDS.]

ROLLS-COURT, the Court of the Master of the Rolls, of which there are two, one at Westminster in the new buildings adjoining the hall, the other in the Rolls Buildings in Chancery Lane. The latter was originally a house or hospital for the reception of Jewish converts: but when the Jews were banished from England by King Edward I., there was little use for an hospital of this kind: whereupon it was assigned to the Master of the Rolls, who had thenceforth the denomination of *Magister Rotulorum, Recordorum, &c., et Custos Domus Conversorum*. One or two converts were maintained on a poor pittance in this house in the sixteenth century.

ROLLS, MASTER OF THE, a very eminent officer of the Court of Chancery, second only to the chancellor himself. Originally he had, as the name implies, the custody of the rolls or recorded proceedings of that court, and, it seems also, of any other documentary matter belonging to that court. But the custody had long been merely nominal, the actual care of them being vested in certain keepers, who were not even appointed by the Master of the Rolls: the two chief depositaries being at the Tower, where the records previous to the reign of Richard III., and at the Rolls Buildings, where are kept those of the later period. But this state of things was altered by the act 1 and 2 Victoria, chap. 94, entitled an 'Act for the better custody of the Public Records,' by which the custody is restored to the Master of the Rolls for the time being, and very extensive powers are given to him with respect to the custody and use of them. The act further commits to him the records also of the Common-Law Courts and of the Court of Exchequer.

By what means the Master of the Rolls became divested of the peculiar duties indicated by the name, is a point of legal antiquarianism which has not been satisfactorily elucidated; nor is it quite clear when or how he came to sit to hear causes in equity. Now the chief duties of this officer are judicial; but from his decrees there is an appeal to the chancellor. He signs all injunctions of the Court of Chancery.

ROMA, COMARCA DI, is the name of a province of the Papal state, in which the city of Rome is situated, and which is under the same administrative authorities as the metropolis itself. It consists of the Agro Romano, or territory immediately around Rome, and of the districts of Tivoli, Albano, and Subiaco. The province extends on both banks of the Tiber, including Bracciano, Monte Rosi, and Monte Sant' Oreste (the ancient Soracte) on the west or right bank of the river, and it extends as far as Magliano on the eastern or left bank, including Palombara, Tivoli, Vicovaro, and the whole valley of the Anio, with Palestrina, Frascati, Albano Genzano, and Porto d'Anzo and Nettuno on the sea-coast. It is bounded on the north by the province of Spoleto e Riëti, on the east by the kingdom of Naples, on the south by the province of Frosinone, south west by the Mediterranean, and west by the province of Viterbo. The city of Velletri forms a separate government under the Cardinal Decano, or senior cardinal, who is by custom legate of Velletri and Ostia. For a description of the Comarca see CAMPAGNA DI ROMA.

ROMAGNA, ROMANDIO'LA, a name which was given in the middle ages to a tract of country north of the Apennines, extending along the coast of the Adriatic, from the river Foglia near Pesaro, which was the northern boundary of the Picenum, or March of Ancona, to the Scoltenna, or Panaro, which flows half way between Bologna and Modena. This extent of territory corresponds to that

of the modern Papal legations, Bologna, Ravenna, Ferrara, and Forli. The Po was its boundary on the north, and the Apennines of Tuscany on the south and west. Ravenna was the chief town. The name of Romagna, or rather Romandiota, 'Little Rome,' is said by Alberti to have been given to it in consequence of the Exarchs having fixed their residence at Ravenna, which thereby became a second Rome, being the seat of the Imperial government in Italy. But the appellation came into common use later than the period of the Exarchs, for in their time the old administrative names of the time of the empire, 'Flaminia' and 'Æmia,' were still in use. (Paulus Diaconus, *Hist. of the Longobards*, ii. 19.) In the quarrels between the popes and the Greek emperors on the subject of images, the people of Ravenna and the neighbouring country took part with the former, and afterwards Pepin and Charlemagne bestowed Æmia, Flaminia, and Pentapolis on the see of Rome, although the popes could not for a long time after enforce their political supremacy over the whole of that country [PAPAL STATE], still they considered it as their own, and gave it the name of Romandiota. Such is the account of Giannone and other historians. During the middle ages several popes strove to maintain their authority over the petty princes and towns among which the country was divided. [ALBORNOZ.] Alexander VI. commissioned his son Cesare Borgia to conquer the country, which he effected in great measure, partly by force and partly by treachery, and the pope created him duke of Romandiota; but after the death of Alexander VI., Julius II. annexed it to the Papal state. The country was afterwards divided into administrative divisions styled legations, but the general appellation of Romagna continued in use, being applied more especially to the eastern part of the country near the Adriatic, between Rimini and Ravenna, the inhabitants of which are called at Rome to this day 'Romagnoli.' The people of Bologna and Ferrara are not understood as included in this denomination. The Romagnoli are lively and quick, but they have the character of being hasty and violent. Of late years they, as well as their neighbours, Bologna, have shown themselves the most impatient of Papal control of all the populations of the Papal State. The principal towns of Romagna are: CESENA; FAENZA; FORLI; IMOLA; RAVENNA.

ROMAGNO'SI, GIAN DOME'NICO, born near Piacenza in 1761, studied first in the College Alberoni, where he had for a schoolfellow his countryman Gioia, who afterwards distinguished himself as a publicist and a political economist. [GIOIA, MELCHIORRE.] Romagnosi continued his studies at Parma, where he took his degree of Doctor of Law in 1786. He afterwards practised as an advocate. In 1791 he published his 'Genesi del Diritto Penale,' being an investigation of the grounds on which the infliction of punishment for offences is founded. Beccaria, Filangieri, and other Italian jurists of that age had adopted the French theory of a social contract, by which each member of an ancient society was supposed to have given up a portion of his original independence into the hands of the collective body, and to have thus bound himself and his descendants. Romagnosi rejected this hypothesis, and he derived what he called the right of punishing from the principle of necessity and of self-defence, inasmuch as the whole of society is concerned in an injury which is done to any of its members. His work was well received in France and Germany, but it has been little noticed in Italy until of late years, where it has been republished five or six times; and it is now much studied, especially in Tuscany. Soon after the publication of the work, the prince bishop of Trent named him prætor, or chief magistrate, of that town, an office held for one year, but in which Romagnosi was confirmed for three consecutive years, after which the bishop named him his aulic councillor.

During the turmoil of the French revolution, Romagnosi did not participate in the blind admiration of many of his countrymen for what were called the new ideas, and he tried to define the just meaning of liberty and equality in two little works, 'Che Cosa è Eguaglianza,' 'Che Cosa è Libertà,' 1793. When the French invaded Italy in 1796, Romagnosi remained in the Italian Tyrol, to whose population he was greatly attached: he said of them, among other things, that they did not know how to tell a lie. When the French entered the Tyrol, Romagnosi was named secretary of the provisional council in which he did all he could to oppose the foreign invasion.

When the French were driven away in 1799, he was accused by some invidious person of disaffection to his legitimate sovereign, and was arrested and confined at Innsprück; but he was soon released, and the emperor Francis himself declared him innocent, and banished his accuser. In December, 1802, he was appointed professor of law in the university of Parma, where he published his second professional work, 'Introduzione allo Studio del Diritto Pubblico Universale,' a treatise on general jurisprudence, or what has been styled by Hobbes 'civil philosophy,' and by Barbeyrac and Burlamaqui, 'droit naturel,' or 'law of nature.' Romagnosi maintained that moral and political science is as susceptible of demonstration as the natural and metaphysical sciences. He took for the basis of his system the principle of moral necessity, saying that man and society tend not only to their preservation, but to their physical and moral improvement, in the quickest and at the same time safest progression. This progression can only be effected by raising the intellectual and moral powers. The understanding and the heart ought to be educated so as to create only wishes and habits consistent with the general welfare, and so that utility and justice shall coincide.

A second edition of Romagnosi's work appeared at Milan in 1825, with the addition of five letters by the author to Professor Valeri of Siena, in which he develops and illustrates his principles.

In 1806 Romagnosi was requested by the government of the so-called kingdom of Italy, then under Napoleon, to repair to Milan, in order to assist other distinguished jurists in compiling a code of criminal procedure. Romagnosi attended all the sittings of the Commission in which the draught of the new code was discussed. He wished to introduce the jury; but Napoleon put his veto on it, saying that he did not think that the state of Italy allowed of such an institution. Some one proposed to introduce into Italy the 'lettres-de-cachet,' or royal orders for imprisoning individuals for state reasons without trial, which existed in France under Napoleon, as well as under the old monarchy; but Romagnosi strenuously opposed the measure. Perceiving much coldness among his colleagues on the subject, he told them that the crosses and decorations which they wore on their breasts produced on them the effect of Medusa's head: finally he carried his point. He had also the merit of introducing into the code the heads 'rehabilitation' and 'revision of trials.' The code, as revised by Romagnosi and his colleagues, was adopted, and published under the following title, 'Codice di Procedura Penale del Regno d'Italia,' 8vo., Brescia, 1807. In France it was praised by Cambacères. The suggestions of Romagnosi during the discussion of the code were published separately under the title 'Ultime e più necessarie Aggiunte e Riforme al Progetto del Codice di Procedura Penale,' Milano, 1806.

Romagnosi was likewise employed in the compilation of a penal code for the kingdom of Italy, which however never became law. In consequence of the numerous revisions to which it was subjected, and the dilatoriness of the Italian ministers, the project had not reached Paris when Napoleon asked for it. Finding that it was not ready, with his characteristic impatience he ordered the French penal code to be forthwith translated purely and simply, and enforced in Italy, to the great regret of the Italians, who complained of the arbitrary and perverse character of many of the French criminal laws, which are decidedly the worst portion of the existing law of France. [CODES, LES CINQ.] The proposed Italian code was conceived in a very different spirit: it was printed, together with the discussions which it had elicited, in six volumes, 8vo.: 'Collezione dei Travagli sul Codice Penale del Regno d'Italia,' Brescia, 1807. These particulars are useful for enabling us to understand the history of those times and the true character of Napoleon's legislation and administration.

In 1807 Romagnosi was appointed professor of civil law in the university of Pavia, and in 1809 he was recalled to Milan to lecture on legislative science, in order to form a kind of academy of advocates and magistrates. As part of his scheme, he published his 'Discorso sul Soggetto ed Importanza dello Studio dell'alta Legislazione,' Milan, 1812; and also 'Principii fondamentali di Diritto Amministrativo,' 1814. From his lectures he compiled, in 1820, his 'Assunto primo della Scienza del Diritto Naturale,' which may be considered as a continuation of his 'Introduzione al Diritto Pubblico Universale' mentioned above. He demonstrates that society is the natural state of man, from which all his

rights and duties are derived; that agriculture, arts and commerce, education and instruction, and religion, are necessary to the social state; and that knowledge, will, and power are the three conditions required for its improvement. On being appointed inspector of the schools of law in the kingdom, he laid down the principle, that candidates for professorships ought to be examined more especially on the system of teaching which they propose to follow, even more than on the subject-matter of their lessons; he insisted, in short, on the importance of pedagogical science and aptitude.

His 'Saggio filosofico-politico sull'Istruzione Pubblica Legale,' Milan, 1807, belongs to this period. He had previously written a 'Progetto di Regolamento degli Studj Politici Legali.' He also edited a 'Journal of Civil and Administrative Jurisprudence.'

When Napoleon's power was overthrown in 1814, Romagnosi lost his offices, but he continued to lecture on jurisprudence till September, 1817, when the special chairs at Milan were suppressed. He continued however to teach privately at Milan. In June, 1821, during the political agitation of that period, he was summoned to Venice to be tried on a charge of high treason, of which however he was fully acquitted in December of the same year, and the emperor confirmed the sentence of the court in words most honourable to Romagnosi.

He still continued to live at Milan, teaching, and writing for several journals, and especially for the 'Annali di Statistica,' to which he was one of the chief contributors. He wrote also on matters of law, especially on the important subject of property in water, and water-ways and channels for irrigation, questions of the utmost importance to Lombardy: 'Della Condotta delle Acque secondo le vecchie, intermedie, e vigenti Legislazioni dei diversi Paesi d'Italia,' Milan, 1822-5, six volumes, with an appendix in two volumes. This work was very well received, not only in Italy, but also in Holland. A second work by Romagnosi on the same subject is entitled 'Della Ragione Civile delle Acque nella Rurale Economia,' two vols., Milan, 1829-30.

He also began a 'Dizionario Ragionato delle più importanti Parole della Giurisprudenza Romana, Francese, ed Austriaca,' but the work was not continued. His work entitled 'Dell'Indole e dei Fattori dell'Incivilimento con Esempio del suo Risorgimento in Italia,' contains a brief sketch of the progress of human civilization through different ages, a subject which Herder has more fully and elaborately treated in his 'Philosophy of the History of Mankind' (*Ideen zur Philosophie der Geschichte der Menschheit*). Long before Romagnosi, the Neapolitan jurist Gianbattista Vico, in his 'Principii di una Nuova Scienza,' and Jacopo Stellini, a native of Friuli, in his remarkable work, 'De Ortu et Progressu Morum,' had laboured in the same field, but their works have scarcely been noticed. Romagnosi had the merit of rendering their inquiries and his own, on the vast subject of the progress of civilization, familiar to the Italian readers.

The other works of Romagnosi are: 1, 'Che Cos'è la Mente Sana?' Milan, 1827; 2, 'Della Suprema Economia dell'Umano Sapere in relazione alla Mente Sana,' Milan, 1828; 3, 'Dell'Insegnamento primitivo delle Matematiche;' 4, 'L'antica Morale Filosofia;' 5, 'Elogio storico di Melchiorre Gioia;' 7, 'Elogio del Cardinale Alberoni;' 8, 'Note, Supplementi, ed Illustrazioni all'India Antica di Robertson.' He left several works in MS., among others: 1, 'Della vita degli stati;' 2, 'Della Civile Filosofia in relazione alla Vita degli Stati;' 3, 'Ricerche sulla Validità dei Giudizii del Pubblico a discernere il Vero dal Falso.'

Romagnosi was no dreamer. In an age of confusion of ideas, he retained his mental self-possession, and was not led away by crude theories, nor was he entranced by any superstitious veneration for irrational though ancient custom. He was an original thinker, and as such not justly appreciated in his life-time; but he is now remembered as an able supporter and expounder of sound political principles. Some of the most distinguished living writers of that country, Rossi, Cantù, and others, boast of having been his disciples. Romagnosi was a member of the Italian Academy, of the Academy of the Georgofili, of the French Institute for the class of moral sciences, and of other learned societies. He died at Milan, in June, 1835. His funeral was attended by more than two hundred of the most distinguished men of that capital, who felt the value of de-

parted merit, and who subscribed on the spot to raise a monument to his memory. (*Notizia di G. D. Romagnosi, stesa da Cesare Cantù, Milan, 1835.*)

ROMAINE, WILLIAM, was born at Hartlepool, in Durham, on the 25th of September, 1714. His father was one of the French Protestants who fled to England upon the revocation of the Edict of Nantes, and a man of the strictest piety and integrity. Mr. Romaine was his second son. He was educated at the grammar-school of Houghton-le-Spring, in the county of Durham, whence he proceeded to Oxford in 1730 or 1731, and entered first at Hertford College, and afterwards at Christchurch. He resided principally at Oxford, devoting himself especially to the study of the Hebrew and Greek Scriptures, till he took his degree of M.A. in 1737. He had received deacon's orders the year before. His first curacy was that of Loe Trenchard, in Devon, which he served for six months. In 1738 we find him residing at Epsom, in Surrey, and about the same time that he received priest's orders from Dr. Hoadly, bishop of Winchester, he became curate of the parishes of Banstead and Horton, in Middlesex. At Banstead he became acquainted with Sir Daniel Lambert, who, on his election to the mayoralty of London in 1741, appointed Mr. Romaine as his chaplain. In this capacity he preached a sermon at St. Paul's, on *Romans* ii., 14, 15. This was the second sermon he published, the first having been one which he preached before the university of Oxford in 1739, entitled 'The Divine Legation of Moses demonstrated, from his having made express mention of, and insisted so much on, the Doctrine of a Future State; whereby Mr. Warburton's Attempt to prove the Divine Legation of Moses from the Omission of a Future State is proved to be absurd and destructive of all Revelation.' At the end of the year 1741, he returned to the attack on Warburton's theory, in a sermon preached at St. Mary's, Oxford, having in the mean time been engaged in an epistolary controversy with Warburton. The next seven years of his life were devoted to the preparation of a new edition of Calasio's Hebrew Concordance and Lexicon, which was published in 1747. He discharged his office as editor of this work most faithfully. He was chosen lecturer of St. George's, Botolph-lane, and St. Botolph's, Billingsgate, in the year 1748. In the following year he was elected to two lectureships at St. Dunstan's in the West, the duties of which he had discharged for some time, when the rector thought fit to deny him the use of the pulpit. The matter was referred to the Court of King's Bench, which deprived Romaine of one of the lectureships, but confirmed him in the other, with a salary of eighteen pounds a year; but he was still refused the use of lights in the church, and used to preach by the light of a single candle held in his own hand, till this unseemly contest was put an end to by the mediation of Dr. Terrick, the then bishop of London. This lectureship was held by Romaine till his death. In 1750 he was appointed assistant morning preacher at St. George's, Hanover-square. He held this office till September, 1755, when he was removed from it, his biographer tells us, on account of 'the popularity and plainness of his ministry.' About the time of his appointment to this lectureship, he was chosen professor of astronomy in Gresham College. His views of natural science were Hutchinsonian, and he always expressed his opinions with boldness, and not always without bigotry. Accordingly he spoke of the Newtonian views as having 'a difference in their demonstrations of no less than one hundred and twenty-one millions of miles,' and of 'the modern divinity as bringing you no nearer than one hundred and twenty-one millions of miles short of heaven.' It is not surprising that he gained little reputation from this office. He seems however to have regained his credit with the citizens by his opposition to the bill for naturalizing the Jews in 1753.

In February, 1755, he married Miss Price; and in the following year he became curate and morning preacher at St. Olave's, Southwark, where he remained till 1759. During this period he resided in a pleasant retreat in Walnut-tree Walk, Lambeth, where he was in the habit of inviting young clergymen to his early breakfasts, and many have spoken with great gratitude of the instruction and encouragement they received from him.

Romaine had frequently preached before the university of Oxford up to the year 1757, when he was refused the use of the University pulpit, in consequence of the offence which was taken at a sermon he delivered there on 'the Lord our Righteousness.' This sermon he published in vindication of

his conduct. In the same year he published a tract, addressed to members of the Established Church, exhorting them to set apart one hour in every week for prayer on behalf of the church and nation.

About this time he received pressing invitations to the ministry of a church in Philadelphia, which Mr. White strongly urged him to accept, but he preferred remaining in his own country.

In 1764 he was chosen to the rectory of St. Andrew's, the Wardrobe, and St. Ann's, Blackfriars. His election was disputed, but in 1766 it was confirmed by the Court of Chancery. He spent the rest of his life in the faithful and zealous discharge of the duties of this office. He died Jan. 26th, 1795, and was buried in the rectory vault of Blackfriars Church, on the 3rd of August.

Romaine has been compared to a 'diamond, rough at first but very pointed, and the more he was broken by years the more he appeared to shine.' His firm attachment to what he esteemed truth was not always tempered with moderation towards his opponents, and sometimes, if we are to believe anecdotes that are told of him, his bold impetuosity betrayed him into acts of rudeness, for which however he always apologised with Christian humility. His deportment in private life was mild and amiable, and he was most exemplary in his domestic relations. He was especially remarkable for the diligence and regularity with which he improved his time. His religious sentiments were strongly Calvinistic, and he spent his life in boldly maintaining them in an age when such a course was sure to excite violent opposition and to shut out all hopes of preferment. During his whole life he continued strongly attached to the Church of England. His chief works, in addition to those already mentioned, are the following:—'Nine Sermons on the 107th Psalm,' 1747; 'A seasonable Antidote against Popery, in a Dialogue upon Justification,' 1757; 'Twelve Sermons upon Solomon's Song,' 1759; 'Twelve Discourses upon the Law and the Gospel,' 1760; 'The Life of Faith,' 1763; 'The Scriptural Doctrine of the Sacrament of the Lord's Supper briefly stated,' 1765; 'The Walk of Faith,' 2 vols., 1771; 'An Essay on Psalmody,' 1775; 'The Triumph of Faith,' 1795; and some Sermons and Letters. His works were published in 8 vols., in 1796, with a Life by the Hon. and Rev. William Bromley Cadogan, M.A., some accounts of whom is contained in 'The Life and Times of the Countess of Huntingdon,' vol. ii., chap. 49.

(The *Life of Romaine*, by Cadogan and by Haweis; 'Mémorial' in the *Evangelical Magazine* for November, 1795.)

ROMAN ARCHITECTURE. Of the Grecian style an account has been given under CIVIL ARCHITECTURE; to which article we refer for such information as is necessary for understanding the present one, which is to be considered as supplementary to the other.

With regard merely to the orders, Roman architecture presents chiefly a corruption of the Doric and Ionic, &c. may claim the Corinthian as almost entirely its own, the Roman examples of that order being not only numerous and varied, but at the same time exceedingly different in character from the almost solitary specimen of one with foliated capitals which occurs in a Grecian building. But even as regards the application of the orders, there is a wide difference between the two styles; in the Roman they are frequently employed as mere decoration, the columns being engaged or attached to the walls, or in some cases (as those of triumphal arches) though the columns are insulated and advanced from the structure, they are in a manner detached from it, inasmuch as they do not support its general entablature, but merely projecting portions of it. Nor are these the only differences, for besides the frequent employment of pilasters as substitutes for columns—that is, as constituting the order without columns—the practice of supercolumniation, or raising one order upon another, was by no means uncommon; a practice that was indeed a matter of necessity in such enormous edifices as the Colosseum, if columns were to be employed at all. From all this it will be evident that, as regards the orders alone, there is a very marked difference between Roman and Grecian architecture; yet such difference is by no means the whole of the two styles being almost opposites in nearly every respect. If there were no other distinction between them that arising from the arch, and diverse applications of its principles to vaults and domes, it would be a very material one; but we also remark a great simplicity and complexity in Roman buildings & in those of Greece.

The only instance that we are acquainted with in Grecian architecture, of anything like grouping or combination of building, is that of the Erechtheion, or triple temple on the Acropolis of Athens. With this exception, Greek temples were merely simple parallelograms, differing from each other as to plan only in the number and disposition of the columns around the cella [CIVIL ARCHITECTURE, p. 221]; consequently, however beautiful when considered separately, a very great monotony prevailed in that class of buildings, at least, in which the forms were so limited and fixed as to preclude any fresh combinations, or anything approaching to what is understood by composition.

By the adoption of the circular form in their plans, whether for the whole or parts of a building, the Romans introduced an important element of variety into architectural design; especially when we consider that to such shape in the ground-plan is to be ascribed the origin of the *tholus*, or concave dome, which harmonizes so beautifully with all the rest, and renders the rotunda-shape at once the most picturesque and the most complete for internal effect,—that in which both unity and variety are thoroughly combined. The Pantheon alone [PANTHEON] would suffice to convince us that the Romans were not mere copyists, and that if as such they deteriorated the Greek orders, they also added much to the art, and greatly extended its powers by new appliances. As regards its exterior, the Pantheon presents what is certainly a strikingly picturesque (and what we consider to be also a consistent and appropriate, because a well-motivated) combination, namely, of a rectangular mass projecting from a larger circular one. In that example the body of the edifice, or rotunda itself, has no columns externally; but circular peristylar temples, or rotundas, whose cella was enclosed by an external colonnade, were not uncommon. Of this kind is the temple of the Sibyl, or, as it is otherwise called, that of Vesta, at Tivoli, an edifice of singular beauty, and highly interesting as a very peculiar and unique example of the Corinthian order, the first application of which in any modern building was made by Soane, at the Bank of England. Edifices of this kind were covered with hemispherical domes, or with smaller sections of a sphere, which consequently did not show themselves much externally, as they were raised only over the *cella*, and therefore the lower part was concealed by the colonnade projecting around it. The dome of the Pantheon is hemispherical within, but is of very low proportions and flattened form without, for its spring commences at about the level of the first or lower cornice of the exterior cylinder, and is further reduced by the base of the outer portion of the dome being expanded and formed into separate cylindrical courses or gradini. If the dome had sprung immediately from the upper cornice, so as to present a perfect hemisphere on the outside, the rotunda itself would have looked merely as a *tambour* to it, and the effect would have been as preposterous as if the cupola of St. Paul's and the colonnaded rotunda on which it is raised were placed immediately on the ground, instead of being elevated upon a larger pile of building.

Polygonal forms of plan were sometimes employed, of which there is an instance in what is called the temple of Minerva Medica at Rome, which is circular on the exterior, but internally decagonal, with nine of its sides occupied by as many recesses, and the other by the doorway—a remarkable peculiarity, it being very unusual to enclose a polygon within a cylindrical structure, although not the contrary, nor to erect a cylinder upon a square or polygonal basement. Octagon plans were by no means uncommon: such form was frequently made use of for the saloons of public baths; and there is an instance of an octagonal temple, supposed to have been dedicated to Jupiter, in one of the courts of Diocletian's palace at Spalatro. Of hexagonal structures we are acquainted with no example, but a court with six sides occurs in the remains of the temple of Baalbec, not however a regular hexagon, but of elongated figure, two of the sides being 110, and the remaining four 88 feet each. In the later periods of Roman architecture, circular and polygonal structures became more frequent, and those of the first-mentioned kind deviated considerably from the original simple rotundas and circular temples. An inner peristyle of columns was introduced so as to make a spacious circular or ring-shaped ambulatory around the centre, which was much loftier than the colonnade, being covered by a dome raised upon a cylindrical wall over the columns. What is now called San Stefano Rotundo, at Rome, supposed by some to have been originally a temple dedicated first to Faunus, and

afterwards to the emperor Claudius, and by others to have been a public market, is a structure planned according to the arrangement just mentioned, with a circular Ionic colonnade of twenty columns and two piers. The Church of Santa Costanza, traditionally reported to have been a temple of Bacchus, but now generally supposed to have been erected by Constantine as a baptistery, and afterwards converted by him into a funeral chapel to his daughter Constantia, is a remarkable example, owing to the columns being not only coupled, but unusually disposed, and to there being arches springing from their entablature, that is, there are twenty-four columns (with composite capitals) placed in pairs, on the radii of the plan, or one behind the other, forming twelve inter-columns and as many arches; and as far as the mere arrangement goes, this interior is strikingly picturesque; but it would be an improvement, if the dome were in such case to spring immediately from the imposts of the arches, and the latter to groin into it; or at least were it to spring from the vertex of the arches.

The circular form was a favourite one with the Romans for their sepulchral structures of a more pretending class than ordinary. It will be sufficient here merely to mention those in honour of Augustus and Hadrian, an account of which has been given under MAUSOLEUM. The tomb of Cæcilia Metella is a low cylinder, the height being only 62 feet, while the diameter is 90; and it may be considered as nearly solid, the chamber or cella being no more than 19 feet in diameter. This cylindrical mass is raised upon a square substructure; which combination of the two forms is productive of agreeable contrast; and it was accordingly frequently resorted to. The tomb of Plautius Sylvanus near Tivoli consists also of a short cylindrical superstructure on a square basement, but is otherwise of peculiar design, one side of that stereobate being carried up so as to form a sort of low screen or frontispiece, decorated with six half-columns, and five upright tablets with inscriptions, between them. The tomb of Munatius Plancus, at Gaeta, is a simple circular structure, of low proportions, the height not exceeding the diameter, and therefore hardly to be called a tower, notwithstanding that it is now popularly called Roland's or Orlando's Tower. Of quite different character and design from any of the preceding ones, is the ancient Roman sepulchral monument at St. Remi, which consists of three stages; the first a square stereobate raised on gradini, and entirely covered on each side with sculptures in relief; the next is also square, with an attached fluted Corinthian angle, and an open arch on each side; and the uppermost is a Corinthian rotunda, forming an open or monopteral temple (i.e., without any cella), the centre of which is occupied by two statues.

As instances of other combinations, we may briefly refer to what is called the tomb of Virgil, near Naples, consisting of a square substructure surmounted by a conical one; to the Roman monument at Constantina, in Africa, conjectured to have been a cenotaph in honour of Constantine, the lower portion of which is a cylindrical structure surrounded by a peristyle of twenty-four Doric columns, and carried up as a lofty cone, in receding courses or gradini, leaving at its summit a platform for an equestrian statue.

These notices may serve to convey some idea of the variety aimed at by the Romans in the distribution of the plans and general masses of their edifices, independently of decoration. Their *thermae*, or public baths, a class of structures remarkable for their vast extent and magnificence, are most interesting studies of combinations of plan; as they were not merely baths, but places of public resort and amusement, and consisted of an assemblage of courts, porticoes, libraries, and spacious saloons and galleries, most of which presented some peculiarity of form and distribution. If therefore we estimate Roman architecture by the manifold resources which it opened to the art, rather than by its debasement of what it borrowed from that of Greece, we shall find much in it both to admire and to imitate, as well as to censure and reprove. Its Greek rival has nothing that will bear a parallel with it in this respect. Judging from its remains, we can see nothing in it that answers to the title of interior architecture; whereas some of the Roman temples were striking on account both of the size and the magnificence of their interiors. That of the Pantheon has been already referred to, and we shall now bestow some notice on two very singular examples of a different kind, viz. the Temple of Peace, erected by Vespasian, and the double one of

Venus and Roma, by Hadrian. Of neither of them however more than the mere ruins now remain, owing to which they have never been cited as examples of the orders. What was the external design of the first-mentioned temple is now altogether doubtful, but its interior is very remarkable, the plan being divided in its breadth into three nearly equal portions, the centre one of which formed a spacious nave, terminating in a large semicircular tribune, or apsis, covered by a semi-dome. This nave was disposed in three compartments, presenting as many arches of exceedingly wide proportions, opening into as many divisions of the lateral portions of the plan, which did not constitute continuous aisles along the nave, but small chapels or recesses. Of these the centre one on each side terminated, like the nave, in a semicircular tribune, of the same dimensions as that apsis, so as to form a transept, and give the whole a marked cruciform appearance. The side divisions were covered by semicircular vaults, concentric with the arches opening into the nave; and this latter had a vaulted roof, in three groins or compartments, the ribs of which sprung from eight Corinthian columns, placed against the piers of the arches. Besides other peculiarities, we have here an instance of the effect resulting from the application of the semicircular form to plans in interiors, and of further varieties of design arising out of it, for the semidomes of the tribunes exhibit a rich specimen of coffering, being composed of octagons and squares.

Assisted by the excavations made of late years in the Roman Forum, M. Caristie, a French architect, has given us a restoration of the temple of Venus and Roma, judging from which we may pronounce it to have been one of the most splendid edifices in the city. According to his plan of it, the temple stood in the centre of a quadrilateral enclosure, or peribolus, measuring 525 by 318 feet, and was enclosed by double colonnades of the Corinthian order, consisting altogether of 264 columns. The temple itself was of the same order, upon a considerably larger scale, and its dimensions about 350 by 166 feet. It was consequently large in proportion to the area within which it stood; and when viewed in combination with the extended files of columns around it, must have produced a powerful effect,—one in which harmony and regularity were blended with contrast. This main edifice was further remarkable as being not only decastyle, but pseudo-dipteral also, that is, the space between the columns and the walls of the cella was equal to two intercolumns and a column; accordingly the width of the cella corresponded with six columns and five intercolumns of the decastyle fronts. Each end elevation of the cella was therefore made a tetrastyle in antis to a pronaos or inner loggia; and these pronaos, being of greater depth than the surrounding portico, were vaulted hemicylindrically in a transverse direction, or from end to end, whereas the others were ceiled horizontally with beams and lacunaria. The cella was divided internally into two distinct halls, placed back to back, each of which was of nearly square proportions, but extended by a magnificent semicircular recess or tribune, containing a colossal sitting figure of the deity to which it was dedicated. Along each side were five tabernacle niches, with pediments alternately angular and segmental, and placed within the intercolumns of a small order, with statues upon its entablature, over each column. The coiling was a richly coffered hemicylindrical vault, and the dome of the tribune was similarly decorated with coffers of a lozenge-form pattern. If we have dwelt somewhat at length upon this edifice, it is because we regard it as a very important example of Roman, as contradistinguished from Grecian architecture, and of that accumulated richness and pomp, together with that diversity of plan, which it affected. While they have noticed small and common-place temples, most writers have adverted but slightly, if at all, to other circumstances than those relating to their respective orders, as if architectural design was confined to or depended upon such matters alone, or as if they constituted the chief differences between the styles of Greece and Rome, and their respective application. By no means are we insonable to the refined taste displayed by the former, but neither are we to the grand compositions furnished us by the latter. Taking therefore the above temple according to Caristie's restoration of it, we agree with a writer who has said that it 'must have produced an effect perhaps unrivalled in sublimity by any work in the ancient world;' for whether viewed from within the peribolus, or as seen through and towering above the open colonnades which

formed that court, it must have been a varied and magnificent architectural scene.

The Romans seem to have affected the practice of grouping buildings together as features in one general symmetrical plan. Their temples and basilicas were frequently placed, as the principal architectural objects, at the extremity of a forum, or other regular area enclosed with colonnades. The temple of Nerva stood at one end of an partly projected into an enclosure (measuring about 360 by 160 feet), the entrance end of which had five open arches and the sides were formed by screen walls, decorated with Corinthian pilasters, and columns immediately before them over which the entablature formed breaks. Of Trajan's forum, which was surrounded not only by colonnades, but various stately edifices, nothing now remains except the celebrated triumphal column that occupied its centre, and which, so placed as a principal object, must have heightened the splendour of the whole. Like that of Nerva, the temple of Antoninus and Faustina was placed at one end of a court of moderate dimensions, whose sides were adorned with couple columns placed immediately against the walls; and only the portico part of the temple (a Corinthian hexastyle, triprostyle) [PORTICO] advanced into the enclosed area in front. The forum of Caracalla was nearly a square, entirely surrounded by arcades, presenting thirteen arches on each the longer and eleven on each of the shorter sides. In the centre was a Corinthian temple very similar in plan to the Pantheon, with an hexastyle, triprostyle portico in front, so remarkable for having inner columns behind the screen from each angle, so that there was a double range of them at each end, and the central space within the portico was a perfect square equal to three intercolumns. The notion we have incidentally made in regard to these temples may not improperly be followed by some additional remarks upon Roman edifices of that class. Unlike those of Greece, peripteral temples were of comparatively rare occurrence among the Romans: they were mostly prostyle, the portico being attached only in continuation of the cella, whose walls formed the flanks of the building, though the order of the portico was frequently continued along them either in half-columns or pilasters. Such is the plan of that celebrated one at Nismes, known by the name of the *Maison Quarree*, which is a Corinthian hexastyle, pseudo-peripteral, the cella being ornamented with attached columns, thereby making ten intercolumns on each flank, three of which are open, and belong to the portico, which latter is accordingly *triprostyle*. The Corinthian temple at Assisi was similar in plan except that it was not pseudo-peripteral, the sides of the cella being plain. That of *Fortuna Virilis* at Rome was an Ionic tetrastyle, diprostyle, and pseudo-peripteral. Besides contributing to variety, temples of this kind possess a certain variety of effect in themselves, owing to the depth of the portico, and the contrast between that part and the cella. The portico announced itself more decidedly as the *façade par excellence*; particularly as such temples were generally raised upon a stereobate continued as pedestals to enclose the steps leading up to them in front, and which, sometimes, as in the temple of Nerva, and that of Antoninus and Faustina, projected very considerably. As our object is rather to direct attention to the modes of composition affected by the Romans and the elements of the style, than to describe their chief architectural monuments, either historically or according to their respective character and destination, we proceed now to consider some of the individual peculiarities and features belonging to their buildings.

In the application of sculpture, particularly of statues, they were prodigal; but they employed the latter chiefly as architectural accessories, frequently placing them over columns, or on the summits of their edifices as acroteria to pediments, by way of giving variety to the outline of their buildings, and also of indicating at first sight their particular appropriation—a practice almost unknown to the Greeks, there being only one instance of it. In Italian buildings, on the contrary, the practice has been frequently carried to a preposterous extent, rows of statues being placed on the pedestals of balustrades, so as almost to look like pinnacles, and to produce rather a stiff and formal effect than one of richness; whereas when they are introduced on the angles and apex of a pediment, or when there is merely one in the latter situation, as in the temple of Nerva, the softness does not take place, and additional interest and loftiness may be given to that portion of the decoration. The

abundant use of statues led to the adoption of the niche—a feature unknown in Greek architecture—as a convenient mode of inserting them within the surface of walls, and thereby decorating them; at the same time space was gained in interiors, where, if otherwise placed, they would have taken up room. Niches frequently occur in Roman temples and baths; and, as we have seen, from the account given of the temple of Venus and Roma, were occasionally decorated with a frontispiece of small columns, with their entablatures and pediments, but were generally left plain, and were for the most part semicircular in plan, in which case they usually terminated in an arch and semidome, after the manner of a tribune or large recess, of which the niche was in fact a miniature copy. Niches however were very frequently rectangular in plan, as were also exhedræ, or recesses, in which case the latter formed arches vaulted hemicylindrically.

These various applications of curvilinear forms, both in plan and elevation, undoubtedly furnished Roman architecture with resources unknown to that of Greece. Nor can it be denied that the arch itself is a very beautiful feature, although it was employed by the Romans to such excess as rather to occasion monotony than to contribute to variety of design; for if the general character of Greek temples was invariably uniform, presenting in the exterior merely lines of columns, the amphitheatres and similar works of the Romans consisted only of continuous tiers of arches, which constituted their more strongly marked features, the columns placed against their tiers being merely ornamental accessories, and comparatively of little effect, and even that not of the very best kind. In either case—the Roman or the Greek—a single compartment of an edifice, whether arcaded or colonnaded, serves as a pattern for the whole; and although uniformity and continuity conduce to grandeur, yet if precisely the same kind of uniformity recurs in every building of the same class, it becomes wearisome. In this respect Gothic architecture is far more favourably constituted than either Grecian or Roman, for it admits of infinite diversity of expression, where that of the general design is nearly similar to other buildings. There was one class of structures however, which though consisting uniformly of arches and piers alone, were eminently impressive and picturesque, namely, the Roman aqueducts, works of extraordinary grandeur, if estimated by their prodigious extent, and the colossal massiveness of their construction, but not otherwise entitled to be termed magnificent, their architecture being in the plainest and severest style. In these there were sometimes two or even more tiers of arches, at others only a single one, as in that at Metz on the Moselle, which has exceedingly lofty arches, or, to speak more correctly, arches on exceedingly lofty piers, divided by offsets into three stages, the effect of which is no less advantageous than it is uncommon.

We now come to consider a practice eventually adopted, by means of which the arch and column became amalgamated as integral parts of the same ordinance, viz. that of supporting arches upon columns, making them spring either directly from their capitals or from an entablature-shaped block over them. We are aware that this practice is almost uniformly condemned as barbarous and absurd; yet in our opinion somewhat too hastily, and with more of prejudice than of fair examination. That it was introduced during the decline of the art, and that it was an innovation subversive of former principles, is not to be denied. Yet if it must be reprobated, it ought to be so for its own demerits, not as an innovation; for all invention is such. It appears a very poor argument against it, to say that columns were originally designed to support horizontal architraves: we do not see how that circumstance, of necessity, renders every other application inadmissible. At that rate we must censure as vicious a great deal of both Roman and modern architecture, where attached columns are employed merely as ornaments, yet, as frequently as not, in such manner as to produce a character of littleness and poverty, they being so small in proportion to the rest as to appear insignificant, and at such intervals from each other that all the beauty and harmony of a columnar ordinance is lost. Where columns are employed to support, it certainly cannot be alleged that they are idle unmeaning expletives; nor that they are mutilated by being apparently partly embedded in the wall behind them. 'A pier,' it has been remarked by an intelligent writer, 'is but a differently shaped and more massive column;' which being granted, what impropriety can

there be in employing the latter as a substitute for the other, provided it be done with judgment and discretion, and where upon the whole it will prove an advantageous mode of treatment? It certainly is a barbarous mode to turn small arches upon columns, which are not more than between two and three diameters apart, of which we have examples in the basilica of S. Paolo, and Santa Agnese fuor delle Mura, at Rome. The intercolumns are such that they might easily have been closed horizontally; indeed the openings between the columns have scarcely the appearance of being arches; but the whole looks as if the wall resting upon the columns was scooped out into diminutive arches over the intercolumns. In those instances too the arches themselves are quite plain, without archivolt or mouldings of any kind, and consequently all keeping is destroyed; the architectural embellishment terminates with the capitals of the columns, and so far the effect is similar to what would be produced by placing a plain horizontal mass upon a range of columns, instead of a moulded entablature. Although one of an opposite kind, it is equally a fault to make the arches spring not immediately from the capitals of the columns, but from square fragments of entablature over them (as, for example, in the interior of St. Martin's, London) not only because such fragments are unmeaning in themselves, and suggest the idea of the columns having been found too short for their intended purpose, but because they remind us quite unnecessarily of the original application of the column to the horizontal entablature. If entablature be admissible at all, it is when the columns are coupled, as in the church of Costanza already noticed; for then some kind of architrave at least becomes requisite, in order to connect the two capitals, as it were, together. One very great advantage attending the combination of the arch with the column as its support, is that it allows the openings to be considerably wider than they otherwise could be, because such intervals as would produce a poor and straggling effect in a colonnade, become well proportioned and agreeable when spanned by arches. Such columnar arcades have frequently been employed by the Italians with happy effect in *cortili* and places of that kind, where piers of the usual kind would obstruct the view too much, and where intercolumns of the same proportions, between pillars supporting a horizontal entablature, would have a poor and disagreeable effect, particularly if, as is generally the case, other stories of the building rested upon the porticos below. In fact, ordinances composed of arches and pillars constitute the best specimens of Italian columnated architecture. That in the cortile of the Palazzo Piccolomini at Siena, the work of Francesco di Giorgio, is singularly beautiful in its distribution, remarkable for the richness of its details, and also for the variety which it presents in perspective, as may be judged from the view of it given in Grandjean and Famin's 'Architecture Toscane.' We have already mentioned the interior of St. Martin's as containing an example of arches upon columns, and that of St. Bride's, London, furnishes another, but neither is a favourable one. A more satisfactory example may be found within the loggia of the Strand portion of Somerset-house, where, though the arches spring from entablatures over the columns, yet as the latter are placed in pairs, those horizontal parts are more than mere upright blocks over the capitals. The quadrangle of the late Royal Exchange, London, had arches springing immediately from the capitals of the columns, but their breadth was excessive in proportion to the height of the latter, and their elliptical form was a great defect, and certainly did not at all contribute to beauty. All that we contend for is the principle on which the practice is founded; for as to the merits of the buildings in which it is adopted, that must, like everything else in architecture, depend upon the taste shown in the particular application of it, which may be exceedingly good or altogether the reverse. Hungerford-market affords a good example of an ordinance composed of columns and arches, and also an idea of the general character of a basilica, though of course somewhat modified, and without any sort of architectural luxury.

If we have dwelt somewhat at length upon this particular point, it is because we consider it rather an important one, were it merely as showing how what was introduced barbarously and ignorantly was afterwards refined into an ordinance or mode of composition not without elegance, frequently combining both that quality and picturesque effect in an eminent degree. In regard to the orders, we shall, on the

contrary, be more concise than others, who have confined their notice of Roman architecture almost to them alone.

Of the two Grecian orders, the Roman specimens usually referred to, namely, the Doric of the theatre of Marcellus, and the Ionic of that building and the temple of Fortuna Virilis, are exceedingly poor and meagre, spiritless and tasteless; while the Ionic of the temple of Concord may be pronounced detestable. In this last example the volutes of the capitals are turned diagonally, a mode afterwards adopted by Scamozzi for that order, and also practised in what is called the Composite. Both the Roman and Italian examples are ill-composed and totally devoid of grace; yet it does not therefore follow that such arrangement is radically defective and altogether inadmissible; on the contrary, we find it partially employed even in the Grecian Ionic, namely, in the capitals at the angles of porticos, where the volute is so turned, in order that there may be two adjoining faces, instead of a baluster side showing itself externally; and a similar disposition of the volutes throughout, giving four faces to each capital, might be made, perhaps, to produce an agreeable variety; and if authority alone be required to justify it, it may in fact be found in the Ionic order of the temple of Apollo at Bassæ. [COLUMN, p. 384.] Even when comparatively pleasing in its contours, the Roman Ionic capital is poor and devoid of expression, in consequence of the smallness of the volutes, which is such that they almost cease to be characteristic features of the order. To this defect may be added the meagreness arising from the few revolutions made by the spirals, and the omission of intermediate ones; and also the harshness occasioned by the great projection of the ovalo, the narrowness of the face of the capital above it, and by that part forming a straight line, instead of the gracefully-flowing festoon-hem which unites the volutes together in all the Athenian specimens of the order. Perhaps it is unfortunate that any Roman examples of it are to be found in buildings, because that circumstance has led to their being regarded as authorities, whereas many better specimens are to be met with in single capitals and relics of that kind, which, though faulty in many respects, and evidently susceptible of improvement, are at least treated with more taste, and possess a certain richness of character. Numerous studies of both voluted and foliated capitals may be seen in Piranesi's 'Magnificenza de' Romani;' and the variety of composition displayed in the latter very greatly exceeds what would be imagined by those who are acquainted only with what are referred to as standard examples of that order. This last may in fact be emphatically denominated the Roman order, although such distinctive title is usually applied to what is otherwise called the Composite, but which is only a variety of the foliage-capitalised class, and by no means the most striking as such, there being instances of compound capitals, in which griffins, eagles, human figures, or masks, are introduced above the foliage; consequently, if the voluted variety is to be received as a separate order, each of the others is quite as much entitled to the same distinction. How far the ordinary Corinthian capital differs from that in which the small volutes, or caulicoli, at the angles of the abacus are developed and enlarged to the size of those of the Roman Ionic capital, may at once be seen by referring to COLUMN, p. 386, where a half of each example is placed in juxtaposition; and at page 383 will be found a similar comparison between the capitals of the Tivoli Corinthian and that of the monument of Lysicrates. The contrast presented by the two last is striking enough, there being no similarity of character, but merely such degree of resemblance as serves to make the differences the more obvious. And if that Tivoli example be compared with the one shown in the other cut, and which may be received as an average sample of the order, it will be tolerably evident, even from such comparison alone, that the foliated capital was treated by the Romans in a variety of modes and in a free artistical spirit. Neither are such distinctions confined to the capitals alone, for different examples present equal diversity in their entablatures and cornices. That of the Tivoli temple is remarkable throughout; and has such a peculiar character stamped upon it, that it almost deserves to be considered a separate order—certainly much more so than the Composite. Among other examples, that of the three columns of the temple of Jupiter Stator is the richest and most elegant in its capital, and is beautifully composed throughout. The Romans bestowed great diversity of character and expression upon this order, as the Greeks had done upon their

Doric and Ionic; whereas, if they erred in nothing else, the Italian revivalists and their followers did so in pursuing a directly opposite course, endeavouring to establish a fixed and unalterable standard for each order, reducing them to merely so many architectural formulas, to be applied without any change, on every occasion.

ROMAN SCHOOL OF PAINTING. That style of art which was eventually formed, or prevailed, at Rome during the golden age of painting, in the beginning of the 16th century, is termed the Roman school, whether it was practised by subjects of the papal government, natives of the city of Rome, or strangers resident there. The simple fact however, of having practised the art of painting at Rome, does not constitute a disciple of that school. The works of Raphael exhibit this style in its full development or most perfect form, and he is accordingly the head or representative of the Roman school.

The history of this school may be divided into three periods: its origin or gradual formation from the revival of painting in Italy; its development, which was accomplished in the works of Raphael; and lastly, its decline, through its imitators and those of the great Florentine at Rome.

The art of the earlier period cannot be said to have any further connection with the subsequent style, which, through its peculiar characteristics, became distinguished as one of the great schools of Italian painting, than that of having been its basis; although the natural simplicity and dignity of the earlier style characterised the latter throughout its purer form.

The immediate founder of the Roman school in its extended sense was Pietro Vannucci of Citta della Pieve commonly called Il Perugino, from his having obtained the citizenship of Perugia: although that which may be termed essentially the Roman school both commenced and ended with Raphael, in the same manner as the Florentine did with Michael Angelo; for the styles of these two great masters were rather destroyed than preserved by their imitators.

I. In retracing the progress of the Roman school, we must go back to that original and most ancient school of Italian painting, which flourished in the 14th century in various cities of the Roman states, within the limits of ancient Umbria; in Gubbio, Fabriano, Macerata, Borgo S. Sepolcro, Urbino, Assisi, and other places.

But the influence of this school, which has been termed the Umbrian, was not confined within these limits. It extended not only throughout Romagna, but over many parts of Tuscany; and although the term Umbrian school has been restricted to the works of the masters of the district alluded to, it might be applied with equal propriety and more system to designate the style of art which prevailed in the works of the revivers of painting in Italy generally, or of the ancient masters (gli Antichi), whether Umbrian or Tuscan, anterior to Masaccio; in other words, previous to any acquaintance with or rather study of the works of ancient art. Many of the Umbrian painters, and those of Bologna, Arezzo, and Perugia, and therefore also of Pisa, Siena, and Florence, had common masters: and if we compare the dissimilarities of the individual styles of these masters with the dissimilarity of those styles compared with that of Masaccio, we may declare them all to be similar. The only difference between what is termed the early Tuscan and the Umbrian school, is, if any thing, that the latter, with equal simplicity, is somewhat less rigid than the former; and if they do not originate in the same source, they were at least both greatly influenced by the colonies of Greek artists who migrated from Constantinople to Italy, and settled in Venice and Pisa, in the 11th and 12th centuries.

Oderigi of Gubbio, one of the old practitioners of miniature painting, an art which was extinct in Italy, seems

to be the most antient painter of this school whose period is ascertained with any degree of certainty; he died about 1300 A.D. Oderigi appears to have been an active reviver of painting, and he was a man of reputation in his day. He is mentioned honourably by Dante, who terms him 'L'onor d' Agobbio, e l'onor di quell' arte.'

There is mention also of three other antient painters of Gubbio: Cecco and Puccio, who were employed in 1321 in painting the dome of Orvieto; and Guido Palmerucci, who was employed about 1324, in the town-hall of his native city.

A still more important name in the early history of the Roman school is that of Pietro Cavallini, who is said to have received instruction from Giotto while at Rome. A Crucifixion by this master, still extant at Assisi, is a remarkable production. The return of the papal government from Avignon to Rome gave a new impulse to the arts; the most skilful artists were sought throughout Italy to decorate the temples and palaces of the luxurious pontiffs of Rome. Of these the principal were Ottaviano Martis, and Gentile da Fabriano, a master of much greater merits. Fabriano was surnamed *Magister Magistrorum*, and practised his art in many parts of Italy. In 1417 we find him engaged at Orvieto; he resided afterwards at Venice, where he obtained the rank of patrician, and was the master of Giacopo Bellini, whose sons were the founders of the Venetian school. His style, which by Michel Angelo was pronounced to be, like his name, 'Gentile,' somewhat resembled that of Fra Angelico da Fiesole, though it was much inferior to it.

Piero della Francesca, or Piero Borghese, advanced the art still further; he was reckoned one of the best geometers of his time, and was the first Italian who had any knowledge of the principles of perspective. He introduced immense improvements in the management of draperies, and also greatly enlarged the manner of treating the naked figure. Bramante studied the works of Piero, who was fond of introducing architectural backgrounds in his pictures, which he executed in tolerable perspective. Additional improvements were made by Bartolomeo Corradini of Urbino, called *Fra Carnevale*, who gave great character to his heads, and was the first to introduce portraits into historical compositions, in which practice he was afterwards followed by Raphael, who paid great attention to the works of this painter at the commencement of his career.

Niccolo Alunno of Foligno and Benedetto Bonfigli complete the list of the considerable artists of this school previous to and contemporary with Pietro Perugino, the master of Raphael, and Giovanni Sanzio of Urbino, his father. Although, through the united efforts of the above masters, painting had attained to many high and pleasing qualities, true taste in design may be said to have totally failed them. They had not yet discovered what was beautiful and what was not, or what belonged to the individual and what to the class. Their art was not truly imitative, nor does it appear that an appearance of reality was an object with these painters; they seem to have considered that their end was sufficiently accomplished in an intelligible indication of whatever they represented. The deficiency of this school could only be supplied through the study of the antique, and to supply it in a great degree was a distinction which fell to the lot of Masaccio, who must be looked upon as the leader of the great painters of the 15th century, or the *Quattrocentisti*, as the Italians have termed them, among whose works we first perceive any distinctive characteristics of style.

It cannot be denied that Perugino owed his great superiority over his predecessors to his visit to Florence, where, whether he became the pupil of Verocchio or not, which is a matter of dispute, he was at least enabled to study the noble works of Masaccio. His taste was however still dry and mean, his design was meagre and feeble, though often correct, his draperies were stiff and in a little manner, yet his colouring was sometimes exceedingly rich, and for graceful delicacy of attitude and motion, and a softness and simplicity of expression, he surpassed all his contemporaries. But there is a symmetrical repetition and similarity in the disposition of his figures, which betray a total absence of anything like vigour or truth of composition, and which place him at an immeasurable distance from his great scholar. No pupils ever imitated their master so closely as, with the exception of Raphael, did those of Perugino; and many of their works are reputed works of their master. His most celebrated scholars were, Bernardino Pinturicchio; Andrea Luigi of Assisi, called *L'Ingegno* on account of his great abilities,

who became blind when still young; Domenico and his son Orazio di Paris Alfani; Eusebio da S. Giorgio; Giannicola da Perugia; Lo Spagna; Berto di Giovanni; Sinibaldo da Perugia; Adone Doni of Assisi; and Palmerini of Urbino. The works of all these masters were more or less conspicuous for symmetrical composition and a profuse application of gold.

II. We now arrive at the pride of Perugino and the glory of the Roman School, Raffaello Sanzio d'Urbino, the first of painters; for moral force in allegory and history, unrivalled; for fidelity in portrait, unsurpassed; who has never been approached in propriety of invention, composition, or expression; who is almost without a rival in design; and in sublimity and grandeur, inferior to Michel Angelo alone, whose prophets and sibyls in the Capella Sistina are in these respects unquestionably the triumphs of modern art.

It must not be supposed that Raphael attained these great qualities intuitively: they were the result of long and intense application; and in the works of no artist is the progress of improvement so apparent as in those of Raphael. He painted in three styles: his first was that of Perugino. His second was an enlargement of that style in the taste of Fra Bartolomeo, and is termed his Florentine. But this change or improvement in style was not effected through an acquaintance with that great painter alone, but also through the impression made upon Raphael's mind by the works of Masaccio, of Lionardo da Vinci, and also of Michel Angelo, at Florence. His third style, which is the subject we have now more particularly to consider, was peculiarly his own; although those magnificent works the Prophets and Sibyls of Michel Angelo were the principal causes of its ultimate fulness and grandeur. This third style, which is the proper style of Raphael, constitutes the Roman school in its full development, which is the least defective of all the schools of painting.

To allow that the Roman school is principally indebted for its grandeur to the works of the great Florentine on the vault of the Sistine Chapel, is allowing no more than is just. But to venture to the extent of asserting, as Sir Joshua Reynolds has done in his fifteenth discourse, that 'the artists of that age, even Raffaele himself, seemed to be going on very contentedly in the dry manner of Pietro Perugino, and, if Michel Angelo had never appeared, the art might still have continued in the same style,' is not only doing the highest injustice to Raphael, but also to Lionardo da Vinci and to Fra Bartolomeo, whose styles were essentially developed, and who were themselves considerably advanced in life, especially the former, before Michel Angelo had executed a single great work in painting. When the Cartoon of Pisa was exhibited in 1506, which work cannot in any respect be compared with the vault of the Capella Sistina, Bartolomeo was in his thirty-seventh and Da Vinci in his fifty-fifth year. [TUSCAN SCHOOL.] How much more to the purpose is the remark of Fuseli, who says that Bartolomeo 'was the true master of Raphael, whom his tuition weaned from the meanness of Perugino, and prepared for the mighty style of Michel Angelo.' Whatever effects the Cartoon of Pisa and the works of the Florentine school had upon Raphael's style, must have been evinced in the great picture of Theology, or the Dispute on the Sacrament, as it is also called, in the Camera della Segnatura in the Vatican, which was painted in 1508, and was his first great work in Rome. But the picture of Philosophy, or the School of Athens, which was painted opposite to it immediately afterwards, exhibits a great aggrandizement of style, and in it the characteristics of Raphael's third style are at least essentially if not completely developed. Now this aggrandizement could not have proceeded from the works of Michel Angelo, since the paintings of the vault of the Capella Sistina were not commenced until some time after that great work was executed. It therefore proceeded from other causes, from Raphael's own additional experience, and from the study of the works of antient art in Rome, to which Raphael was, in common with Michael Angelo, principally indebted, and infinitely more so than to the works of that truly great master. Even the Heliodorus (which, although it was painted in the time of Julius II., if not commenced, must at least have been finished after Raphael had seen the vault of the Capella Sistina), does not exhibit any remarkable superiority of style over the School of Athens, although it is decidedly superior; but other causes besides the works of Michael Angelo must have contributed to produce this result. The work of Raphael

in which the imitation of the style of Michel Angelo is most apparent, is the *Incendio del Borgo*, decidedly the worst production of Raphael's maturer years; indeed it is even doubtful whether he had any hand in the execution of that work.

In considering however the respective claims of these two great masters to originality of style, it should be borne in mind that Raphael's great works in the *Camera della Segnatura* preceded those of Michel Angelo on the vault of the *Capella Sistina*, and that what has been generally considered to be Michel Angelo's greatest work, the *Last Judgment*, was first commenced in the pontificate of Paul III., years after the pencil of Raphael had ceased its labours, and was not completed until twenty-one years after the death of that great painter. Therefore these two extraordinary men may be safely said to have been indebted the one to the other.

Raphael has had many critics, but of these perhaps Mengs is the most discerning and the most just, although that painter's extraordinary veneration for the works of ancient art must not be forgotten while we consider his critique upon the works and genius of Raphael. The only essential fault, in the opinion of Mengs, in Raphael's style, is a deficiency of the ideal in almost every department. But is it not by reason of this very deficiency, as Mengs views it, that his style distinguishes him from and raises him above all other painters? Raphael was pre-eminently and essentially natural; idealize his style, and you immediately degrade him to the level of Guido.

His forms are neither so ideal, nor, in one sense, so perfect as the *Apollo* or the *Mercury*, but they are equally grand, and more natural. Such forms would be incompatible with Raphael's style. They are supposed to represent beings beyond the influence of the common emotions of mankind. His design however is very little inferior if not equal to the *Discobolus*, the *Gladiator*, or even the *Laocoon*; but it must decidedly yield in style to the *Torso of Apollonius*, and in beauty and elegance to the *Antinous*.

There is a degree to which the powers of imitation may be combined with those of the imagination, which, when regulated by a just refinement of feeling or taste, constitutes the perfection of painting, and this degree, though not attained, was in the aggregate approximated more nearly by Raphael than by any other painter. He never designed a figure which he did not inspire with appropriate sentiment; the affections of mankind were the sphere of his genius; from the calculating sage to the thoughtless infant, his works are the history of the human heart, and deservedly has he been entitled the 'painter of the passions.' The elements of his style are nowhere more apparent than in the *Cartoons at Hampton Court*. To particularise amidst so much excellence, and to single out the works in which Raphael has been most eminently successful, is rather a delicate task; yet perhaps the following examples may be instanced as being more decidedly conspicuous for those particular qualities which characterise his style:—for grandeur of design, the *Heliodorus*; for sublimity of character and conception, the *Madonna di San Sisto*; for composition and expression, the *Cartoons*; and perhaps for invention and general technical excellence, the *Transfiguration*, his last performance. [RAPHAËL.]

The style of Raphael has seldom been found congenial to their taste by the lovers of colour, and certainly those who consider the perfection of painting to consist in splendid colouring must not look for it in the works of the Roman school, but in those of Paul Veronese or of Rubens. Many critics have regretted that Raphael did not colour like Titian; but colour was to Raphael a *means*, and not an *end*, as it was with the majority of the Venetian painters; and its effect is to dazzle and to obscure, rather than to enhance the essential qualities of the grand style. For as the painted face of a player harmonises with the accompanying spectacle and the tone of light around, and would as certainly be ridiculous if exposed to the light of day, so the Venetian colouring, which is in such perfect harmony with the subjects of that school and their general treatment, would as certainly be in utter discordance with those qualities which characterise the style of Raphael. Even Ludovico Caracci, the founder of the Eclectic school of Bologna, discovered that Venetian colouring was inapplicable to the subjects which he chose for his own pencil. And Raphael would not have been the great painter that he proved himself to be, had he chosen any other than the sombre

colour for which he is so conspicuous, and which, so far from being a defect in his style, is indeed an additional evidence of his profound genius. These remarks do not refer to the carnations particularly, which should always harmonise with the draperies, but to the composition of colours generally, to their choice and intensity, and also to the stuffs and materials of which the draperies are composed. Raphael rarely if ever painted silks or satins; most of the Venetians seldom painted anything else. [VENETIAN SCHOOL.]

Raphael had many scholars and many imitators; of the former, the principal were Giulio Romano, Gianfrancesco Penni (with Giulio, Raphael's principal heir), and Perino del Vaga: these painters completed, from Raphael's designs, the great works in the Vatican, which he had left unfinished.

Giulio Pippi, called Giulio Romano, certainly the most eminent of all Raphael's scholars and imitators, was conspicuous for the correct and powerful design of his master, but in other respects he never approached him. Although he had great powers of invention, an unpleasing expression, and an evident absence of sentiment prevail throughout his works. He is also heavy both in design and colouring; but his particular employment under Raphael, that of dead-colouring and preparing his works in oil, may have greatly contributed to this effect. Giulio left Rome during the pontificate of Clement VII., shortly after the completion of the Constantine series in the Vatican, and, at the invitation of Federigo Gonzaga, repaired to Mantua, where he founded a school and painted his famous works, the *Fall of the Giants*, and the *Loves of Cupid and Psyche*. [GIULIO ROMANO.]

Gianfrancesco Penni, with little less vigour than Giulio, was conspicuous for more of the grace of his master. Perino Buonaccorsi, called Perino del Vaga, displayed nearly equal powers. Other pupils and assistants of Raphael in the stanze and the loggie of the Vatican, were—Giovanni da Udine, Polidoro Caldara da Caravaggio, celebrated for his imitations of ancient bassi-rilievi; Pellegrino da Modena; Bartolomeo Ramenghi, called Il Bagnacavallo; Vincenzo di S. Gimignano; Timoteo della Vite; Raffaellino del Colle; Benvenuto Tisi, called Il Garofolo; and many others too numerous to mention here.

III. The accession of Adrian VI. to the papal chair had for a time paralysed the arts, but they were shortly inspired with new vigour by his successor Clement VII., Guilian de' Medici, who continued the works that had been interrupted by Adrian. But a more serious interruption succeeded in the sack of Rome, in 1527, by the soldiers of Bourbon. The school of painters formed by Raphael was totally dispersed; it spread however the elements of his style all over Italy, although scarcely a single beauty of the original was to any extent preserved in the copies.

In the pontificate of Paul III., the arts commenced again to revive in Rome. Michel Angelo executed his great work of the *Last Judgment*, the labour of eight years, by the orders of this pontiff: it was completed in 1541. The effect however of this work was for a time fatal to painting; hosts of copyists and mannerists arose, who, possessed with a mania for representing the naked figure, and sacrificing everything to anatomical display, imagined the perfection of design to consist in violent action and muscular protuberance; and in imitating the *manner*, they imagined they had acquired the *art* of Michel Angelo.

This great painter, who in the time of Julius II. had himself been chiefly instrumental in raising painting nearer to perfection than it has ever attained in modern times, lived also to see it degenerate, greatly through his own influence, into a mere handicraft in the time of Pius IV., when a reference to nature was considered as an acknowledgment of a want of genius.

The most distinguished mannerists of this school and period, whose style was a species of compound of those of Raphael and Michel Angelo, without the correctness or purity of the former, and with only the manner of the latter, were Taddeo and Federigo Zuccari. The former died young. The latter executed vast works at Florence, which were, however, remarkable for their vastness alone; and he has left specimens of his pencil in the principal cities of Italy. He succeeded Girolamo Muziano as president of the Academy of St. Luke at Rome, which had been lately founded by Gregory XIII. In the instance of Muziano, Gregory was elected in 1577.

The following excep-

tioned, as being

distinguished for their greater propriety of style, from the general host of mannerists:—Girolamo Sicciante of Sermoneta, Marcello Venusti, and Livio Agresti, all scholars of Perino del Vaga; also Scipione Pulzone, called Gaetano, the scholar of Giacompo del Conte, both excellent in portrait.

Giuseppe Cesari d' Arpino succeeded Federigo Zuccaro in public estimation at Rome; but though without a rival in that city until the appearance of Michel Angelo Amerighi, Il Caravaggio, he cannot be said to belong to the Roman school. The heavy and vulgar nature of Caravaggio's style was in direct opposition to the ideal mannerism of Cesari's. They both had their partisans, who were termed respectively naturalisti and idealisti; the latter prevailed. Annibale Caracci also endeavoured in vain to reform taste in Rome; the works of this great master in the Palazzo Farnese had little or no effect upon the style of the Roman painters of that period, and Cesari left a numerous school of imitators. But these noble works, certainly inferior only to those of Michel Angelo and Raphael in Rome, eventually had their effect, and painting was again restored to something approaching its former splendour; and what the painters of Bologna had borrowed from the Romans in the pontificate of Clement VII., the pupils of the Caracci returned with interest in that of Urban VIII.

A better style was adopted by Federigo Baroccio of Urbino, which might boast of a nearer approach to the correctness of form of the great founder of the Roman school, but his colouring was generally artificial, and very different from that of Raphael. Its tone is unpleasant, a cold violet hue prevails throughout, and there is a striking deficiency of yellow in his carnations, which in the lights are pink, in the shadows grey. Baroccio had several imitators, but his influence upon the general character of Roman art was inconsiderable. The Eclectic school of Bologna [BOLOGNESE SCHOOL] seems to have had the principal share in reforming the art in Rome. During the pontificates of Paul V., Gregory XV., and Urban VIII., the celebrated pupils of the Caracci, Domenichino, Guido, Guercino, and Lanfranco, were much employed by those pontiffs; and the example of these great masters, but more especially of Domenichino, produced many good painters, of whom we may mention the following:—Antonio Ricci, called Barbalunga; Camassei; Giovanni Carbone; Francesco Cozza; Pietro del Po; Canini; Giambatista Passeri; and Luigi Scaramuccia; and there were many others of considerable merit. The school of the Caracci seems to have had a more immediate influence upon portrait painting, truth or fidelity of representation being indispensably requisite to constitute excellence in portraiture. The excessive mannerism of the painters of the period had so generally incapacitated them for executing anything excellent in that department, that it began to be nearly a distinct profession, and the following masters distinguished themselves as excellent portrait painters, though they did not confine themselves quite exclusively to portraits:—Antonio di Monti; Pietro Fchetti; Antonio Scalvati; Grammatica; Ottavio Leoni; and Baldassare Alloisi, called Galanino.

Upon the imitators of Domenichino followed the bold style of Lanfranco, whose most successful scholar was Giacinto Brandi; and contemporary with Lanfranco flourished Albano in Rome. Pier Francesco Molu was an imitator of his style.

From the studio of Albano came Andrea Sacchi, a painter who drew well and coloured admirably, who never bestowed labour upon a trifle, and who was better versed in the theory of art than any of his contemporaries or immediate predecessors. There is a nobility and grandeur about his style, and a truth and breadth in his execution, which distinguish him as one of the noblest disciples of the Roman school, second only to Giulio Romano in invention, and in all other respects inferior to its great founder alone. Raphael was his model of perfection, but he was no servile imitator; he could appreciate also the beauties of Titian and of Correggio; and he had recourse to the same sources through which his great model attained to excellence—nature and the antique, but he availed himself only so far of the antique as it served to regulate his study of nature.

No inconsiderable ornament also of the arts of Rome of this period was Nicholas Poussin, for though a Frenchman by birth, he was essentially a Roman painter; he formed his style from Raphael and the antique. He attended also the academies of Domenichino and of Sacchi, being a great admirer of the works of those masters; he considered

Domenichino inferior to Raphael alone. His style was however very peculiar, and had no influence upon the arts in Rome; his works have too much the appearance of painted bassi-rilievi.

Pietro Berrettini, called also Pietro da Cortona, set himself up as the rival of Sacchi in Rome, and if the number of imitators is a criterion of the degree of excellence, Pietro da Cortona was certainly superior to Sacchi. The art of Sacchi was not so easily imitated. The style of Cortona was rich and attractive, but superficial and incorrect, and he takes the lead in that class of painters termed machinists by the Italians.

The scholars of these two masters formed two rival factions of art, which divided Rome: that of Sacchi was headed by Carlo Maratta, supported by Ludovico Garzi: that of Cortona, by Ciro Ferri, supported by Romanelli. Bernini, who during the pontificates of Urban VIII. and Innocent X., in matters of art was all-powerful in Rome, opposed, as was to be expected, that party which was conspicuous for good taste; and for a time the machinists prevailed. But the school of Cortona was predominant only in fresco, for in oil Maratta was unrivalled. In 1689 however Ciro died, and Maratta stood alone; and upon the accession of Innocent XII. in 1691, he was appointed inspector of the stanze of the Vatican, and in 1702, by the orders of Clement XI., he restored the works of Raphael in those apartments, which had considerably suffered through time and neglect. He had restored previously the frescoes of Annibale Caracci in the Palazzo Farnese. He died in 1713. His style was generally considerably less vigorous than that of Sacchi, and both his colouring and his composition were occasionally artificial; his drawing was also sometimes incorrect; his taste was upon the whole very inferior to his master's, though his style has been termed more graceful.

Maratta formed a most numerous school, but its chief characteristics were the studied composition and affected grace which are the blemishes of his own style.

Maratta has been termed the last of the Romans, and perhaps he may be safely termed the last of the Romans who has merited the name of a great painter; for neither Pompeo Batoni nor Mengs can be said to dispute that claim with him, though both are deservedly celebrated names. The former gave too much importance to high finish; the latter was too blindly devoted to the antique. Batoni painted excellent portraits, and Mengs drew correctly, but he was so eager after the ideal, that he lost nature in the search of it; in this respect Batoni has greatly the advantage over Mengs. They were both eminently academic, and for mere technical excellence have not often been equalled; but there is a palpable absence of the 'mens divinior' and moral sentiment in their works, which are more than ordinarily conspicuous for that insipidity and monotony so generally attendant upon the fastidious preciseness of academic art.

(Vasari, *Vite de' Pittori*, &c.; Bellori, *Vite de' Pittori*, &c.; Lanzi, *Storia Pittorica*; and Fiorillo, *Geschichte der Malerey*.)

#### ROMAN WALL. [BRITANNIA.]

ROMANCE originally signified any composition in the Romance language, or dialects which superseded the Latin after the fall of the Western Empire. [ROMANCE LANGUAGE.] As however, in course of time, the Trouveres of North France composed a number of poems containing fictitious narratives of war and love, and their lays became popular all over France and in the neighbouring countries, the name of Romance was more particularly applied to all compositions, whether in verse or prose, in any language, which treated of marvellous or uncommon incidents, and the name has been retained to this day in several European languages to signify a fictitious narrative. The Italians and French call a novel 'un romanzo,' 'un roman.' But the French call an historical ballad 'une romance,' in the feminine gender. The distinction between romance and the modern novel is shown under NOVEL. The appellation Romance in a narrower sense is applied to those compositions which refer to the ages of chivalry, either real or supposed. [CHIVALRY.]

The oldest romances in this latter sense appear to have been legendary stories concerning Arthur and the Knights of the Round Table, and they were of English origin; but the original narratives, if they ever existed in writing, which is doubtful, are lost. The earliest romantic legends which have come down to us are of the twelfth century: Geoffrey of Monmouth's Latin Chronicle of England; Turpin's

Latin Chronicle in France; Wace's 'Le Brut,' a metrical romance concerning the fabulous history of England, in Norman French; 'Le Roman du Rou,' by the same writer, concerning Rollo and his successors; and 'I Reali di Francia,' in Italian prose. To these may be added the Latin romance of Gualtieri, found in the Chronicle of La Novalesa, which relates to the wars of Attila; next in order of date comes Guido della Colonna's 'War of Troy,' and Mathew Paris's account of the Round Table. [GEOFFREY OF MONMOUTH.] The 'Roman de la Rose' was written under St. Louis of France. At that time chivalry was established over all Europe, and the writers of romance introduced the customs and manners of chivalry into their narratives of events, real or supposed, long antecedent to the existence of chivalry.

The vast subject of romantic literature, in its general and more extended sense, may be divided into the following branches:—1, Romantic ballads and traditional songs, which appears to be the oldest form, and which have existed among most nations in their primitive state. The songs of the antient bards, and those concerning Arminius, which are mentioned by Tacitus (*Annal.*, ii. 88, and *German.*, 2); the German Niebelungen; the poems of Antar, and others before the era of Mohammed; the song of Roland, mentioned by the chroniclers of Charlemagne; and the old Spanish romantic ballads, all belong to this class. M. de Tressan collected several fragments among the mountaineers of the Pyrenees, which seem to belong to Roland's 'Cantilena,' or war song. 2, The narrative romances of chivalry concerning the deeds of Arthur and the peers of the Round Table. 3, The romances concerning the supposed wars of Charlemagne against the Saracens. 4, The Spanish and Portuguese romances concerning the fabulous exploits of Amadis and Palmerin. [AMADIS DE GAULA.] 5, The classic romances concerning Jason, Hercules, Alexander, those heroes having been transformed into knights of chivalry. 6, The epic romances of the Italians in the fifteenth and sixteenth centuries. [PULCI.] 7, The spiritual or religious romances concerning the miracles of saints and the death of martyrs, such as the 'Contes dévots' of the French, the 'Golden Legend,' &c. 8, The pastoral romance, which Cervantes ridiculed, and which afterwards gave rise in the seventeenth century to the interminable and dull romances of La Calprenède, Madame de Scudery, and others, in which perfection of beauty and pure spiritual love are the chief ingredients. 9, The comic romances, which were written chiefly as parodies of the heroic and chivalrous romances. Such were those of Rabelais, Cervantes, Mendoza, and Scarron. 10, The political romances, such as Télémaque, Sethos, &c. 11, Lastly comes the modern novel, which forms a distinct species, as it does not deal in the marvellous and supernatural, but represents men conformably to the manners of the age in which they lived.

The library of romance is extremely numerous; bibliographical catalogues of those of a particular class and nation have been published, such as Count Melzi's 'Bibliografia dei Romanzi e Opere di Cavalleria in Italiano,' Milan, 1838. The Spaniards have several collections of their old romances: 'Poesias escogidas de nuestros Cancioneros y Romanceros antiguos,' Madrid, 1796; Depping, 'Coleccion de los mas celebres Romances antiguos Españoles, historicos y caballerescos,' Londres, 1825; 'Romancero del Cid Ruy Diaz, en language antiguo, recopilado por Juan de Escobar,' Madrid, 1818. Dr. Ferrario has published a good work on the Italian romances of chivalry: 'Storia ed Analisi degli antichi Romanzi di Cavalleria, e dei Poemi Romanzeschi d'Italia, con Dissertazioni sull' Origine, sugl' Istituti, sulle Ceremonie dei Cavalieri, con Figure tratte dai Monumenti dell' Arte,' 4 vols. 8vo., Milan, 1828-9. A notice of Ferrario's work appeared in the 'Foreign Quarterly Review,' No. XII., October, 1830. Panizza, in the first or introductory volume of his edition of Boiardo, London, 1830, has elaborately investigated the origin and history of the romances of chivalry. Turner, in his 'History of the Anglo-Saxons,' Ritson, in his 'Historical Essay on National Songs,' Dunlop, in his 'History of Romantic Fiction,' and others, have treated of the history of romance in various countries.

ROMANCE LANGUAGE ('Langue Romane' or 'Romande,' in French) is the name given to a kind of bastard Latin, which came into common use in Western Europe after the fall of the Roman Empire, among the populations

formerly subject to Rome, while the Northern conquerors, the Goths, Franks, Burgundians, Langobards, &c., spoke their own language or dialects, which are called by chroniclers of the times 'lingua Teutonica' or 'Teutisca.' The conquered people were called by the general name of Romans, from whence came the name of the language, which was also called 'vulgaris.' In course of time however the conquerors adopted the language of the conquered, who being more instructed, furnished most of the priests and scholars of the age. But the language thus adopted by both the conquering and the conquered races, although essentially formed of Latin elements, differed according to the various localities and the greater or lesser degree of admixture of the northern people with the Roman population. For instance, King Dagobert in the seventh century published a statute, styled 'Lex Alamannorum,' for the use of the German tribes who had crossed the Rhine, the language of which differs from that of the 'Lex Ripuariorum,' which the same king published for the use of the people situated between the Lower Rhine and the Moselle, who were mostly of old Roman extraction. The former employs the *ist* as an article before substantives, in imitation of the articles *su* and *der* used by the Goths and Franks in their own language; but the Lex Ripuaria does not employ *ille* for the same purpose. In the old charters of Italy and Spain of the eighth and ninth centuries, we find *ille* and *ipse* employed likewise as articles, *ipsa ecclesia, illa alia, illa casa, illa strada, illo rio, &c.*; but these charters are not so old by a century or two as the Franco-Latin documents, in which those pronouns are introduced for a similar purpose. The oldest document in the 'España Sagrada' in which *ille* appears as an article is A.D. 775; and the oldest of those of Italy quoted by Muratori are of the years 713 and 734.

Of the various dialects thus formed, that of the south of France, called afterwards Langue d'Oc, became a refined language sooner than the others, and retained its superiority from the tenth to the thirteenth century, when the Italian, Portuguese, and Spanish languages assumed a regular grammatical and literary form, which they have retained; while the Romance of the south of France has gradually fallen into disuse, having given way to the Northern French Langue d'Oïl or d'Oui. The latter appears to have originally differed little from the Langue d'Oc, but it gradually changed its terminations, and assumed other peculiarities of form, which have been retained by the modern French. It is demonstrated by Raynouard that the inhabitants of Northern France in the ninth century spoke the same language as those of the south. The text of the oath taken at Strasburg in the year 842, by Louis, called the Germanic before the French people, would alone be a sufficient proof of this. The text of this curious document is as follows:—'Pro Deo amur et pro Christiano populo, et nostro communi salvamento, dist di en avant, in quant Deus savir et podir adunat, si salvara jeo cist meon fradre Karlo, et in adjuvance et in cadhuna cosa, si cum om per dreit son fradre salvar dist, in o quid il mi altre si fazet, et ab Ludher nul part nunquam prindrai, qui meon vol cist meon fradre Karle r damno sit.' (Roquefort, *Glossaire de la Langue Romane*, Paris, 1808, 'Introduction.')

The gradual process by which the corrupt Latin spoken in the provinces of Western and Southern Europe in the sixth, seventh, and eighth centuries was transformed into the Romance languages of the ninth and tenth centuries, is very clearly exhibited by Raynouard, in his 'Éléments de Grammaire de la Langue Romane avant l'an 1000.' The Latin cases had become neglected or confused, and to supply their place the prepositions *de* served to denote the genitive and *ad* the dative. The next step was to cut off the final syllable of the noun, and so to make it indeclinable. Thus the accusative *abbatem* became *abbat*; *majestatem*, *majestat*; *ardentem*, *ardent*; *amantem*, *amant*; and so forth. The accusatives in *ionem* were reduced to *ion*, *religionem*, *religion*, &c. When the suppression of the Latin termination left two harsh-sounding consonants at the end of the word, a euphonic vowel was added, 'arbitr-um,' 'arbitr-a.' The pronouns *ille* and *ipse* had been used in the corrupt Latin as auxiliary to substantives: 'Dono illas vineas quomodo ille rivulus currit;' 'Illa medietate de ipsa portione,' &c. From *ille* so used originated the Romance articles *el, la, lo, la*, and from *ipse* the demonstrative pronouns *tu, so or su, and sa*, which the Sardinian dialect has retained to this day as an article. These articles were declined with the prepositions *de* and *a*. 'Ego Hugo della Roca;' 'For-

satum de la vite; 'Villam nostram quæ vocatur al la Corbaria,' &c. These and other examples taken from documents of the ninth century show the introduction of articles even in the written language which affected to preserve in some degree the Latin form; the change must have been more rapid and complete in the spoken or popular idiom. Other changes took place in the pronouns and the verbs, for which we refer to Raynouard's *Elémens*. The use of the auxiliary verb *aver*, 'habere,' already existed in the Latin, in a certain form: 'De Cæsare satis hoc tempore dictum habebō' (Cicero, *Philip V.*, 28); 'Si habes jam statutum quod tibi agendum putes' (*Epist. ad Famil.*, iv. 2). The Latin also used the auxiliary 'esse' in some tenses of the passive. The Romance language only made the use of these auxiliaries more general.

After A.D. 1000 the Romance language may be considered as having become fully formed, and the age of the Troubadours began. William, count of Poitiers, is one of the earliest whose works have been preserved. In the twelfth century the institution of the Courts of Love was established. That century was the brilliant age of Romance poetry, and in the same Wace wrote in North or Norman French his 'Roman du Rou.' In the thirteenth century the war and massacre of the Albigenses, and the establishment of the Inquisition, frightened away many of the adepts of 'la gaya ciencia;' and afterwards several other events, such as the accession of the house of Anjou or Provence to the throne of Naples, and the encroachments of the northern French, contributed to the decline of the Troubadour poetry, and at the same time of the Romance language. The Italian or Tuscan rose upon its decay. When Dante appeared, the decline had already begun, and it was completed during the first part of the fourteenth century. (Raynouard, *Choix de Poésies Originales des Troubadours*; Professor Diez, *Leben und Werke der Troubadours*, Zwickau, 1829.) In the fifteenth century king René made some attempts at reviving the poetry of the Langue d'Oc, but the race of the Troubadours was now extinct, and the only result of his endeavours was the collecting and compiling the lives of the old Troubadours by the monk of the isles of Hyeres, 'Le Monge des Isles d'Or.' In Eastern Spain also the Inquisition destroyed many MSS. in the Limosin or Valencian language, as being suspected of containing heresy. In 1434 the library of the Marquis de Villena at Barcelona was burnt on suspicion of containing sorcery. (Ferrario, *Storia ed Analisi degli antichi Romanzi*, &c.)

Various political and social circumstances had contributed to give to the Langue d'Oc that early refinement in an age of comparative ignorance and barbarism which is still a matter of surprise to philologists and historical inquirers. The provinces of Southern France had not, like Italy and the northern parts of France, been overrun by a succession of barbarians; they had not been exposed to the ravages of the Sclavonians, the Huns, and the Danes. The Burgundians and the Visigoths, who had settled there nearly about the same time, were more civilised than the other German races; they amalgamated themselves gradually and quietly with the old inhabitants, and they applied to agricultural pursuits, which a fertile soil and a happy climate rendered pleasant and productive. The country suffered no subsequent invasion from the northern tribes, and the victory of Charles Martel in the plains of Tours arrested the advance of the Saracens from the west. Southern France was, it is true, subjugated by the Franks, who had occupied the countries north of the Loire, but the Franks had by that time formed themselves into a regular monarchy under Pepin and Charlemagne, and were no longer unruly barbarians. During the decline and imbecility of the later princes of the Carolingian dynasty, Southern France became a separate and independent state, of which duke Bozon, an active and vigorous man, became monarch, and the kingdom of Arles or Provence extended over the whole south of France. The descendants of Bozon retained their sovereignty for more than two hundred years; and when the male line ended in 1092, in the person of Count Gillibert, his states became the dowry of his daughters, of whom the elder, Douce, heiress of Provence, was married in the year 1112, to Raymond Berenger, count of Barcelona, and her sister Stephanie married the count of Toulouse. A treaty, concluded in 1125, between the counts of Barcelona and Toulouse, fixed the division of the states of Gillibert between them. Another powerful baron, the count of Poitiers, became duke of Aquitaine or Guyenne, which afterwards

P. C., No. 1241.

came by marriage into the possession of Henry II. of England. These three states, Barcelona, Toulouse, and Guienne included the whole country in which the Langue d'Oc was spoken. The union of Provence with Catalonia introduced into the former country a taste for poetry and chivalry, which was fostered in Spain by the Moors. The maritime towns of Catalonia and Provence carried on a lucrative trade all over the Mediterranean, and Catalonian armaments took an active part in the Eastern wars between the Greeks, the Normans, and the Saracens. All these circumstances contributed to refine the manners of the people as well as their language, and the singular institution of the Courts of Love gave a peculiar turn to their poetry. [TROUBADOURS.]

The Langue d'Oil, or Northern French, also called sometimes Norman French, having become the language of the court and capital of the kingdom of France, gradually encroached upon the Langue d'Oc, as the various provinces south of the Loire became incorporated with the monarchy. From the 13th century downwards, the edicts and ordinances of the French kings being issued in the Langue d'Oil, were forwarded, either in the original or translated into Latin, to the provinces of the south. The writers of Northern France, the Trouvères, refined their own language, and found encouragement at court, which was not extended to the writers in the Langue d'Oc. Ronsard, who was a native of the south, in his 'Abregé de l'Art Poétique,' complains of this: 'Now that our France is all subject to one king, we are obliged, if we wish to attain honour or fame, to speak his language, else our works, however honourable and perfect, would be thought little of, or might perhaps be altogether despised and neglected.' With the invention of printing, copies of the works in the Langue d'Oil were speedily multiplied, while those of the Troubadours remained mostly in MSS. confined to a few libraries. In the 16th century it was enacted that all public acts and deeds should be written in French. The Langue d'Oc, being thus restricted to the mere purposes of a domestic idiom, degenerated into various patois or dialects. Still there appeared, here and there, in the seventeenth and eighteenth centuries, several native poets who wrote with spirit and humour in their respective patois, such as Lesage, a Languedocian, whose burlesque and frequently licentious poems were published at Montpellier: 'Les Folies de le Sage,' 1650; Ader, 'Lou Gentilhomme Gascoun,' Toulouse, 1610, and 'Lou Catounet Gascon,' 1611; a version of Homer's 'Batrachomyomachia,' in Gascon, 'La Granoul-Batromachio,' Toulouse, 1664; 'La Pastourale (a comedy in 4 acts) deu Paysan que cerque mestié a son hils,' in the dialect of Béarn, by Fondeville de Lescar, Pau, 1767; 'L'Embarras de la Fieiro de Beaucaire,' by Michel, Amsterdam, 1700; 'Actes du Synode de la Sainte Réformation,' Montpellier, 1599, a satire against the Calvinists, by Reboul, a witty but profligate adventurer, who was at last executed at Rome, under Pope Paul V., in September, 1611, in consequence of his undis-criminating satirical propensity; 'Lou Banquet,' par Augié, Gaillard, Paris, 1583; the 'Jardin deys Musos Provençales,' Aix, 1628; &c.

In Spain the Latin language became corrupted, though perhaps less rapidly and at a later date than in Italy and France, which is proved by the fact that during the eighth and ninth centuries masters were procured from the Peninsula to teach that language in Italy. It is another evidence of this, that till the beginning of the 12th century, Latin, though corrupt, was the only language used among the Christian population of the Peninsula, not only in the acts of the cortes and councils, but also in the municipal fueros, the public edicts, diplomas, testaments, and the writings of authors. It was also the language of the tribunals, until San Fernando, about the middle of the 13th century, caused the 'Liber Judicum' to be translated into the vulgar tongue.

The corrupt Latin of Spain gave rise to the Catalonian and Valencian, the old Portuguese or Galician, and the Castilian or modern Spanish. The last two, and especially the Castilian, received a considerable admixture of Arabic words (said to be about 2000 in the Spanish language), from which the Catalonian remained comparatively free. The process of corruption of the Latin into Romance was the same as in France and Italy, and may be traced even in the writings of the clergy, who professed to use the literary language of the country. Elipando, bishop of Toledo, a man of learning for the time, who strongly opposed the introduction into Spain of the tenets of the supremacy and infallibility of the Roman see, writes to Felix, bishop of Urgel, in the following style: 'Domino Felice, sciente vos

VOL. XX.—M

reddo quia vestro scripto accepi. . . direxi vobis scriptum parvum de fratre Militane . . . ego vero direxi epistolam tuam ad Cordoba,' &c.

It is impossible to fix the epochs of the origin of the various languages of the Spanish Peninsula. The Catalanian and Galician or old Portuguese appear to be the oldest. The Castilian, notwithstanding the assertion of Bouterwek to the contrary, was not formed in the eleventh century; its oldest existing monument, the poem of 'El Cid,' is not older than the year 1200. Previous to the twelfth century the Galician, or old Portuguese, appears to have prevailed in all western Spain. An old MS. Cancioneiro in this dialect, belonging to the library of the Royal College of the Nobles at Lisbon, of which Sir Charles Stuart obtained a copy, which he communicated to Raynouard, speaks of the Galician dialect as being spoken in Galicia and in Portugal, as far south as Coimbra, in the tenth and eleventh centuries, after which the Portuguese grew into a separate and polished dialect, which was much in use for poetry among Galicians and Castilians as well as Portuguese. (Raynouard, *Grammaire Comparée*, 'Discours Préliminaire.')

In the 'Elucidación das Palavras, Termos, e Frases que em Portugal antiguamente se usáram,' 2 vols. fol., Lisbon, 1798, are other specimens of old Portuguese or Galician compositions. The original text of the 'Amadis de Gaula,' by Vasco de Lobeira, which is lost, was written in the same language.

The Catalanian dialect became early a literary language, and as such subject to fixed grammatical rules; it has its grammars and dictionaries, a great number of printed books, and a still greater number in MS. It had its historians; among others an anonymous historian of Catalonia, mentioned by Zurita in his 'Chronicas de Aragon;' Bernard de Sclot, who lived in the thirteenth century, and wrote a history of the principality of Catalonia and of the Aragonese kings subsequent to the junction of the two states; and King Jayme I. of Aragon, who wrote an account of his own reign, which has been published under the following title: 'Chronica o Commentari del gloriosissim e invictissim Rey Jacme Rey d'Aragó de Mallorques e de Valencia, Compte de Barcelona e de Urgell, e de Muntpellier, escrita per aquell en sa lingua natural, e treita del Archiu del molt magnífich Rational de la insigne Ciutat de Valencia, hon estava custodida,' Valencia, 1557. King Jayme also wrote a book 'de la Saviesa' 'on wisdom,' quoted by Nicolaus Antonio, in his 'Bibliotheca Vetus.' The Catalanian is rich in poetry, which was introduced into the Peninsula by the troubadours of Provence and Languedoc. Alonso II. of Aragon, in the twelfth century, is numbered among its poets, as well as Guillermo de Berguedan, a Catalanian noble, who lived in the following century, and some of whose verses are preserved in a MS. in the Vatican library. Mosen Pero March, Jacme March, Mosen Jorde, Mosen Febler, and Ausias March of Valencia, rank also among the Catalanian, Aragonese, and Valencian troubadours. [TROUBADOURS.]

The languages of Aragon and Valencia, in the time of the Aragonese monarchy, may be considered as one and the same with the Catalanian. It is worthy of remark, that at the end of the 13th century, when the Castilian language had already gained the preponderance in a great part of Spain, we find a controversial conference between the Jews of Granada and some Christian missionaries from Castile, carried on in the Catalanian language, which appears to have been vernacular at Granada. (*Memoirs of the Royal Academy of Barcelona*, i., p. 615.) In the same Memoirs (p. 613) it is stated that the bishop of Orense, having been requested to examine what analogy there might be between the vulgar Galician and the Catalanian, answered, that there were in both, not only nouns, verbs, and other parts of speech quite identical, but also entire phrases. And Terreros (in his 'Paleography') and others have stated, that the language of Asturias is the same as that of Galicia, bating the difference of pronunciation.

The Catalanian, observes Raynouard, is the living language which most resembles the old Romance of the troubadours, and that of the Valdenses of Pignerol in Piedmont is the next. The following are among the shades of difference between the Catalanian and the Romance:—1, The Romance substantives and adjectives ending in *an, en, in, and un*, add in Catalanian the euphonic final vowel *y*; *afun, affany, estran, estrany*, &c. The plural feminine in *as* is changed into *es*. The Catalanian often changes the *s* into an *x*; *ari, pux*: it doubles the *l* at the beginning and at the end of words; *aquell, Uoch, lluny*: it sometimes changes the *s* into

an *t*, especially of the Romance participles in *ent*; *deservint, servint, fugint, premit*: it adds a final *s* to some inflections of the verba, &c. The Catalanian has retained the *est* of the Romance, of which the following are specimens taken from the poems of Ausias March, the Valencian troubadour:—

Motra es la llum de vera esperanga,  
Be es mostra Deu lo mou que vol finir,  
Tot mon parlar als que no es aurán vista,  
No solament los teigs qui t venen contra.

The popular patois or dialects of the south of France, after being long neglected, have of late years attracted the attention of philologists. Colomb de Batines has given an account of the patois of Dauphiné; Sainte Beuve has inserted a notice in the 'Revue des Deux Mondes,' vol. x., 1837, of the poems of Jasmin, the barber poet of Agen; a 'Recueil de Poesies Béarnaises,' was published at Pau in 1827. (The Bearnese dialect is a Romance and not a Basque dialect, and resembles the Gascon.) The dialect of Gascony has been illustrated by the Viscount de Métiérier: 'De l'Agriculture et du Défrichement des Landes,' Bordeaux, 1839; and also by Du Mege: 'Statistique des Départemens des Pyrénées.' The Languedocian boasts of two graceful poets: 'Poésies Patouesas de P. A. et Cyr. Rigaud Mounpeyé, 1806; 'Mélanges sur les Langues, Dialectes, & Patois,' Paris, 1831; Bérone, 'Dictionnaire Patois,' Turin, 1820; the poems of Verdié, a self-instructed artisan of Bordeaux, who died in 1820—whose works, full of humor and nature, are unknown beyond the precincts of his native town; an imitation of the fables of La Fontaine, in the dialect of Limousin, by J. Foucaud, 1835; Brunet, 'Notices et Extraits de quelques ouvrages écrits en Patois du Midi de France,' Paris, 1840; Millin, 'Essai sur la Langue et la Littérature Provençale,' Paris, 1811; J. Champollion Figeac, 'Nouvelles Recherches sur les Patois ou Idiomes vulgaires de la France, et en particulier sur ceux du Département de l'Isère, suivies d'un Essai sur la Littérature Dauphinoise, et d'un Appendix contenant des pièces en vers et en prose reconnues, et un Vocabulaire,' Paris, 1809; Grinet, 'Vocabulaire Limousin,' a dialect which resembles those of French Comté and Western Switzerland.

With regard to the ancient Langue d'Oc, or Langue Romane, the most refined of all the southern dialects, to which may be considered now as a dead language, it was illustrated in the last century, in Italy, by Bastero, 'La Crusca Provenzale;' and in France, by L'Abbé Millot, 'Histoire Littéraire des Troubadours,' who compiled his work from the voluminous MS. folios of M. de Sainte Palaye. In the present century, Raynouard has been the most industrious and most successful investigator of the Romance language and literature.

In Italy, the dialect of the valleys of Pignerol, or of the Valdenses, has most affinity to the old Romance. [VALDENSES.] The Piedmontese, which is a written language, and is spoken by all classes of people, bears also considerable affinity to the modern Romance dialects of Southern France, and we have heard it stated that natives of Languedoc can understand those of Piedmont with ease [PIEDMONT.] Dr. Pipino published a Piedmontese grammar, Turin, 1783; and Ponzia published, in 1827-8, a Dictionary, Piedmontese and Italian. The language of Nice is also a corrupt dialect of the Langue d'Oc. [NICE.]

With regard to the other North Italian or Lombard dialects, they differ more or less from the old Romance language, though they had a common and perhaps coeval origin with it, and resemble it more than the Italian or Tuscan. The Langue d'Oc, having been formed chiefly from a corrupt and provincial Latin, as well as the dialects of Italy, reduced its materials to a regular form sooner than they: and having become a polished and literary language, the Italians in their turn borrowed at second-hand from it. Raynouard, in his 'Grammaire Comparée,' observes that the dialect of Ferrara is one of those which has retained more completely the forms of the Romance with the least admixture. That of Bergamo comes perhaps the next in affinity: it often changes the *e* into *o*; for example, instead of *el, del* (Romance), it has made *ol, dol*. The dialects of Bologna and Mantua abound with contractions and sponges, which render them very harsh; they have taken away the *t* of the Romance terminations in *at, it, ut*. The Milanese has a broad pronunciation, and many double vowels changing into *aa, ii, and uu*, the Romance terminations in *at, it and ut; veritea, serris, avuu*, &c.: it also changes *er* into *er*; *noster, sepolarer*, for the Romance *noster, sepolarer*

The dialects of the Venetian territory, with the exception of that of Friuli, are more remote from the Romance in their formation, as are likewise still more so the dialects south of the Apennines, or of Southern Italy. We cannot here enlarge upon the multifarious subject of the Italian dialects, but must refer the inquisitive reader to their grammars, vocabularies, and other works, and also to an article in the *Quarterly Journal of Education*, No. x., in which are given specimens of composition in each; and also to an article in the *Foreign Quarterly Review*, No. ix., 1829, on the dialects of Southern Italy.

The dialects of Western Switzerland, Vaud, Neuchâtel, Geneva, part of Freyburg, and Lower Valais, and also of Savoy, have retained to this day the name of patois Romand, or Langue Romande. Western Switzerland, as far as the Aar, was occupied in the decline of the Roman empire by the Burgundians, a less rude tribe than the Alemanni, who settled in Eastern Switzerland. The Burgundians shared the land with the native population of Roman, Helvetian, or Allobrogic race; they applied themselves to agriculture, and soon constituted themselves into a well regulated and orderly monarchy. They gradually adopted the provincial Latin which they found in use in the country, and from the corruption of which several Romance dialects were formed, which resembled those of the South of France that were formed through a similar process. Some of the dialects of Western Switzerland approximate in their inflexions to the Northern French, or Langue d'Oil, whilst others, like that of Gruyère in the canton of Freyburg, bear more affinity to the Romance of the south, and consequently to the Italian. Specimens of both are contained in Stalder's 'Dialektologie,' and also in the collection of Ranz des Vaches, both in German and Romance, 'Sammlung von Schweizer Kuhreihen und Volksliedern,' Bern, 1818. To this day, Switzerland is divided, by language, races, and habits, into German and Romande, and the Germans call the latter by the general name of Wälschland.

In the country of the Grisons, or antient Rheti, one half of the people speak a language called Rumonsch, which is an Italian dialect of very antient formation, supposed by some to be derived from the language of the Etruscans, who emigrated to those valleys about 600 years B.C.; but this is a mere conjecture. The Rumonsch is a written language, and books have been published in it. MSS. eight or nine centuries old existed at the end of the last century, and perhaps some still exist in the convent of Disentis. The dialect of the Engadina, or valley of the Inn, is called Ladin: it has still greater affinity to the Italian or Lombard dialects. Specimens of Rumonsch and Ladin are found in the Appendix to Vieusseux's 'History of Switzerland,' published by the Society for the Diffusion of Useful Knowledge. Raynouard observes that the Rumonsch has the affixes and other essential forms of the Romance language, though it is disfigured by an admixture of Northern or Teutonic orthography and pronunciation. It often adds a *g* to the end of words; *silg, volg, haig, testamaing*, for the Romance *sil, vol, hai, testament*.

If we take the appellation of Romance language in its most extended sense, all the languages and dialects of Western Europe, that is to say, of Italy, Western Switzerland, the Grisons, France, and Spain, may be called Romance, being derived essentially from the Roman or Latin, and having been formed after the fall of the Western Empire. The Basque and the Armorican or language of Lower Brittany belong to a different family. The Walloon of Liège and the Valachian are also Romance languages. The Valachian resembles the others, though less perhaps in its grammatical forms than in the etymology of the words. Raynouard shows the analogy existing between them all in their grammatical construction and etymology in his 'Grammaire Comparée des Langues de l'Europe Latine.' But if we take the word Romance in its more restricted sense, as having been especially applied to the language of the troubadours, or Langue d'Oc, we must consider it as confined to the south of France, and the eastern provinces of Spain as far as Murcia; and it is there that we find its legitimate offspring in the languages of Catalonia, Valencia, and Majorca, and in the Languedocian, Provençal, and Valdenses dialects.

Raynouard at the conclusion of his 'Grammaire Comparée' of the languages of Latin or Roman Europe, enumerates twenty-three special characteristics in the construction of the Romance language, most of which occur also in

the other languages and dialects of Western and Southern Europe, which he styles 'Neo-Latin.' 1, The use of articles to determine the cases, instead of their being designated by the termination of the word as in Latin. This characteristic is found in all the modern languages derived from the Latin. 2 and 3 relate to the terminations of words, especially nouns, of which Raynouard gives comparative tables in the various languages. 4 is peculiar to the old Romance, but existed also in the Northern French till the fourteenth century. It consists in placing an *s* at the end of substantives in the singular, when they stand as subjects; the absence of the *s* shows they were used in the objective case. In the plural it was the reverse, the absence of the *s* designated the nominative. The Northern French dropped the *s* generally in the singular, and gave it to the plural without distinction. 5 refers to other terminations employed by the old Romance, especially in proper names, to distinguish the subject from the object. 6 concerns the gender of the adjectives. 7 concerns the degrees of comparison. 8 is on the Romance affixes representing personal pronouns, *ous, os, m, x*, which are also met with in the old French and old Spanish, and also in some rustic dialects of France, in the Catalanian, and in some north Italian dialects. 9, The pronoun *altre* as an expletive added to the personal pronoun. This has been adopted by all the Neo-Latin languages of Europe; *vous autres, vos otros, vos outros, voi altri, &c.* 10, Relative pronouns *qui, que, lo qual*. 11, The indefinite pronoun *om*, derived from the Latin *homo*, which the French has retained in *on*. The Spanish and Portuguese, which formerly employed *ome* in the same sense, have since substituted *se*, and the Italians *si*. 12 concerns the use in the conjugations of the auxiliary verbs *aver, ester, and estar*, which have been adopted, with some modifications, by all the other Romance languages. 13 and 14 concern the formation of the future and the conditional. 15 concerns the participles in *ut*, of which the French has made *u*. 16 concerns the double formation of participles of the same verb, such as *rot* and *romput, defet* and *defendat, eleit* and *elegit, &c.* 17, the compound passive formed of the auxiliary *esser* and the participle past, which has been substituted in all cases for the Latin simple passive form. 18 concerns the verbs used impersonally. 19, The infinitive with the negative, used as an imperative. The Italian has retained it: 'Non parlare:' speak not. 20, The various uses of the conjunction *que*. 21, Formation of adverbs from the feminine adjective by adding the affix *ment*, which has been adopted by all the other languages derived from the Latin. 22, The expletives *pas, mica, gaire, &c.*, added to the negative particle to give it greater emphasis. This form is retained by the French in *pas*, and by the Italians in *mica* and *guari*. 23 concerns the appellations *Romans, Romance, Roumonch, Romanza*, which were used by the old French, Italian, Spanish, and Portuguese writers to designate their respective idioms; an appellation which serves to show their common origin.

The following specimens of the Lord's Prayer, in the various dialects which are nearest to the old Romance, may convey some notion of their respective shades of variation as well as of their common origin:—

*Old Provençal, from 'L'Arbre d'Amor,' A.D. 1288.*

Paire nostre que iest el Cels;  
Ton nom tia sanctificat;  
A nos venga lo teu regnat;  
En la terra facha sia,  
Quo el Cel, voluntat tia.  
La Pa nostre cotidia  
Huei nos dona, Dieus, de ta ma;  
Remet so que nos te deuem,  
Que nos als autres remetem;  
De temptacio nos deffen;  
Ens delivra de mal.

*Modern Provençal, from a Collection of Dialects published at Paris, as quoted by Adelung.*

Nouastre Paire que sias ou Ciele; que vouastre noum siegue santificat; que vouastre rouyaoume nous arribe; que voustre voulountà siegue facho su la terro, coumo din lou Ciele: dounas nou encui noustre pan de cade jou; pardounas noue noustre coufensas, coumo lei pardounan a n'aquelei que nous an coufensas; e nou laissez pa succumba a la tentation; mai delivra nous doou maou.

*Languedocian, from Adelung's 'Mithridates.'*

Nostre Pero que tes au ciel, que vostre nôum siegue santificat, que vostre reyno nous arribe; que vostra voluntat siegue facha, tant sur la terra que din lou Ciel; donna nous aujourd' ivi nostre pan quotidian; perdonna nous nostras ouffenças, couma naoutres las perdounan on d'aquelles que nous an ouffençat. Nous lesses pas succumba a la tentation; me delivra nous de maou.

*Catalonian, from Bern. Aldrete, 'Del Origen de la Lengua Castellana.'*

Pare nostro que estau en lo Cel, santificat sen el vostre sant nom; vinga en nos altres el vostre sant reine; fasas la vostra voluntat axi en la terra como se fa en lo Cel. El pa nostre de cada die da nous lo gui: i perdonau nos nostres culpes, axi com nos altres perdonam a nostres deudores; i no permetau que nos altres caigam en la tentacio; aus desllibra nos de qualsevol mal.

*Balearic of Mallorca, from Adelung.*

Pare nostro que estau en los Cels; sia santificat lo vostro sant nom; vingue a nos altres el vostro sant regne; fases, Señor, la vostra voluntad axi en la terra com se fa en lo Cel. El nostro pa de cada dia daunos, Señor, en lo dia de vuy; y perdonau nos nostras culpas, axi com nos altres perdonam a nostros deudors, y dellivraunos, Señor, de tot mal.

*Valencian, from Hervas's Collection in Adelung.*

Pare nostre que estas en lo Cel; santificad siga el teu nom; venga a nos el teu reine; fagas la teua voluntad aicsi en la terra com en el Cel. El pa nostre de cada die daunoste gui. Y perdonau nos les nostres deudes aicsi com nos otros perdonam a nostres deudores; y no nos deiceses caure en la tentacio; mes lliuranos de mal.

*Sardinian of Cagliari and other Towns, from Adelung.*

Pare nostru qui istas in sos Quelos; Siat santificadu su Nomen teu; vengat a nois su regnu teu; fasase sa voluntat tua axi comen su quelu gasi in terra. Lo pa nostru de dognia die da nos hoe; i dexia a nos altres sos deppitos nostros comente nosateros dexiam als deppitores nostros; i no nos induescas in sa tentatio; ma livra nos de male.

*Sardinian Rustic.*

Babbu nostra sughale ses in sos Chelus, santufiada su nomine tuo; bengiad su rennu tuo; faciadsa sa voluntade tua, zomenti in Chelo gasi in terra. Su pane nostru de ognie die da nos lu hoe; et lassa a nos ateros is deppidos nostrus gasi comente nos ateros lassaos a sos deppitores nostros; e non nos portis in sa tentassione; impero libera nos de su male.

*Gallego or Galician, from Hervas's Collection, No. 295.*

Padre nostro que estas no Ceo; Santificado sea o teu nome; venja a nos outros o teu renjo; fagase a tua vontade asi na terra come no Ceo. O pan nostro de cada dia danolo oje; e perdonainos as nostras deudas, asi come nos outros perdonaimos aos nostros deudores; e non nos deixes cair na tentazon; mas libra nos de male.

*Portuguese.*

Padre nosso que stas nos Ceos, Sanctificado seja o teu nome; venha a nos o teu reino; sea feita a tua vontade assi nos Ceos come na terra. O pao nosso de cada dia da nos oje; e perdoa a nos, Senhor, a nossas dividas assi como nos perdoamos aos nossos dividores; e nao nos dexes cair in tentação; mas libra nos do mal.

*Valdenses of the year 1100, from Leger.*

O tu lo noste Payre, local sies en li Cel; lo tio Nom sia sanctifica; lo tio regne venga; la toa voluntà sia fayta en ayua illi es fayta al Cel, sia fayta en la terra; dona nos la nostre pan quotidian euchoy; pardonna a nos li nostre debit e peccà, coma nos perdonnen a li nostre debtors o offendadors; non nos amenar en tentation; ma delivra nos del mal.

*Modern Piedmontese. (This dialect has adopted in a great degree the pronunciation of the northern or modern French.)*

Padre nüst, ch't ses in Ciel; Santificà sia l' tö nom; vegna a noi l' tö regu; s' fassa la tua voluntà com in Ciel così in terra; dane encüe l' nüst pan di tut i di; perdona a noi i nüst debit com noi perdonoma ai nüst debitor; lasne nen casché en t' la tentasion; ma librone dal mal.

*Rumontsch of the Grisons.*

Bap nos chi est n' ils tschels; fat sangt vegna teis nom;

teis reginom vegna nan proa; tia voellga dvainta s' en in tschel, usché eir in terra; nos paun d' minchiadi da; nus hoz, e perdunains nos debitts sco eir nus ils perdunals als noss debittadurs; en 'nus manar in provamaint; zaspendra ons dal mal

**ROMA'NO, GIU'LIO. [GIULIO ROMANO.]**

ROMANS, a town in the south of France, in the department of Drôme, 10 miles north-east of Valence, on a cross road from that town to Grenoble, and 362 miles from Paris by Lyon, Vienne, and Valence. The town owes its origin to a monastery founded by St. Bernard, A.D. 837. In the sixteenth century it was the centre of a considerable trade in woollen cloth, which was exported even into Asia; but the religious wars of that period combined with the ravages of pestilence to diminish its prosperity. It is, however, a place of considerable trade, and the activity which prevails in it contrasts strongly with the dulness of the neighbouring town of Valence. Romans is in a district on the right or north bank of the Isère, by which it is separated from the little town of Le Péage du Pizay now called Le Bourg-du-Péage, which is virtually a suburb of Romans, and is joined to it by a handsome bridge. Romans is surrounded with an antient wall flanked with towers and defended by a ditch: it is an ill-built town, destitute of any remarkable edifices, except the parish church which was antiently the church of the monastery founded by St. Bernard. The population in 1831 was 7677 for the town, or 9285 for the whole commune; that of Le Bourg-du-Péage was 3095 for the town, or 3577 for the commune, making 10,772 for the two towns, or 12,862 for the commune. The manufactures of Romans are silk, woollen cloths, serges, and other woollen fabrics, worsted hose, and leather: there are oil-presses for walnut-oil, and lime and plaster kilns. The trade of the place comprehends wheat, tow, hides, silk, nut-oil, liqueurs which are made in the district, excellent truffles, and wine. There are three fairs in the year. Hats and silk goods are made at Péage where also are dye-houses for cotton and silk, tanneries, ropewalks, and cartwrights' shops. Péage has four fairs in the year. Romans has a high school and a tribunal of commerce. It was the native place of the unfortunate General Lalley. [PONDICHERRY.] The celebrated Hermitage wines are grown near Romans.

ROMANS, EPISTLE TO THE. The Epistle to the Romans has been almost universally admitted to be the work of St. Paul. The only sects which have disputed its genuineness are the Ebionites, the Encratites, and the Cerinthians, and these purely on doctrinal grounds, inasmuch as the doctrines of this Epistle were adverse to their own opinions. (Stuart's *Commen. on the Epis.*, p. 2.) Some modern commentators however have supposed that the Epistle properly ends with the fifteenth chapter, a supposition which may seem plausible from the want of connection between the last chapter and the rest of the Epistle. But this want of connection may be accounted for easily enough, without any such hypothesis. (Stuart, *Introd.*, p. 2.)

The verses 25-27 inclusive of this last chapter are in some MSS., as in the Codex Alexandrinus, made to follow ver. 23 of cap. xiv., and Griesbach and others give them the arrangement. But a doxology of so sublime a character as is contained in these verses does not seem a fit conclusion for a discussion about eating meats or abstaining from them, and accordingly Hug and others agree with the received text in placing them at the close of the Epistle. Some few MSS. omit them altogether. The words *I, Tertius, &c.* xvi. 22, imply that this chapter formed the end of the Epistle, and that the Epistle is *one*. There are however indications in the last chapter that the Epistle received several unimportant additions or insertions after it was in the main completed, according as any afterthoughts occurred to the writer, before it was finally dispatched.

With respect to the date of the Epistle, various years have been assigned to it, from A.D. 55 to A.D. 58. According to the most probable opinion, it was written towards the end of 57 or in the beginning of 58, when St. Paul was at Corinth, and on the point of setting out to Jerusalem with the 'contribution made by them of Macedonia and Achaia for the poor saints which were at Jerusalem' and in Judea. (Cap. xv., ver. 25, 26.)

The Epistle was dictated in Greek by the Apostle to Tertius, his amanuensis (xvi. 22), and conveyed to the church at Rome by Phœbe (xvi. 1), a servant or deaconess of the church at Cenchrea, a place not far from Corinth.

Another proof of the Epistle having been written from Corinth is given in xvi. 23, where St. Paul sends salutations from Gaius, his host, and Erastus, the chamberlain of the city of Corinth. (Comp. 2 *Timoth.*, iv. 20, and 1 *Cor.*, i. 14.) The position of this Epistle in the New Testament does not depend upon its date, for it is the seventh in order of time, and is placed first, either from being the 'longest and most comprehensive' of the Epistles of St. Paul, or from the importance of the church to which it was addressed. (Horne's *Introduct.*, vol. iv.) With respect to the origin of this church, we have no certain information in the Scriptures. They do not tell us when or by whom it was founded. The opinion that it was founded by St. Peter does not appear to rest on any satisfactory evidence: the chief authorities for it are, Irenæus (*Adv. Hær.*, iii. 1) and Eusebius (*Chron. an. 2 Claud.*); but if he had indeed preached the Gospel at Rome, such a circumstance would probably have been noticed in the *Acts of the Apostles*, nor is it likely that St. Paul would have made no allusion to it in this Epistle. Perhaps the most reasonable opinion on the subject is, that the Gospel was first preached at Rome by 'the strangers from that city, the Jews and proselytes,' who were converted by Peter's preaching at Jerusalem on the day of Pentecost (*Acts*, ii. 10); so that, like many other churches, that at Rome was at first composed of Jews, and gradually increased by the admixture of Gentiles, till the whole Christian community there became so large and important, 'that their faith was spoken of through the world.' The fact of this combination and co-existence of Jews and Gentiles as parts of one Christian church sufficiently explains to a careful reader the occasion and object of the Epistle. Prejudices and pretensions on one side would be met with disdain or opposition on the other. (cap. ii. and xi.) The Jews were attached to the Mosaic institutes and the Levitical rites and distinctions between clean and unclean. They were impatient of subordination to or equality with the Gentiles, and wished to impose upon them a conformity to many points of the Mosaic ritual, especially that of circumcision, before they were admitted to a participation in the privileges of the Gospel. The Gentiles, on the other hand, disregarded (perhaps too contemptuously) the prejudices of the Jews, and were of course offended at their pretensions to superiority, for which their fallen position afforded in the eye of the Gentiles no justification. They might not reflect with fairness on what the Jews conceived themselves to have lost by the publication of the Gospel. Such a position of parties, and such a state of feeling between them, would naturally give rise to the divisions and offences which occasioned some of the admonitions and cautions contained in the hortatory portion of the Epistle, and the existence of it can scarcely fail to be observed by a careful reader.

The argument of the Epistle is mainly directed against the two great prejudices of the Jews, viz. (1), their trust in the works of the law, and particularly in the rite of circumcision, as if by these they were already justified, *i. e.* accounted righteous in the sight of God; an idea which led them to reject the offers of the Gospel: (2), a trust in their privilege, as the chosen seed of Abraham, which led them to consider themselves as God's peculiar people, and to look down upon the Gentiles as aliens.

The point which the Apostle endeavoured to establish in the Epistle is briefly laid down in cap. i., ver. 10, where he affirms, in opposition to the prejudices and pretensions of the Jews, that 'the Gospel is the power of God unto salvation to every one that believeth: to the Jew first, and also to the Greek.'

Here two things, as Mr. Young remarks, are contained in this affirmation:—

1st. The perfect efficacy of the Gospel to salvation, for it is the power of God unto salvation, *i. e.* the means whereby God brings about the salvation of men; which indeed implies the *inefficacy* of the law for that purpose, whether that of Moses or that of nature, by which the Gentiles were 'a law to themselves.' (i., 19; ii., 14.)

2ndly. The *universal* extent of this saving power is included in the words, 'to every one that believeth: to the Jew first, and also to the Greek.'

The Apostle therefore in this Epistle does mainly these four things:—

1. He shows the *inefficacy* of the law of Moses to salvation. (iii., 26.)

2. He shows the perfect *efficacy* of the Gospel to the same. (iii., 28.)

3. He destroys the *exclusive* claims of the Jew to the benefits of this salvation. (iii., 29.)

4. He establishes the claims of the Gentiles to justification, or acceptance with God, without their being under any obligation to perform the law of Moses.

These four points are the chief topics of the three first chapters, but the Epistle (or rather, the argumentative portion of it) may further be broken up into three great divisions:—

1. Concerning justification: the first five chapters.

2. Concerning sanctification; or the helps afforded under the Christian dispensation to purity of heart and holiness of life. (chapters 6, 7, and 8.)

3. Concerning the rejection of the Jews: the 9th, 10th, and 11th chapters.

The remainder of the Epistle is chiefly taken up with exhortations and precepts on various subjects.

The preceding arrangement and division is in accordance with Young's 'Synopsis of the Argument of St. Paul's Epistle to the Romans;' but perhaps the best idea of its general character is given by Paley, who observes that the 'principal object of the argumentative part of it is to place the Gentile convert upon a par with the Jewish, in respect of his religious condition and rank in the divine favour. The Epistle supports this point by a variety of arguments, such as that no man of either description was justified by the works of the law, inasmuch as no man had performed them; and it became therefore necessary to appoint another medium or condition of justification, in which the Jewish peculiarity was merged and lost: that Abraham's own justification was antecedent to the law and independent of it: that the Jewish converts were to consider the law as now dead, and themselves as married to another: that what the law could not do, in that it was weak through the flesh, God had done by sending his Son: that God had rejected the unbelieving Jews, and had substituted in their place a society of believers in Christ, collected indifferently from Jews and Gentiles.' A doctrine of this sort was not however likely to be acceptable to the Jewish members of the Christian church; and accordingly we find that St. Paul makes every attempt to reconcile them to it; and whenever he says anything disparaging of them, invariably qualifies or softens it by a subsequent observation. Instances of this occur very frequently, and especially in the tenth and eleventh chapters.

(Young; Horne; Townshend; and Stuart. For examples of undesigned coincidence between this Epistle and the *Acts of the Apostles*, the reader is referred to Paley.)

ROMA'NUS I., an Armenian by birth, served with distinction under Leo the Philosopher and his son Constantine Porphyrogennetus, who made him great admiral. Romanus gave his daughter Helena in marriage to the emperor, who made him his colleague in the empire, A.D. 919. Romanus became in fact the real emperor, the weak character of Constantine not being equal to the cares of the state. His own sons however, whom he had named Cæsars, conspired against him, and having seized him, they confined him to a convent (A.D. 945), where he died in the year 948. His two sons did not reap the fruit of their unnatural treachery; they were seized by order of Constantine, and banished to a convent.

ROMA'NUS II., son of Constantine Porphyrogennetus, and grandson, by his mother's side, of Romanus I., poisoned his father, and succeeded him, A.D. 959. He showed himself as incapable as he was unworthy of the throne. After a reign of little more than four years, he died in 963, it is said by some of poison administered by his wife Theophana. His widow became regent and guardian of her infant children, and she soon after married NICEPHORUS PHOCAS.

ROMA'NUS III., of a patrician family and senator of Constantinople, was chosen his successor by Constantine IX., and the emperor gave him in marriage his daughter Zoe. He succeeded Constantine, A.D. 1028. The beginning of his reign was favourable, but he afterwards met with reverses, his armies having been defeated by the Saracens, and he became stern, avaricious, and unpopular. His wife Zoe, much younger than himself, having formed a guilty connection with an obscure individual called Michael of Paphlagonia, caused her husband to be murdered in the year 1034, upon which she married Michael, and placed him on the throne.

ROMA'NUS IV., DIOGENES, of a noble family, was a

soldier under the reign of Constantine Ducas, and after that emperor's death was chosen by his widow Eudocia for her husband and her partner on the throne, A.D. 1068. [EUDOCIA.] He passed with an army into Asia, and carried on a successful war against the Turks, whom he drove beyond the Euphrates. Having afterwards entered Armenia, he was defeated by Alp Arslan, sultan of the Turks, and taken prisoner. He was kindly treated by his conqueror, and obtained his liberty by paying a heavy ransom. In the meantime a revolution had taken place at Constantinople, where Michael, son of Constantine Ducas, had risen against his mother, and shut her up in a convent. Romanus on his way homewards was seized by order of Michael, was deprived of his sight, and banished to the island of Prinkipos, in the Sea of Marmara, where he soon after died, A.D. 1071.

ROMANZOFF, or ROMANZOW. [CATHERINE II.]

ROMANZOFF, NICHOLAUS, COUNT, was the son of the field-marshal Romanzoff who became celebrated by his victories over the Turks under the reign of Catherine II. He was born in 1753, and appointed Russian minister at Frankfort on the Main in 1785. Under the emperor Alexander he was nominated minister of commerce. He introduced many liberal measures into his department, and it was owing to his exertions that the first Russian expedition round the world, under Krusenstern and Lisirnski, was sent out in 1803. In 1807 he was appointed minister for foreign affairs, and soon afterwards chancellor of the empire.\* He accompanied the emperor Alexander to the interview with Napoleon at Erfurt in 1808, concluded the treaty of peace with Sweden in 1809, and that of peace and alliance with Spain in 1812, by which Russia formally acknowledged the constitution of the Cortes of Cadiz. In 1814 he left public life, and devoted his time and fortune to the promotion of literature, science, and education in his own country. Many important works were published at his expense, as for instance the diplomatic code of Russia at Moscow; the history of the Byzantine writer Leo Diaconus, edited by Professor Hase at Paris, and a Russian translation at St. Petersburg; the history of the Mongols and Tatars by Abulghazi, which was printed for the first time in the original Tatar at Kazan, 1825; and many other important publications relating not only to the political history of Russia, but also to that of its manners, customs, literature, and art. The scientific expedition round the world by Captain Kotzebue in the years 1815-18 was undertaken and the account of it was published at the expense of Romanzoff. He established on his estate of Homel in the government of Mohiloff, under the direction of an Englishman, Mr. Heard, the first Lancasterian and industrial schools in Russia. This patriotic individual died in 1826. He had never been married.

The Russian mode of writing his name is Rumiancoff, pronounced Roomiantzoff, but the form Romanzoff has been adopted in all foreign works.

ROMBOUTS, THEODORE, a painter, was born at Antwerp in 1597, and st died under Abraham Jansens until he was twenty years of age, when he went to Rome, and was soon known as one of the most promising young artists of his time. He obtained from a nobleman in that city a commission to execute a series of twelve pictures of subjects from the Old Testament, which, when completed, added greatly to his reputation. After residing at Rome a few years, and gaining constant employment, he was invited to Florence by the grand-duke of Tuscany, and executed for that prince several large historical works for the palace. After an absence of eight years, Rombouts returned to Flanders, and established himself in his native city in 1625. He was soon engaged to paint in the churches, and his pictures excited universal admiration. He was thus induced to believe that he could rival if not surpass Rubens, who was then in the full exercise of his astonishing powers. Rombouts made the trial, and though he did not succeed, his failure was unattended by disgrace. If his works do not possess the magnificence of his great competitor in their conception, nor his splendour and breadth of effect in their execution, they must be admitted to show a readiness of invention, a correctness of design, an animation of expression, a warmth and brilliancy of colouring, and a surprising facility of touch, which would have placed him, at another time and under other circumstances, at the head of his profession. The works

\* The chancellorship is the highest civil rank in Russia, and the place is for life. It has nothing in common with its synonymous dignity in England; the chief officer of Russia is the head of the foreign department.

which he executed in competition with Rubens were St. Francis receiving the Stigmata; the Sacrifice of Abraham in the Church of the Recolets; and Themis with the Attributes of Justice, in the town-house of Ghent. The Taken Down from the Cross, in the cathedral of the same city, a composition which proves that Rombouts possessed many of the qualities of a great master. In order to gain more he did not hesitate to paint familiar subjects, such as concerts, assemblies, and merry-making, which, though executed with taste and freedom, are far inferior to his other works. He also painted decorations for theatres. Having amassed a considerable fortune, he commenced building a handsome mansion, but had not proceeded far when he found his means to be inadequate, and he pretended that the grand-duke of Tuscany required his attendance at Florence, as an excuse for not proceeding with the edifice. The mortification of this disappointment is supposed to have hastened his death, which took place at Antwerp in 1640 according to Houbraken, and according to Weyerman in 1640.

(*Biographie Universelle*; Bryan's *Dictionary of Painters and Engravers*.)

ROME, ROMA, the head town of the Papal State, and formerly the capital of the whole Western world, is situated in the wide plain of the Campagna, on the banks of the Tiber, 15 miles from the sea-coast, in  $41^{\circ} 54'$  N. lat. and  $12^{\circ} 28'$  E. long. The Campagna about Rome is not a plain like the flats of Apulia or Lombardy; it is a kind of table-land with a very undulating surface, crossed by groups of ridges of low hills, and it slopes towards the south-west with a rapid descent to the alluvial marshy tract of the Maremma, which extends along the coast of the Mediterranean. [CAMPAGNA DI ROMA; MAREMMA.] The descent from the dry table-land of the Campagna to the maritime plain occurs, as we follow the right bank of the Tiber, about ten miles below Rome, and two miles and a half above Capua due Rami, or the bifurcation of the Tiber. At that point the table-land is from 100 to 120 feet above the sea. On the left or southern bank the descent is nearer the bifurcation, above the Marsh of Ostia. [OSTIA.] Further south-east, the villages of Pratica (the ancient Lavinium) and Ardea stand on the edge of the slope.

The basin of the Lower Tiber, after the river emerges from the Sabine Hills on one side and Mount Soracte on the other, and enters the Campagna, partakes of the character both of the lowlands and the table-land, the immediate banks of the river being considerably lower than the surrounding country. The site of Rome consists partly of several strips of low land on both banks of the Tiber, the ordinary level of the river being there about 35 feet above that of the sea, and partly of the table-land of the Campagna, which rises on both sides from 150 to 200 feet above the river. The projections of this table-land which advance towards the river have been, perhaps improperly, called hills; and hence, the name of the Seven Hills. After the enlargement of the city walls by Aurelian, these hills or projections were considerably more than seven. On the right bank of the river, the Vatican and the Janiculus, which are within the modern city, are a continuation of the ridge of Monte Mario, which is outside of the walls to the north, and is 450 feet above the sea, and of Monte Verde to the south. On the left or eastern bank, the table-land of the Campagna extends, within the walls of Rome, in a semicircular shape, forming several projections to the west towards the river. The low grounds between these projections and the river constitute the Campus Martius, on which the greater part of the modern town is built. Beginning from the north, the first projection of high lands within the town is that called Monte Pincio (the ancient Collis Hortulorum); farther east, and partly separated from it by a depression or ravine, is the Quirinal, and still farther south-east the Esquiline. In a kind of recess between the Quirinal and the Esquiline is a smaller projection, which has received the name of Mount Viminalis, but which is now hardly distinguishable from the other two. It rises above and north of the church of San Lorenzo Panisperna. The Quirinal, Viminal, and Esquiline are joined on the east, within the walls of Rome, by an extensive plateau, which is about 150 feet above the ordinary level of the Tiber, and which slopes gently towards the country outside of the walls of Rome. The highest points of the Esquiline and the Quirinal are nearly 200 feet above the Tiber. South of the Esquiline, and separated from it by a depression or valley, is Mount Caelius, which seems

to be more insulated than the other hills already mentioned, as it slopes eastwards towards the country outside of Porta S. Giovanni, and is also divided on the south from the Aventine by the valley of the Aqua Crabra or Marrana. Within the space that is enclosed between the table-land and the Tiber, and in the middle of the antient city, there are three small insulated hills, the Palatine, the Aventine proper, and the Capitol, of which the Aventine is the most southern and the Capitol the most northern. The Capitol rises between the south-west extremity of the Quirinal and the left bank of the Tiber, and nearly fills up the intermediate space. The antient city of Rome, before the time of Aurelian, lay south and east of the Capitol, and along the Palatine, Aventine, Cælian, Esquiline, and Quirinal hills: the main bulk of modern Rome lies north of the Capitol.

The Tiber, on approaching Rome from the north, makes a sweep to the east towards the base of Monte Pincio, receding from Monte Mario and the Vatican hill on its right bank; but on reaching Ripetta within the city, the river makes a bend to the westward, and flows along the north-eastern base of Mount Janiculus, after which it turns again to the east as far as the base of the Capitol. It then turns again to the south-west, sweeping past the base of the Aventine, and along the southern extremity of the Janiculus. It then assumes a course south by east. The level space between the Vatican Mount, the north end of the Janiculus, and the right bank of the river, is the Vatican field, which is about a mile long from east to west. It contains the Borgo or suburb of Rome, enclosed by the popes, and St. Peter's church, the Vatican palace, and their appurtenances. The space between the long ridge of Mount Janiculus and the right bank of the Tiber constitutes the district of Transtevere, which is another suburb of Rome. The space on the left bank running north and south, and between the great westward bend of the river and the eastern hills, is the site of the modern city of Rome, properly speaking, which extends also along the slope of the Pincian, Quirinal, part of the Esquiline, and the Capitol, forming a kind of triangle, of which the apex is to the north, at the Porta del Popolo, and the base extends from Santa Maria Maggiore on the east, to the Tiberine island on the west, a distance of about a mile and a quarter, whilst from the Porta del Popolo to the foot of the Palatine opposite Ponte Rotto, the farthest southern point of modern Rome, the distance is rather more than a mile and a half. All to the south and east of these limits, forming about two-thirds of the area within the walls, is desolate, consisting of ruins, gardens, and fields, with some churches, convents, and other scattered habitations.

The present line of walls of Rome proper on the left bank of the river is generally understood to be that traced by Aurelian, restored by Honorius, and afterwards by Belisarius, and since repeatedly renewed by several popes. It describes an irregular polygon, of which the longest diameter is three miles in length from north-west to south-east, from the Porta del Popolo to the Porta S. Sebastiano on the Appian road. The whole circuit of the present walls, including those of Transtevere and of the Borgo or Vatican, is between fourteen and fifteen miles. The wall is made of brick mixed with stones and rubbish, and has been often repaired. It varies in height, but in most places does not exceed 15 feet. It has no ditch, but is flanked by towers and bastions, which were last repaired by Pope Benedict XIV. Rome has sixteen gates, some of which however are walled up. Beginning from the north is: 1. Porta del Popolo, on the Flaminian way, or high northern road, which divides at a short distance from Rome, one branch leading to Florence and the other to Ancona. 2. Farther east, the next gate is Porta Pinciana. 3. Porta Salara or Salaria, on the road to Rieti. 4. Porta Pia, on the north-east, formerly Nomentana, the road from which joins the Via Salaria. 5. Porta S. Lorenzo, facing the east, and leading to Tivoli. 6. Porta Maggiore, leading to Palestrina: this is the handsomest of the gates of Rome, being originally part of the aqueduct of Claudius restored by Vespasian and Titus, which is attested by the triple inscription over it. It consists of a fine arch which crosses the high road, built of Travertine or Tiburtine stone. 7. Porta S. Giovanni, which looks to the south-east on the modern road to Albano and Naples. 8. Porta Latina, the road from which joins the Naples road. 9. Porta S. Sebastiano, on the antient Via Appia. 10. Porta S. Paolo, on the road to Ostia. Crossing the Tiber, we find, 11. Porta Portese, which leads to Fiumicino, the

present port of Rome. 12. Porta S. Pancrazio, on the summit of Mount Janiculus, which is nearly 300 feet above the Tiber. Outside of this gate is the Villa Pamfili, with its shady walks, its waterworks, and beautiful groves of lofty umbrella pines. 13. Porta Cavalleggieri, south-west of St. Peter's; it leads towards Civita Vecchia. 14. Porta Fabrica, on the same side, is now walled up. 15. Port' Angelica, on the opposite or northern side of St. Peter's, on the road leading to Monte Mario. 16. Porta Castello, which opened from the Castle of S. Angelo northwards into the country, and is now walled up. Besides these, there are two internal gates, one called S. Spirito, leading from the Borgo to the Lungara, and the other Porta Settimiana, leading from the Lungara to Transtevere. These districts, Borgo and Lungara, have been consecutively annexed to the modern city.

The course of the Tiber within Rome, including its windings, is about three miles; the banks are not built up with quays or walks, but in most places the river is bordered by the backs of houses generally of an inferior sort; in other places there is a slip of sand or gravelly ground between the houses and the river, which is frequently overflowed. There are only two places where there is a sort of quay or landing-place; one in the northern part of the town, on the left bank, above the bridge of S. Angelo, called Ripetta, where the boats from the inland provinces on the upper Tiber land wine, charcoal, and provisions; and the other at the southern extremity of the town, on the right bank near Porta Portese, called Ripa Grande, where sea-vessels land their cargoes, and where there is a line of warehouses and a custom-house. There are three bridges across the Tiber within Rome; the northernmost is Ponte Sant'Angelo, the Pons Ælius, built by Hadrian, and restored by several popes, and lastly by Clement IX., by whose order Bernini constructed the present balustrade and the statues with which it is decorated. It is about 300 feet long, but the width of the bed of the river is not more than 200 feet. The Ponte Sisto, formerly Pons Janiculensis, built originally by Marcus Aurelius, and rebuilt by Sixtus IV., is about 300 feet long, the bed of the river being 230 feet wide. About half-a-mile lower down is the island of San Bartolomeo, the antient Insula Tiberina. This island is of an oblong shape, something like a ship, being about 1000 feet long, and 300 feet wide in the middle of its length. It is joined to the mainland by two bridges; one to the left bank called Ponte San Bartolomeo; and the other to the right bank, called Ponte Quattro Capi, from a head of Janus Quadrifrons which once decorated it. The two arms of the river together form a bed of about 200 feet in width. There are also within Rome the remains of three antient bridges: the Triumphalis, called also Vaticanus, just below Sant'Angelo, of which the piers have fallen into the bed of the river and occasion a rapid; the Pons Palatinus, now called Ponte Rotto, of which three arches remain on the Transtevere side; and lastly, the Pons Sublicius, at the foot of the Aventine, the first bridge built by the Romans, of which there are very few vestiges.

Rome is divided into fourteen districts, called Rioni, which however do not correspond in their boundaries to the Regiones of the antient city. The modern Rioni are of very unequal extent, their boundaries being determined with reference to the population included within them. Thus the inhabited part of the city contains eleven Rioni, namely: 1, Campo Marzo, near Porta del Popolo; 2, Colonna; and 3, Trevi, along the slope of the Pincian and Quirinal; 4, Sant' Eustachio; and 5, Pigna, in the middle of the lower town, 6, Ponte; 7, Parione; and 8, Regola, near the left bank of the Tiber; 9, Sant' Angelo in Pescheria, between the Capitol and the Tiber; and 10, Transtevere; and 11, Borgo, on the right bank of the river. The whole of the antient or southern city is comprised within three extensive Rioni, namely: 12, Monti, on the north-east; 13, Campitelli, south-east; and 14, Ripa, south-west.

The modern town of Rome may be conveniently divided, for the sake of topographical description, into three great divisions: 1, the lower part of the town between the eastern hills, the Tiber, and the Capitol; 2, the upper town, which extends along the eastern hills; 3, the part of the town which is on the right bank of the Tiber.

The lower town, which occupies the site of the ancient Campus Martius and Campus Tiberinus, is the seat of all the bustle and trade. It is crossed in its central part from north by west to south by east by the street Del Corso,

which is about one mile in length from the Piazza del Popolo, or great northern entrance of Rome, a handsome open place with an obelisk in the middle, to the palace of Venice, near the foot of the Capitol. Two other streets branch out from the Piazza del Popolo, on the right and left of the Corso, and at an acute angle with it. One leads south-east to the fine open place called Piazza di Spagna, the great resort of foreigners, at the foot of the Pincian Mount, after crossing which, it continues in the same direction to the College of Propaganda at the foot of the Quirinal. The other street, called Ripetta, runs in a south direction, parallel to the bank of the Tiber, and then, following the bend of the river, leads, under a different name, to the bridge of Sant' Angelo.

About the middle of the Corso is a square, called Piazza Colonna, from the antient pillar which stands in the middle of it. [ANTONINE COLUMN.] Immediately to the west of the Piazza Colonna is an irregular square, which crowns a slight eminence called Monte Citorio, or Citatorio, a small hill which rises in the middle of the Campus Martius. It contains a fine building, called Curia Innocenziana, in which the courts of justice sit: a handsome obelisk stands in front of it. Returning to the Corso, and following it southwards, we meet with a street on the left, which leads to the Fontana di Trevi, the handsomest fountain in Rome, and then we come to another street, leading to the ascent of the Quirinal, or Monte Cavallo. Farther up the Corso, on the right, is a wide street, called Strada del Gesù, which leads to the splendid church and convent of that name, the head-quarters of the Order of the Jesuits, from whence, turning to the left, is a street that leads to the foot of the Capitol. The whole of this part of the city, in the neighbourhood of the Corso, consists chiefly of regular and substantial buildings. The most remarkable are: 1. the Palazzo Borghese, near Ripetta, one of the largest and finest in Rome; it contains a choice collection of paintings, by Titian, Domenichino, Albano, Annibale Caracci, Caravaggio, Parmigiano, and other great masters. 2. Further north the old mausoleum of Augustus has been transformed into an amphitheatre, called Corra, for bull-fights, fireworks, and other popular diversions. 3. Palazzo Ruspoli, on the Corso, in a good style of architecture, by Ammanato, has a much-admired staircase, constructed by Martino Longhi, consisting of 115 steps, each of a single block of white marble. The extensive ground-floor of the palace has been converted into a coffee-house, which is the largest in Rome, and consists of various rooms, where several 'crocchi,' or clubs of lawyers, merchants, and other persons assemble, that of the contributors to the 'Giornale Arcadico,' the literary review of Rome, among the rest. The club of the artists is held at the Caffè del Greco, in the Piazza di Spagna; that of the antiquarians at the caffè of Fontana di Trevi; the club of professors and other men of letters meets at the Caffè di Monte Citorio. 4. Palazzo Ghigi, which forms the north side of the Piazza Colonna, contains some choice paintings, and a fine library rich in curious MSS., among others an inedited chronicle of the monastery of Mount Soracte; a copy of Dionysius of Halicarnassus, written in the eleventh century; several letters of Melancthon; one of Henry VIII. of England, concerning Luther; about twenty volumes of original documents relative to the treaty of Westphalia; a handsome parchment volume, in folio, containing French and Flemish music of the fifteenth century, &c. 5. Palazzo Piombino, on the opposite or south side of the square. 6. Palazzo Sciarra Colonna, on the Corso, has a rich collection of paintings and a handsome Doric marble gate. 7. Palazzo Doria, a vast building, designed by Borromino, also contains a gallery of choice paintings. 8. The Palazzo Torlonia, formerly Odescalchi, or Bracciano, on the Piazza S. Apostoli, has a splendid marble gallery fitted up in the modern taste, and some good modern paintings. 9. On the opposite side, next to the church of S. Apostoli, is the Palazzo Colonna, with a handsome court and gardens behind, which extend up the slope of the Quirinal, and a gallery of paintings with some splendid portraits by Titian, Veronese, and Giorgione. 10. The huge Palazzo di Venezia, so called because it once belonged to that proud republic, is now occupied by the Austrian ambassador; it looks like an old castle, with its massive walls and battlements. 11. Opposite the church of the Gesù is the Palazzo Altieri. All these palaces are in the immediate neighbourhood of the Corso. The principal churches in the same district are: 1. Santa Maria del Popolo, which, like most churches at Rome, contains some good paintings,

several remarkable sepulchral monuments, and a handsome chapel belonging to the Ghigi family. 2. San Carlo Corso. 3. S. Lorenzo in Lucina, raised on the ruins of an antient temple. 4. S. Ignazio, which is rich in ornaments adjoins the Gregorian or Roman College. 5. The handsome church del Gesù contains some good and some indifferent paintings, the splendid chapel of S. Ignatius, enriched with lapis lazuli, silver, and gold, and the mausoleum of Bernini, by Bernini. 6. Santi Apostoli, with the fine mausoleum of Pope Ganganelli, the work of Canova when twenty-five years old (which has been so graphically described by Milizia in his letters), and a cenotaph by the same illustrious artist, to the memory of his father, the engraver Volpato. In the adjoining cloisters is the tomb of Cardinal Bessarion. 7. S. Marcello contains a sepulchral monument of Cardinal Consalvi. 8. S. Maria in Vialata, &c.

West of the Corso, and between it and the Tiber, is a dense mass of irregular streets, a busy part of the town, containing market-places, shops, and inferior dwellings, where here and there a fine building. Towards the centre of the district is the fine oval place called Piazza Navona (the antient Circus Agonalis), one of the largest in Rome, with fountains, by Bernini, its three churches, and the marble palace Braschi at one extremity of it. The university of La Sapienza is in the neighbourhood. Between it and the Corso is the Rotunda [PANTHEON], next to which is the Palazzo Giustiniani, and on the other side of it is the church and Dominican convent of La Minerva. Near the river are: 1. the Palazzo della Cancelleria, by Bramante. 2. The Palazzo Farnese, the best-built in Rome, with a square before it, ornamented by two handsome fountains; some of the apartments are painted by Caracci, Zuccaro, Vasari, and others. Next to the Piazza Farnese is another square, called Campo di Fiore. 3. The Palazzo Spada, with a collection of antient sculptures, among others a supposed statue of Pompey, and some very fine bas-reliefs, found at Santa Agnese without the walls. 4. The handsome church of Santa Maria in Vallicella, belonging to the brothers of S. Filippo Neri, or Congregation of the Oratory [NERI, FILIPPO; ORATORIO], a most gentlemanly, assuming, and useful body of clergymen. The library contains many valuable MSS., historical and ecclesiastical. 5. The church Santa Maria dell'Anima has some good paintings, and the monuments of Pope Adrian VI. and of Lucas Holstenius, a Protestant converted to Catholicism, who was librarian of the Vatican. Holstenius was succeeded in office by Allatius, a native of Chios, and Allatius was succeeded by J. Simonius Assemani, a Maronite. The heterogeneous succession of librarians gave occasion to the following distich, in the caustic humour of modern Rome:

\* Præfuit hæreticus; post hunc schismaticus; at nunc Turca præest: Petri bibliotheca, vale.

Near the left bank of the Tiber, and parallel to it, runs a handsome regular street, called Strada Giulia, about three-quarters of a mile long, from Ponte Sisto to Ponte S. Angelo. This district, though well built, is dull, when compared with the Corso and the adjoining streets.

South of Ponte Sisto, along the left bank of the Tiber, and extending round the western base of the Capitol, to the foot of the Palatine, is the lowest, meanest, and dirtiest part of modern Rome. It is partly occupied by the Jews, who are cooped up to the number of 4000, in several narrow filthy alleys, in rows of tall old houses, near the river side, between Ponte Sisto and Ponte S. Bartolomeo. They are not allowed to live outside of their district, called Ghetto, which is separated by a wall from the rest of the city. They are not otherwise molested. They have their Rabbis and a synagogue, a sort of municipal council, their schools, support their own poor, and follow their customary custom of buying and selling. The lower sort are seen in the streets of Rome, with their dingy bags, crying 'vecchi,' old clothes. Some of the higher class carry on trade with foreign countries, and are regular merchants. It has been observed that this district, low and dirty as it is, is remarkably healthy. Facing the Ghetto is the island of S. Bartolomeo, with the church of that name, and an hospital kept by the philanthropic congregation commonly called the Ben Fratelli, from their motto, 'Fate bene, Fratelli' ('brethren, do good' to your fellow-men), which was founded in Spain, about 1538, by S. Juan de Dios: the brethren have voted themselves to attend on and nurse gratuitously the

poor. Proceeding farther south, along the left bank of the river, is a succession of narrow streets, extending to the foot of the Palatine, with some of the most antient churches in Rome, especially Santa Maria in Cosmedin, built in the third century of our æra, it is said, on the ruins of a temple, or rather sacellum, dedicated to Pudicitia Plebeia by Virginia, daughter of the patrician Aulus, who, having married the plebeian consul Volumnius, was excluded from the sacellum of Pudicitia Patricia. The conduct of Virginia on this occasion, as represented by Livy (x. 23), is full of interest. The church of Santa Maria in Cosmedin is adorned with two rows of fine antient columns. It is also called Bocca della Verità, from a large stone mask with a large mouth which is seen in the portico of the church, and the use of which is unknown. In the same neighbourhood are the churches of S. Giorgio in Velabro, Santa Anastasia, Santa Maria Egiziaca, and of S. Teodoro, said to be on the site of the temple of Romulus, on the Palatine, at the southern extremity of the inhabited part of modern Rome, on the left bank of the Tiber. Beyond it, the Aventine, Palatine, and Cælian hills stretch to the south and south-east. They are occupied with fields and gardens, and contain several churches, convents, and scattered ruins. The most remarkable churches are: Santa Sabina and S. Alessio, on the Aventine, and S. Bonaventura and its adjoining solitary convent and garden, on the Palatine. The Cælian, an extensive hill, has some interesting churches: 1. S. Gregorio, a fine building on the west slope of the hill, has splendid frescoes by Domenichino and Guido, representing the martyrdom of St. Andrew; a painting of Pope St. Gregory by Annibale Caracci; and a statue of the same pope. Imperia, a kind of modern Aspasia, rich, accomplished, and well informed, who lived in the age of Leo X., and was the friend of Beroaldo, Sadoleto, Campani, and other learned men of that period, was buried in this church, where her epitaph was still seen in the last century, but has been since removed, in consequence of repairs. 2. S. Stefano Rotondo is an antient circular building, transformed into a church in the fifth century, and is remarkable as exhibiting the various changes in the history of the arts through the dark ages. 3. S. Giovanni e Paolo, belonging to the Order of Barnabites, in a fine situation, commanding a view of the Palatine and Aventine, is much resorted to by persons religiously inclined, who retire thither for a time, and board in the convent, where they employ themselves in pious exercises, and in quiet meditation, which the solitude of the spot and the view of the majestic ruins before them are well calculated to assist. A solitary palm-tree rises in the garden of the convent; there is another in the garden of S. Bonaventura, on the Palatine. No one has better described the scenery of this part of Rome and the impression which it produces, than Madame de Staël, in her 'Corinne.' The Villa Mattei occupies a considerable space on the Cælian hill. The group of buildings connected with the Basilica of S. Giovanni, at the eastern end of the Cælian, is described under LATERAN. The Colosseum, triumphal arches, and other antient remains are noticed hereafter. Between the Lateran and the Colosseum is the remarkable antient church of S. Clemente.

South of the Aventine, and between it, the Tiber, and the walls, is a large space of low ground laid out in fields, part of which are common, and go by the name of 'Prati del Popolo Romano.' An artificial hill, called Mount Testaccio, rises on one side of them: it is formed of a quantity of broken earthenware (testæ) and other rubbish which has been thrown and has accumulated here from antient times, and over which a green turf has formed. The modern Romans have excavated cellars in the side of the hill, where they keep their wine cool, and the place is resorted to on holidays by the people of Rome, especially the lower orders, something like the tea-gardens outside of London. On the other side, by the gate of S. Paolo, is the Protestant burying-ground, and near it is the pyramid of Caius Cestius.

The upper town, or eastern part of modern Rome, stretches up the slope of the Pincian and Quirinal hills, and occupies also part of the plateau which unites all the eastern hills of Rome. This part is not so densely built as the lower town: it consists in great measure of palaces and villas, of churches, convents, and other large buildings, with spacious courts and gardens, and is intersected by two fine long streets, which cross each other at right angles on the summit of the Quirinal, forming

there a small circus, with a fountain at each bifurcation, from which the place has received the name of 'Le Quattro Fontane.' We shall briefly describe this part of the town, beginning from the north.

On the terrace or plateau of the Pincian Mount there is the fine new promenade or public walk, laid out during the French occupation. Next to it is the villa Medici, now the Academy of French pensionary artists; and the church of La Trinità de' Monti, and the esplanade with the obelisk in front of it, from which there is a splendid view of modern Rome. From this esplanade a good street, called Via Sistina, leads in a south-east direction to the Piazza Barberini, which lies in the depression between the Pincian and the Quirinal. The Palazzo Barberini, one of the largest in Rome, is at the east end of the Piazza. It contains a good collection of paintings, among others, the celebrated portrait of La Cenci painted by Guido, who had seen her on the scaffold at her execution. The library of the Barberini palace has about 50,000 printed volumes, and many valuable MSS., autograph letters, and other documents. [BARBERINI.] At the north end of the Piazza Barberini is the church and convent of the Capuchins, with its garden, which is kept in excellent condition, like all the gardens of the convents of that order; and adjoining them is the vast and splendid patrician villa Piombino, called also Ludovisi, from Cardinal Luigi Ludovisi, nephew of Gregory XIV. It has beautiful walks, and in the apartments of the principal casino is a valuable collection of antient sculptures, and also the fresco of Aurora by Guercino.

South of the Piazza Barberini rises the Quirinal Mount, which bears on its summit the extensive pontifical palace and gardens. At Rome it is commonly called Monte Cavallo, from the two colossal statues of Castor and Pollux, with their horses, which stand in the square before the palace. On the east side of the square is the Palazzo della Consulta, and next to it the Palazzo Rospigliosi, which occupies an extensive area. In a detached gallery or summer-house of the latter is the celebrated Aurora of Guido, which is considered the masterpiece of that great painter. A fine street, about a mile in length, leads from the square of the pontifical palace along the plateau of the Quirinal to Porta Pia, passing near the Thermæ of Diocletian. It is crossed at the Quattro Fontane by another street, leading from the Piazza Barberini to Santa Maria Maggiore, from whence several streets lead to Porta Maggiore, Porta S. Lorenzo, and Porta S. Giovanni. The magnificent church of Santa Maria Maggiore on the Esquiline hill, which here joins the Quirinal, is the eastern extremity of modern Rome. Beyond it, north, east, and south, the whole expanse of the Esquiline is occupied by gardens, villas, and fields, with some solitary churches. The more interesting of these churches are: 1. S. Pietro in Vincoli, built first by Eudoxia, wife of Valentinian III., and rebuilt by Pope Adrian I.: it contains the mausoleum of Julius II., with the statue of Moses by Michel Angelo. 2nd, The handsome church of S. Martino ai Monti, with its antient oratory and vaults, its modern embellishments, and the frescoes by Poussin, is worthy of notice.

Between the west slope of the Esquiline and the south slope of the Quirinal are several streets inhabited chiefly by the lower orders, which extend to the Campo Vaccino. Farther north, at the foot of the Quirinal, and in the gap between it and the Capitoline Mount, is the piazza which contains Trajan's column.

The Capitoline Mount and its buildings are described under CAPITOL.

The third great division of modern Rome, which lies on the right bank of the Tiber, consists of two distinct parts: Il Borgo, or Vatican, and Transtevere, properly so called, which are divided from one another by an inner wall. The Borgo, or Città Leonina, extends from the bridge of St. Angelo to the Place of St. Peter's. The group of buildings constituting St. Peter's and the Vatican palace are described under VATICAN. The other remarkable building in the Borgo is the great charitable establishment of Santo Spirito, the largest in Rome, situated close to the right bank of the Tiber. It comprises an hospital for the sick, which in the summer months contains from 1000 to 1200 patients at a time, a foundling hospital, and a lunatic asylum.

The castle Sant' Angelo (of which the massive circular tower was built by Hadrian for his mausoleum, and the fortifications around it, consisting of ramparts, ditches, and bastions mounted with cannon, were begun by Pope Boni-

face IX. and continued by successive popes) is the citadel of Rome, but it is not capable of a regular defence. It serves as a state prison and also as a house of correction.

The district called Transtevere lies south of the Borgo and between the Janiculus and the Tiber, and communicates with the Borgo by the handsome gate of S. Spirito. The Janiculus is a long straight ridge about a mile and a half long from north to south, and it rises nearly 300 feet above the level of the river. In the northern half of its length it rises almost immediately from the bank of Tiber, leaving however sufficient level ground for a street, which from its length is called La Lungara. This street contains some fine buildings, the Palazzo Salviati, the Palazzo Corsini, one of the handsomest in Rome, once the residence of Christina of Sweden, with a gallery of paintings, a library, and delightful gardens which extend up the slope of the Janiculus, and from which there is a splendid view of Rome; and lastly, La Farnesina, a house and gardens built by the wealthy banker Ghigi in the time of Leo X., with some fine frescoes by Raphael. On the slope of the Janiculus is the Villa Lante, the casino of which was painted by Giulio Romano. The church and convent of S. Onofrio, likewise on the Janiculus, above La Lungara, is worthy of notice, as having been the last asylum of Tasso, where he died and was buried. Another Italian poet, Guidi, is also buried at S. Onofrio.

Towards the southern end of the Lungara the hill recedes farther from the banks of the river, which here makes a bend to the east, and it is within this bend that the great bulk of the district called Transtevere is situated. Some of the streets run up the Janiculus to the gate of S. Pancrazio, but the higher part of the hill is chiefly unbuilt, though it is enclosed within the walls. The villa Spada is in this part, near the gate, outside of which is the villa Pamfili, a favourite promenade of the youth of Rome, with shady walks, waterworks, and clusters of lofty umbrella pines. Among the most remarkable buildings of Transtevere is the church of S. Pietro in Montorio, which contains some fine paintings, and in the cloisters an elegant circular temple by Bramante. Above S. Pietro in Montorio, in a commanding situation, is the fountain of L'Acqua Paola, the largest in Rome, which appears at a distance like a triple triumphal arch with streams of water rushing through: it was constructed by Paul V. with the marble taken from a temple of Minerva. Lower down, at the foot of the hill, is the collegiate church of Santa Maria in Transtevere, a vast and handsome structure, with granite and porphyry columns, rich marbles, some good paintings, and an old mosaic of the twelfth century. Near to it is the fine Benedictine convent of S. Calisto, in the library of which is a splendid Latin Bible of the ninth century, which is supposed to have belonged to Charlemagne, but from the illuminations it appears more probable that it was written for his grandson Charles the Bald. A long street leads from S. Calisto to the church and convent of S. Francesco a Ripa, once inhabited by St. Francis of Assisi. The church is ornamented with paintings, sculptures, and rich marbles, and has a chapel with vaults belonging to the Pallavicini family. Not far from S. Francesco is the large building of S. Michele a Ripa, near the Tiber, facing the Aventine hill, which rises on the opposite bank. S. Michele is one of the most useful and best conducted charitable establishments of Rome, and is inhabited by above seven hundred persons. It consists of a work-house or house of industry for poor boys and girls, of a school of the fine arts for those boys who have a taste for them, of an asylum for the old and infirm of both sexes, and of a house of correction for juvenile offenders. Tournon, Valéry, and other recent writers agree in praising the arrangement, and regulation of this important establishment. Along one side of this vast building is the handsome quay and landing-place of Ripa Grande, where the vessels which ascend the Tiber from the sea land their goods, and annexed to which are warehouses. Below it is the Porta Portese, or gate leading to Fiumicino, which is the southern extremity of Rome on the right bank of the Tiber.

There are above three hundred churches in Rome, most of which are worthy of notice, either for their architecture or for their paintings and other ornaments. We have mentioned a few of the most interesting, and we refer to Vasi, Fea, and the other guide-books for further information. The churches constitute one of the principal attractions of modern Rome.

The palaces of the nobility form another class of interesting objects. It has been said sneeringly, that every house at Rome that has a 'porte cochère,' or carriage-gate, is called a palace: this may seem very witty, but it is nevertheless true that Rome contains many real palaces, building princely magnitude and imposing style, containing courts and long ranges of spacious apartments, and to boast of a greater number of these than any other capital in the world. In point however of interior comfort, neatness and splendour, most of them are sadly deficient. The walls of Travertino or Tiburtine stone, the pillars and staircases are frequently of marble and other costly materials; but the furniture is old, clumsy, and scanty; the floor of the apartment is often of unvarnished brick, and the curtains and tapestry are dingy, and a general want of cleanliness is frequently observable. The men-servants are often numerous in the hall, but they are dirty, lazy, and ill-paid. Partly through the long suites of vast and lofty apartments, you see here and there marble tables, fine paintings, and gilt chairs, but nothing resembling the Parisian salons, boudoir, or the English drawing-room. The ground is either let as shops or used for coach-houses, stables, kitchens or other menial offices, and the windows are glassed with a strong iron grating, without glass behind it, which gives to the lower part of the building the appearance of a prison. Several of the Roman palaces are partly occupied by lodgers, and the owners occupy only one floor or part of a floor; the building being too large for any single family to live in, except such as a baronial family of the feudal times with its numerous dependants. The higher and wealthier Roman nobles however, the Borghese, Colonna, Doria, Rospigliosi, and others, still retain something of that feudal state, although they have lost their feudal jurisdiction.

The villas of the Roman nobility are more pleasant than their palaces. 'The modern villas, those splendid residences of the modern Romans, are like a connecting link between them and their proud predecessors of the classical times. The modern Roman palace differs greatly from the ancient Roman house, but the villa resembles much what we see of the country-houses of the wealthy Romans of old. There is in both the same taste of magnificent retirement. The mansions of these villas have generally their front towards Rome, whose splendid horizon harmonises with the position; their architecture, and with the display of rich marble, statues, pillars, and vases and fountains with which they are decorated. The gardens are mostly regularly laid out, though not monotonous; they are not made, like the English parks, for the effect of scenery within, but to afford quiet walks from which to enjoy the splendid scenery without. Even in its solitary and often-neglected state, the Roman villa retains its ancient classical character, and its melancholy appearance seems to add to its grandeur.' (Valéry, *Voyages en Italie* xv. 1.) Several of the villas are within the walls of Rome, such as Medici, Piombino, Mattei, Corsini, and others which have been mentioned; others are outside of the walls, such as the Villa Pamfili, on the Janiculus; Villa Patrizi, outside Porta Pia; and the Villa Madama, upon Monte Mario, called from Margaret of Austria, a natural daughter of Charles V., who was married to Ottavio Farnese, duke of Parma. This house was designed by Raphael, and executed by Giulio Romano, who painted the loggia as a hall. The Villa Albani, though shamefully plundered by the French republicans in 1798, on the plea that its then possessor was, naturally enough, their political enemy, has still retained or recovered so much of its inexhaustible treasures as to be reckoned a third museum of antiquities in Rome, and next to the Vatican and the Capitol. In the time of its full splendour it was Winckelman's great study, which he illustrated in his 'Storia dell'Arte' and his 'Monumenti Inediti.' The great boast of the Albani museum is that its collection is of a choice, while most other collections contain a great deal of rubbish. Cardinal Alessandro Albani, who created this museum, and its still nobler museum towards the middle of the last century, made it the business of his life; he was a man of taste and an enthusiast for antiquity and the fine arts. Among the finest sculptures are, the rilievo of Antinous, the Thetis found in the villa of Antoninus Pius at Lanuvium, the Minerva, the Jupiter, the Apollo Sauroctonus, Diogenes in his tub, the two Caryatides representing Greek basket-bearers, the bassi-relievi of the triumph of M. Aurelius, and others.

The Villa Borghese, on the Pincian Mount, outside the walls, is well known for its sculptures, which are laid out

in the English style, its laurel and myrtle groves, its fine sheet of water, its temple, and hippodrome. The fine museum of antient sculptures was sold or given up for a consideration by the late prince to Napoleon, his brother-in-law; but it has been partly replaced by new acquisitions. Of all the enormous quantity of works of art carried away by the French from Rome, only a small part has been restored; much was purloined by private individuals and sold, much was irreparably damaged in the removal. The Borghese collection has remained in the Louvre, being a purchase; and a splendid collection of coins and gems, taken from Rome, was entirely exempted from the claim of restitution by the treaty of Paris.

The numerous handsome fountains form another peculiar ornament of modern Rome as works of art, independent of their utility. Rome is better supplied with good water than most continental towns, and was much more abundantly supplied in antient times. Of the antient aqueducts, three still continue to carry water into the town, having been repaired by the popes. The first is that of the *Acqua Vergine*, the best in quality, which comes from near the antient *Collatia*, fourteen miles north of Rome: it supplies a great part of the lower town, and feeds thirteen public fountains, of which those of *Trevi*, of *La Barcaccia* in *Piazza di Spagna*, of *Piazza Navona*, and *Farnese*, are the principal. The second is the *Acqua Felice*, the antient *Aqua Marcia* and *Claudia*, restored by Pope Sixtus V. (*Felice da Montalto*): it comes from the east, and supplies the upper or eastern part of the town, and feeds twenty-seven public fountains, of which that of *Moses*, near *Porta Pia*, that of *Triton* in the *Piazza Barberini*, and that of *Monte Cavallo*, are the principal. The third aqueduct, called *Acqua Paola*, the antient *Alsiatina*, enters Rome by *Mount Janiculus*, and supplies both *Transtevere* and the *Vatican*, feeding the *Fontana Paolina*, and the splendid fountains before *St. Peter's*: passing the *Ponte Sisto* by conduits, it supplies the adjoining fountain and the neighbouring district of *Strada Giulia*. *Tournon* observes that the supply of water thus carried into Rome is much greater than that carried by the *Canal de l'Ourcq* into *Paris* for the supply of a population six times as large as that of Rome.

The obelisks which adorn most of the squares of Rome are another peculiar feature of this city. An account of them is given under **OBELISK**.

The streets of Rome are generally narrow, like those of most old cities, but many of them are straight and regular, and the great number of open spaces, such as squares, places, gardens, large courts, &c., render the town generally airy. The pavement of the streets is made of *selci*, or small cubes of basaltic stone, not very agreeable to pedestrians, especially as there are no footpaths except along the *Corso*. The streets are lighted at night with oil lamps. Rome possesses a great advantage over many continental towns, in being provided with a regular system of sewers, partly antient and partly modern. [**CLOACÆ.**]

The lower town is subject to occasional inundations from the *Tiber*, which sometimes rises, in seasons of extraordinary rains, from 25 to 30 feet above its ordinary level, whilst a considerable part of the town is hardly 20 feet above the level. In 1530 the river rose above 40 feet, and the destruction which it caused is described by *Baldi*, in his poem '*La Nautica*.'

The climate of the city of Rome has been of late years the subject of much discussion. In the time of the republic Rome was considered healthy when compared with the surrounding country. Parts of *Latium* were unhealthy in *Cicero's* time, and probably long before him; and the unhealthiness was greatly increased by the depopulation of the country, the consequence first of the wars between Rome and its immediate neighbours, and afterwards of the civil wars in the last century of the republic. Tillage cultivation was abandoned, and the country became divided among a few large proprietors, who turned fields into pasture-grounds. '*Propter avaritiam ex segetibus fecit prata*,' says *Varro*, speaking of one of these proprietors; and *Pliny* observes that '*Latifundia perdidere Italiam*.' Now it is proved that tillage cultivation and a dense population check the increase and spread of the malaria. The dense population of antient Rome and the elevated position of the old city, with the plentiful supply of wholesome water, the convenience of sewers, and other circumstances contributed to maintain a tolerable state of salubrity within the walls.

*Cicero* remarks the good choice of those who built Rome in the most favourable spot in the midst of a generally unhealthy region. (*De Republ.*, ii. 6.) *Horace* however (*Epist.* i. 7) complains of the fevers which prevailed in the month of August. The improvements made by *Augustus*, and the reconstruction of the town after the great fire in *Nero's* time, seem to have had a good effect on the salubrity of the city, and *Frontinus* (i. 18) observes that the increased supply of water by means of additional aqueducts had contributed to render the atmosphere purer than it was in the old times. After the fall of the Empire, and the ravages committed by the barbarians, we read of the complete desolation of the *Campagna* during the dark ages, and of the abandonment of *Porto*, *Ostia*, *Ardea*, and other neighbouring towns in consequence of the malaria. At the same time a gradual removal was taking place within the walls; the population, which was much diminished, was leaving the southern part of the city for the northern, the hills for the plain of the *Campus Martius*.

As the southern hills, the *Cælian*, *Aventine*, *Palatine*, and *Esquiline*, became abandoned, they became also unhealthy, for populousness and salubrity go together in the whole *Maremma* region. In the eleventh century *Petrus Damianus* (*Epist.*, xix., '*Ad Nicolaum II., Pontificem*'), draws a fearful picture of the epidemic fevers to which Rome was subject. But still the unhealthiness of the old city was, and is, much less in degree than that of the country without the walls, and especially of the lowlands towards the sea-coast. There are families and whole religious communities that live all the year round on the desolate hills of old Rome without any remarkable inconvenience, though no one would venture to spend the summer months, at least from choice, outside of the walls between Rome and the sea. The miasmata which produce the malaria, emanate from the volcanic soil of the *Campagna* acted upon by the rays of a burning sun; they seem to be of a dense heavy nature, seldom rising very high above the ground, unless wafted by the winds. Walls appear to stop their advance, fire dispels them, house foundations and pavements prevent their emanation. For an investigation of this curious subject see *Brocchi*, '*Stato fisico del Suolo di Roma*;' *Tournon*, '*Etudes Statistiques sur Rome*,' and an article on *Tournon's* book, in the '*Foreign Quarterly Review*,' xxi., January, 1833, and the article **CAMPAGNA DI ROMA** in this work.

It seems now proved that whenever the population has decreased within Rome, from political and other causes, the air has become less wholesome, and that the thinly inhabited districts are, independently of their situation, unwholesome in summer, when compared with the more populous parts of the town. Thus the neighbourhood of the *Corso* and the lower town in general, and even the low filthy quarter of the *Jews*, are salubrious, whilst the eastern part of the fine street of *Porta Pia*, the neighbourhood of *Santa Maria Maggiore*, and that of the *Lateran* are considered unhealthy in summer, although they are on comparatively high ground. The parts of the *Quirinal* and the *Pincian* which are built upon are the most desirable situations in modern Rome for fresh air and health. On the other side of the river, the thinly-built district of *La Lungara* and the *Vatican* are considered unhealthy in summer, whilst the densely peopled part of *Transtevere* is less complained of.

It has been stated by some writers, but not upon sufficient grounds, that the malaria is encroaching upon the inhabited part of Rome, so as to threaten in course of time the depopulation of the whole city. *Châteauvieux*, who, we believe, was the first to start this theory, mistook the effect for the cause. He visited Rome at two different periods; first in 1791, when 'the city contained 166,000 inhabitants, the streets were thronged with sumptuous equipages and liveries, and the splendid palaces were open to the gaze of strangers—everything in short had an appearance of opulence and splendour.' But a few years afterwards came the French invasion of 1798, with its wholesale spolations, forced contributions, and oppression of every sort, which no one has more honestly condemned and deplored than *Count Tournon*, after which the *Papal State* was reduced to one half, and the poorer half, of its territory. After a few years more of a precarious existence, the *Papal Government* was again upset by *Napoleon* in 1809, and the cardinal prelates, the foreign ministers, and a number of noblemen and other persons were driven away from Rome; numerous families were deprived of their accustomed means of support,

and the whole social system was violently overturned. The population then dwindled apace, and in 1810 it was 123,000, of which no less than 30,000 were on the poor-lists made out by the rectors of the respective parishes. (Tournon, vol. ii., p. 136.) It was under these circumstances that Châteauevieux visited Rome a second time in 1813. 'I entered the city by the same road as before (by the Corso), but instead of equipages, I saw it filled with droves of cattle, goats, and half-wild horses, driven along by a number of Tartar-looking herdsmen armed with long spears and covered with dark capotes. The population is now reduced to 100,000, and of this number one-tenth part are vine-dressers, herdsmen, or gardeners. The city presents everywhere the appearance of ruin. As there are more houses than inhabitants (he means families), the houses are not repaired; when they get out of order, the occupiers remove to others. A multitude of convents have assumed the appearance of ruins; a number of palaces, no longer inhabited, are left without even a porter to take care of them.' (*Lettres écrites d'Italie.*) And yet, though he had the recent history of the country before his eyes, Châteauevieux attributed this depopulation and decay to the advance of the malaria. The fact is, that wherever the population gets thin and miserable, the malaria will gain ground; it will take possession of houses and gardens from which the warmth of the blazing hearth, and the cheering breath of human life, and the cares of domestic industry have disappeared. (See on this subject an article 'On modern Books of Travels in Italy,' in No. VIII. of the 'Quarterly Journal of Education.') The population of Rome has rapidly increased since the peace of 1814; by the census of Easter, 1838, it amounted to 148,903 inhabitants, exclusive of 4500 Jews. (Serristori, *Statistica d'Italia.*) An account of its distribution, social occupations, habits, and other moral features comes under another head of this article.

The temperature of Rome is generally mild and genial; frosts occur in January; but the thermometer seldom descends lower than 26° of Fahrenheit, and the midday sun generally produces a thaw. The tramontana, or north wind, sometimes however blows cold and piercing for days together. Snow falls at times, but it seldom remains on the ground for more than a day. Orange-trees thrive in the open air, but lemon-trees require covering during the winter months. Rains are frequent and heavy in November and December, but fogs are rare. In the summer months the heat is at times oppressive, especially when the scirocco, or south wind, blows. The hour which follows sunset is considered the most unwholesome in summer, and people avoid exposure to the open air.

The sky of Rome has been admired by most travellers for its soft transparent light, its ultramarine blue tinge, and the splendid colours of the sunset, which Claude has so well rendered. The general scenery of the country, the purple hue of the mountains, and the long waving lines of the plain of the Campagna, are noticed under ALBA LONGA. Within the walls of Rome there are many fine points of view. From the tower of the Senatorial Palace on the Capitol, there is a good panorama of Rome, embracing both the old and new towns; from the terrace of La Trinità de' Monti is a fine western view of modern Rome; there is another view from the Janiculus, in an opposite or eastern direction; and lastly, from the gallery above St. Peter's dome is a splendid and extensive panorama, embracing the whole town, the Campagna, the distant mountains, and the long line of the blue sea.

For the better understanding of the topography of Rome, the large map of Nolli, the atlas which accompanies Bunsen's 'Beschreibung der Stadt Rom,' or the small map by the Society for the Diffusion of Useful Knowledge, may be consulted. The map in Brocchi's work above mentioned gives a good idea of the surface of the ground.

TABLE OF SOME OF THE MORE REMARKABLE MODERN BUILDINGS IN ROME.

[The dates are to be considered only as approximations to the time when the respective structures were either commenced or in progress.]

Date	Building.	Architect.
1378	Santa Maria sopra la Minerva, the only Gothic church in Rome . . . . .	
1400	Santa Maria dell' Anima . . . . .	
	Castel N. Angelo, restored . . . . .	
1431	Church of Spirito Santo . . . . .	

Date.	Building.	Architect.
1440	S. Stefano Rotondo restored	
1450	S. Francesco . . . . .	L. B. Alberti.
1460	Palazzo di Venezia . . . . .	Giul. di Majano.
	Santa Maria del Popolo . . . . .	Baccio Pintelli.
	S. Pietro in Montorio . . . . .	
	S. Pietro Rotonda in do. . . . .	Bramante.
	Hospital S. Spirito . . . . .	
	Cloister SS. Apostoli . . . . .	
1468	S. Marco . . . . .	Giul. di Majano.
1494	Cancelleria . . . . .	Bramante.
	Cloister Santa Maria della Pace . . . . .	Bramante.
1500	S. Pietro in Vincoli restored	
1505	Palazzo Sora . . . . .	Bramante.
1506	St. Peter's begun . . . . .	Bramante.
	Palazzo Giraud . . . . .	Bramante.
	Palazzo Chigi . . . . .	Bald. Peruzzi.
	Palazzo Palma . . . . .	Ant. Sangallo.
	Santa Maria di Loreto . . . . .	Ant. Sangallo.
	Farnesina . . . . .	Bald. Peruzzi.
1513	Palazzo Caffarelli . . . . .	Raphael.
	Palazzo Linotti . . . . .	Bald. Peruzzi.
	Villa Madama . . . . .	Giul. Romano.
	Palazzo Strozzi . . . . .	
1526	Palazzo Massimi begun . . . . .	Bald. Peruzzi.
	Palazzo Cicciporci . . . . .	Giul. Romano.
	Palazzo Cenci . . . . .	Giul. Romano.
	Palazzo Lanti . . . . .	Giul. Romano.
	Madonna dell' Orto . . . . .	Giul. Romano.
	Palazzo Serlupi . . . . .	Giac. della Porta.
	Palazzo Niccolini . . . . .	Ditto.
	S. Spirito, façade . . . . .	Mascherino.
	Palazzo Farnese . . . . .	{ Ant. Sangallo. M. A. Buonarroti.
1550	Villa Giulia begun . . . . .	{ Vasari. Vignola.
1556	Palazzo Ruspoli . . . . .	Ammanati.
	Il Campidoglio . . . . .	M. A. Buonarroti.
1560	Palazzo Lancellotti . . . . .	Pirro Ligorio.
	Palazzo Nari . . . . .	Vignola.
1564	Palazzo Spada . . . . .	Mazzoni.
	Palazzo Negroni . . . . .	Ammanati.
	Palazzo Mattei . . . . .	Ammanati.
	Santa Caterina de' Funari . . . . .	Giac. della Porta.
	Collegio Romano . . . . .	B. Ammanati.
1576	Collegio della Sapienza . . . . .	Giac. della Porta.
	Villa Pia . . . . .	P. Ligorio.
1580	Villa Negroni . . . . .	Dom. Fontana.
	Capella Sestina, in Santa Maria Maggiore . . . . .	Dom. Fontana.
	Palazzo Altemps . . . . .	M. Lunghi.
	Palazzo Giustiniani . . . . .	Giov. Fontana.
1586	Obelisk in front of St. Peter's erected by . . . . .	Dom. Fontana.
1595	S. Andrea della Valle . . . . .	Olivieri.
1595	San Michele in Sassia . . . . .	
1602	SS. Apostoli rebuilt . . . . .	Rainaldi.
1603	Collegio Mattei . . . . .	
	Palazzo Rospigliosi . . . . .	
	Villa Borghese . . . . .	Bernini.
	Palazzo Sciarra . . . . .	Ponzio.
1608	Capella Borghese (Sta. Maria Maggiore) . . . . .	Ponzio.
1612	Aqua Paolina . . . . .	
1614	St. Peter's façade completed.	C. Maderno.
	Palazzo Verospi . . . . .	Onorio Lunghi.
	Palazzo Propag. Fide . . . . .	Dom. Fontana.
1618	Palazzo Altieri . . . . .	Rossi.
	Villa Ludovisi . . . . .	Bernini.
	San Carlo . . . . .	Onor. Lunghi.
	Collegio Nazareno . . . . .	
	S. Andrea del Noviziato . . . . .	Bernini.
	S. Francesco di Paola . . . . .	
1640	Palazzo Barberini . . . . .	{ Maderno. Bernini. Borromini.
	Palazzo Mattei . . . . .	Borromini.
1642	Palazzo Madama (di Governo) . . . . .	Maruscelli.
	Palazzo Pamfili . . . . .	G. Rainaldi.
	Santa Agnese . . . . .	G. Rainaldi.
	Curia Innocenziana . . . . .	tana.

Date.	Building.	Architect.
1650	Santa Maria, Via Lata . . .	P. da Cortona.
	Palazzo Doria . . . . .	
1667	Colonnades of Piazza San Pietro finished . . . . .	Bernini.
1668	Palazzo Altieri . . . . .	Rossi.
	Palazzo Odelscalchi . . . . .	Bernini.
1725	S. Giov. de' Fiorentini . . . . .	A. Galilei.
1729	Capella Corsini . . . . .	A. Galilei.
	Palazzo Corsini . . . . .	Fuga.
1730	Pal. Consulta (now barracks) Teatro Argentina . . . . .	Fuga. Marq. Teodoli.
1734	Lateran Church, façade . . . . .	A. Galilei.
	Fontana Trevi . . . . .	N. Salvi.
	Palazzo Corsini restored . . . . .	Fuga.
1741	Santa Maria Maggiore, façade . . . . .	Fuga.
1743	Hospital S. Spirito enlarged. Villa Albani . . . . .	Fuga.
	Palazzo Petronj . . . . .	Fuga.
1740	Convent S. Agostino . . . . .	Vanvitelli.
1775	New Sacristy St. Peter's begun . . . . .	Carlo Marchionni.
	Palazzo Braschi . . . . .	
1780	Museo Pio Clementino . . . . .	M. A. Simonetti.
1801	Excavations of the Forum commenced . . . . .	
1805	Arch of Constantine excavated . . . . .	
1812	Temple of Venus and Roma excavated . . . . .	
1813	The Pillar of Phocas discovered . . . . .	
1823	Basilica San Paolo fuor delle Mura burnt, restored by . . . . .	Belli.
1825	New Buildings of the Piazza del Popolo . . . . .	Gius. Valadier.
1856	S. Andrea delle Fratte, façade . . . . .	
	Palazzo Ceccopiero . . . . .	Luigi Poletti.
1838	Post-office, Piazza Colonna . . . . .	
	Museo Gregoriano, Vatican, opened . . . . .	

THE PRINCIPAL ANTIENT ROMAN BUILDINGS OF WHICH THERE ARE REMAINS.

*Baths.*

*Baths of Titus*, hastily constructed near the Flavian Amphitheatre, about A.D. 80, on the site of the gardens of the golden house of Nero. The ruins stand now in a vineyard called in Nolli's map Sinibaldi, on a spot circumscribed by the modern street of the Polveriera and the street of the Colosseum; they occupied a space of about 400 feet by 600. The baths of Titus were however absorbed in those of Trajan.

*Baths of Trajan*, partly on the same site, and adjoining those of Titus, were commenced by Domitian and finished by Trajan; they were more extensive than those of Titus, and extended towards the church of S. Pietro in Vincoli, which they almost touched. They appear, from an inscription, to have been embellished by Julius Felix Campanianus, præfect of Rome. These are the baths of which Vasari mentions the circumstance, in the Life of Giovanni da Udine, of excavations being made near S. Pietro, and the discovery of the pictures and stuccoes, which so much pleased both Giovanni and Raphael that they imitated them in the arabesques of the Vatican. Palladio made a plan of these baths. The plan of the baths of Trajan resembles very much those of Diocletian: it occupies an area of about 1100 feet by 800.

One of the great hemicycles near the northern angle still remains. On the shorter sides, near the eastern and southern angles, are the remains of two hemicycles with niches for statues. The long side opposite the Colosseum contains in the centre the remains of a great semicircular theatre.

There are few, and those few are unintelligible, remains of the internal part of the building. Part of the golden house of Nero remains under the baths of Trajan. In the passages and chambers of this house there are still some elegant arabesque decorations, the colours of which in many parts are still very vivid.

*Baths of Constantine*, were, according to Victor, in the fourth region, or in that of the Quirinal. The remains, which

were extensive, appear to have stood on the boundary of the Quirinal, on the ground now occupied by the palaces of the Consulta and Rospigliosi. Buffalini, in his map (1551), places them near the church of S. Silvestro, on the Monte Cavallo. Some slight traces of these baths still exist in the Villa Aldobrandini. They were erected probably about A.D. 326, and were repaired in the middle of the fifth century by Petronius Perpenna and Magnus Quadratianus. In 1519 some of the ruins were still in existence, but they disappeared about 1527.

Palladio restored the plan, and in the reign of Clement XII. an excavation was made on their site, when a magnificent portico, with an ornamented ceiling, and walls painted with historical subjects, were discovered.

*Baths of Diocletian*, situated on the Viminal, and erected by Diocletian about A.D. 302. They were of vast dimensions. The extensive and capacious ruins were adapted to the purposes of a monastery, and M. Angelo transformed the antient tepidarium, the caldarium, and a part of the frigidarium into a church with its dependencies. The church is called Santa Maria degli Angeli. The rest of the ruins consist of large brick masses with arches of enormous span; some of these masses still support parts of the vaulted ceiling. On a part of the site of the baths M. Angelo constructed a spacious and elegant cloister.

*Baths of Agrippa*, were enclosed within the space circumscribed by the square of the Rotunda or Pantheon, the street of the theatre called Valle, the street of the Stimmate, and that of Gesù. They occupied a space about 500 feet from east to west, and 700 from north to south. According to Dion Cassius, they were constructed A.U.C. 729. The temple called the Pantheon has been sometimes considered a part of these baths.

*Baths of Nero*, situated on the ground which stretches from east to west between the square of the Pantheon and the square called Madama, and from north to south between the church of S. Eustachio and the street of the Coppelle. Eusebius fixes the date of their construction, A.D. 65. They appear therefore to have been commenced in the year of the great fire of Rome in the reign of Nero, and during the consulate of Quintus or Caius Lecanius Bassus and Marcus Licinius Crassus Frugi. One hemicycle alone of these baths exists in the inn of the Piazza Rondanini.

*Baths of Alexander*. An anonymous author quoted by Mabillon states that these baths stood between the Piazza Navona, the church of S. Eustachio, and the Pantheon. They were therefore contiguous to the baths of Agrippa. The baths of Alexander were built, according to Eusebius, in the year 229, and, according to Cassiodorus, in 227. They appear to have been an extension of the baths of Nero, as those of Nero probably were an extension of those of Agrippa.

*Baths of Caracalla*. Commenced about A.D. 212, and continued by Elagabalus and Alexander Severus. They are situated on a prolongation of the Aventine, not far from the gate of S. Sebastian. They are perhaps the most extensive ruins in Rome; but being stripped of their marbles, columns, stuccoes, and paintings, they consist only of vast and lofty walls, corbels, and niches of brick and tile, and for the ordinary spectator possess in this dilapidated state little interest. [BATHS.] At the extremity of the great platform the constructions are still tolerably perfect, as well as part of the castellum in a neighbouring vineyard. The ruins stand in three separate vineyards.

*Temples.*

*Temple of Romulus*. Erected by Maxentius to the memory of his son Romulus. These ruins, which are vulgarly called the stables of the Circus of Caracalla, are situated in a large quadrilateral enclosure forming part of the villa of Maxentius on the Appian way, and about one mile from the gate of S. Sebastian. From two medals of Romulus we see this building as it appeared at two separate periods: one medal represents the building with a dome, and without a portico; the other with the addition of a portico. It may have served both for a temple and a tomb. The lower part or basement is purely sepulchral, with niches for the sepulchral urns. The ceiling is vaulted, and supported by a huge central pier.

*Temple of Bacchus*. At what time first constructed is uncertain. The tetrastyle portico of four Corinthian white

marble columns is an addition, taken from some other edifice, probably about the time of the Antonines. These columns have been walled up, and form part of the modern church to which the cella has been adapted. In the reign of Urban VIII. a circular altar with a Greek inscription was found in the subterranean part of this edifice, to the left on entering. The internal part of the cell is adorned with a stucco frieze representing military trophies; the vaulting is adorned with sunk octagonal pannels; slight traces of a bas-relief remain in the centre of the ceiling. These ornaments are in a good style.

*Temple*, called that of the *Divus Rediculus*. Built in commemoration of Hannibal's retreat from Rome, and situated in the same valley as the Nymphæum of Egeria, about a mile from Rome, and close to the little brook called Al-mone. At what time it was constructed is unknown, and the name of the temple of Redicolo is probably founded in error, as the temple of this name stood two miles from Rome on the Via Appia, and to the left on leaving the city.

It is a most beautiful construction of brick, elegantly designed, and executed with great skill. The walls of the cella externally are of yellow brick, the basement and pilasters of red, and the moulded parts are carved, and the cornice is enriched with modillions. On the southern side the pilasters are changed for octagonal columns set in a sort of niche. It appears that on this side there was a road, which was the cause of a greater richness and of variation in the design. The portico had originally four peperino columns, of which however only part of one on the ground near the temple remains. The interior was adorned with stuccoed ornaments.

*Temple of Vesta*.—One of the temples to Vesta, situated in the Forum Boarium near the banks of the Tiber. Nibby thinks that it was constructed in the time of the Antonines. It is of a pure Greek style, and may have been rebuilt by Vespasian, who probably commemorated it by striking a coin, on the reverse of which this temple is represented. Twenty Corinthian columns, of which nineteen remain, surrounded the circular cella, which was formed of masonry in the Greek taste. These columns are of Parian marble, and fluted; they are raised on a series of steps, most of which have been destroyed or removed. The ancient entablature and roof are wanting, and the latter is supplied by an ugly tile covering.

*Temple of Ceres and Proserpine*.—Rebuilt by Tiberius, and now forming part of the church of Santa Maria in Cosmedin, called also the Bocca della Verità, is situated almost opposite the circular temple of Vesta. A part of the cell constructed with large masses of travertine, and eight columns of the peristyle, remain partly walled up in the church. The fluted white marble columns are in a good style, and of the Composite order.

*Temple of Fortuna Virilis*.—Originally built by Servius Tullius on the banks of the Tiber. It was burnt and rebuilt in the time of the republic. It is of an oblong figure, constructed of travertine stone and tufa, and stuccoed with a fine and hard marble stucco. The hexastyle portico of the Ionic order has been walled up between the columns, and an engaged intercolumniation is continued on the walls of the cella. The temple is placed on a high moulded basement, and was ascended by a flight of steps. The columns support an entablature, the cornice is bold, and the frieze is decorated with festoons supported by infantine figures, and intermixed with skulls of oxen and candelabra. These are however ill preserved. The style of the architecture is heavy; still the basement is a grand feature.

*Temple of Fortune*, according to Nibby, but, in the opinion of Bunsen, the temple of the *Vespasiani*, is situated in the Forum Romanum, on the Clivus Capitolinus. On the entablature is the following inscription:—

SENATUS POPVLVSQVE ROMANVS  
INCENDIO CONSUMPTVM RESTITVIT.

The edifice now consists of a rude Ionic hexastyle portico of granite columns, two of which are returned on the flank, and so badly restored from the ruins of the former temple, that in one instance part of the shaft from the base is placed under a capital. The bases, capitals, and the entablature are of white marble. The internal part of the frieze is ornamented, but this appears to have been some of the old masonry used in the rebuilding. The portico and temple were placed on a high basement of travertine, which was covered with a veneer of marble, and in front there was a flight of steps

*Temple of Jupiter Tonans*, according to Nibby; Bunsen calls it the *Temple of Saturn*. It is situated on the Clivus Capitolinus. It was built by Augustus, and is supposed to have been restored by Sept. Severus and Caracalla. A fragment of an inscription on the entablature over the columns of the angle, is read . . . ESTITVIT. The portico was hexastyle, of the Corinthian order, and of white marble. The columns are deeply fluted. In order to gain space, the steps are constructed between the columns on a basement which supports them. The basement was paved with marble, and divided at intervals by small pilasters. Upon the frieze are carved instruments of sacrifice, and other decorations which remain indicate that the building was highly ornamented. Between this temple and that called the Temple of Concord, are the ruins of a small aedicular building which was discovered a votive altar sacred to Faustina Younger. To the left of this temple are some chambers the front of which was a portico of cipollino marble columns of the Corinthian order; the capitals are however adorned with victories and trophies. From an inscription on the entablature of the portico, these chambers appear to have contained the statues of the Dii Consentes, replaced by Vettius Agorius, præfect of Rome, A.D. 368. Nibby considers this building to have been originally constructed by Hadrian. It was burnt in the reign of Commodus, and restored by Septimius Severus. Bunsen calls it 'Porticus Clivi et Schola Xantha.' (See the *Plan of the Forum*, p. 7 Bunsen.)

*Temple of Concord*. The site only of this temple remains near the temple of Jupiter Tonans. Of this famous building there remain only the ruins of the cella, which was originally covered with giallo antico and pavonazzetta. The pavement was formed of slabs of the same material. Numerous fragments discovered in the late excavations prove that it was profusely enriched with ornamental carvings and statues, and that it was also destroyed by fire. Owing to the narrow site on which it was placed, the cella was wider than the portico.

*Temple of Antoninus Pius* is in the Forum of Antoninus now the Piazza della Pietra, and at a short distance from the Column of M. Aurelius Antoninus. Eleven Ionic Corinthian columns, which are much injured, remain on the northern side, and support a white marble architrave; the middle of the entablature, being much ruined, was restored with stucco. The columns have been walled together, and form the front of the present Custom-house, in the court of which there are several fragments of vaulting adorned with stucco pannels. A representation of the portico with a pediment belonging probably to this temple, appears on a large brass coin, from which it appears to have been decastyle. An octastyle portico with a pediment appears on silver and brass coins of the same emperor, and most probably represents another temple belonging to the Antonine Forum.

*Temple of Antoninus and Faustina*. Erected by the emperor to the emperor and his wife in the Forum Romanum. The two sides of the cella of Peperino, once clothed with marble, remain, as well as the magnificent marble entablature over them. The hexastyle portico, with the return columns of the Corinthian order, each of one single piece of Caryatian cipollino marble, still supports a considerable part of the entablature. In the frieze are griffins, candelabra, and other ornaments, in a fine style of art. The ascent to the temple was anciently by a flight of twenty-one steps: upon the entablature of the portico is cut the dedicatory inscription to Antoninus and Faustina. The columns, which were once partly buried, have been cleared of the surrounding earth. On the ruins of the cella has been erected the church of San Lorenzo in Miranda. A representation of this temple, with its steps, statues, and pediment, is given in a coin, published in Bunsen's 'Forum Romanum.'

*Temple of Romulus and Remus*, called by Bunsen, 'Ædificium Penatium.' A circular temple in the Forum Romanum, near the temple of Antoninus and Faustina, erected, according to Nibby, at a period when art was in its decline. It is however probable that the circular building belongs to an earlier period than he would assign to it. In the year 527 this building was used as a vestibule to the church of SS. Cosmo and Damiano, erected by Felix IV. Urban VIII applied the present Etruscan bronze door, found at Perugia, and placed the two antique porphyry columns, with their entablatures, in their present situations. This piece of architecture stood originally a short way to the left of the present entrance. Bunsen has given a plan of it in his plan of

two cipollino columns, half buried, and standing near the *Ædes Penatum*; one is without a capital, and the other has a capital and part of an entablature showing a return, as if they were decorative columns of an enclosure, like that of the temple of Minerva in the Forum of Nerva.

*Temple of Peace*, called also the Basilica of Constantine, was built by Maxentius, on the antient site of the *Horrea Piperatoria*, and after his death dedicated by Constantine. This edifice, which consisted of three naves, has the northernmost still in good preservation, and divided into three great arches, embracing the whole length of the nave. The centre arch, at a later period, was altered into the form of a tribune. The vaultings of all three are decorated with enormous sunk pannels and stuccoed ornaments, and the walls with niches. The southernmost nave was similar, but without a tribune. All except the indications of the piers have disappeared, as well as the great centre nave, at the extremity of which was the principal tribune, of which there are only a few fragments of the vaulted ceiling on the ground. High up in the piers there are still some fragments of the great marble cornice, which was supported by eight marble columns, one of which, still standing in the time of Paul V., was removed to the piazza of Santa Maria Maggiore. It is of white marble, of the Corinthian order, and fluted, eighteen Roman feet in circumference and forty-eight high. Winding brick staircases led up to the roof; one is still almost entire. The building was 300 feet long and 220 feet wide. The principal façade faced the Colosseum, and part of an external arcade remains in this direction. The pavement was of giallo antico, pavonazzetto, and cipollino. At a later period this building was converted into a Christian church, at which time an entrance was formed towards the Palatine, on the Via Sacra.

*Temple of Venus and Rome*. Designed and built by the emperor Hadrian, who personally directed the construction. It suffered from fire, and was restored by Maxentius. Of this vast building the substructions of the surrounding colonnade and the great niches at the division of the cella, with some fragments of granite columns, are all that remain. [ROMAN ARCHITECTURE.]

*Temple of Venus and Cupid*, so called, stands in what is supposed to be the antient Horti Variiani, and close to the church of Santa Croce in Gerusalemme. All that remains of this large edifice consists of an immense niche and two lateral walls of brick, belonging perhaps either to a great hall or basilica. Near these ruins is a fragment of the Claudian aqueduct.

*Temple called Minerva Medica*. A circular domed temple of brick, erected probably about the time of Diocletian. It is thought by Nibby to have been a large hall, erected in the Licinian gardens, which he places here. The circumference has nine niches for statues, seven of which have been found among the ruins at different times. It appears to have been lined with marble and painted with stucco, though only a part of its bare walls and dome, with the buttresses to secure it against a lateral thrust, now remain. In 1828, a large portion of the dome, which had been propped up with a wooden scaffolding, fell down.

*Temple of Nerva*, situated in the forum of Nerva, was consecrated by Trajan to the memory of Nerva; it was one of the most sumptuous edifices in Rome. Only three columns and a pilaster, partly buried in the ground, on the south side, now remain. The ornaments were in the finest style, and the proportions of the order form a correct model for the moderns. (See Bunsen's plan for the general design.)

*Temple of the Sun*, on the terrace of the Colonna gardens on the Quirinal hill. This temple, said to have been erected by Elagabalus, was of gigantic dimensions, of noble masses of masonry, and highly enriched, if we may judge from the two great masses that are left—a part of an architrave and frieze, and the angle of the pediment. The temple was probably Corinthian, and the style, though not decidedly bad, shows plainly that art was on the decline. Many fragments of sculpture dug up in the gardens have been fixed in walls at the back of these two masses. The site was eminently calculated for a colossal temple, as the entire height of the building would have been visible from most parts of Rome.

*Temple of Janus* no longer exists, but the site is placed, with every appearance of probability, by Bunsen, at the junction of the four great forums, in the immediate vicinity

of the Mamertine prison, the arch of Septimius Severus, and the Basilica Pauli.

A temple for a long time called the *Temple of Jupiter Stator*, afterwards the *Græcostasis*, and lately by Bunsen, first the *Temple of Castor and Pollux*, and afterwards the *Temple of Minerva Chalcidica*. It is situated in the Forum Romanum, next to the site of a temple of Castor and Pollux. The ruin consists of three marble Corinthian fluted columns on an isolated basement of travertine; the columns support a part of the highly enriched entablature, which is in tolerable preservation. The proportions and execution of this fragment are the very finest, and, since the restoration or true architecture, it has served as the great model of the Corinthian order.

*Pantheon*. [PANTHEON.]

#### Gates.

*Porta Asinaria* stands near the Porta S. Giovanni, which was built in its place by Gregory XIII., and to the left of it on going out of the city. The antient gate is closed, and forms, with the walls, a picturesque brick ruin.

*Porta Nomentana* led formerly to Nomentum, now Lamentana; it stands near the more modern gate called Porta Pia. It was built by Honorius.

*Porta Salaria*, built by Honorius in his new walls, and substituted for the Porta Collina of Servius, called Salaria from the road to which it leads. Through this gate Alaric entered Rome, A.D. 409.

*Porta Capena* stands at an angle of the Cælian hill, below the Villa Mattei, within the antient walls of Servius Tullius, and at a short distance from the Porta Latina. The walls of Honorius make a bend inwards towards this gate.

*Porta Latina*, now closed, stands between the Porta Capena and the gate of San Sebastian. The present gate was constructed by Honorius, A.D. 402, and repaired under Justinian, A.D. 550.

*Porta Appia*, or S. Sebastiano, situated on the Appian way, and built by Honorius in his extension of the Roman walls. This gate supplied the place of the antient Porta Capena, which was then closed. The fine semicircular brick towers were constructed either by Belisarius or Narses.

*Porta Portese*, on the banks of the Tiber, in Transtevere, built by Urban VIII., and substituted for the antient *P. Portuensis*.

*Porta Pinciana*, situated on the Pincian, and now closed; originally built by Honorius, and rebuilt by Belisarius.

*Porta Pia*, substituted by Pius IV., for that built by Honorius, and called Nomentana, from leading to the Via Nomentana.

*Porta S. Lorenzo*, built by Honorius, A.D. 402, called also Tiburtina from its leading to Tivoli; it also opened out on the Via Collatina. This gate is attached to the monument at the junction of the three aqueducts, the Aqua Marcia, Tepula, and Julia, which bears an inscription alluding to the repairs made by Caracalla. The aqueduct called Marcia is commemorated by a coin of the Marcii, which possibly may represent the original monument.

*Porta Maggiore*, situated at a spot called the 'Spes Vetus.' Here are the antient gates of the Via Labicana and Via Prænestina, formed by the monument of the Claudian aqueduct. The Porta Labicana was disfigured by Honorius, but his barbarous construction has been lately removed, on which occasion the tomb of Eurysaces was discovered in Bivis formed by the Labican and Prænestine roads; and at the same time there were uncovered, towards the open country, the magnificent Prænestine and Labican gateways, as they stood before the additions of Honorius disfigured them. The magnificence of these gateways was owing, in a great measure perhaps, to the circumstance of the Claudian aqueduct passing over them. The three great inscriptions on the attic above the gateways show, first, that Tiberius Claudius, the emperor, brought to Rome, the Claudian waters composed of the Cærulean and Curtian streams, and also the Aniene Nova. The second indicates the restoration by Vespasian; and the third, that by Titus. This magnificent façade consists of two great archways, and three piers, each decorated with two rusticated columns of the Corinthian order, placed on a rustic basement, and supporting an entablature and pediment. Above these is the lofty attic in which are the two water-channels. This attic is surmounted with a cornice. Severe in character, this structure is one of the best preserved, and one of the most imposing architectural masses in Rome. From this gate

may be seen the four aqueducts, Julia, Tepula, Marcia, and Aniene Vetus.

*Porta S. Giovanni*, substituted by Gregory XIII. for the antient *Porta Asinaria*.

*Porta S. Paolo*, substituted by Honorius for the antient gates of Servius called *Trigemina*, *Minucia*, *Navalis*, and *Lavernalis*. Being built on the *Via Ostiensis*, it was called also *Ostiensis*. The present gate was rebuilt by Belisarius, who constructed it on a new level, the antient being 26 palms lower. The internal gate is older than the time of Belisarius, and is formed with a double arch.

*Porta del Popolo*, the chief entrance into Rome, the *Flaminian Gate*, was built by Honorius on a site a little higher up than the present gate, towards the Pincian hill, on a slight elevation; it was removed between the sixth and eighth centuries to its present situation. The name of *Porta del Popolo* was given to it in the fifteenth century. Aided by Vignola, Pius IV. decorated the external front, after the design of M. Angelo; notwithstanding these great names, the façade is neither very striking nor in very good taste. The internal decoration of this gateway is by Bernini.

*Porta Cavalleggieri* and *Angelica*, one on each side of the Vatican, are of modern construction. The former is considered to be of the architecture of San Gallo; the latter was built by Pius IV.

*Tombs.*

*Sepulchre of Eurysaces the Baker.*—The exact date of the construction of this monument is doubtful; it was most probably erected between 580 and 803 A.U.C. It is situated at the junction in Bivvis of the *Via Labicana* and the *Via Praenestina*, close to the monument of the Claudian aqueduct, which formed the majestic entrance into Rome from these two roads.

This singular monument was imbedded in the rude construction of the gate built by Honorius in front of the Claudian monument; and the upper part of the tomb was injured by the new constructions. The plan of this building is an irregular trapezoid, formed by the roads and the contracted site. The elevation is divided into three parts: the lower, or basement, of Alban masonry, is divided from the second by a band, on which is formed the second division. The second division is constructed with the circular stone-mortars (*mortaria*) for kneading the bread, which are placed in a perpendicular position, with flat-face piers at the angles; above these is a continuous band, on each of the four faces of which is repeated the inscription,

EST HOC MONIMENTVM MARCEI VERGILEI EURYSACIS  
PISTORIS REDEMPTORIS APPARET.

On this is the third story, in which three rows of mortars are placed horizontally, with their circular mouths towards the spectator, having had originally a ball of stone carved in them to represent the dough. This story is bounded by pilasters at the angles with a capital in the Greek style. The pilasters support a frieze, and there was a cornice with a blocking course all round, and a pulvinus on two sides: above and between the extremities of the pulvinus was a band carved with a representation of circular loaves; from this band sprang a pyramidal roof, terminated with the representation of a wicker-basket used to carry bread in. In the principal front was a marble bas-relief representing Eurysaces and his wife Atistia, and underneath a sarcophagus with the inscription,

FVIT ATISTIA VXOR MIHEI  
FEMINA OPITVMA VEINSIT  
QVOIVS CORPORIS RELIQVIAS  
QVOD SVPERANT SVNT IN  
HOC PANARIO.

Within this sarcophagus was a representation of a panarium, or wicker-basket, in which the ashes were deposited. Such part of the frieze of this singular monument as remains has the daily employment of the baker and the business of the bakehouse sculptured upon it.

*Tomb of C. Publicius Bibulus*, stood originally without the walls of Servius Tullius, at the angle formed by two streets close to the antient *Porta Ratumena*.

This ruin, which is small, is of two stories, but the lower is buried by the accumulation of soil. It stands now at the extremity of the *Corso* and forms part of the external wall of a house in the *Via Marforio*, and at present appears to consist of the upper story only, decorated with four diminishing pilasters, two of which are imperfect, and part of the

architrave and enriched frieze. Two tablet inscriptions are placed in the wall between the pilasters. In the centre is an antient opening similar to that of the *Porta S. Paolo*, with moulded architraves. The material is of the same age.

The style of this monument is simple, massive, and it appears to have been erected probably in the antient age.

*Tomb of the Claudii*, a mass of shapeless masonry, in the *Via Marforio* almost opposite the *Porta S. Paolo*.

*Tomb of St. Constantia*, erected by Constantine the Great, probably by Constantine the Great, the body of either his sister or his daughter, were placed in a magnificent sarcophagus in the museum of the Vatican.

It was converted into a church by Alexander IV., and went through many changes from its original use. It is a pure specimen of architecture for its arrangement of double columns supporting a dome, and for its massive design.

*Pyramid of Caius Cestius*, erected by Augustus, for the ashes of his father, in the *Via Appia*, near *Porta S. Paolo*, on the *Via Appia*, has the following inscription:—

C. CESTIVS, L. P. P. P.  
VII  
OPVS ABS  
DIEB  
PONIT

This almost solid structure is composed of slabs of white travertine. The wall in the centre is a small opening with arabesques. The remains of the structure remain. The structure is of white marble, and has bases which have been taken from an inscription to a statue of the centre of the structure. The structure is now in the earth, now in the base of the structure. It was found in 1820, and which it stood upon.

*Tomb of the Claudii*, in the *Via Appia*, is a regularly executed structure, turned into a purpose of a structure. It appears to be an antiently structure. Over the structure is an inscription. The structure is a chamber. The structure is a peperin. One of the structure is the Vatican.

*Tomb of the Claudii*, on the side of the *Corso*, is a structure of Romulus, daughter of the structure. The inscription is on the structure.

Round in the structure, constructed with a surmounted cornice, from which a formed roof, now a sepulchre to a probably domed with phagus was found the Farnese pal-

In the decoration of the inscription, is a figure of Victory if to communicate. The Victory on

both of the figures of Victory had slaves bound underneath them.

*Mausoleum of Augustus*, constructed by Augustus, between the Via Flaminia and the banks of the Tiber, during his sixth consulate. When it first became ruined is unknown, but being turned into a fortress, and becoming eventually the property of the Colonna family, it was destroyed in 1167 in a popular tumult, and became a shapeless ruin.

The building was of a circular form, 220 ancient Roman feet in diameter, and was probably domed. Round the inner circumference were thirteen sepulchral chambers and an ample chamber in the centre, of which there only remains the basement of reticulated work in tufa. In the latter part of the last century the remains of this edifice were turned into an amphitheatre for bull-fights and fire-works.

Two obelisks without hieroglyphics, which formerly stood at the entrance of the Mausoleum, now adorn the piazza of Santa Maria Maggiore and the Quirinal.

*Mausoleum of Hadrian*, now called *Castle of S. Angelo*, erected by Hadrian on the right bank of the Tiber, within the gardens of Domitia. This building consists of a circular tower whose present diameter is 188 feet, placed on a quadrilateral basement, each side of which is 253 feet. It was once highly decorated, but no vestiges of the decorative part remain. Procopius, who described it in the sixth century, before it was injured, says it was built of Parian marble, and adorned with statues, both of men and horses, of the same material. (*Goth.*, lib. i.) Between the time of the rebuilding of the walls of Rome by Honorius and the Gothic war, it appears to have been already turned into a fortress, but without injury to the decorations. During the wars with the Goths, the Romans, being shut up in the building, were reduced to the necessity of throwing down the statues on their besiegers. In the tenth century it was fortified by a certain Crescenzo, and afterwards increased in extent and strengthened by the popes Nicholas V., Alexander VI., and Urban VIII., the last assisted by Bernini. The ancient doorway, recently opened, is situated immediately in front of the bridge; at the same time the ancient spiral-way which led to the sepulchral chambers was discovered. This rose with a gentle inclination to the summit of the building; part of the white mosaic floor with which the way was paved is still remaining.

#### *Columbaria.*

Between the temple of Minerva Medica and the Porta Maggiore are two columbaria, or tombs. The first, to the memory of Lucius Arruntius, consul under Augustus (A. D. 7), consists of two small chambers, in one of which are some small cinerary urns; and in the other, some pictures on the ceiling, and some small figures and ornaments of stucco. The second consists of one chamber.

*Columbarium in the Villa Doria Pamphili*. This columbarium, the general plan of which was tolerably well preserved in 1829, consisted of several small chambers irregularly disposed. It has however been lately destroyed. The plan measured by W. B. Clarke, architect, was published in the 'Library of Entertaining Knowledge—Townley Marbles.'

*Columbarium of Cneius Pomponius Hylas and of Pomponia Vitalina* stands in the same vineyard which contains the tomb of Scipio. The small urns and tablets in their several niches appear to belong to a period from the age of Augustus to the time of the Antonines. This columbarium is filled with niches with their ollae and lapidary inscriptions, and is partially decorated with arabesques.

*Tomb in the Vigna di Luzzano*, at a short distance from the Porta Pia, and without the walls. The date is uncertain. The square chamber of fine travertine masonry surmounted with a cornice is in high preservation, and also the three marble sarcophagi of the interior, which are highly enriched with bas-reliefs, and contain skeletons. The upper part, which was probably circular, has entirely disappeared, and the preservation of its base was entirely owing to its having been buried.

#### *Bridges.*

*Pons Aelius*, now Ponte S. Angelo, crosses the Tiber immediately opposite the Mausoleum of Hadrian, now the Castle of S. Angelo. It was constructed by Hadrian as an entrance to his mausoleum and the gardens of Domitia, which were much frequented by him, and in which he also built his circus. The whole of this bridge is ancient except the parapets, some trifling restorations of masonry, and a small arch on the side of the Castle of S. Angelo. The P. C., No. 1243.

bridge consists of three large arches and two small arches, with buttresses attached to the piers and starlings projecting beyond them. It was restored by Nicholas V. in 1450, and the Clements VII. and IX. decorated it with modern statues. Clement IX. added the parapet.

*Pons Milvius*, now *Ponte Molle*, on the Flaminian way, rather more than a mile from the city. It was antiently called not only Milvius, but Mulvius and Molvius. The construction is attributed to Æmilius Scaurus, about the middle of the seventh century of Rome. According to Livy (xxvii., c. 51), there must have been a bridge here at least a century earlier. A part only of the bridge is antient; Nicholas V. restored it in the middle of the fifteenth century up to which period the extremities consisted of wooden drawbridges.

*Pons Sublicius*, or Sublician Bridge, first erected by Ancus Marcius, of wood, was destroyed by an inundation in the time of Augustus, and rebuilt of stone by M. Æmilius Lepidus, the censor, an event which is commemorated in a coin of the Æmilii. From this circumstance it took the name of Æmilian. It was restored by Antoninus Pius, and in little more than six centuries after was destroyed by a great inundation of the Tiber during the reign of Pope Adrian I. What remained of it after this was removed, in 1454, to make cannon balls, and nothing but the rubble basements of the piers are visible when the water is low. From the coin it appears to have consisted of three arches, and was adorned with an equestrian statue of the censor.

*Pons Fabricius*, built by Fabricius, the Curator Viarum, A. U. C. 690; connects the city with the *Isola Tiburtina*, and is the best preserved of the antient Roman bridges.

*Pons Gratianus* is a continuation of the Pons Fabricius, connecting the Isola Tiburtina with Transtevere. It was constructed about A. D. 367, during the reigns of the emperors Valentinian and Gratian, from whom it derives its name.

*Pons Janiculensis*, now *Ponte Sisto*, connecting Transtevere with the city above the Fabrician bridge. It appears to have been called Janiculensis under the emperors, and to have been restored by one of them. It was ruined in the middle ages, and reconstructed under Sixtus IV. in 1774 by Baccio Pintelli.

*Pons Palatinus* or *Senatorius*, now called Ponte Rotto, was below the Fabrician and Gratian bridges, and above the Sublician; only three arches of it remain, on the Transtevere side. It was first built by P. Cornelius Scipio Africanus, and was repaired by Augustus. It was a very handsome bridge, and had a roof supported by marble columns. Being carried off by a great flood, it was rebuilt by Pope Pius III., and again by Gregory XIII. in 1575; after which it broke down, and has not been repaired since.

*Pons Triumphalis*, called also *Pons Vaticanus*, was constructed in a bend of the river near the Vatican. It is conjectured to have been built by Caligula or Nero as a means of easy access to their gardens on the Vatican. It appears to have been ruined about the fifth century: some remains of the rubble piers of this bridge may be seen when the water is low.

#### *Theatres and Amphitheatres.*

*Theatre of Pompey*, built by and named after Pompey the Great, occupied the space circumscribed by the palace called Pio, the Campo di Fiore, and the streets called Chiavari and Giupponari. Under the palace there are some ruins of this edifice.

*Theatre of Marcellus*, built by Augustus, and dedicated to Marcellus, son of Octavia, his sister, in honour of whom he named the portico attached to this theatre. This was the second solid theatre constructed in Rome, and consisted of three orders, the upper of which is entirely lost. The remains of this building are in the Piazza Montanara, and a small part near the entrance to the Palazzo Orsini. A small portion of the curved part of the theatre shows the remains of two orders of architecture, the Doric and Ionic, both in a bad state of preservation. The highest order above the Ionic is supplied by the upper story of the modern dwellings, which are formed in the antient curved front of the theatre. The style of the architecture is much superior to that of the Colosseum, and was the Palladian model of the Roman Doric and Ionic orders.

*Flavian Amphitheatre*, or Colosseum, commenced by Vespasian, in the last year of his life, on the site of the great pond formed by Nero within the extent of his *Domus Aurea*. [AMPHITHEATRE.]

*Amphitheatre called Castrensium*, a small brick amphitheatre

theatre, at what time erected is unknown, but probably, if we may judge from the style of brickwork, in the first century of the Christian era. It originally stood without the walls of Servius Tullius, but during the reign of Honorius it was employed to form part of the new enclosure, and the arches were filled up. On the inside the form of a semi-ellipse on its greatest axis is all that can be discerned; but externally the engaged Corinthian columns of the lower order, with their brick capitals, are well preserved; of the upper order there only remain a pilaster and part of an arch. During some excavations made here, an Egyptian statue, and some pieces of marble with which the amphitheatre was decorated, were discovered.

#### Arches.

*Arch of Titus* stands near the ruins of the temple of Venus and Rome. On the side facing the Colosseum is a finely cut inscription on the attic:

SENATVS . POPVLVSQVE ROMANVS.  
DIVO . TITO . DIVI . VESPASIANI . F  
VESPASIANO . AVG.

Erected by Domitian, in honour of Titus, and to commemorate the great event of the conquest of Jerusalem. It is of Pentelic marble, and of an elegant design, but with only one arch. On each side were fluted columns of the composite order, of which only two on each side, and these imperfect, are antique; the rest of the arch was restored by Pius VII. On the sides of the piers under the arch, which is highly decorated, are two very fine bas-reliefs, illustrating the victory of Titus over the Jews. In one of them is represented the golden table, the trumpets and horns of silver, and the golden candlestick with its branches. The triumph of Titus is represented also on the frieze on the outside of the arch.

*Arch of Septimius Severus*, erected A.D. 205, by the senate and Roman people, in honour of Septimius Severus, and his sons Caracalla and Geta, for their victories over the Parthians, the Arabs, the Adiabeni, and other oriental nations. In the long inscription on the attic may be recognised the erasure made by Caracalla when he changed the expression, ET . P . SEPTIMIO . L . F . GETÆ . NOB . CÆSARI, for P . P . OPTIMIS . FORTISSIMIS . QVE . PRINCIPIBUS. The arch is of Pentelic marble, with archways and transverse archways through the piers of the centre arch. Each front is decorated with four fluted columns, and a series of bas-reliefs, which, though not of a high order, are highly interesting as a picture of the modes of warfare and the commissariat of a Roman army. From a medal of Severus and Caracalla, it appears that the attic of the arch was decorated with a chariot drawn by six horses, and in the chariot was placed the emperor between his two sons: on each side of the car was a soldier on foot and a soldier on horseback. The whole of the mouldings and the vaulting are highly enriched with carved ornaments. An accumulation of earth had half buried this monument when it was first excavated by Pius VII., and afterwards by Leo XII., Pius VII., and Gregory XIV.

*Arch of Constantine*, erected in commemoration of his great victory over Maxentius, stands near the Meta Sudans, and fronting the Colosseum. Formed with three archways, adorned with four beautiful columns of giallo antico on each side, and enriched with many fine bas-reliefs and statues, as well as with specimens of art of indifferent workmanship, it shows the decline of art at that period. The fine parts are supposed to have been taken from a triumphal arch erected to Trajan, the situation of which is unknown. It is also possible that some might have been taken from the forum of Trajan. The statues of the Dacian prisoners are probably taken from an arch of Trajan. Above the attic was a triumphal quadriga. The arch remained partially buried until it was excavated by Pius VII., who enclosed the basement within a circular wall. During the reigns of his successors the whole of the surrounding earth has been removed, so that the roadway now passes under it.

*Arch of Dolabella*. This single arch of travertine was constructed A.D. 10, by the consuls Publius Cornelius Dolabella and Caius Junius Silanus. It stands near the church of S. Giovanni and Paolo, and is thought to have been the entrance to the Campus Martialis, where the Equiria, or equestrian games in honour of Mars, were celebrated, when the Campus Martius was inundated by the Tiber. This campus stands immediately to the left after passing the opening. It is flanked on the west by a magnificent substruction of large niches belonging to the Nymphæum of Nero and

Temple of Claudius. Nero took advantage of the arch of Dolabella, and passed his aqueduct over it, the arch of which is still extant.

*Arch of Gallienus*, upon the site of the Esquiline gate, dedicated to Gallienus and Salonina, by Marcus Aurelius Victor. The gate is formed of a single arch, adorned with four pilasters, and flanked with two buttresses, a part of one of which remains on the side towards the church of Santa Maria Maggiore. The structure is formed of large blocks of travertine, and is of a plain and simple but not a bad style of architecture.

*Arch of Drusus*, erected across the Appian way, close to the gate of St. Sebastian, by the senate, to Claudius Nero Drusus, father of the emperor Claudius. It consists of one arch only, adorned on each side with two marble columns of the composite order; above the entablature are the remains of a pediment, and there was also an attic. Caracalla used the arch as part of the line of his aqueduct for his Thermæ. An extant coin gives a faithful representation of this arch when perfect. Excavations have lately been made round this building. The arch appears to have been veneered with marble; but the cornices were formed of solid blocks of that material.

*Arch of Janus Quadrifrons*, situated in the Velabrum: the exact date of its erection is unknown, but from its debased style and want of simplicity, it may be attributed to a period after Septimius Severus. The form is square, 10-5 palms on each face, with a large arch in each front, forming an open vaulted space. In each of the piers supporting the arch are twelve niches in two rows, between which were small columns as a decoration forming a double order. The construction is formed of large blocks of white marble. The upper part is ruined, and it was held by the Frangipani as a fortress during the civil wars.

*Arch of Septimius Severus*, commonly called the Arch of the Gold-miths, is situated also in the Velabrum, and close to the arch of Janus. This small structure, in a style which shows the decadence of art, is highly enriched, and consists of a single opening, square in form, and supported on broad pilasters filled with ornament. The following inscription shows it to have been erected by the bankers and dealers of the Forum Boarium, in honour of Septimius Severus, Julia Domna, his wife, and Caracalla:—

IMP. CAES. L. SEPTIMIO . SEVERO . PIO . PERTINACI . AVG.  
ARABIC . ADIABENIC . PARTHIC . MAX . FORTISSIMO . FELI-  
CISIMO.  
PONT. MAX. TRIB. POTEST. XII. IMP. XI. COS. III. PATRI  
PATRIAE . ET.  
IMP. CAES. M. AVRELIO . ANTONINO . PIO . FELICI . AVG.  
TRIB. POTEST. VII. COS. III.  
FORTISSIMO . FELICISSIMOQUE . PRINCIPI . P . P . PROCOS . ET .  
IVLIAE . AVG . MATRI . AVG . N . ET . CASTRORVM . ET . SE-  
NATVS . ET . PATRIAE . ET . IMP . CAES .  
M . AVRELII . ANTONINI . PII . FELICIS . AVG  
PARTHICI . MAXIMI . BRITANNICI . MAXIMI .  
ARGENTARI . ET . NEGOTIANTES . BOARII . HVIVS . LOCI .  
QVI . INVEHENT . DEVOTI . NVMINI . KORVM .

The name of Geta was originally in the dedication, but his name was erased after his death.

#### Columns.

*Column of M. Aurelius Antoninus*, in the Piazza Colonna [ANTONINE COLUMN.]

*Column of Antoninus Pius* was discovered on the Monte Citorio, in the house of the Mission, in 1709. It was of a single piece of red granite, and had a white marble pedestal, now in the Vatican, representing alto-reliefs, with the inscription:

DIVO ANTONINO AVGVSTO PIO  
ANTONINVS AVGVSTVS ET  
VERVS AVGVSTVS FILII.

The shaft was 68 Roman palms long, and was used to restore the obelisks erected by Pius VI. This column, which is represented on the coins of Antoninus Pius, was enclosed with a fence, and most probably stood within the forum of Antoninus Pius, adjoining that of Aurelius, as did also the temple called the Temple of Antoninus Pius.

*Column of Trajan*, formed of 34 pieces of white marble, situated in the forum of Trajan, and erected by that emperor as a decoration to his great forum. The height represents the height of the Quirinal cut away and removed for the level site of his forum, and is stated in the following inscription:—

SENATUS . POPVLVSQVE ROMANVS.  
 IMP. CAESARI . DIVI . NERVAE . F NERVAE  
 TRAJANO . AVG. GERM. DACICO PONTIF.  
 MAXIMO. TRIB. POT. XVII. IMP VI. COS. VI. PP.  
 AD . DECLARANDVM . QVANTAE . ALTITVDINIS.  
 MONS. ET . LOCVS . TANTIS OPERIBVS  
 SIT VASTVS.

This column, admirable both for its proportion and for the design and execution of the bas-reliefs and ornaments, which are in the best taste, was the receptacle for the ashes of Trajan. The spiral bas-reliefs do not destroy the line of the shaft by their projection, as in the column of Marcus Aurelius, called the Antonine column. The Trajan column is, with few exceptions, in a high state of preservation. A statue of St. Peter is placed on the pedestal at its summit, and it is ascended by a spiral staircase.

*Column of Phocas*, erected in the Forum Romanum by the Ezech Smaragdus to the emperor Phocas, A.D. 608, according to an inscription on the pedestal.

The erasure of the name of Phocas, made by Heraclius, is discernible on the pedestal of the fluted Corinthian column, which is of a much earlier date, probably of the time of the Antonines. On the top of the capital there was a gilt statue of the emperor. The pedestal is placed on a flight of steps of a bad construction, from which it is evident that the column was taken from some other structure.

#### Forums.

*Forum of Nerva*, situated near the Forum Romanum, commenced by Domitian, and dedicated to Pallas. It was however terminated by Nerva. It received the names of *Transitorium* and *Pervium*, from its being a passage-way to other fora. Two fluted columns of the Corinthian order, half buried in the ground, with a rich entablature and attic over them, adorned with a bas-relief of Pallas or Rome, formed part of the internal decoration of the inclosure of the temple of Minerva. A large part of an irregular line of wall belonging to this forum is remarkable for its height and massive masonry of Travertino, set without cement. It is highly probable that the wall is much more antient than the date of the formation of the forum by Domitian and Nerva. Through this wall there is an antient archway with the masonry cut diagonally. See the Plan of the Forum, by Bunsen, for the extent and position of this forum.

*Forum of Trajan*, adjoining the forum of Nerva. (See Bunsen's Plan.) Of this extensive forum only the Cochlide column and part of the Basilica Ulpia can be seen; the rest of the site is buried under the adjacent streets and houses. The earth round the pedestal of the column was excavated in 1590, during the pontificate of Sixtus V.; and Pius VII. in 1812 and 1813 caused the present area to be formed by the removal of the houses and excavation of the site of part of the Basilica. The columns are of grey granite, and have been replaced in their respective situations. The site of the steps and pedestals at their entrance may be distinguished, and numerous fragments of marble capitals, entablatures, and ornaments are ranged round the area.

#### Miscellaneous.

*Mamertine and Tullian Prisons*, situated near the Capitol, close to the forum, built prior to the reign of Servius Tullius, and enlarged by him. Part of the front, forty-five feet long and eighteen high, is constructed with large blocks of tufa without cement; a part is also buried in the earth. C. VIBIVS. C. F. RVFINVS M. COCCIVS.... NERVA. COS. EX. S. C. repaired this edifice in the reign of Tiberius, A.D. 22. The prison was divided into two floors, and the round hole through which criminals were dropped into the lower prison still exists.

*Tubularium and Atrarium Sanctius*, place for the public archives and treasure, constructed on the side of the Capitol, by Quintus Lutatius Catulus. The inscription referred to by Nardini after Poggio is:—

Q. LVTATIVS . Q. F. Q. N. CATVLVS . COS.  
 SVBSTRUCTIONEM . ET . TABVLARIVM . S. S.  
 FACIENDVM . COERAVIT.

(See *Plan of Rome*, by Bunsen.)

*Sphaeridium*, commonly called the *Sette Sale*, is near the baths of Titus, enlarged by Trajan. It is a large brick ruin, and may be classed among the *Piscinae*, or reservoirs. It is thought to be older than the time of Titus, though it was applied to the use of his baths. It consists of two floors, the lower of which is buried in the ground; the upper is divided into nine chambers, with the opening from one to the other in a diagonal line. The construction is very solid.

*Cloaca Maxima*, said to have been constructed by Tarquinius Priscus. Two parts of this cloaca only are visible, one near the arch of Janus Quadrifrons, and the other on the Tiber near the temple of Vesta. [CLOACA.]

*Praetorian Camp*, built by Sejanus, in the reign of Tiberius, without the walls of Servius, to the north-east of Rome, and dismantled by Constantine the Great. Three sides of the walled enclosure of a rectangular figure were joined by Honorius to his new walls, and form a large rectangular recess on the plan of Rome. The appearance of the leading features of the camp may be collected from a gold coin of Claudius.

*Meta Sudans*, a fountain placed at the point of junction of four antient regions, the second, third, sixth, and tenth, and within a short distance of the Colosseum. It appears to have been at least as old as the time of Nero, and was reconstructed by Domitian in the form of a cone, in the centre of a circular basin 80 Roman feet in diameter. This brick rim has been entirely divested of its marble covering and ornaments; the water came out in a jet from the top; a representation of it appears on the coins bearing the impress of the Flavian amphitheatre. In the coin there are two large figures: one may probably represent the colossal statue removed here first by Vespasian and afterwards removed by Hadrian. The gladiators of the amphitheatre are said to have washed themselves at this fountain.

*Portico of Octavia*, built by Augustus, near the theatre of Marcellus, as a place of refuge for the spectators in the theatre from a storm. The portico, which was burnt, probably in the reign of Titus, was restored by the emperors Septimius Severus and Caracalla.

The ruin consists of one of the principal entrances only, which had two fronts similar in design and proportion; each front was adorned with four fluted Corinthian columns of white marble and two pilasters, supporting an entablature and pediment. Several columns of Cipolino and Carystian marble are walled into the houses of the fish-market, which is its present destination.

The restoration by Septimius Severus may easily be distinguished. A large brick arch and brick piers have been constructed to support the entablature ruined by the fire; some other remains of brick arches clearly indicate, from the difference in construction, the restoration. The style of the original building is bold, simple, and worthy of the Augustan age. A part of the portico is now used as a church.

*Palace of the Cæsars*, commenced by Augustus Cæsar, on the site of the house of Hortensius, the orator, and of Catiline. Augustus added to the original dwelling of Hortensius a temple dedicated to Apollo, with a portico of Numidian columns, and also a library. This palace, with its posterior additions, was distinguished by the name of 'Domus Augustana.' It was extended by Tiberius, towards the Velabrum, to the extremity of the hill. This part, in contradistinction to the Domus Augustana, was called 'Domus Tiberiana.' It was increased towards the forum by Caligula, and united to the Capitol by a bridge, which was afterwards destroyed by Claudius. The Palatine not being sufficient for Nero, he extended the palace of the Cæsars over the whole of the plain between it, the Cælius, and the Esquiline, and a part even of the Esquiline itself, thus uniting the palace with the gardens of Mæcenæ. This extensive palace having been destroyed by the great fire of Rome in the reign of Nero, it was rebuilt by him in a sumptuous style, and called the Domus Aurea. After having suffered many changes and mutilations during the reigns of successive emperors, it was much injured at the sacking of Rome by the Vandals. Yet Heraclius inhabited it in the seventh century, and in the time of Pope Constantine, in the beginning of the eighth century, the greater part of it was standing. Extensive remains of the substructions and some of the corridors still exist, especially towards the Circus Maximus. A rude coloured drawing in the print room of the British Museum, among the folios of original drawings, represents a portion of a triple-storied colonnade, as it stood in the seventeenth century. The ruins of the palace of the Cæsars stood in what is now called the Orti Farnesiani, and here may be recognised the position of a part of the palace of Augustus, of that of Tiberius, of Caligula, and of Nero. The most extensive parts of the ruins are the foundations and basements which sustained the external porticos, and the basements of the other parts of the palace, which from time to time was enlarged. On the higher part of the hill may be seen considerable re-

mains of the famous Palatine library, built by Augustus, and the magnificent temple of Apollo connected with it, and built after the victory of Actium. Towards the Circus Maximus are the foundations of the theatre built by Caligula, in the palace which he joined on to the front of the house of Augustus. Near the temple of Apollo, but below it, there are two small chambers, called the baths of Livia, which are very well preserved, and the painting and gilding are in good taste.

*Villa of the Quintilii*, extensive ruins, at the distance of five miles from Rome, on the Via Latina, hitherto called 'Ruins of the Pagus Lemonius.' This villa was built by the Quintilii, who were destroyed by Commodus. The inscription on the leaden pipes dug up in the villa contains the name of the Quintilii. Among the ruins, which appear to have been enlarged or restored about the close of the third or beginning of the fourth century, may be distinguished an amphitheatre, two magnificent bathing-halls, an aqueduct, and a fountain.

*Fountain of Egeria*, erroneously so called, is a chamber, situated in a valley about a mile from the Porta Latina, and at a short distance from the Via Latina. It appears from its construction to be a combination of reticulated with lateral work, and to be about the age of Vespasian. It is a chamber which contains eleven niches. The pavement was of serpentine; the lower part of the walls was once adorned with verde antique, and the niches were lined with white marble, with margins of rosso antico. All these embellishments are gone, and there is only a mutilated recumbent statue at the extremity of the chamber. A small spring of water still oozes from this building.

*Curia Hostilia*, on the southern side of the Forum. Three walls only of this building remain; they were originally covered with marble, and the façade was probably decorated with columns.

*Milliarium Aureum*, close to the arch of Septimius Severus, in the Forum Romanum. On the left, looking towards the Capitol, is a circular terminal, placed on a circular base-ment lined with marble.

*Circus Maximus*, situated in the valley at the south side of the Palatine hill, was founded by Tarquinius Priscus, and restored and enlarged by Julius Cæsar. Augustus erected the obelisk of the spina. It was burnt in the great fire of Rome under Nero. Vespasian restored and perhaps enlarged it. Trajan embellished it, and under Constantine the Great it was again repaired and beautified, and his son Constantius erected the second obelisk. Of this vast edifice the general form only is distinguishable in the vineyard in which it now stands.

*Circus of Romulus*, commonly called the circus of Caracalla [CIRCUS], is adjoining to the temple of Romulus, and is of the same style of brick construction. This circus was consecrated by Maxentius, A.D. 311, according to the inscription upon it.

#### TOPOGRAPHY OF ANTIENT ROME.

It is universally admitted that the part of Rome which was said to have been built by Romulus, occupied the Palatine hill on the eastern side of the Tiber. This town on the hill was, according to the custom of the Latins (Göttling, *Geschichte der Röm. Staatsverfassung*, p. 17), built in a square form, whence it is called *Roma Quadrata* (Fest., s. v.; Dionys. Hal., i. 88): it was intersected by two main streets, one running from north to south, the other from east to west. The point at which these streets intersected each other was called *gruma*, or *groma* (from which perhaps the name Roma was formed), and sometimes *mundus*. This spot, which itself formed a square, existed till a very late period, and was surrounded by a wall. This original Roma is generally supposed to have had three gates: 1, *Porta Mucionis*, or *Mugonia*, at the northern extremity of the hill, which looked towards the northern part of the Forum Romanum; 2, *Porta Romanula*, or *Romana*; and 3, the *Porta Janualis*. The Pomerium, that is, the precincts within which auguria could be taken, ran, according to Gellius (xiii. 14, 2) round the foot of the hill; but it seems to have been extended even before the union of Rome with any of the neighbouring places, for, according to the description of Tacitus (*Annal.*, xii. 24), the Pomerium embraced not only the sides of the hill, but a considerable portion of the adjoining plain. It ran from the Forum Boarium through the valley of the Circus Maximus, including the *Ara Maxima*, to the *Ara Cons*, along the foot

of the Palatine as far as the *Curia Veteres*, subsequently the *Thermae Trajani*. From thence it proceeded along to top of the Velia to the chapel of the *Lares*, subsequently to Arch of Titus; it then crossed the valley between the *Cælius*, the *Carinæ*, and the *Velia*. The space from the mentioned place to the point from which it commenced, subsequently the Forum Romanum, through which no lake mentioned, was then a lake or swamp. (Niebuhr, *Hist. Rome*, i. 288.) The town itself, which had about the same extent as the Pomerium, was probably surrounded by a wall and a narrow ditch. Towards the Capitoline and the Aventine respectively it was surrounded by swamps and ponds. Between the Palatine and *Cælius* the valley was so deep, and it contained a long tract of elevated ground called the *Velia*, on which side the town, being cut off from access, required fortifications.

As early as the time of Romulus, Etruscan settlements existed on the *Cælian* hill, and extended over *Monte Caput* and *Oppius*, which are parts of the *Esquiline*. Whether these Etruscans lived in open villages or fortified places is unknown; but we learn from Varro that they were expelled by the Romans to abandon their seats on the hills and to descend into the plains between the *Cælius* and the *Esquiline*, whence the *Vicus Tuscus* in that district derived its name. The principal of these Etruscan settlements was, according to the well-known hypothesis of Niebuhr, called *Lucerum*.

The three hills north of the Palatine, that is, the *Quirinal*, *Viminal*, and *Capitoline*, were occupied by *Sabines*, and the last of these hills was their citadel. Their town on the *Quirinal* was, according to Niebuhr, called *Quirina*. When the Latin and Sabine towns became united, the valleys between the hills must have been drained, and the cloacæ by which this was effected belong to the earliest architectural remains of Rome. (Niebuhr, i. 391, &c.) The valley between the Palatine and Capitoline was apart as the place of meeting for the two nations (*Cæstium* and *Forum Romanum*), and the boundary between the territories of the two towns was probably marked by the *Via Sacra*, which came down from the top of the *Velia* between the *Quirinal* and the *Palatine*, and then making a bend proceeded between the latter hill and the *Capitoline* as far as the temple of *Vesta*, whence it turned right towards the *Comitium* towards the gate of the *Palatine*.

The Seven Hills inhabited by these three different nations were united into one town, and surrounded by a wall making *Servius Tullius*. The Pomerium had been extended with the increase of the city, but the *Aventine*, though included in the new wall, did not lie within the Pomerium and it continued to be chiefly inhabited by plebeians. Hence it is not mentioned among the districts of the city by Varro, who calls them *Palatium*, *Velia*, *Cermalus*, *Cælius*, *Fagugial*, *Oppius*, and *Cispium*. All these were within the Pomerium. *Cermalus* was the spot at the foot of the *Palatine*, where the *Lupercal* and the *Ficus Ruminalis* were, and where in early times, when the waters were high, the ground was flooded from the *Velabrum*. The *Fagugial*, according to Niebuhr, the wide plain between the *Palatine* and the *Cælius-Septizonium* and the *Colosseum*. The fortification consisted in some places of a wall, probably with towers at certain intervals; in other places the steep sides of the hills rendered artificial fortifications unnecessary, as, for instance, on the western side of the *Capitoline*. The fortification of the eastern part from the *Colline* to the *Esquiline* gate, seven eighths of a mile in length, was fortified by a wall, or rather a mound. From the border of a moat 100 feet broad and 50 feet deep, was raised a wall 50 feet wide and above 60 feet high, faced towards the moat with flagstones, and flanked by towers. (Niebuhr, i., p. 394, &c.) Traces of this fortification work are still visible. From the *Colline* gate the wall ran in a south-west direction along the skirts of the *Quirinal*, then turned off to the western side of the *Capitoline*, and proceeded along this hill through the low grounds between the *Palatine* and the river towards the northern part of the *Aventine*. It then ran along the western and southern sides of the *Aventine*, crossed the valley between the *Velia* and *Monte San Balbina*, part of which was enclosed towards the southern skirts of *Cælius*, and after running along them, it proceeded in a northern direction towards the *Esquiline* gate at the southern extremity of the great moat. The gates of this wall, as far as they can be ascertained, were:—1, *Porta Salutaris*. 2, *Porta Sanguinalis*: both led from the *Campus Martius* to the *Quirinal*. On the same side

lay probably—3, *Porta Fontinalis*, from which, in the time of the Republic, an arcade led to the altar of Mars in the *Campus Martius*. 4, *Porta Ratumena*, probably on the northern side of the Capitoline, and likewise leading to the *Campus Martius*. 5, *Porta Carmentalis*, on the southern side of the Capitoline, and near the present *Vicolo della Bufala*. This gate, together with the—6, *Porta Triumphalis*, and 7, *Porta Flumentana*, lay in the line of the wall which ran across the low ground from the Capitoline to the Aventine, and not, as has generally been supposed, in a straight line from the southern end of the Capitoline to the river, which supposition has suggested an entirely false direction of the wall of Servius in this part. The *Porta Flumentana* was near to or on the spot of the *Janus Quadrifrons*, and the *Porta Triumphalis* at the north-western entrance of the *Circus Maximus*. Near this gate, or perhaps connected with it, were the so-called—8, *Duodecim Portæ*, which Pliny reckons as one gate. 9, *Porta Trigemina*, a little below the *Circus Sublicius*, leading up the Aventine from the *Forum Boarium*. On the steep side of this hill towards the river there was no gate. The next was the—10, *Porta Navalis*, which, in early times, probably led to *Ostia*. The district before it was called *Regio Navalis*; it was the ship-wharf and maritime arsenal of the city, and a great number of magazines were built in this plain. Between the *Porta Navalis* and the *Porta Capena*, on the *Cælius*, we have three gates—11, *Porta Naevia*; 12, *Porta Raudusculana*; and—13, *Porta Lavernalis*. The first of these three lay probably in the valley between the Aventine and *Monte San Balbina*; the second on the hill of *San Balbina*, and the third in the valley between this hill and the *Cælius*, that is, south of the *Porta Capena*. The *Porta Raudusculana* must have been the point at which the road to *Ardea* commenced. 14, *Porta Capena* was probably at the foot of the *Cælian* hill. The exact course of the wall from this gate towards the east, and then north towards the *Esquiline* gate, cannot be clearly ascertained, though we know that the *Lateran* was not included. 15, *Porta Cælimontana* must have been towards the *Esquiline*. 16, *Porta Esquilina* was at the southern end of the great north-eastern wall, near the arch of *Gallienus*; from it issued the *Via Prænestina* and *Laticana*. 17, *Porta Querculana* was probably in the valley between the *Cælius* and *Esquiline*. The great wall commencing at the *Esquiline* gate, in its whole extent from south to north, had two gates besides the *Esquiline*, viz. 18, *Porta Viminalis*, which lay about the middle of the wall; and 19, *Porta Collina*, which must have been on the spot where the *Via Salaria* and *Nomentana* meet. The sites of the *Porta Catularia* and *Piacularis* are entirely unknown.

The whole circumference of the walls of Servius Tullius was about six miles. They included considerable tracts of land which were not occupied by buildings, but were either pasture-grounds or covered with wood or thickets, such as great parts of the *Esquiline* and *Viminal*. Accordingly in times of war the people of the surrounding districts took refuge within the walls of the city, where they found sufficient space and food for their cattle. It was however principally the inner space near the wall itself which was not occupied by buildings until a very late period. Servius Tullius divided the whole city within the walls into four regions, which coincided with the four city tribes into which he divided the commonalty. The *Capitoline*, which was the city of the gods, and the town on the *Aventine*, were not included in these regions. Their names were: 1, *Regio Suburana*, comprehending the *Cælius*, the *Carinæ*, and the valley between them (afterwards the site of the *Colosseum*), the *Via Sacra*, and the *Subura*; 2, *Regio Esquilina*, comprising the whole of the *Esquilæ*, as far as they were included within the wall; 3, *Regio Collina*, extending over the *Viminal* and *Quirinal*; and 4, *Regio Palatina*, which comprehended the whole of the *Palatine*.

Each of these regions was again subdivided into six districts, which derived their names from the *Sacella Argæorum*, which probably stood wherever two streets crossed each other, so that these subdivisions appear to have been compact masses of houses, such as were subsequently called *vici*. Their number is stated by *Varro* to have been twenty-seven: twenty-four belonging to the four regions, and the three remaining ones probably to the *Capitoline*.

Many great buildings were erected at Rome during the long period. The great temple of *Jupiter* was on the *Capitol*. The prison of *Tullius*, called *Carcer Tullianus*, or *Mamertinus*, was at the eastern foot of the *Capitoline*. It is

uncertain whether the remains are genuine which are generally considered to belong to this prison. The *Circus Maximus* was between the *Palatine* and *Aventine*, of which there are probably no remains. The *Forum Romanum* was between the *Palatine* and *Capitoline*. The *Cloaca Maxima* carried the waters of the *Velabrum* and the *Forum Romanum* into the *Tiber*, and was a stupendous work. The wall of the elder *Tarquin* formed an embankment on the east side of the river: the remains are still visible to some extent. Of the wall of *Servius Tullius* few traces remain; but it existed in the eighth century of Rome, as appears from the description of *Pliny* (iii. 5), and from *Dionysius of Halicarnassus* (ix., p. 624).

During the early part of the Republic, we find no mention of such great architectural works as those which were built during the period of the kings; but, with the increase of the population, many of the uncultivated and uninhabited districts must have gradually become covered with houses. About 120 years after the establishment of the republic, when the city was taken by the Gauls, the whole was consumed by fire, with the exception of the *Capitol*, a few houses on the *Palatine*, and some of the works above enumerated, the magnitude of which saved them from destruction. The hasty mode in which the city was rebuilt explains the fact that down to the time of *Nero* the streets of Rome were narrow, irregular, and crooked, and, in point of beauty and regularity, Rome was far inferior to most of the other great towns in Italy. After this restoration, a long time probably passed before any new ground was built upon. Down to the fifth century of the city, private houses were generally covered with shingles, and there continued to be a number of groves within the walls of the city. But towards the end of the period which is comprised between the *Gallic* conflagration and the end of the second *Punic* war, Rome began to be embellished with temples, which however, both as to material and architecture, were far inferior to the temples of Greece. High roads and aqueducts also began to be built. The streets of the city itself were not paved, though we have no reason to suppose that they were neglected. At a somewhat later period we find public places, streets, and walks under the porticos, commonly paved with large square blocks of tuffo or of travertino. In the year 176 B.C., the censors ordered the streets of the city to be paved with blocks of basalt, which were laid on a stratum of gravel, such as is still visible in a part of the *Via Appia*. At the time of the war with *Hannibal*, the district near the river, between the *Capitoline* and *Aventine*, was almost entirely covered with buildings, and it was called *Extra Portam Flumentanam*.

The private houses had from the earliest times been very simple in structure; but after the conquest of Greece, and more especially of Asia, individuals began to build their dwellings in a magnificent style, and the taste for splendid mansions and palaces increased so rapidly, that a house like that of *Crassus*, which at first was universally admired for its splendour and magnificence, in the course of a few years was lost among superior buildings. Public edifices however still remained the chief objects of the pride of the Romans. Theatres, a class of buildings which had once been scarcely tolerated, were erected in several parts of Rome during the last century of the republic, especially after the time of *Sulla*. During the civil wars between *Marius* and *Sulla* we find that the number of houses had increased to such a degree, that the walls of *Servius Tullius* in several parts lay within the city itself, and *Niebuhr* thinks it not improbable that at this time a suburb already existed in the plain west of the *Tiber*, which was afterwards called the *Regio Transtiberina*. At the beginning of the eighth century of the city, another suburb is mentioned, in *Æmilianis*, between the *Circus Flaminius* and the *Quirinal*. A third arose south of the *Cælius*, a mile from the *Porta Capena*, and was called *Ad Martis*.

Of all the splendid buildings which were raised during the latter part of the republic, scarcely any traces exist, and the only remains which can with any probability be reckoned among them, are the substructions of three ancient temples below the church of *San Nicola in Carcere*; the so-called temple of *Fortuna Virilis*, not far from the theatre of *Marcellus*; and perhaps also the three columns of the so-called temple of *Castor and Pollux*, near the *Forum*.

*Augustus* might well say that he had changed Rome from a city of bricks into one of marble, for the roads, aqueducts, and public buildings of every description, temples, arcades,

and theatres, which were raised during his long and peaceful reign, were almost innumerable. The whole plain between the Quirinal and the river became a new town, which in splendour and magnificence far surpassed the city of the hills: this new town was one mass of temples, arcades, theatres, and public places of amusement, not interrupted by any private habitations. Aqueducts for the purpose of supplying the city with water had been built as early as the year 313 B.C., and the first (*Aqua Claudia*) was begun by Appius Claudius. It ran almost entirely under ground, and conveyed the water from a distance of about eight miles in the direction of the Porta Capena into the city. Other aqueducts (*Anio vetus*, 273 B.C.; *Aqua Marcia*, 145 B.C.; *Tejula*, 127 B.C.; *Julia*, 35 B.C.) were constructed, but it was not until the Imperial period that this kind of architecture reached perfection, and most of the remains which are still extant belong to the period of the Empire. They were mostly built upon arches, which had an easy inclination, so that the water ran gently from its source towards the city. Augustus built two new aqueducts (*Aqua Alsietina* or *Augusta*, and *Aqua Virgo*), and increased the Marcia. Subsequent emperors added the *Aqua Claudia*, *Anio novus* (both in A.D. 50); *Aqua Trajana*, A.D. 111; *Antoniniana* (A.D. 212); *Alexandrina* (A.D. 230); and *Jovia* (A.D. 300). (Frontinus, *De Aquæductibus Urbis Romæ*: Platner, *Beschreibung der Stadt Rom*, i, p. 195, &c.) The division into four regions, made by Servius Tullius, had remained unaltered; but Augustus, for the convenience of administration, divided the whole city, both within and without the walls of Servius, into fourteen new regions, a division which continued to the eighth century, when it began gradually to give way to the Ecclesiastical division into seven regions. Each of the Augustan regions, according to a survey taken in the reign of Vespasian, contained nineteen, or, according to a later account, twenty-two vici, with as many sacella in places where two streets crossed each other (in compitis). Each vicus seems, on an average, to have contained about 230 dwelling-houses, so that every region contained rather more than 3000. About one twenty-fifth part of this number of houses were *domus*, that is, habitations of the rich (palazzi), with a portico in front and an extensive inner court (atrium). The remaining twenty-four twenty-fifths consisted of *insulæ*, that is, habitations for citizens of the middle and lower classes; they had no portico in front, but mostly an open space which served as a shop or workshop. In the interior they may have had a court, but of smaller extent than the atrium of a *domus*. The number of these *insulæ* was about 44,000. All Roman houses were very high. Augustus fixed 70, and Trajan 60 feet as the height, above which none were allowed to be built; and the upper story was generally of wood. It was a law of the Twelve Tables which also occurs in the Roman legislation of later times, that no two houses, whether *domus* or *insulæ*, should be built closely together; but that an open space of five feet should be left between them. The fourteen regions of Augustus are:—1, Porta Capena, to the south of the gate of this name. 2, Cælimontium, which embraced the whole of the Cælian hill. 3, Isis et Serapis, the valley between the Cælius, Palatine, and Esquiline. 4, Via Sacra, or Templum Pacis. 5, Regio Esquilina. 6, Alta Semita. 7, Via Lata. 8, Forum Romanum. 9, Circus Flaminius. 10, Palatium. 11, Circus Maximus. 12, Piscina Publica. 13, Aventinus. 14, Regio Transtiberina.

Tiberius, besides completing many of the buildings of his predecessor, began the Prætorian camp on the north east side of the city, in the Campus Viminalis, and surrounded it with high walls. The wealthy Romans at this time had their palaces principally in the district from the Porta Collina to the Porta Cælimontana; they did however not form streets, but lay in gardens within the fields between the high roads which issued from the city; and hence they are generally called Horti, as Horti Mæconatis, Pallantiani, Epaphroditii, &c. All that had been done for the embellishment of the city previous to the reign of Nero was eclipsed by the magnificent buildings of this emperor; but the greater part of these works, together with those of former days, perished in the conflagration which took place in his reign. His plan of restoring Rome was gigantic, and proved to be impracticable: he proposed to make Rome a port, and to connect it with the sea by long walls from the Capitol to Ostia. But all that he could do, notwithstanding his profusion, was to restore those parts of the city which had been destroyed. The face of the new city however

assumed a totally different aspect. On the ruins of temples and the imperial palace on the Palatine rose the called Golden House of Nero, which occupied a space equal to a large town. The greatest care was taken to make new streets wide and straight, and that the buildings should not exceed a reasonable height. In order to render possible the execution of the regular plan, the several quarters of the city were measured, and the heaps of ruins were removed and conveyed in ships to Ostia to fill up the marshes in the vicinity. All the new buildings were massive, and constructed of the fire-proof peperino, without the old upper story. The width of the new streets rendered it necessary to extend the city beyond its former limits. Some time afterwards, in the reign of Vespasian, a measurement of the circumference of Rome was taken, according to which it amounted to 13½ Roman miles. The subsequent emperors continued to increase and embellish the city; but in the reign of Commodus a great part was again consumed by a fire which destroyed all the buildings on the Palatine. Septimius Severus exerted himself to restore the parts which had been burnt, and to ornament the city, and some of his buildings are still extant. But the grandeur and magnificence of the thermæ of Caracalla, south of the Porta Capena, surpass all the works of his predecessors. Almost all the public buildings, or their remains, which still exist at Rome, belong to the period between Nero and Constantine.

The most extensive work of this latter period is the Aurelian wall, with its numerous towers, with which Aurelian surrounded the city. The work, which was completed in the reign of Probus (A.D. 276), does not however enable us to form a correct estimate of the real extent of the city at the objects of the fortification may have rendered it necessary to enclose parts which were not covered with buildings. The Janiculus, which seems to have been fortified from the earliest times of the republic, was now for the first time included within the city walls, together with the Regio Transtiberina. On the north it embraced the whole of the Cælius Martius, together with a considerable part of the Hortulorum, or Mons Pincius; and on the south, the Testaceus and a considerable portion of the Via Appia Latina. On the eastern side it enclosed the Amphitheatrum Castrense, and then proceeded northward to the Prætorian camp. Most of the gates in this new wall were determined by and named after the great roads which commenced at the gates in the Servian wall. The walls of modern Rome as well as the gates, differ in many parts from those built by Aurelian. The names of the gates of the Aurelian wall, beginning on the north and proceeding to the east and south, are: Porta Flaminia, Pinciana, Salaria, Nomentana, Trastiverina, Collatina, Prænestina, Labicana, Anagnina, Minturnæ, Latina, Appia, and Ostiensis. Seven bridges connected the eastern and western sides of the river. The whole circumference of these new fortifications was about 21 miles. In the time of Honorius some parts of this wall were decayed and others had become useless on account of the great quantity of rubbish which had accumulated near them; but they were restored by this emperor. (Platner, *Beschreibung der Stadt Rom*, i, p. 618.) Though the present walls, as already observed (p. 87), do not much exceed the height of fifteen or twenty feet on the inside, owing to the accumulation of rubbish, they are in many places as high as fifty feet high on the outside.

The Prætorian camp, south of the Porta Nomentana, intersected the Aurelian wall; but Constantine destroyed the western side of the camp, which faced the city, and the three remaining sides serve as continuations of the Aurelian wall. Some remains of these fortifications are still visible.

After the time of Constantine, when the emperors and the Roman nobles had adopted the Christian religion, the decay and destruction of the ancient edifices commenced. The building of numerous churches was the immediate cause of this destruction. Neither the court nor private individuals possessed sufficient wealth to raise buildings equal in form or material to those of their ancestors, and as heathen temples could not always be converted into Christian churches, they were generally pulled down and the materials used for other purposes. Numerous columns were thus removed from their places, and the remaining parts of the edifices were carried away and used by any person who chose to take them. During the fifth century of our era great calamities were inflicted upon Rome by the ravages of the northern barbarians, though it is a mistake to suppose that the buildings of Rome

suffered much injury from the invaders, for they could have no interest in destroying anything, and all historians agree in stating that it was their principal object to carry away gold, silver, and other costly things. The few buildings which were destroyed at the capture of the city by Alaric (410) were near the Porta Salaria, where the enemy entered. There are in this part still some remains of the house of Sallust which was destroyed on that occasion. A harder fate befell the city in 455, when it was taken by the Vandals, though even then, and notwithstanding the sack of fourteen days, the buildings seem to have suffered little; the precious metals were the main object of the cupidity of the barbarians. Theodoric and his immediate successors not only took the greatest care to preserve what remained, but even exerted themselves to restore the public buildings which had suffered or were beginning to decay. The population however rapidly decreased during the fifth century, and became impoverished, so that towards the end of the century the suburbs around Rome seem to have no longer existed, with the exception of that which had arisen between the northern extremity of the Janiculus and the Vatican. Rome was thus confined to the walls of Aurelian and their restoration by Honorius, and even within its precincts extensive districts were uninhabited. The most remarkable buildings of former days indeed still existed, but after the reign of Deodatus they were entirely neglected, and thus one after another they fell into decay and ruin.

The ancient writers who furnish information respecting the topography of ancient Rome are: Varro, Livy, Pliny, Festus, two little works commonly ascribed to Aurelius Victor and Rufus, the 'Notitia,' the 'Curiosum Urbis Romae,' Strabo, Dionysius, and Dion Cassius. The principal modern works on the topography of Rome are: Flavius Blondus, 'Roma Instaurata,' Florentiæ, 1742. The author of this work lived about the middle of the fifteenth century. Bartholomæus Marlianus, 'Urbis Romæ Topographia,' Rome, 1534, reprinted in 1588, though the author had published an improved edition in 1544, fol. Onuphrius Panvinus, 'Commentariorum Rei publicæ Romanæ,' libb. iii.; the first book contains, 'Antiquæ Urbis Imago,' Venice, 1558, 8vo. Guido Pancirollus, 'Urbis Romæ Descriptio et de XIV Urbis Regionibus Commentarius,' Venice, 1593, fol. Georgius Fabricius, 'Romanarum Antiquitatum Libri Duo, ex aere, marmoribus, saxis, membranis veteribus collecti.' The first edition appeared at Basel, without date, in 8vo.; a second appeared in 1567. It is reprinted with the work of Panvinus and others in the 4th vol. of 'Graevii Thesaurus.' Alexander Donatus, 'Roma Vetus ac Recens,' Rome, 1638, 4to. This work has often been reprinted. Famiano Nardini, 'Roma Antica, cum Figuris,' Rome, 1666, 4to. This work, which gained very great celebrity, has often been reprinted, and was translated into Latin by Jac. Tollius (in the Thesaurus of Graevius). An improved edition, with numerous additions, maps, plans, &c., appeared in 1818 at Rome, by Nibby, in 4 vols. 8vo.

Olaus Borrichius, 'De Antiqua Urbis Romæ Facie,' Hafniæ, 1687. T. P. Bellorius, 'Fragmenta Vestigii veteris Romæ ex Lapidibus Farnesianis, nunc primum in lucem edita, cum notis,' Rome, 1673, fol. A new edition of this work, with notes, and plates of the Capitol, was made by Joh. Christoph. Amaduzzi, Rome, 1764, fol. Antoine Desgodetz, 'Les Edifices Antiques de Rome, mesurés et dessinés,' Paris, 1682, fol. J. Chr. Adler, 'Ausführliche Beschreibung der Stadt Rom, mit Kupfern,' Altona, 1781, 4to. Ridolfino Venuti, 'Accurata e succinta Descrizione topografica delle Antichità di Roma,' Rome, 1763. This work has been edited by F. A. Visconti, in 1803, and by Stef. Piale in 1824, 2 vols. 4to. Gius. Antonio Guattani, 'Roma descritta ed illustrata,' 2nd edition, Rome, 1806, 2 vols. 4to. D. Carlo Fea, 'Descrizione di Roma,' Rome, 1822, 3 vols. Anton. Nibby, 'Viaggio antiquario ne' Contorni di Roma,' in 2 vols., with plates, Rome, 1819. Burton's 'Antiquities of Rome,' have been translated into German and greatly improved by F. C. L. Sickler, Weimar, 1823, 8vo. The last and most important work on the topography and antiquities of Rome is, 'Beschreibung der Stadt Rom,' by Platner, Bunsen, Gerhard, and Köstelk, 3 vols. 8vo., with numerous maps and plans, Stuttgart and Tübingen, 1830. The preface to this work (p. xiii-lvi.) contains a critical account of the whole literature of Roman topography.

#### HISTORY OF ANCIENT ROME.

We shall confine ourselves in this article to a brief outline

of the external history of Rome, and endeavour to trace the gradual development of the Roman constitution, so far as this has not already been done in other articles. Taking moreover for granted that the reader is acquainted with the legends of the early history of Rome, we shall only give the results of the latest investigations on the subject, and refer our readers for further information to the best modern works, of which we subjoin a list. Each of the Roman kings and emperors is treated of in a separate article, and a chronological list of their names is given here.

*Period I.:*—From the building of the city to the establishment of the Republic, from 753-510 B.C.—Romulus, 753-714; Numa Pompilius, 715-673; Tullus Hostilius, 673-641; Ancus Marcius, 641-616; L. Tarquinius Priscus, 616-578; Servius Tullius, 578-534; Tarquinius Superbus, 534-510.

Rome, or at least that portion of the city which ultimately gave its name to the whole, was a Latin colony from Alba Longa, established on the Palatine hill, on the left bank of the river Tiber. Alba, which for several centuries before and at the time of the foundation of Rome was at the head of the confederacy of Latin cities, was now, like the other Latin towns, governed by an annual dictator, who however was probably under the control of a senate. Alba had previously been governed by kings. The legends of Romulus seem to suggest that in his time Alba was distracted by internal dissensions, which, in all probability, induced a number of the citizens, who were discontented with the form of government, to seek a home elsewhere, and thus led to the foundation of Rome. The time of this event is involved in great obscurity, for all the chronological statements which we possess are founded upon calculations made at a time when most of the authentic documents had perished in the capture of the city by the Gauls, and upon such numerical combinations as seemed best to agree with certain symbolical theories which were familiar to the Romans. But for the sake of expediency we shall follow the Varronian æra, which has been adopted by most modern writers, according to which the foundation of Rome is referred to the year 753 B.C. Tradition had even handed down the day on which Rome was founded, and in commemoration of the event the festival of the Palilia was celebrated on the 21st of April. If, according to our supposition, Rome was founded by a portion of the Alban population who left their home because they were dissatisfied with the dictatorial government, we see why the colony adopted the old kingly rule, which, though abolished in the metropolis, continued to exist in the colony for nearly two centuries and a half. It is another proof that the colony was not founded under ordinary circumstances, but by a secession, that until the time of the third king we do not read of any intermarriages having taken place between the colony and the other Latin towns; and hence the legend of the rape of the Sabine women.

The constitution of the colony on the Palatine was a limited monarchy, for in the reign of Romulus, whom the legends call the first king of Rome, it is said that there existed a senate consisting of one hundred members, which, like that of the Latin towns, had criminal jurisdiction, and the preparation of new measures, which were to be laid before the assembly of the people, who might either accept or reject them. How long this Latin colony stood alone and unconnected with any of the towns on the neighbouring hills, cannot be historically ascertained. There existed on the Cælius and the Esquiline an Etruscan settlement, which was said to have been founded by Cælius Vibenna, who seems to have come with a band of malcontents from Vulturnus, and who is said to have joined his forces to those of Romulus in the war against the Sabines. This seems to show that the Etruscan settlement in these parts was older than that of the Sabines. The Etruscan town, which Niebuhr calls Lucerum, seems to have fallen into a state of dependence upon the town on the Palatine (Roma), as may be inferred from the story that the Etruscans were compelled to leave their fortified places on the hills, and to descend into the plain. (Vicus Tuscus; Varro; *De Ling. Lat.*, iv., p. 14, ed. Bip.) The Etruscan colony seems from time to time to have received new settlers from the mother-country, and the last accession of this kind may have been those Etruscans who, after the war with Porsenna, remained behind and inhabited the Vicus Tuscus.

The Latins on the Palatine had made the Capitoline hill their citadel (Acropolis), but a band of Sabines, led by T. Tatius, who settled on the Quirinal and Viminal (this settle-

ment is called Quirium by Niebuhr), appear to have been hostile to the Latin colony, and to have taken from them the Capitoline. A short time afterwards however the three different cities or tribes appear reconciled to one another, and united into one state, with a new pomerium, which included the three original cities. The Latin and Sabine parts of the new state enjoyed equal rights, and each of them was at first governed by its own king and senate of one hundred members. The gods of these two were the Dii Majorum Gentium. The Etruscans, on the other hand, were in a state of dependence, had no king of their own, and did not obtain equality of rights until the time of Tarquinius Priscus. Their gods were the Dii Minorum Gentium.

Rome was thus, in its origin, a state consisting of three distinct elements, which together formed the Populus Romanus, and each of which exercised a certain influence upon the whole, an influence which is discernible in various ways down to the end of the republic. Each of them also seems in some particular departments to have given the tone to the rest. The Latins appear to have had the superiority in political wisdom, and accordingly their influence in this respect prevailed over the two other tribes, while all those political institutions, the introduction of which is ascribed to the Etruscans, consist of little more than mere ceremonies and formalities. As regards religion, each of the three tribes retained its own peculiar worship and rites, though the influence of the Sabines seems to have prevailed in many points. In all matters relating to the military constitution, the influence of the Etruscans and Sabines appears to have predominated; and the Roman armies, down to the time of Camillus, were drawn up in the Etruscan manner. This original diversity however was, in the course of time, effaced by the overwhelming influence of the Latins, and the various elements of the Roman state appear united into one organised body, the constitution and vital energy of which have attracted the attention of political inquirers in all ages and countries.

After the death of T. Tatius, the king of the Sabines, Romulus governed alone, and it was determined that in future there should only be one king, chosen alternately from the Latins and Sabines. Romulus is said to have now divided each of the three tribes, Ramnes (the Latins), Tities (the Sabines), and Luceres (the Etruscans), into ten curiæ, and each curia into ten decuriones, so that each tribe contained 100 decuriones, whence they were sometimes also called centuriæ. The decuriones were not identical with the gentes, but were a subdivision made for the purpose of representing the curiæ, as each decury in early times had to appoint one senator and one eques. (Götting, p. 62, &c.; Liv., i. 36; Festus, v. *Centuriata Comitia*.) Tribunes, curiones, and decuriones were at the head of these respective divisions, which they represented in political, religious, and military affairs. Each tribe also consisted of 100 gentes or houses, so that on the whole there were 300 gentes. These gentes did not necessarily indeed consist of families connected by blood, but their relation was such that the members of each gens had one common name, generally ending in *ius* (nomen gentilicium), had the right to inherit the property of a gentilis who died without agnati, and had their common sacred rites (*sacra gentilicia*) and sacred places (*sacella*). Each gens contained a number of families. To belong to a gens was a characteristic inseparable from a Roman citizen. Hence every citizen had, besides his personal name, another which was derived from that of his gens, of which Caius Julius Cæsar is an example, Caius being the name of the individual, and Julius that of his gens.

Besides the Roman citizens, or burghers, contained in the tribes, curiæ, and gentes, we find from the earliest times a class of dependents called clients (*clientes*), who were under the patronage of the burghers. What they originally were is not quite certain, though it seems probable that they partly consisted of poor emigrants who had accompanied the first settlers on these hills, and partly of other poor and oppressed strangers who flocked to Rome as an asylum from various neighbouring places, and settled there under the protection of the established colonies. In subsequent times their number was increased by freedmen, who, on being manumitted, had a relation to their former masters similar to that of the clients. The relation of clients to their patrons is one of the noblest features in the history of the Romans. The clients were indeed citizens, but they could not vote in

the comitia curiata, or receive the honores; they either tilled the lands or tended the flocks of their patrons, or followed the various trades which the burghers were not allowed to carry on. Numa Pompilius is said to have divided the clients into two classes, those of the city and those of the country. The former were again subdivided into nine leges or crafts, while the latter were subdivided into patres and husbandmen. Servius Tullius gave to some classes the right of voting in the comitia centuriata, and incorporated them into his four city tribes (*tribus urbanae*), though he continued in the same relation to their patrons as before. By the legislation of the Decemvirs the clientela was abolished, and the clients appear almost on a footing of equality with the plebeians, and consequently they voted in the comitia tributa. But practically the clientela continued to exist.

A new element was introduced into the population of Rome by the third king, Tullus Hostilius, which was enlarged by his successor Ancus Marcius. This was the class of plebeians. Under Tullus Hostilius, Alba Longa was destroyed by the Romans, and the greater part of the inhabitants were transplanted to Rome, where they settled on the Cælius, as far as this hill was not occupied by the Luceres. In the reign of Ancus Marcius many other Latin towns were conquered, and the inhabitants, being sent to Rome, had the Aventine and the valley between it and the Palatine assigned for their residence. (Götting, *Geogr. d. Röm. Staatsverf.*, p. 221, &c.) Some of these new settlers were probably incorporated into the existing tribes, but the bulk of them formed the class which is henceforth called Plebes, and which in numbers far exceeded the Roman citizens included in the tribes, who are from this time distinguished by the name of patricians (*patricii* or *patres*). As the plebeians were not included either in the tribes, curiæ, or gentes, they did not enjoy the full rights of citizens (*non optimo jure civis*). They had also no *connubium* with the patricians, that is, a marriage between patricians and plebeians was not a legal Roman marriage, and consequently the children of such a marriage had not the privileges of those children who were sprung from persons who could contract a legal Roman marriage, or, to use the legal phrase, had *connubium*. This was a consequence of a marriage where there was *connubium*, that the children were in the power of their father, and were Roman citizens. This restriction as to marriage was subsequently sanctioned by the laws of the Twelve Tables, and was strictly observed till the year 445 B.C., when it was taken away by the Lex Canuleia. The plebeians differed from the clients, inasmuch as they had their own *sacra*, which were regulated by the pontiffs, their own auspicia, some of their own gentes, the independent possession of landed property, and did not require the protection of a patron. The old burghers, in contradistinction to the plebeians, and their relations to them, formed a real aristocracy, or body of nobles, a character which they had not possessed before, unless we apply that name to the relation in which they stood to their clients. In the armies the plebeians formed a distinct body, and in the infantry they always formed the majority. Hence Tullus Hostilius increased the original number of three centuries of equites, each decury having formerly appointed one eques, to six, so that each century now appointed two equites instead of one. The two orders, patricians and plebeians, stood opposed to each other, without their mutual relations being accurately defined; but the plebeians themselves appear to have formed a compact body with a regular internal organization. This was an evil, which Tarquinius Priscus first endeavoured to remove in some measure by admitting the noblest plebeian families into the old tribes, each of which thus consisted of a majority of the old burghers and a number of noble plebeians (*maiores gentes*, and *minores gentes*: Cic., *De Rep.*, ii. 27). The number of the equestrian centuries was now again doubled, and the six new centuries were formed of the gentes minores, so that out of the 1200 equites, 600 were called *secundi* or *posteriores*, to distinguish them from the 600 patrician equites. (Götting, l. c., p. 229.) It was probably owing to the opposition of the patrician gentes that Tarquinius Priscus did not place the plebeians on a footing of equality with the patricians, at least in the main points, and it was reserved to his successor, Servius Tullius, to organise the body of the plebeians and to fix their relations to the patricians. This king divided the plebes into thirty local tribes, four for the city (*tribus urbanae*), and twenty-six for the country (*tribus rusticae*). For further

particulars respecting his new constitution see the article **SERVIVS TULLIVS**. His successor, Tarquinius Superbus, the last king of Rome, not only undid what his predecessor had done for the plebeians, but his oppression was equally felt by both orders. This led, in 510 B.C., to the abolition of the kingly power and the establishment of the Republic.

The constitution of Rome during the kingly period was an elective monarchy, with a king, a senate, and an assembly of the people (*populus*). At the head of it was the king, as chief magistrate, high-priest, and commander of the army. On the demise of a king, the assembly of the *curiæ* (*comitia curiata*) for the election of a successor was held under the presidency of an interrex. The king received the potestas as well as the imperium from the *populus*, and was inaugurated by the augurs or the college of pontiffs. All other officers were appointed either by the particular bodies or divisions of the people, whose affairs they managed, or by the king, but always from among those in whom the people themselves had already shown their confidence. The *populus* thus in reality possessed the supreme power, and even if it be true, as stated by Livy (i. 8), that the king had the power of electing senators from the tribes and *curiæ*, still they were always elected from those who were equites, or had held one of the great offices to which they had been appointed by the *populus*.

The senate of the Ramnes on the Palatine consisted of one hundred members. This number was increased by a hundred members when the Sabine tribe became united with the Latin; and when at last the Etruscans also obtained equal rights, the senate was increased to the number of three hundred, each tribe being represented by one hundred. This number seems to have remained unaltered down to the time of the Gracchi. (Dionys., v. 55, 60; Liv., *Epit.*, lib. 60.) The senate was convoked by the king, who also proposed the subjects for discussion. The majority of votes, which was either ascertained by counting or by a division (*accessio*), was decisive (*Senatus auctoritas, decretum, or consultum*). But the decrees of the senate did not become law until they obtained the sanction of the *populus* (*jussum or scitum populi*). [**SENATUS.**]

The assembly (*comitiatus* or *comitia curiata*) consisted of the burghers only. These assemblies met either to decide on matters concerning the gentes, or concerning public affairs. In the former the pontiffs presided. The latter related either to matters connected with the constitution, or to religion, or to military affairs. They were assembled by the king or his vicegerent. In these assemblies the chief magistrates were elected, and the measures prepared by the senate were laid before the *populus*, who might either accept or reject them. In the former case the measure became law, *lex regia*, or *tribunitia*, according as it had been passed under the presidency of the king or of the *tribunus celerum*. The decision as to war or peace, after the subject had been proposed by the senate, was likewise made by the assembled *populus*. By virtue of the Imperium, which the *populus* in its assembly gave to the king, he became the supreme judge, but he was allowed to transfer this power to deputies (*quæstores*, or the assembly of the *populus*), but there was no appeal from his sentence. In the constitution of Servius Tullius, the plebeians, being contained in his five classes, were admitted to the national assemblies of the centuries, which were distinct from the *comitia* of the *curiæ*, which still continued to be held. [**SERVIVS TULLIVS.**] The plebeians did not obtain the privilege of meeting as a body independent of and unconnected with the patricians before the year 491 B.C. (*comitia tributa*).

At the close of the kingly period we find Rome mistress of nearly all the tribes of Latium and of a part of the Sabine territory. In the territory of the Volsci, the first two Roman colonies, Signia and Circeii, were founded, though Ostia, founded by Ancus Marcius, is also sometimes called a Roman colony. On the Etruscan side of the Tiber, Rome was in possession of the Janiculus, which was probably fortified, as a contest with Etruria was to be expected sooner or later. From the first treaty of Rome with Carthage, which was concluded in the first year of the republic, we must conclude that the Romans had already formed important mercantile connections with foreign nations. (Polyb., iii. 22.)

*Period II:—From the establishment of the Republic to the Dictatorship of Sulla, from 510 to 82 B.C.*—The abolition of the kingly power and the establishment of the republic did not produce any other material change in the P. C., No. 1244.

constitution of Rome. The plebeians derived scarcely any benefit from it, but the patricians extended their power, inasmuch as they appointed, in the place of a king, two magistrates, originally called Praetors and afterwards Consuls, who were proposed by the senate and appointed in the *comitia centuriata*. Patricians only were eligible to this and the other great offices of the state. With the exception of the office of high-priest (*pontifex maximus*), which was transferred to the *rex sacrificulus*, the consuls possessed all the rights and privileges as well as most of the insignia of the former kings; but their office was only annual, and upon its expiration they might be called to account for their conduct. On the termination of their office, they returned indeed to a private station, but as members of the senate they still retained some influence in the administration of the republic. The number of senators, which had been greatly diminished by the last king, was completed to 300 by admitting some plebeian equites into the senate (Dionys., v. 13; Festus, v., *qui patres, qui conscripti*), and these new plebeian senators were called *conscripti* or *adlecti*, and hence the phrase *patres conscripti, i.e. patres et conscripti*. Valerius Publicola, to whom this completion of the senate is ascribed, and who according to some accounts was the successor of Tarquinius Collatinus, gave to the new republic a somewhat more definite and regulated constitution, by a series of laws called *Leges Valeriae*. [**PUBLICOLA.**]

The banishment of the Tarquins involved the Romans in a war with the Etruscans, in which the Romans, and especially the plebeian order, suffered very severely; but the Romans soon recovered their strength. [**PORSENA.**] The patricians gained a considerable addition to their power when the Sabine Claudii with their 5000 clients emigrated to Rome, and were received among the patricii, of which body they subsequently formed a distinguished gens. The plebeians, who had never recovered some of the rights conferred upon them by the constitution of Servius Tullius, began to show their discontent; but the patricians, who had gained new strength by the accession of the haughty Claudii, endeavoured to quell the aspiring spirit of the plebeians. Accordingly in 500 B.C., when the plebeians refused to take up arms against the revolted Latin towns, Titus Lartius was made dictator (*prætor maximus, or magister populi*) with unlimited power both within and without the city, so that during his rule the Valerian laws, by which the plebeians were in some degree protected, were suspended. The war with the Latins lasted till 496 B.C. and the battle of the Lake Regillus, when the Romans again became masters of Latium. This successful event emboldened the patricians still more, and they no longer feared the plebeians. The latter had by their service in the armies been obliged to neglect the cultivation of their fields, and in the war against Porsena they had lost a considerable portion of their lands. Receiving no compensation for their losses, they had been compelled through want to become the debtors of the patricians, who, when the time of payment came, exacted their money with the most merciless cruelty, and in cases of insolvency made their debtors their prisoners, and, in a certain sense, their slaves (*addicti, nexi*; see Niebuhr. *Hist. of Rome*, i., p. 571, &c.; Göttling, p. 283, &c.). The most conspicuous among the oppressors was the Sabine Appius Claudius, who in 495 B.C. was consul with P. Servilius Priscus. The indignation of the plebeians now rose to such a height, that when a war against the Volscians broke out, they again refused to bear arms. But a promise that their condition should be considered and their wishes satisfied, induced them to follow their patrician general. The Volscian city of Suessa Pometia was taken, but the plebeian debtors on their return from the campaign were again thrown into the dungeons of the rich. This incensed the plebeians to such a degree, that nothing could prevent an insurrection but the iron rule of a dictator, M. Valerius, who, with an army of 40,000 plebeians, defeated the Volscians, Aequians, and Sabines. Being again deceived, the plebeians seceded from Rome, and took up a fortified and threatening position on a neighbouring hill (*Mons Sacer*). The senate in great alarm granted the demands of the plebeians, the exact nature of which is unknown. Some important advantages however were gained: two, or, according to others, five plebeian tribunes (*tribuni plebei*) were created to protect their order, and two other plebeian magistrates, called *aediles*. The most important concession however was that which the plebeians shortly afterwards obtained, the right of sum-

moning before their own comitia (comitia tributa) any one who violated the rights of their order. (Göttling, p. 300.)

The year after the secession of the plebeians to the Mons Sacer (493 B.C.), the consul Spurius Cassius renewed the offensive and defensive alliance with the Latins, by which both nations seem to have been placed on a footing of equality: conquered lands were to be divided, the chief commander of the allied army was to be alternately a Roman and a Latin, and the laws made on the days of meeting were to be binding on both states. Rome however gradually became more assuming and arrogant, until, in 388 B.C., the Latin league was dissolved. But soon after the renewal of the alliance with the Latins (489 B.C.), both nations had hard struggles with the Volscians and Aequians, who probably took possession of some of the Latin towns. [CORIOLANUS] In 486 B.C. the Romans admitted the Hernicans as a third party to the Latin league, in order to strengthen themselves. In the same year the first attempt was made by Sp. Cassius Viscellinus to assign to the plebeians in full ownership a portion of the public lands [AGRARIAN LAWS]; but the attempt cost him his life.

For a series of years (485-479 B.C.) one of the consuls was always a member of the Fabian house, a circumstance which at last raised a suspicion that the Fabii secretly aimed at subverting the republican institutions. The Fabii emigrated with 4000 clients to Etruria, where a few years afterwards they were all cut to pieces by the Etruscans.

The three allied nations, the Romans, Latins, and Hernicans, now carried on a series of wars against the Etruscans, Volscians, and Aequians, in which the allies, especially the Romans, were often near the verge of destruction. The Etruscans made peace in 474 B.C., while the Volscians and Aequians continued their hostilities, and would in the end have probably destroyed the whole Roman army, if the dictator L. Quinctius Cincinnatus had not delivered the consul L. Minucius and his forces at the moment when they were surrounded by the enemy (458 B.C.). The Aequians however still continued to infest the Roman and Latin territories, until 446 B.C., when they were defeated near Corbio, and remained quiet for a long time.

Until the year 472 B.C. the plebeian magistrates, the tribunes, and the plebeian aediles had been elected by the comitia tributa and confirmed by the curiae; but in the year 471 B.C. the tribune Publilius Volero succeeded in procuring for the plebeians the right to elect their own magistrates without any interference on the part of the patricians, to deliberate and make laws in their own comitia (plebiscita), which indeed were not binding as leges, but still must have had a considerable influence, being the declared will of the commonalty. From this time the Roman republic was divided into two opposite classes or parties. On the one hand there were purely patrician assemblies (comitia curiata), in which all the patrician magistrates and certain classes of priests were appointed, and which were the supreme court of justice for the patrician order; the comitia tributa on the other hand were purely plebeian assemblies, with the right of appointing the plebeian magistrates, of making plebiscita, and of summoning before their tribunal those who infringed the rights of the plebeians. The tribunes and the senate were in a kind of opposition to one another, similar to that of the patricians and plebeians. The comitia centuriata, in which both orders met, were a feeble bond of union. This anomalous condition of the state, and the constant disturbances arising from it, necessarily produced a conviction that a reform in the constitution could not be avoided. The tribune C. Terentilius Arsa therefore, in 462 B.C., proposed that ten men should be appointed to make a code of laws, by which it was chiefly intended to limit the power of the consuls. But this proposal met with the strongest opposition from the patricians, and it was not carried into effect for a number of years, during which the commonalty continually gained strength, especially by the increase of the number of tribunes to ten, 457 B.C., and by the assignment of the Aventine to the plebeians (456 B.C.). At length preparations for a new code of laws were made, and in 451 B.C. ten patricians were appointed for the purpose; all other magistrates were suspended until the business should be completed. The result was that in the first year ten tables were produced, with which both parties were satisfied. In the second year, when the patricians had secured the decemviral power to themselves, two other tables were added. When the task was completed, the decemvirs were unwilling to

lay down their power, to which however they were at last compelled by the people. The usual magistrates were now again elected, both orders became reconciled, and in 449 B.C. the laws of Valerius and Horatius declared that plebiscita should be leges and binding on the whole nation (Liv., iii. 55); and that there should be no magistrate from whose sentence an appeal might not be made to the people. Various other measures were at the same time taken to secure the plebeians in the possession of their newly acquired rights. But they still continued to be a separate body, for the whole administration remained in the hands of the patricians, and no connubium yet existed between the two estates. The connubium however was obtained in 445 B.C., by the tribune Canuleius (*rogationes Canuleii*), who also made an attempt to divide the consulship between the two estates. But the latter of these rogations was evaded by the patricians, who agreed that, instead of two consuls, six military tribunes with consular power should be elected indifferently from both orders. (Niebuhr, ii., p. 398, &c.; Göttling, p. 326, &c.) This evasive concession was made because the patricians were determined not to give to the plebeians the censorial power with which the consuls had been invested; and in order to retain this, the patricians created two censors, a new curule dignity, which belonged to their order exclusively, until the year 351 B.C., when the plebeians participated in this dignity also.

After these arrangements, though frequently violated by the patricians, Rome enjoyed a short period of internal tranquillity; but abroad her arms were kept in constant activity by the wars with Fidenae, which was destroyed in 426 B.C. with the Aequians, who were defeated, in 418 B.C., at the foot of Mount Algidus, by the dictator A. Servilius Priscus, and with the Veii. The war with Veii lasted for several years, and in 396 B.C. this wealthy city was taken by M. Furius Camillus. Two years after, the Faliscans surrendered to Rome. This success of the Roman arms was partly owing to the invasion of Etruria by the Gauls, who however, in 390 B.C., completely defeated a Roman army on the small river Allia. The Gauls then advanced towards Rome, took and burned the city, and laid siege to the Capitol. The whole narrative of this event in the ancient historians is distorted by fiction. The simple truth is related by Polybius (ii. 18), who says that after the Gauls had taken possession of Rome, they were induced, by an inroad of the Veneti into their own territory, to quit Rome and return home; though the city was indeed soon rebuilt, its weakness encouraged the Aequians, Volscians, and Etruscans to renew their hostilities; but they were conquered by Camillus, and two Roman colonies, Sutrium and Nepete, were founded in Etruria, as a barrier against the enemies. The Hernicans and Latins also endeavoured to shake off the yoke of their alliance with Rome, and renewed the contest for their liberty. The former, after a series of campaigns and reverses, were completely subdued in 306 B.C.; while the Latins, induced by the repeated incursions of the Gauls, soon renewed their alliance with Rome.

The oppression of the patricians, together with the numerous and wearisome campaigns, and the invasion of the Gauls, had reduced the plebeians to a condition which was little better than it was before the first secession. Two noble plebeians, L. Licinius Stolo and L. Sextius, were determined to keep the oligarchical party in bounds, and to procure for their own order a share in the consulship. In 376 B.C. both of them were tribunes, and in this capacity proposed four rogations to the following effect:—1. That no more consular tribunes should be appointed, but two consuls instead, one of whom should always be a plebeian; 2. that no citizen should possess above 500 jugera of the public domain, and should not keep above a certain number of cattle upon them; 3. that the amount of interest paid by debtors to that day, should be deducted from the capital, which was to be paid off in three annual instalments; 4. that instead of the duumvirs who kept the Sibylline books, decemvirs should be elected, five of whom should be plebeians. The ensuing contest was carried on with the greatest determination and bitterness. The patricians contrived to get the veto of the other tribunes, but Licinius and Sextius prevented the elections of the higher magistrates, so that from 375 till 371 B.C. Rome was in a state of complete anarchy. The two tribunes Licinius and Sextius however retained their office from year to year; and in their tenth tribuneship, they first carried their fourth rogation, and soon after the senate felt obliged to agree to the others.

The excitement at Rome had been tremendous, and the mediation of Camillus, who had just returned from a victory over the Gauls, was necessary to allay the fury of party-spirit. Lucius Sextius Lateranus was the first plebeian consul, 368 B.C., and a temple was erected to Concordia as a monument of the happy reconciliation of the two orders. But in sharing the consulate with the plebeians, the patricians, being determined to retain all that they could, curtailed the consular dignity of one important part of its rights, and reserved to themselves exclusively the jurisdiction, or judicial (in the modern sense) authority. Accordingly they created the offices of praetor and of curule aediles. However, it was a consequence of the advantages now gained by the plebeians, that all the other great civil and religious offices were gradually thrown open to them; first the dictatorship in 356 B.C.; the censorship in 351 B.C.; the praetorship in 336 B.C.; and at last, in 300 B.C., by the Ogulnian law, the offices of pontiff and augur. The old distinction between patricians and plebeians thus gradually disappeared in all matters of real importance, and Rome, internally strengthened, united, and consolidated, seemed now enabled to direct her whole energy against external enemies. But this internal harmony was at first more apparent than real, for the patricians made many attempts to evade the Licinian laws, and they contrived for a number of years to keep the consulship to themselves, or at least they kept the plebeians away from it by electing either a dictator or an interrex. The law respecting the interest of money was likewise not always observed, and the rigorous manner of exacting payment of debts gave rise in many cases to complaint. The beneficial working of the new constitution did not fully manifest itself until after the year 339 B.C.

The first plebeian dictator, C. Marcius Rutilus, carried on a war against the Faliscans and Tarquinienses (365 B.C.), which was terminated by a peace. Caere obtained a truce for one hundred years by giving up to Rome half of its territory (353 B.C.). The last war against the Gauls, who had at intervals renewed their attacks on the Romans, was successfully terminated (349 B.C.) by L. Furius Camillus. The treaty with Carthage was renewed in 348 B.C., probably on account of the Greek pirates, who about this time infested the coasts of Latium, and against whom the Romans were unable to protect themselves. (Livy, vii. 27.) The great power which the Romans had gradually acquired and shown in the various contests with their immediate neighbours, now began to be displayed in the war against the Samnites, which soon brought them into contact with all the nations of Italy. This war however was preceded by a victory over the Volscians and Aurunci, which opened to the Romans the way into Campania. The Samnite war lasted from 343 to 341 B.C., and ended in a treaty with Rome, whose power now began to raise apprehension throughout Italy. [SAMNITES.] The Latins were the first who showed this feeling, and they demanded to be put on an equality with Rome, that one of the consuls and half of the senators should be Latins. The consequence was a war with the Latins, and a continuation of that against Samnium, for which the Latins had interceded. The Romans were successful against both, and in 338 B.C. all Latium was subdued. Some of the towns retained the Roman franchise with or without the suffragium, others lost their fortifications and part of their territories; the Latin confederacy was dissolved, and the commercium and connubium, which hitherto existed among many of the Latin states, was abolished.

The establishment of a Roman colony at Fregellae and its fortification led to a second war with the Samnites, who were allied with Palaeopolis and Neapolis, two Greek colonies, which, relying upon this alliance, ventured to insult the Romans. A Roman army marched into Campania, and Palaeopolis fell, in 326 B.C., by treason. Neapolis opened its gates to the enemy. In the year following, the war with the Samnites commenced, and lasted till 315 B.C. Appulia submitted to Rome in 318 B.C. The Etruscans, Umbrians, and Gauls now rose successively against Rome, and the Marsians, Pelignians, Aequians, and Hernicans made common cause with them. But as these enemies did not rise at the same time, and as they were not all actuated by the same spirit, the Romans subdued them all, and the Aequians were annihilated. The Samnites in the meanwhile entered into an alliance with the Etruscans, Umbrians, and Gauls, against Rome, and thus commenced their third war, which lasted from 298 to 290 B.C., when they were compelled by M.

Curius Dentatus to make peace. All Latium, Etruria, Campania, Samnium, a great part of Appulia, and several other Italian nations now submitted to the overwhelming power of Rome.

The internal state of the republic during these wars was tolerably quiet, as the plebeians had gradually acquired the same rights as the patricians. Appius Claudius Cæcus distributed, in 312 B.C., the libertini (freedmen), who as aerarii were not included in the tribes or classes, among all the tribes; but this arrangement lasted only till 304 B.C., when Fabius Rullianus threw all the libertini into the four city tribes. The last secession of the plebeians, 286 B.C., arose from a renewal of the attacks on the personal liberty of a debtor; but the law of the dictator Hortensius pacified them by securing to the plebeians their rights, and by giving to the plebiscita the full effect of leges.

In 284 B.C. the Tarentines in southern Italy secretly induced the Etruscans and Boians to revolt; the Samnites also again took up arms, and the Lucanians and Bruttians laid siege to Thurii, where they were defeated by the consul Fabricius Luscinus, who left a Roman garrison at Thurii. The Gauls destroyed one Roman army, but the Boians were defeated in 283 B.C. The Tarentines insulted a Roman fleet which had been driven into their port by a storm, and at the same time took Thurii, drove away the Roman garrison, and plundered the town. But being pressed by a Roman army under Aemilius Barbula, Tarentum sought and obtained the aid of Pyrrhus. [PYRRHUS.] The war with Pyrrhus and the Tarentines lasted from 281 to 275 B.C., and three years afterwards Tarentum surrendered to the Romans, and Rhegium also soon fell into their hands. The war with Tarentum made the Romans masters of the whole of the southern peninsula; and all Italy, from the Sicilian Straits to the river Macra in the north of Etruria, now recognised the supremacy of Rome (265 B.C.). Colonies, chiefly Latin, that is, colonies which had inferior rights to the Roman colonies, were established in various parts to ensure the submission of the conquered nations, and the Italian states and towns either received new constitutions or retained their old ones, modified according to the circumstances under which they had submitted to Rome. Some towns however, such as Capua, seem to have remained almost independent states.

The Roman constitution had now gained its perfection, and out of an exclusive aristocracy a moderate democracy had gradually been developed, in which all classes exercised their proper influence with the power to counterbalance each other. This constitution lasted without any important change for a considerable time, and Polybius, who saw it in operation towards the end of the Punic wars, looked upon it with high admiration. (Polyb, iv. 2.)

Two conquering republics cannot easily exist as peaceful neighbours. After the conquest of Italy, Rome was as desirous to take Sicily, as Carthage was jealous of the gigantic strides which Rome had made. The immediate causes which led to the first Punic war, together with its progress from 264 till 241 B.C., are described in the article PUNIC WARS. The result of this war was that Rome gained possession of Sicily and the adjacent islands; and Sicily became the first Roman province. [PROVINCIA.] Syracuse however, Panormus, Segesta, and some other Sicilian towns retained their independence. The immense loss of men which Rome had sustained was scarcely felt, and the way for new conquests was prepared. In 239 B.C. the Romans took possession of Sardinia, where the rebellious Carthaginian mercenaries sought the protection of Rome against the natives. Notwithstanding the hard struggles of the Sardinians as well as the Corsicans for their independence, the Romans in the end made themselves masters of both islands, and the Carthaginians, who, after the conclusion of a war against the mercenaries in their own country, attempted to reduce their armies in Sardinia and Corsica to obedience, were compelled to evacuate the islands and to pay to Rome 1200 talents. In the meantime a war broke out with the Ligurians (238 B.C.), who were probably instigated by the injured Carthaginians. The Insubrians also formed extensive connections with other Gallic tribes, and when, in 232 B.C., C. Flaminius carried a plebiscitum to the effect that the country of the Senones, between Sena Gallica and the Rubicon, should be assigned to the plebeians, the Boians, who had most to fear, united with many of the neighbouring tribes, and even with some of the Transalpine Gauls, and marched southward as far as Clusium, where they were completely defeated by the

consuls L. Aemilius and C. Atilius (225 B.C.). The Romans now advanced towards the north, gained a second victory over the Gauls at Clastidium, and took possession of Mediolanum (222 B.C.). The Gauls in Gallia Cisalpina, despairing of success, submitted to Rome, which strengthened its power in these parts by two new colonies, Cremona and Placentia. A year after this event Istria was added to the Roman republic. While the Gallic war was carried on, Illyrian pirates gave rise to the first war with Illyricum, which lasted from 230 till 228 B.C. The Illyrian queen Teuta was compelled to give a part of her dominions to Rome, to pay tribute, and to stop the piracy of her subjects; some Greek towns, which had been subject to her, were declared free. The Romans thus came in contact with Greece. (Polyb. ap. Zonaras, viii. 9) A second war with the Illyrians, in 219 B.C., made the Romans masters of the whole coast of Illyricum.

While Rome was thus engaged, the second Punic war was caused by the operations of the Carthaginians in Spain. It lasted from 218 till 202 B.C. [PUNIC WARS.] Great as the sufferings were to which Italy was exposed during the presence of the Carthaginian armies, and although the majority of the Italians had sided with the enemy, still the Romans soon recovered their losses, and established their power more firmly by new colonies in Italy. Spain was added to their former possessions, and when the navy of Carthage was destroyed, Rome was mistress of the sea. But the republic had gone beyond its natural limits, and with their extensive conquests the Romans lost the simple and manly character for which their forefathers had been distinguished: demoralization and corruption began to manifest themselves in their public as well as in their private life.

Philip III., king of Macedonia, after the battle of Cannae, had concluded a treaty with Hannibal. The Romans, into whose hands the treaty fell, sent a fleet to Illyricum, which compelled the king to a shameful flight. This was the prelude to the first Macedonian war, which lasted from 214 till 205 B.C., and was carried on with little vigour. A peace was at last concluded, which was not honestly meant by either party. Accordingly, five years later, when Athens implored the assistance of Rome against Philip and the Acarnanians, a second war with Macedonia commenced, which lasted from 200 till 197 B.C., and was terminated by the battle of Cynoscephalae, gained by Quinctius Flaminius, by which the power of Macedonia was broken. Philip was confined to his own kingdom, and became a vassal of Rome. Flaminius proclaimed the liberty of Greece, but nevertheless he remained several years in Peloponnesus to watch the movements of Antiochus the Great and the Aetolians, to arrange the affairs of Greece, and to foster dissension among the Greeks. There were many occasions on which the Romans might have attacked Antiochus, but their wars in Spain and the north of Italy caused the outbreak of the war to be deferred until 192 B.C. Antiochus, invited by the Aetolians, landed in Greece. The Aetolians obtained a truce for themselves, but the war against Antiochus, who fled to Asia, was continued; the battle of Magnesia decided the victory, and the power of Syria was broken. Eumenes of Pergamus and the Rhodians were richly rewarded for their servility towards Rome, and acted the same part towards Antiochus as Massinissa acted towards Carthage. The Aetolians afterwards concluded a peace with Rome, but on very hard conditions. The Galatians in Asia, and Ariarathes, both allies of Antiochus, sued for peace and obtained it. Asia was now reduced to such a state that it only required one more blow to effect its complete submission.

But the Romans had to contend in northern Italy, from 209 till 191 B.C., and in Spain from 197 B.C., with more determined enemies. In Spain, peace was not restored until 179 B.C., when Tib. Sempronius Gracchus, the father of the celebrated tribunes, by his humanity conciliated the Celtiberians. The Istrians, Sardinians, and Corsicans likewise made a fruitless attempt to shake off the Roman yoke. The corruption of the Romans, after they had become acquainted with the luxuries of Greece and Asia, had rapidly increased. As one instance out of many, we mention the manner in which the Bacchanalia were celebrated at Rome. (Livy, xxxix. 8-17.)

Perseus, the successor of Philip III. in Macedonia, who had inherited his father's hatred of the Romans, declared war against them in 171 B.C. This war was at first very unfortunate for the Romans, but in 168 B.C. L. Aemilius Paulus decided the fate of Macedonia in the battle of

Pydna. Gentius, king of the Illyrians, had been ally of Perseus, and this circumstance led to the Illyric war, which ended in a division of the country, that of Macedonia. In Epirus, Aemilius Paulus and his soldiers behaved with a cruelty which has perhaps never been equalled in the history of the Roman republic. (Livy, xlv. 34.) Eumenes and the Rhodians, who had drawn themselves the suspicions of the Romans in the war against Perseus, were now humbled. Others, such as the king of Prusias of Bithynia, Massinissa in Numidia, Seleucus, the governor of Syria, and the kings of Egypt acknowledged the supremacy of Rome, which by cunning and fraud gradually acquired the means of completely reducing them where inclination prompted.

The first blow was directed against Carthage, which long endured the insults of Massinissa, the ally of the Romans; and when at last she attempted to maintain her rights, the Romans razed Carthage to the ground (146 B.C.) and her territory became a Roman province under the name of Africa. [PUNIC WARS.] In Macedonia two pretors had risen against Rome, the consequence of which was that Macedonia was reduced to the form of a province. The same was the fate of Greece after the fall of Corinth (146 B.C.).

Some years before these events (153 B.C.) a new war broke out in Spain, as the inhabitants of Segeda did not strictly observe the conditions on which peace had been granted to them. The war was carried on for many years with varying success, and the cruelty of the Romans contributed to make the exasperation of the Spaniards more general. Viriathus [VIRIATHUS], who had placed himself at their head, carried on the war from 149 till 139 B.C. After his death, Brutus penetrated indeed as far as the western coast, and in 132 B.C. returned to Rome in triumph; but the natives nevertheless did not submit. Numantia offered the most determined resistance, and was totally destroyed, 133 B.C. After these bloody wars Spain was apparently quiet, and Roman commissioners arranged the affairs of the country.

During this period Italy appears to have enjoyed perfect tranquillity, and its wealth and population increased. (Max., iv. 1, 11), but a formidable insurrection broke out in Sicily. In this island the extensive estates of wealthy Romans were cultivated by numerous slaves, who, being ill-treated by their masters, rose under Eunus and Cleon, and effected destruction all over the island. In 131 B.C. they were defeated by P. Rupilius at Enna. Attalus, the last king of Pergamus, left, in 133 B.C., his kingdom as an inheritance to Rome; the disputes arising out of this gift led to the reduction of Asia into the form of a province (129 B.C.). Phrygia was given to Mithridates V. as a reward for his assistance to the Romans.

How completely the old distinction between patricians and plebeians had now disappeared, may be inferred from the fact, that in 172 B.C. both consuls, and in 131 B.C. both censors, were plebeians. Ever since the wars of Hannibal the number of plebeian senators had exceeded that of patricians. The only distinction which now had any value was that between *nobiles* or *illustres*, and *obscuri*. The laws which were made during this period had little or no relation to the constitution, but were for the most part intended to counteract the growing love of luxuries (*leges sumptuariae*), to fix the age at which persons might attain to different offices of the state (*leges annales*), to prevent the extortion of the governors of provinces (*de pecuniis relictis*), &c. After the reduction of Macedonia (168 B.C.) the treasury (aerarium) of the Roman republic was so well stocked, that the head-tax (tributum) which the Roman citizens had hitherto paid, was abolished. But during this apparent indifference in regard to constitutional matters a state of things had gradually been developed, which broke out like a volcano, and gave the first example of civil war. An active and thriving middle class did not exist at Rome. The citizens were either exorbitantly rich or in absolute poverty. The illustrious families had almost monopolized the lucrative offices of the republic, and the small landowners, on account of the constant wars, had been compelled to neglect their fields, and in numerous cases had sold them to the nobles. Such reduced persons wandered about homeless, with their wives and children, and lived in extreme poverty. (Plat., Tib. Gracchus, c. 9.) The only remedy was to provide this multitude of destitute citizens with lands, and to raise them to the rank of an independent

middle class. This was undertaken by the two brothers, Tiberius and Caius Gracchus. Who they were, what measures they proposed, and how they ended, is related in the articles GRACCHUS and AGRARIAN LAWS. The aristocratic party gained the victory in this contest, but it was gained by crime and bloodshed. Several regulations of the agrarian law were abolished, the nobles left off paying the rent which was due for the public domain that they occupied, extended (as before) their possessions by purchasing the smaller portions of the poor, and expelled the impoverished peasantry from their paternal roof. (Appian., *Civil.*, i. 27.)

A frightful example of the demoralised condition of all classes of Roman citizens was exhibited in the war against the usurper Jugurtha [JUGURTHA; METELLUS. Q. CÆCILIUS; MARIUS, C.; SULLA], who, in 106 B.C., was brought to Rome in triumph. During this war there appeared on the northern frontiers of Italy hosts of barbarians, Cimbri and Teutones (113 B.C.). Several Roman armies which were sent against them were defeated; but C. Marius, in 102 B.C., annihilated the whole body of the Teutones near Aquæ Sextiæ, and in the following year the Cimbri in the Campi Raudii. The few barbarians who survived were made slaves or fled into Gaul, where Cæsar saw the remnants of them. (*Bell. Gall.*, ii. 29.)

In Italy several petty rebellions of the slaves in Campania showed what might be expected, and Sicily became the scene of a second insurrection of the slaves, who carried on a fearful and destructive war with Rome (103-99 B.C.). The proconsul M. Aquilius succeeded in subduing the insurgents, after their last leader Athenion had fallen. In 96 B.C. the kingdom of Cyrenaica was given to the Romans by the will of the last king.

At Rome, where peace had only been restored by violence, a fresh attempt was made to introduce an Agrarian law, but the mover, L. Apuleius Saturninus, a man of no principle, who acted merely from selfish motives, was put to death with his associates (99 B.C.). (See *Cic. pro Rubir.*, c. 9.) It was about this time that two other important subjects began to attract general attention: first, the *Judicia*, which were in the hands of the equites, and grossly abused. In 91 B.C. the tribune Livius Drusus endeavoured to remedy the evil by adding 300 equites to the senate of 300, and by giving to this new senate of 600 all judicial powers in matters affecting a person's caput or civil condition. This attempt however had not the desired effect. The second question was, whether the Roman franchise should be given to the Italian subjects and allies of Rome. Many sensible Romans saw the necessity of such a measure; but the powerful party at Rome could not prevail on themselves to come to any definite conclusion. The Italians however persisted in their demand, which, in 91 B.C., led to the bloody and destructive Social or Marsian war. The Italians, seeing that there was no hope of gaining their object, intended nothing less than to destroy Rome, to establish a new Italian republic, with a senate of 500 members and two consuls, and to make Corfinium, under the name of Italica, its centre and capital. The Latins and Umbrians remained faithful to Rome, and obtained, together with some other places in Etruria, the Roman franchise by a *Lex Julia*. (Göttling, p. 448, &c.) In the first campaign the Romans were unsuccessful, but Cn. Pompeius Strabo defeated the Italian allies at Asculum, which he took and destroyed (89 B.C.). The Italians gradually submitted, and received the franchise, and thus the great mass of the inhabitants of the peninsula became Roman citizens. The dangerous designs of Marius and Sulla induced the senate to promise the franchise to all those who were still in arms, on condition that they should lay them down. But the Samnites resolutely continued the war, and in the ensuing civil contest they joined the party of Marius. The new citizens were, according to some writers, divided into 15 new tribes; according to others, into 10; and according to Velleius Paterculus, they were distributed into 8 of the old tribes. This last account is the most probable. But Italy had lost the flower of her population, and many once flourishing towns had been destroyed and razed to the ground. The number of tribes which, at the time of the war with Porsena, had been considerably reduced, was afterwards gradually increased to 35, a number which remained till the latest times. The province of Gallia Transpadana received in the same year, by the *Lex Pompeia*, the *Jus Latii*, that is, those political rights which the Latins had possessed previous to receiving the full franchise, and which were expressed by the term *commercium*. In the

dictatorship of Julius Cæsar the Transpadani were placed on an equality with the rest of Italy, and obtained the Roman franchise. The circumstance of Rome giving the franchise to all the Italians without altering its constitution accordingly, was a great mistake, and the first step towards the dissolution of the republic.

For the war against Mithridates, which now followed, and the civil war between Marius and Sulla, see the articles MITHRIDATES, SULLA, and MARIUS. The first Mithridatic war lasted from 87 till 84 B.C. After its conclusion, Sulla returned to Italy, forced his way to Rome, and after having been made perpetual dictator (82 B.C.), he endeavoured to restore peace and save the republic by a new but ill-judged constitution [SULLA], according to which the aristocracy were to form the basis of the republic, just as the Gracchi had endeavoured to base it on an independent middle class.

*Period III:—From the Constitution of Sulla to Augustus, from 81 till 30 B.C.*—In the year 83 B.C. the second Mithridatic war broke out, in which the Romans were defeated, and, in 81 B.C., they concluded a peace with him. After the death of Sulla, in 78 B.C., M. Æmilius Lepidus attempted to repeal all the *leges* of Sulla, but he was defeated in a battle by Lutatius Catulus, and fled to Sardinia, where he died. The tribunes also exerted their utmost power to recover the position which they had lost by the constitution of Sulla. After many fruitless attempts, their object was attained in 70 B.C., in the consulship of Pompey and Crassus, when, by the *Lex Aurelia*, the senate was deprived of the exclusive possession of the *Judicia*, which Sulla had given to it. The judicial power was now divided among the senate, the equites, and the *tribuni aerarii*. Thus the constitution of Sulla was abolished after it had been in force for about ten years.

The history of Rome from this time forward is little more than the history of the leading men. See the articles POMPEY, CÆSAR, CICERO, SERTORIUS, ANTONY, &c. In 74 B.C. Mithridates commenced the third war against the Romans, which led to the complete subjugation of all Asia Minor, Syria, and Phœnicia. Other Roman generals in the mean time advanced into Mœsia as far as the Danube, and on the northern coast of the Euxine as far as the river Don and the Palus Maeotis or Sea of Azof. In 63 B.C. Rome was saved by the watchful care of Cicero from the destruction with which the conspiracy of Catiline threatened it. [CICERO; CATILINE.] The suppression of this conspiracy could not prevent the republic from hastening towards its ruin. Between the years 58 and 50 B.C., Cæsar completed the conquest of Gaul; and in 56 B.C., by the treaty of Lucca, the Roman world was divided among Cæsar, Crassus, and Pompey (first triumvirate); and when Pompey, as sole consul, B.C. 52, placed himself at the head of the republic, the civil war between him and Cæsar broke out, which was decided, in 48 B.C., by the battle of Pharsalus. Cæsar, who had now become dictator, defeated the remains of the Pompeian party, and then endeavoured to restore order in Italy; but he was assassinated in 44 B.C. His opponents, whose republican spirit had survived the republic, were unable to restore it; and in the following year a second triumvirate was formed by Octavian, Antony, and Lepidus, whose object was the total destruction of the republican party. This object they pursued by proscriptions and a series of despotic and cruel measures, until they began to quarrel with one another. Their quarrels led to a new civil war, which ended in the battle of Actium, and placed Octavian (Augustus) at the head of the Roman world. Thus ended the Roman republic.

From the time when the constitution of Sulla was abolished, no thorough reform of the republic was attempted. All that we read of are isolated measures, some of which were calculated to promote the democratical interests, such as the laws of Clodius, by which the power of the magistrates was limited; while others, more in an aristocratical spirit, were intended to introduce gradual improvement, and to preserve as much of the old forms as possible. The numerous innovations of Cæsar, in all departments of administration, are the most important changes that were wrought during this period. Most of them were useful, but they paved the way to the monarchical government, to which the republic submitted the more readily, as for many years it had been accustomed to the almost absolute rule of individuals, who, being only concerned about their own aggrandizement, had brought indescribable sufferings upon the nation. One man at the head of the state, without a rival,

was the only remedy for the public evils. A longer continuation of that state of affairs which had existed for the last 50 years, would probably have broken up the Roman empire, and made Italy a scene of bloodshed and misery.

The Roman republic, at the time of its dissolution, comprehended the following countries, which were for the most part administered as Roman provinces:—Italy and all the islands by which it was surrounded: all Gaul as far as the Rhine, nearly all Spain, Illyricum, Pannonia, Dalmatia, Greece with all the islands of the Ægean, Thrace, Mœsia (the Danube here formed the boundary); in Asia all the countries between the Caspian Sea, the Parthian empire, the Persian and Arabian gulfs, the Mediterranean and the Caucasus, that is, Colchis, Iberia, Armenia, Syria, Palestine, Phœnicia, nearly the whole of Asia Minor, the whole of the northern coast of Africa, Mauritania, Numidia, the territory of Carthage, Cyrenaica, and Egypt. In some of these countries however the power of Rome was not firmly established until the Imperial period.

*Period IV. :—The Empire to its Downfall, from 30 B. C. till 476 A. D.*—The spirit of antient Rome and its moral greatness were gone, and freedom, which can only be based on virtue, had perished. The wise therefore, as well as the many who loved peace as the means of securing sensual enjoyments, and who were unconcerned about the consequences to future generations, preferred the mild rule of one man to the late turbulent and convulsed condition of the republic.

As the history of all the Roman emperors is given in separate articles, we shall only make a few general observations on the administration of the empire, and subjoin a chronological list of the Roman emperors down to the time of Justinian.

Augustus gradually concentrated in his own person all the great offices of the republic, though the officers themselves, mere shadows of former days, still continued to be appointed. He thus in effect acquired the sovereign power, being free from all responsibility. He had the right to raise armies, to impose taxes, to decide on peace and war; he had the command of all the legions, and the power of life and death over all Roman citizens, both within and without the city. The senate, after the removal of those whom Augustus had reason to fear, was filled up with individuals who were his mere creatures. Tiberius indeed restored to the senate part of its former power, but the more the influence of the soldiers increased, the more that of the senate declined, which body, as a compensation for this loss, was made a high court of justice, which took cognizance of offences committed by senators, crimes against the state or the person of the emperor, and of the maladministration of provincial magistrates. The relation between the emperors and the senate was very indefinite, and it varied according to the more or less despotic disposition of the head of the state. No provision was made for a regular succession; the first five emperors all belonged to the Julian and Claudian families. (Tacit., *Hist.*, i. 17.) The succession depended upon the will of the actual emperor, who appointed his successor, either by adoption, or by giving him one of the titles, Cæsar, and Princeps Juventutis; or by making him his colleague in the quality of tribune or proconsul. In cases where no person was designated, the senate exercised the right of election. But this privilege was soon assumed by the soldiers, who proclaimed the emperors, and the sanction of the senate became a mere form. The numerous body-guards of the emperors (prætorians), who, in their stronghold (prætorian camp) formed as it were a new Capitol, in effect possessed the sovereign power; and on some occasions they sold the empire to the best bidder. The numerous legions in the provinces however soon became acquainted with this secret of despotism, and availed themselves of it.

The election of magistrates was restored to the people by Augustus, but in most cases he recommended or even elected the candidates. Tiberius invested the senate with the power of election, still reserving a preference to those candidates who were recommended by himself, and the comitia merely received information of the election when it had taken place. In the third century however we find that the emperor alone exercised the right of election. The aerarium was at first nominally under the control of the senate. Augustus formed a separate aerarium for military purposes. The *fiscus* was the name for the property of the emperor as such, which must be distinguished both from

the aerarium and the private property of the emperor. But gradually the emperors took the whole administration of the finances to themselves, and the term *fiscus* then became equivalent to aerarium in the republican period. In order to keep the magistrates both of the city and the provinces in better subordination, they were paid by salaries.

With respect to legislation, we find that in the reign of Augustus various *leges* were passed (*Lex Julia et Papia Poppæa, De Adulteriis, &c.*), but after his death we scarcely hear of any *leges*, and *senatus consulta* were now made upon the proposition or the recommendation of the emperor. The *Edicta* of the prætors gradually lost their importance, and their place was supplied by the *Constitutiones principum*. The emperor himself of course possessed supreme jurisdiction, and for the decision of extraordinary matters, as in cases of appeal, he appointed an especial council, which seems to have been distinct from his privy council for the administration of the empire. (Spart. Hadr., 18.)

The *Judicia Publica* were usually held by the senate, but civil causes were, as before, tried by judges whom the prætor appointed. The administration of the city engaged a great deal of the attention of Augustus and his successors, as the monarchy depended much more on the peace and order of the capital than the republic. Respecting the division and administration of the provinces, see the article *PROVINCIA*. In the reign of Caracalla all subjects of the empire were made Roman citizens by a constitution of that emperor.

In this state the government of the Roman empire remained, with a few and not very important alterations, down to the time of Diocletian. The measures of this emperor and Constantine produced a complete change in the form of government. [*DIOCLETIAN; CONSTANTINE.*] The despotism of the prætorian soldiers ceased, and to it succeeded the government of the court, with its ministers and innumerable officers. The maintenance of these functionaries and of the numerous armies rendered heavy taxes necessary, and the misery, wretchedness, and degradation of the nations subject to the empire, which had been increasing during the last two centuries previous to its overthrow, at last reached a pitch which it is almost impossible to describe.

The Roman empire, notwithstanding its vast extent at the end of the republic, still continued to increase. *Vindelicia, Rætia, Noricum, Pannonia, and Mœsia* were completely subdued and made parts of the empire. The Danube was made the boundary in these parts, to secure the empire against the incursions of the barbarians. The subjugation of Spain was completed by the submission of the warlike Cantabrians. In Germany conquests were also made, but more with a view to secure Gaul than to acquire any new possessions in that country, and the Rhine may be considered as the frontier on that side of the empire. In the reign of Trajan the empire attained its greatest extent; *Dacia, Assyria, Mesopotamia, Armenia, and Arabia* were made Roman provinces; but some of these conquests were soon given up, and the Danube and the Euphrates became the boundaries of the empire. Britain and the southern part of Scotland had been made a province in the reign of Nero. But the internal weakness, resulting from the imperfect union of so many countries and nations, rendered it impossible to repel the incursions of the barbarians by whom the empire was harassed from about the close of the fourth century. During this period one country was lost after another, and Italy itself was invaded by the Huns under Attila (452 A. D.). In the year 476 A. D. Odoacer, chief of the Scyrri and Heruli, at the head of a number of Germanic tribes, invaded Italy, dethroned the last emperor Romulus Augustulus, and was saluted by his army king of Rome. The Roman senate implored his protection, and Zeno, the emperor of the East, raised him to the rank of a Roman patricius. Thus ended the Roman empire in the West.

Long before this event the necessity of dividing the unwieldy mass of the empire had been felt, and, since the time of Diocletian, had frequently been made for the purpose of facilitating the administration. Constantinople had become the capital of the Eastern part of the empire, but it was not until after the death of the elder Theodosius (395 A. D.) that the division into the Eastern and Western empires became permanent: the two parts however were intended to form one whole. The line of demarcation between the two empires was the Danube, from a little above Pesth, down to where it receives the Drau, thence

the small river Drinus (Drino), and a line drawn past the town of Scutari towards the great Syrtis, near the coast of Cyrenaica. All the countries east of this line belonged to the Eastern empire, and those west of it to the Western empire. The capitals, Rome and Constantinople, had each its senate, with equal privileges; but the bond of union between the two empires was weakened by the course of events, and they soon began to feel jealous of each other. The emperors of the East contrived to avert the invasions of the barbarians, and to turn their attention to the West, which, being also more exposed to such invasions, was destined to fall first; the Eastern empire, which had the advantage of a more favourable position for its capital, and had also greater means and better armies, prolonged its existence for many centuries. And even after it had lost all its provinces, and was confined to a very narrow space, it nevertheless maintained itself in this wretched condition until the year 1453 A.D., when Constantinople was taken by the Turks under Mohammed II.

*A Chronological List of the Roman Emperors.*

Augustus . . . . .	from 30 B.C.	to 14 A.D.
Tiberius . . . . .	14 A.D.	to 37 A.D.
Caligula . . . . .	38	41
Tib. Claudius . . . . .	41	54
Nero . . . . .	54	68
Galba, Otho, Vitellius . . . . .	68	70
Vespasian . . . . .	70	79

Nepos . . . . .	474	475			
Romulus Augustulus . . . . .	475	476			

The following is a list of the most important works on Roman History:—

The ancient authorities on which the history of Rome is chiefly based are the works of Livy (with Freinsheim's 'Supplements'), Dionysius of Halicarnassus, Polybius, Diodorus Siculus, Appian, Dion Cassius, Varro, Cicero, Sallust, Cæsar, Velleius, Tacitus, Plutarch, Suetonius, Florus, Eutropius, Aurelius Victor, Corn. Nepos, Orosius, 'Scriptores Hist. Augustæ,' Ammianus Marcellinus, Procopius, Zonaras, Xiphilinus, Laurentius Lydus, and many other ancient authors, who, though not professing to write the history of Rome, yet incidentally furnish much valuable information.

Among the modern works on the history and constitution of Rome, we may first mention the valuable monographs of Sigonius (contained in Graevii 'Thesaurus Antiquitatum Romanarum,' Ludg. Bat., 1694, &c., 12 vols. fol.), namely, 'De Antiquo Jure Civium Romanorum;' 'De Antiquo Jure Italiæ;' 'De Jure Antiquo Provinciarum;' of Perizonius, 'Animadversiones Historicæ'; Wolfg. Laz., 'Reip. Rom. in exteris Provinciis bello Constitutæ Comment. Libri XII.,' Basel, 1551, and Frankfort 1598; Cuspinianus, 'De Consulibus Romanorum Commentarii,' Basel, 1553, 'Genealogicum Rom. de Familiis Præcipuis Regum, Principum, Cæsarum Rom.,' Frankfort, 1589; and others. Pighius, 'Annales Romanorum, rec. auxit et illustr. A. Schotus,' Antwerp, 1615, 3 vols. fol.; P. Relandus, 'Fasti Consulares,' Traject. Bat., 1715; Ch. Rollin, 'Histoire Romaine, depuis la Fondation de Rome jusqu'à la Bataille d'Actium,' Paris, 1738, 16 vols. 12mo., or 8 vols. 4to. This work has often been reprinted, and has been continued and completed, in Rollin's spirit, by J. B. L. Crevier, 'Histoire des Empereurs Romains, depuis Auguste jusqu'à Constantin,' 12 vols., Paris, 1749. This work of Crevier has likewise often been reprinted. L. de Beaufort, 'La République Romaine, ou Plan Général de l'Ancien Gouvernement de Rome,' La Haye, 1766, 2 vols. 4to.; by the same author, 'Sur l'Incertitude des Cinq Premiers Siècles de l'Histoire Romaine,' Utrecht, 1738, reprinted at La Haye, 1750, 2 vols. 8vo.; Montesquieu, 'Considérations sur les Causes de la Grandeur des Romains et de leur Décadence,' Paris, 1734, often reprinted; Adam Ferguson, 'The History of the Progress and Termination of the Roman Republic,' London, 1783, 3 vols.; Hook, 'History of Rome,' London; P. Ch. Levesque, 'Histoire Critique de la République Romaine,' Paris, 1807, 3 vols. 8vo.; 'Die Geschichte der Römer zur Erklärung ihrer classischen Schriftsteller,' 2 vols., Leipzig, 1787-90; G. A. Ruperti, 'Grundriss der Geschichte, Erd- und Alterthumskunde, Literatur und Kunst der Römer,' Göttingen, 1794; a second edition appeared in 1811; Chr. F. Schulze, 'Kampf der Demokratie und Aristokratie in Rom,' &c., Altenburg und Erfurt, 1802; Micali, 'Italia avanti il Dominio de' Romani,' Firenze, 1810, 4 vols. 8vo., with an atlas; B. G. Niebuhr, 'Römische Geschichte,' 2 vols., Berlin, 1811. The first volume of the second edition, which was much altered, appeared at Berlin, 1827; and a third edition of the same volume in 1828; the second edition of the second volume appeared in 1831; the third volume was edited, after Niebuhr's death, by Dr. Classen, Berlin, 1832. The whole work only brings the history down to the end of the first Punic war. The first two volumes have been translated into English by J. C. Hare and C. Thirlwall. The whole work has been translated into French by P. A. de Golbery, Paris, 1829-1840. Compare the reviews of the first edition of Niebuhr's work by A. W. von Schlegel, in the 'Heidelberger Jahrbücher,' 1817, and by W. Wachsmuth, in his 'Die ältere Geschichte des Römischen Staates,' Halle, 1819; Fr. Buchholz, 'Phi

osophische Untersuchungen über die Römer,' 3 vols., Berlin, 1819; K. L. Blum, 'Einleitung in Roms alte Geschichte,' Berlin, 1828; Eisendecker, 'Ueber die Entstehung, Entwicklung, und Ausbildung des Bürgerrechts im alten Rom,' Hamburg, 1829; K. D. Hüllmann, 'Römische Grundverfassung,' Bonn, 1832; and by the same author, 'Ursprünge der Römischen Verfassung, durch Vergleichenen erläutert,' Bonn, 1835; W. Drumann, 'Geschichte Roms in seinem Uebergange von der Republikanischen zur Monarchischen Verfassung,' &c., 4 vols. 8vo., Königsberg, 1834-38; H. Malden, 'History of Rome,' vol. i., London, 1830; H. C. Reiff, 'Geschichte der Röm. Bürgerkriege,' &c., Berlin, 1825, 4 vols. 8vo.; Dr. Th. Arnold, 'History of Rome,' 2 vols., London, 1838-1840; J. Rubino, 'Untersuchungen über Römische Verfassung und Geschichte,' vol. i., Cassel, 1839; Dr. Fr. Fiedler, 'Geschichte des Römischen Staates und Volkes,' Leipzig, 1839; C. Götting, 'Geschichte der Römischen Staatsverfassung,' Halle, 1840.

The history of the Empire has been written by Tillemont, 'Histoire des Empereurs et des autres Princes qui ont régné dans les Six Premiers Siècles de l'Eglise,' Paris, 1700, 4 vols. 4to., reprinted at Brussels, in 1707, 5 vols. 8vo.; Crevier's continuation of Rollin, mentioned above; 'Les Femmes de Douze Césars, avec des Notes Hist. et Crit.,' par M. de Servies, Amsterdam, 1722, 2 vols. 8vo.; Gibbon, 'The History of the Decline and Fall of the Roman Empire,' London, 1776-82, 4 vols. 4to.; this masterly work has often been reprinted. D. G. H. Hübler, 'Geschichte der Römer unter den Imperatoren, wie auch der Gleichzeitigen Völker,' 2 vols., Freiberg, 1803.

The 'Thesauri' of Graevius and Sallengre contain many good works on Roman antiquities; but, besides these, we may mention, Joh. Rosini, 'Romanarum Antiquitatum Corpus absolutissimum, cum Notis Dempsteri,' Traject. ad Rhen., 1701; Samuel Pitiscus, 'Lexicon Antiquitatum Romanarum,' 2 vols. fol., Leovardiae, 1713; Dr. A. Adams, 'Roman Antiquities,' London, 1791, often reprinted; Friedr. Creuzer, 'Abriss der Römischen Antiquitäten,' Leipzig und Darmstadt, 1824.

The private life and manners of the Romans are described in C. Meiners, 'Geschichte des Verfalls der Sitten und der Staatsverfassung der Römer,' Leipzig, 1782; J. H. L. Meierotto, 'Ueber Sitten und Lebensart der Römer in verschiedenen Zeiten der Republik,' second edition, Berlin, 1802, 2 vols. 8vo.; W. A. Becker, 'Gallus, oder Römische Scenen aus der Zeit des Augustus,' Leipzig, 1838, 2 vols. 8vo.; Otto von Mirbach, 'Römische Briefe aus den letzten Zeiten der Republik,' 2 vols., Mitau, 1835; M. Roulez, 'Observations sur divers points obscurs de l'Histoire de la Civilisation de l'Ancienne Rome,' Bruxelles, 1836.

Works on the Roman finances: P. Burmann, 'Vectigalia populi Romani,' Lugd. Bat., 1734, 4to.; D. H. Hegewisch, 'Versuch über die Römischen Finanzen,' Altona, 1804, 8vo.; R. Bosse, 'Grundzüge des Finanzwesens im Römischen Staat,' Braunschweig, 1803, 2 vols. 8vo.

Works on military affairs: Guisard, 'Mémoires Militaires des Grecs et des Romains,' La Haye, 1758, 2 vols. 4to., and Rast, 'Römische Kriegsalterthümer.'

As chronological tables of the history of Rome: C. J. Zumpt, 'Annales veterum Regnorum et Populorum, imprimis Romanorum,' Berolini, 1819, 4to.; a second edition appeared in 1838. Zander, 'Tabellen der Römischen Geschichte,' second edition, Göttingen, 1829, 4to.; F. Fiedler, 'Zeittafeln der Römisch. Gesch.,' &c., Wesel, 1827, 4to.; Fischer, 'Griechische und Römische Zeittafeln,' Altona, 1840, 4to.; Clinton's 'Fasti Hellenici.'

The works on particular points of the Roman constitution or particular events in Roman history, are too numerous to be mentioned here.

#### ROMAN LANGUAGE AND LITERATURE.

It is intended in the following paragraphs to present merely an outline of the history of the language and literature of ancient Rome, as a separate notice is given in this work to every writer of importance.

The language of the Romans is usually called Latin; for though Rome and Latium were originally distinct communities, their language appears to have been always the same. Any inquiry into the origin of the Latin language must involve an inquiry into the languages spoken by the ancient inhabitants of Italy; and our information on this subject, notwithstanding the investigations of Micali, Grotfend, K. O. Müller, and other distinguished scholars, is at present

very imperfect. So much however appears certain, that the Latin language was different from the Etruscan and Oscan, of which the former was spoken by the inhabitants of the northern and the latter by those of the central and southern parts of Italy. The Latins appear to have originally formed part of that great race which overspread both Greece and Italy under the name of Pelasgians. Their language formed a branch of that extensive family of languages which are known to modern scholars by the name of Indo-Germanic; and it is probable that the Pelasgians who settled in Italy originally spoke the same language as the Pelasgians who settled in Greece. There is consequently a great resemblance between the Latin and Greek languages; though each possesses an element which the other does not. Not only does the Latin language possess many words which it has not in common with the Greek, but also in some parts of its grammatical inflection, as for instance in that of the passive voice it differs considerably from the Greek language. It therefore becomes a question, what that element is, which the Latin language has not in common with the Greek; and here we must attain some further knowledge of the languages of ancient Italy before we can answer this question satisfactorily. The Etruscan, so far as our imperfect knowledge of it will enable us to form an opinion on the subject, appears to have exercised little influence upon the formation of the Latin language; but the Oscan or Opican language, on the contrary, seems to have united with the Pelasgian in forming the Latin language. Niebuhr (*Hist. of Rome*, vol. i., p. 82) has remarked that the words which relate to agriculture and domestic life agree in Greek and Latin, as *domus*, *ager*, *aratrum*, *vinum*, *oleum*, *lac*, *bos*, *sua*, *ovis*, &c.; while those relating to arms and war, as *duellum*, *ensis*, *hasta*, *sagitta*, &c. are different from the Greek. But this remark is to be taken with considerable limitations, for there are many exceptions both ways; indeed so many as to render the position itself at least doubtful, and all inferences derived from it consequently inconclusive. The words relating to arms and war may have been Oscan; and it has therefore been supposed by Dr. Arnold (*Hist. of Rome*, vol. i., p. 22) not only that the Latins were a mixed people, partly Pelasgian and partly Oscan, but also that they arose out of a conquest of the Pelasgians by the Oscans; so that the latter were the ruling class of the united nation, and the former its subjects.

We have very few specimens of the Latin language previous to the time of Ennius and Plautus, when it had become nearly developed and was substantially the same as in the later times of the republic. The specimens of the ancient language which have come down to us principally consist of fragments of ancient laws preserved by Festus, Cicero, and other writers, and of a few inscriptions. The former, as might have been expected, appear to have been considerably altered; and the latter are unfortunately too few to give us much assistance in tracing the rise and progress of the language. Of these however one of the most important was the ancient song of the *Fratres Arvales*, which was discovered in the year 1777, and which appears to have been the same as was sung in the most early times, though the inscription was not cut till A.D. 218. We subjoin a copy of it with a few remarks on some of the ancient forms which it contains:—

1. E nos, Lases, juvate.
2. Neve luerve, Marmor, sins incurrere in pleoris:
3. Satur furere, Mars, limen sali, sta berber:
4. Semunis alternei advocapit conctos.
5. E nos, Marmor, juvato:
6. Triumpo, triumpe, triumpe, triumpe, triumpe.

1. *Lases* is instead of *Lares*. All Latin words which are now written with *r*, had an *s* originally. Thus Quintilian says (*Inst. Orat.*, i. 4, § 13) that *Valerius*, *Furius*, *arbor*, *labor*, *vapor*, *clamor*, and *lares* were originally written *Valesius*, *Fusius*, *arbos*, *vapos*, *clamos*, and *lases*. According to Pomponius the letter *r* was invented by Appius Claudius. (*Dig.*, i., tit. 2, s. 2, § 36.)

2. *Luerve* is instead of *luervem* or *luerem*, which is equivalent to *luem*. The omission of *m* at the end of words is common in Latin. Thus all the adverbs ending in *o* seem to have lost an *m*, as *quo*, *eo*, &c. [See the article *M*] *M* is also omitted in the same way in the accusative singular of most nouns of the third declension in Greek, and does not appear, if we may judge from the elision in poetry of all syllables ending in *m* before words beginning with a vowel, to have been usually pronounced in Latin. *Luervem*

or *luerem* instead of *luem* corresponds to the ancient forms of *nucere*, *bovere*, *suerem*, instead of *nucem*, *bovem*, *suem*, and also to the common accusative *cinerem* from *cinis*.

*Marmar* is a name of Mars, who was called *Mamers* in the Oscan language. *Sins* is instead of *sinas*. *Pleoris* is the older form of *pueres*. The root of this word is *ple*, as we see in *ple-mus* and *im-ple-o*; and the comparative is formed by adding *ior* or *or*. *Pleores* afterwards became *plures*, in the same way as *reversus* or *reorsus* was shortened into *rursus*.

3. *Satur furere* is to be understood in the same sense as the *longo satiate ludo* of Horace (*Carm.*, i. 2, 37), and *limen sulii* in the sense of *pede pulsa limen*. *Sta* appears here to signify *cease*. *Berber* is an old form of *fervere*, *b* being interchangeable with *f*, in the same way as *βρέμειν* and *fremere*, *rubeo* and *rufus*, &c.

4. *Semunis* is instead of *Semones*. The Oscan language has frequently *a* where *o* is found in common Latin, as *pust* for *post*, *Vettune* for *Vettona*, &c. *Advocapit* instead of *advocabile*, the *e* being omitted as in *dic*, *duc*, *fac*, *fer*. The future is here used in the sense of an imperative. *P* was frequently used in the old language where *b* occurs in the later forms, as *poplicus*, *Poplicola*, *scapres* (*scabies*), and the Oscan *pruhipid*, *pruhipust*, which are connected with *prohibere*.

Two of the earliest specimens of Latinity which have come down to us are the inscription on the Columna Rostrata, erected in the Forum to commemorate the victory of C. Duilius over the Carthaginians, B.C. 260 (*Plin.*, *Hist. Nat.*, xxxiv. 11), and the *Senatus-Consultum de Bacchanalibus*, which was passed B.C. 186. (See Orelli, *Corpus Inscrip.*, No. 549; Drakenborch's *Livy*, vol. vii., p. 97, &c.) In both of these, many of the grammatical forms differ widely from those which were afterwards in use, and approximate closely to the specimens of the Oscan which are still extant. Thus all the ablative cases in these inscriptions end in *ed* or *d*, as *present-ed*, *dictator-ed*, *navale-d*, *prædu-d*, *in alto-d*, *mori-d*, *senatu-d*, &c., which correspond to the Oscan *factu-d*, *dolu-d*, *malu-d*, *cum preivatu-d*, *touta-d*, *præsenti-d*, &c. A similar resemblance is seen in the third person singular of the imperative mood: where, instead of *esto*, we find in old Latin *estod*, and in Oscan *estud*. The Latinity of the *Senatus-Consultum de Bacchanalibus* differs in so many respects from that of Plautus, who lived at the time at which this measure was passed, as to make it probable that many of the ancient forms in Plautus must have been altered in subsequent times.

The history of Latin literature may be divided into three periods: the first extending from the time of Livius Andronicus, B.C. 240, to the death of Augustus, A.D. 14; the second from the death of Augustus to the death of Marcus Aurelius, A.D. 180; and the third from the death of Marcus Aurelius to the time of Cassiodorus, A.D. 539.

*First Period*—From the time of Livius Andronicus, B.C. 240, to the death of Augustus, A.D. 14.—The Romans may be said to have possessed no literature for upwards of 500 years from the foundation of the city; and when they at length began to pay some attention to it, they did little more than translate or imitate the works of the Greeks. The tragedies and comedies of Livius Andronicus, who was the first writer of whom we have any account, appear to have been taken entirely from the Greek; and the same was the case with Cn. Nævius, who was contemporary with Livius Andronicus. The first prose writers were Quintus Fabius Pictor and Lucius Cincius Alimentus, who lived in the time of the second Punic war, and wrote the history of Rome from its foundation to their own times, in imitation of the pontifical annals. Cincius however appears to have written his history in Greek; but both his history and that of Fabius, as well as those of the succeeding annalists, appear, like the pontifical annals which they imitated, to have been very meagre, containing only memorials of the times, of men, of places and events, without any ornament; and provided that their meaning was intelligible, they thought, says Cicero (*De Orat.*, ii. 12), that the only excellence of style was brevity.

Ennius however, who was born B.C. 239, may be regarded as the founder of Latin literature. Though a Greek by birth, he was the first who taught the Romans to write their own language with ease and elegance, and he was chiefly instrumental in introducing among the Romans a love of literature. He lived on intimate terms with some

of the most eminent members of the Roman aristocracy, who began at length to study the Greek language. Cato himself learnt Greek from Ennius; and Scipio Africanus, his son Scipio Nasica, and M. Fulvius Nobilior delighted in his society. At the same time, the later comedy of the Athenians was most successfully imitated by Plautus, whose comedies must have had some influence in improving the taste of the people and even of the aristocracy, though the latter do not appear to have shown him any patronage.

In the year B.C. 155, the study of the Greek philosophy was introduced among the Romans, by the embassy which the Athenians sent to Rome, consisting of three of the most eminent philosophers of the age, namely, Carneades of the Academy, Diogenes the Stoic, and Critolaus the Peripatetic; and though the study was condemned by Cato and many of the old school, it soon made great progress among the Roman nobles. The study of the Greek language and literature was still further promoted by the conquest of Achæa, and by the influence of the distinguished Achæan prisoners, who were distributed among the towns of Italy. Among these was Polybius, who attracted the attention of Paullus Æmilius, and was appointed by him instructor of his two sons, Fabius and Scipio. Though Polybius did not write in Latin, he produced a great influence upon Roman literature. He showed the Romans how the history of their own state ought to be treated; and by his intimacy with Scipio and the most distinguished Romans of the time, he produced a great impression upon the literary character of the age. From this time it became the fashion for all well educated Romans to read, speak, and even write the Greek language; and Greek rhetoricians and philosophers found abundant employment in Rome. Literature however was chiefly prosecuted by the great and noble; the body of the people appear to have remained uneducated.

From the preceding account it will be seen that Roman literature only arose and spread in connection with the study of the Greek literature; and the consequence was not only that the Roman writers made the Greeks their models, but that they rarely attempted any original work. One exception however must be made in favour of the Roman satire, which was essentially home-born, and had nothing similar to it in the Greek language. This species of composition appears to have arisen from the practice, which has prevailed in Italy from the earliest times to the present day, of the country-people making rude extempore verses in ridicule of one another. Lucilius, who was the contemporary of Scipio Africanus and of Lælius, with whom he lived on the most intimate terms of friendship, was the first writer who constructed Roman satires on those principles of art which were considered in the time of Horace as essential requisites in a satiric poem. (*Hor.*, *Sat.*, ii. 1, 61.)

The first century before the Christian æra was the most brilliant epoch of Roman literature. The various writings of Cicero had brought the Roman language to perfection; and almost every species of literature was cultivated with success. In didactic poetry, Lucretius rivalled, and we may say surpassed, all the Greek didactic poets, in his great philosophical poem, which, for vigour of conception and splendour of diction, will bear comparison with the best efforts of the poets of any age and country. In lyric poetry, Catullus and Horace made the first attempts to introduce this species of composition among the Romans; while Tibullus, Propertius, and Ovid produced the most beautiful elegiac poems. During this period also, the epic poem of Virgil appeared; but there was no great dramatic poet. In prose, we possess the histories of Sallust, Cæsar, and Livy; the agricultural and antiquarian treatises of Varro; and the orations, letters, and philosophical and historical works of Cicero. The chief characteristic of the literature of this age originated in the leading feature of the Roman character. The Romans were a practical and not a speculative people; and consequently pure speculation found little favour and encouragement among them. No new system of philosophy sprung up amongst them; they received the different systems of Grecian philosophy without any modification or alteration; and even those who, like Cicero, studied this subject most successfully, appear only to have regarded it in a practical point of view, as a solace in adversity, or as an important auxiliary to the study of oratory. The latter subject, at least under the republic, was more studied than any other branch of literature, since it opened the way to the highest dignities in the state; and the influence of this study may be traced in almost all the works of the

In the preceding list the principal Roman jurists are inserted, but a complete list of them, with the relative proportions, which they have contributed to the 'Digest,' is given under JUSTINIAN'S LEGISLATION, p. 164.

*Works on the Roman Language and Literature.*—The following list of works, though far from complete, may be useful to those who are studying the language and literature of ancient Rome. It is hardly necessary to premise that the works here enumerated have very different degrees of merit, and that some are merely mentioned as the best or only works of the kind, or as the best known to the writer.

*Literature.*—Fabricius, 'Bibliotheca Latina,' edited by Ernesti, 3 vols. 8vo., Lips., 1773-1774; Harles, 'Introductio in Notit. Litt. Romanæ,' 2 vols. 8vo., Norimb., 1794; 'Brevior Notitia Litt. Romanæ,' with supplements, 5 vols. 8vo., 1789-1819; Dunlop, 'History of Roman Literature,' 3 vols. 8vo., Lond.; Bähr, 'Geschichte der Römischen Literatur,' 8vo., Carls., 1832, &c.; 'Abriss der Römischen Literaturgeschichte,' 8vo., Heidelb., 1833; Bernhardt, 'Grundriss der Römischen Literatur,' 8vo., Halle, 1830, a useful work; F. A. Wolf, 'Vorlesungen über die Geschichte der Römischen Literatur,' 8vo., Leipz., 1831; F. Passow, 'Uebersicht der Römischen und Griechischen Literatur,' 4to., Berlin, 1815; 'Grundzüge der Griech. und Röm. Literatur und Kunstgeschichte,' 4to., Berlin, 1829; Gyraldus, 'Historia Poetarum tam Græcorum quam Latinorum,' Basel, 1545; Crinitus, 'De Poetis Latinis,' Flor., 1505; Vossius, 'De Vet. Poetarum Temporibus,' Amst., 1654; Crusius, 'Lives of the Latin Poets,' Lond., 1726; Rambach, 'De Poetarum Lyricorum inter Romanos Paucitate,' 4to., Quedlinb., 1769; Lévée, 'Théâtre complet des Latins,' Paris, 1822, &c.; Donatus, 'De Tragœdia et Comœdia'; J. C. Scaliger, 'De Comœdia et Tragœdia,' in Gronovius's 'Thesaurus Ant. Gr.,' vol. viii.; Sagittarius, 'De Vita et Scriptis Livii Andronici, Nævii, Ennii, Cæcili, Statii, Pacuvii, &c.' 8vo., Altenb., 1672; A. W. Schlegel, 'Vorlesungen über Dramatische Kunst und Litteratur,' 3 vols. 8vo., Heidelb., 1817, translated into French, 3 vols. 8vo., Paris, 1814, and into English, 2 vols. 8vo.; the article DRAMA in this work; Casaubon, 'De Satyrica Graec. Poesi et Romanorum Satira,' Par., 1605, Hal., 1774, ed. Rambach; König, 'De Satira Romana,' Oldenb., 8vo., 1796; Manso, 'Ueber die Römischen Satiriker,' in Sulzer's 'Allgem. Theorie der Schönen Künste,' vol. 4; Ruperti, 'De Satira Romanorum et de Satiricis Romanorum Poetis,' prefixed to his edition of Juvenal; Vossius, 'De Historicis Latinis,' Lugd. Bat., 1651.

A list of the principal editions of the Latin writers, with the best modern works upon each writer, is given in Wagner's 'Grundriss der Classischen Bibliographie,' Breslau, 1840.

*Language.*—Folieta, 'De Ling. Lat. Usu et Præstantia,' ed. Mosheim, Hamb., 1723, 8vo.; Facciolati, 'De Ortu, Interitu, et Instaurazione Linguæ Latinæ,' reprinted at Lips., 1725; Tursellinus, 'De Particulis Latinæ Orationis,' often reprinted; Allen, 'Doctrina Copularum Linguæ Latinæ,' 12mo., Lond., 1830, with a notice of the same work in the 'Journal of Education,' No. 8; Döderlein, 'Lateinische Synonyme und Etymologieen,' 6 vols. 8vo., Leipz., 1826-1838; Struve, 'Ueber die Lateinische Declination und Conjugation,' 8vo., Königs., 1823; Schneider, 'Elementarlehre der Lateinischen Sprache,' and 'Formenlehre der Lateinischen Sprache,' Berlin, 1819, 1821, a valuable work for the archæology of the language; Allen, 'Etymological Analysis of Latin Verbs,' 12mo. Lond., 1836; Scheller, 'Ausführliche Lateinische Sprachlehre,' 8vo., Leipz., 1803, translated into English by Walker; Grotfend, 'Ausführliche Grammatik der Lateinischen Sprache,' 2 vols. 8vo., Hannov., 1829-30; Zumpt, 'Lateinische Grammatik,' 8vo., Berlin, 6th edition, 1828, and frequently reprinted, translated into English by Kenrick, with a notice of the same work in the 'Quarterly Journal of Education,' No. 1: this grammar is far superior in the syntactical part to any other. The student will also derive considerable information from those works which treat of the comparative grammar of the Indo-Germanic Languages, as Bopp's 'Vergleichende Grammatik des Sans-

krit, Zend, Griechischen, Lateinischen, &c.,' of which the first part was published at Berlin, 1833, with a notice of the same work in the 'Journal of Education,' No. 16, by the late Dr. Rosen; and Pott's 'Etymologische Forschungen auf dem Gebiete der Indo-Germanischen Sprachen,' 2 vols. 8vo., Lemgo, 1833-36, with two notices of the same in the 'Journal of Education,' Nos. 18, 20, also by Dr. Rosen.

*Dictionaries.*—Stephani, 'Thesaurus Linguae Latinae;' Facciolati and Forcellini, 'Totius Latinitatis Lexicon,' 4 vols. fol., Padua, 1771, which is superior to all other Latin dictionaries, and the recent edition of the same work enlarged by Furlanetto, 4 vols. 4to., Padua; Adam, 'Dictionary of the Latin Tongue,' 8vo., Edinburgh, 1814, 2nd edition, a superior work to that of Ainsworth; Scheller, 'Ausführliches und Möglichst Vollständiges Lateinisch-Deutsches und Deutsch-Lateinisches Lexicon,' 5 vols. 8vo., Leipz., 1804-6, translated into English by Riddle, who has also published a Latin dictionary in one volume, 8vo.; Freund, 'Wörterbuch der Lateinischen Sprache,' which is to be completed in 4 vols. 8vo., but three only have yet appeared; Schwenck, 'Etymologisches Wörterbuch der Latein. Sprache mit Vergleichung der Griechischen und Deutschen,' 8vo., Francf., 1827; Nizolii, 'Lexicon Ciceronianum,' edited by Facciolati, reprinted in London, 3 vols. 8vo., 1820.

#### ROMAN LAW.

The historical origin of the Roman Law is unknown, and its fundamental principles, some of which even survived the legislation of Justinian, are older than the oldest records of Italian history. The foundation of the strict rules of the Roman law as to familia, agnatio, marriage, testaments, succession to intestates, and ownership, was no doubt custom, which, being recognised by the sovereign power, became law. As in many other states of antiquity, the connection of the civil with the ecclesiastical or sacred law was most intimate; or rather, we may consider the law of religion as originally comprehending all other law, and its interpretation as belonging to the priests and the king exclusively. There was however direct legislation even in the period of the kings. These laws, which are mentioned under the name of *Leges Regiae*, were proposed by the king, with the approbation of the senate, and confirmed by the populus in the *Comitia Curiata*, and, after the constitution of Servius Tullius, in the *Comitia Centuriata*. That there were remains of this ancient legislation existing even in the Imperial period, is certain, as appears from the notice of the *Jus Civile Papirianum* or *Papirianum*, which the Pontifex Maximus Papirius is said to have compiled from these sources, about or immediately after the expulsion of Tarquinius Superbus (*Dig.*, i., tit. 2), and from the distinct references to these *Leges* made by late writers. Still there is great uncertainty as to the exact date of the compilation of Papirius, and its real character. Even his name is not quite certain, as he is variously called Caius, Sextus, and Publius. (*Dion. Hal.*, iii. 36; *Dig.*, i., tit. 2.)

But the earliest legislation of which we have any important remains is the compilation of the code called the Twelve Tables. The original bronze tables indeed are said to have perished in the conflagration of the city after its capture by the Gauls, but they were satisfactorily restored from copies and from memory, for no ancient writer who cites them ever expresses a doubt as to the genuineness of their contents. It is the tradition that a commission was sent to Athens and the Greek states of Italy, for the purpose of examining into and collecting what was most useful in their codes; and it is also said that Hermodorus of Ephesus, then an exile in Rome, gave his assistance in the compilation of the code. There is nothing improbable in this story, and yet it is undeniable that the laws of the Tables were based on Roman and not on Greek or Athenian law. Their object was to confirm and define perhaps rather than to enlarge or alter the Roman law, and it is probable that the laws of Solon and those of other Greek states, if they had any effect on the legislation of the Decemviri, served rather as models of form than as sources of positive rules.

Ten tables were completed and made public by the Decemviri, in B.C. 451, and in the following year two other tables were added. This compilation is quoted by the ancient writers by various titles: *Lex XII. Tabularum*, *Leges XII.*, sometimes *XII.* simply (*Cic.*, *Legg.*, ii. 23), *Lex Decemviralis*, and others. The rules contained in these

tables long continued to be the foundation of Roman law, and they were never formally repealed. The laws themselves were considered as a text-book, and they were commented on by the Jurists as late as the age of the Antonines, when Gaius wrote a commentary on them in six books ('*Ad Legem XII. Tabularum*'). The actions of the old Roman law, called *Legitimae*, or *Legis Actiones*, were founded on the provisions of the Twelve Tables, and the demand of the complainant could only be made in the precise terms which were used in the Tables. (*Gaius*, iv. 11.) The rights of action were consequently very limited, and they were only subsequently extended by the *Edicts* of the Praetors. The brevity and obscurity of this ancient legislation rendered interpretation necessary in order to give the laws any application; and both the interpretation of the laws and the framing of the proper forms of action belonged to the College of Pontifices, who yearly appointed a member of their own body to decide in all doubtful cases. The civil law was thus still inseparably connected with that of religion (*Jus Pontificium*), and its interpretation and the knowledge of the forms of procedure were still the exclusive possession of the patricians.

The scanty fragments of the Twelve Tables hardly enable us to form a judgment of their character or a proper estimate of the commendation bestowed on them by Cicero (*De Or.*, i. 43). It seems to have been the object of the compilers to make a complete set of rules both as to religious and civil matters; and they did not confine themselves to what the Romans called private law, but they comprised also public law. ('*Fons publici privatique juris*,' *Liv.*, iii. 34.) They contained provisions as to testaments, successions to intestates, the care of persons of unsound mind, theft, homicide, interments, &c.

They also comprised enactments which affected a man's status, as for instance the law contained in one of the two last Tables, which did not allow to a marriage contracted between a patrician and a plebeian the character of a legal Roman marriage, or, in other words, declared that between patricians and plebeians there could be no *Connubium*. Though great changes were made in the *Jus Publicum* by the various enactments which gave to the plebeians the same rights as the patricians, and by those which concerned public administration, the fundamental principles of the *Jus Privatum*, which were contained in the Tables, remained unchanged, and are referred to by jurists as late as the time of Ulpian.

The old *Leges Regiae*, which were collected into one body by Papirius, were commented on by Granius Flaccus in the time of Julius Cæsar (*Dig.*, 50, tit. 16, s. 144), and thus they were probably preserved. The fragments of these laws have been often collected, but the best essay upon them is by Dirksen, '*Versuchen zur Kritik und Auslegung der Quellen des Römischen Rechts*,' Leipzig, 1823. The fragments of the Twelve Tables also have been often collected. The best work on the subject is that by James Godefroy (*Ja-Gothofredus*), which, with the more recent work of Dirksen, '*Uebersicht der bisherigen Versuche zur Kritik und Herstellung des Textes der Zwölf-Tafel-Fragmente*,' Leipzig, 1824, seems to have exhausted the subject.

For about one hundred years after the Legislation of the Decemviri, the patricians retained their exclusive possession of the forms of procedure. Appius Claudius Cæcus drew up a book of the forms of actions, which it is said that his clerk Cnaeus Flavius stole and published; the fact of the theft may be doubted, though that of the publication of the forms of procedure, and of a list of the *Dies Fasti* and *Nefasti*, rests on sufficient evidence. The book thus made public by Flavius was called *Jus Civile Flavianum*; but like that of Papirius it was only a compilation. The publication of these forms must have had a great effect on the practice of the law: it was in reality equivalent to an extension of the privileges of the plebeians. Subsequently Sextus Aelius published another work, called '*Jus Aelianum*,' which was more complete than that of Flavius. This work, which was extant in the time of Pomponius (*Dig.*, i., tit. 2, s. 2, § 39), was also called '*Tripertita*,' from the circumstance of its containing the laws of the Twelve Tables, a commentary upon them (*interpretatio*), and the *Legis Actiones*. This work of Aelius appears to have been considered in later times as one of the chief sources of the civil law (*veluti cunabula juris*); and he received from his contemporary Ennius the name of 'wise.'

\* *Egregie Cordatus homo Cains Aelius Sextus.*

**Sextus Aelius** was Curule Aedile, B.C. 200, and Consul, B.C. 198.

In the Republican period new laws (*leges*) were enacted both in the *Comitia Centuriata* and in the *Comitia Tributa*. The *Leges Curiatae*, which were enacted by the *curiae*, were limited to cases of adrogation and the conferring of the *imperium*. The *Comitia Centuriata* were made independent of the senate by the *Lex Publilia* (Liv., viii. 12), which declared that the *leges* passed in these *Comitia* should not require the confirmation of the senate. The *leges* passed in the *Comitia Tributa* were properly called *Leges Tributae* or *Plebiscita*, and originally they were merely proposals for a law which were laid before the senate and confirmed by the *curiae*. But the *Lex Publilia* (B.C. 336), and subsequently the *Lex Hortensia* (B.C. 286), gave to the *Plebiscita* the full force of *leges* without the consent of the senate (Liv., viii. 12; Gaius, i. 3; Gell., xv. 27); and a *Plebiscitum* was accordingly sometimes called a *lex*. The *leges* generally took their name from the gentile name of the magistrate who proposed them (*rogavit*), or, if he was a consul, from the name of both consuls, as *Lex Aelia* or *Aelia Sentia*, *Papia* or *Papia Poppaea*. If the proposer of the law was a dictator, praetor, or tribune, the *Lex*, or *Plebiscitum*, as the case might be, took its name from the proposer only, as *Lex Hortensia*. Sometimes the object of the *lex* was indicated by a descriptive term, as *Lex Cincia de donis et muneribus*.

The *Senatus Consulta* also formed a source of law under the republic. That a *senatus consultum* in the time of Gaius (i. 4) should have the force of law (*vicem legis optinet*), may be easily admitted; but Gaius in this passage appears to be referring not only to such *senatus consulta* as had been passed under the empire, but to the *senatus consulta* generally as a source of law. It appears that the senate gradually came to be considered as the representative of the *curiae*, and that its *consulta*, in many matters relating to administration, the care of religion, the *aerarium*, and the administration of the provinces, had the full effect of laws. It does not seem as if the Romans themselves had a very clear notion of the way in which the senate came to exercise the power of legislation; but they imagined that it arose of necessity with the increasing population of the state and the increase of public business. The senate thus became an active administering body, and, as an easy consequence, that which it enacted (*constituit*) was observed, and this new source of law was termed *Senatus Consultum* (*Dig.*, i., tit. 2). It seems probable that the senate began to exercise the power of making *senatus consulta* after the passing of the *Hortensia Lex*, though it is not pretended that the *Hortensia Lex* or any other *Lex* gave this power to the senate. No *senatus consulta* are recorded as designated by the names of magistrates, till the time of Augustus, a circumstance which seems to show that whatever binding authority *senatus consulta* might have acquired under the Republic, they were not then viewed as laws properly so called, or as having the full effect of *leges*. But from the time of Augustus, the titles of *senatus consulta* frequently occur; their names, like those of the *leges*, were derived from the consuls, as *S. C. Velleianum*, *Pegasianum*, *Trebellianum*, &c., or of the emperor who proposed them, as *S. C. Claudianum*, *Neronianum*, &c., or they were said to be made 'auctore Principe,' or 'ex auctoritate Principis.' The expression applied to the senate, so enacting, was 'censere.' (Gaius, i. 47.) Special *consulta* were sometimes passed for the purpose of explaining or rendering effectual previous *leges*.

A new source of law was supplied by the *Edicta* of those magistrates who had the *Jus Edicendi*, but mainly by the praetors, the praetor urbanus and the praetor peregrinus. The edicts of the praetor urbanus were the most important. The body of law which was formed by the *Edicta* is accordingly sometimes called *Jus Praetorium*, which term however might be limited to the *Edicta* of the praetors, as opposed to those of the curule aediles, the tribunes, censors, and pontifices. The name *Jus Honorarium*, as opposed to *Jus Civile*, comprehends the whole body of edictal law; and the name *Honorarium* was given to it, apparently because the *Jus Edicendi* was exercised only by those magistrates who had the *Honores*. *Jus Civile* in its larger sense comprehended all the law of any given nation; but the *Jus Civile Romanorum*, as opposed to the *Honorarium*, consisted of *Leges*, *Plebiscita*, *Senatus Consulta*, to which, under the empire, were added the *Decreta Principum* and the *Auctoritas Prudentium*. The *Honorarium Jus* was

introduced for the purpose of aiding, supplying, and correcting the defects of the *Jus Civile Romanorum* in its limited sense. (*Dig.*, i., tit. 1, s. 7.)

The historical origin of the edictal power is not known, but in the time of Cicero it had been so long exercised, and the *Edicta* had been so far formed into a regular system, that the study of the edictal law was a main part of the systematic study of the Roman law, and had taken the place of the Twelve Tables as an elementary branch of instruction. (Cic., *Legg.*, ii. 4, 23; i. 5.) Servius Sulpicius, a distinguished jurist and a friend of Cicero, wrote two small books on the Edict, which were followed by a work of Offilius, also on the Edict. Though the history of the edictal law, as already observed, cannot be traced, it thus appears that it had assumed a systematic form in the time of Cicero.

An *Edictum* was a rule promulgated by a magistratus when he entered on his office. It was committed to writing and put up in a public place. Its object was to declare by what rules the praetor would be governed in the administration of justice during the year of his office; and hence the *Edictum* was sometimes called *Perpetuum* or *Annua Lex*. An *Edictum Repentinum* applied only to the particular occasion on which it was made. All offices being annual, the rules of one magistratus were not binding on his successor, but his successor might adopt them into his own *Edictum*, and such adopted *Edictum* then became an *Edictum Tralaticium*. In this way numerous *Edicta* were adopted by one magistratus from the *Edicta* of his predecessors, and thus gradually a body of rules was formed and established, which experience had proved to be useful. Those *Edicta* which were of great importance are often referred to under the name of the magistratus who promulgated them, as the *Edictum Carbonianum* and others.

The general character of the Edict has been already stated. It is described in other words as 'viva vox juris civilis,' as a mode by which the rigid rules of the civil law were altered and extended to suit the altered circumstances of the times. The changes introduced by positive enactments into the *Jus Privatum* of the Roman law seem to have been very unimportant. It was not consistent with Roman notions to alter or change fundamental principles, and most of the legislation of the republican period had reference to the disputes between the two estates of the patricians and plebeians, and to other parts of the *Jus Publicum*. Accordingly it was left to the magistratus gradually to introduce the necessary changes into the *Jus Privatum*; but the process of doing this was in strict conformity to the principles of the old law. The Edict did not affect to make new law, but to adopt as law what custom had sanctioned, provided it was not against the *Jus Civile*; to give an action when a *bonâ fide* right existed, if the old law gave none; to protect a man in *bonâ fide* possession of property, without affecting to give him ownership, which the law alone could give him by virtue of *usucapion*; to aid parties by fictions, which however were always of such a kind that the thing which the fiction supposed, was that which would have given a strictly legal right. A great part of the efficacy of the Edict consisted in extending the remedies by action; and after the abolition of the *Legis Actiones* (with the exception of the *Actio Damni Infecti*, and of matters which belonged to the cognizance of the *Centumviri*) by the *Lex Aebutia* and two *Leges Juliae*, the mode of proceeding in actions was settled by the formulæ of the *Edicta*. Still even here it seems probable that the praetors followed the analogy of the *Legis Actiones* and framed their formulæ accordingly. The *Actiones* given by the Edict were named after their author, as *Publiciana*, &c. The commentators on the Edicts were numerous under the early emperors. Labeo wrote at least four books on the *Edictum* of the Praetor Urbanus. Cælius Sabinus commented on the Edict of the Curule Aediles. In the time of Hadrian, Salvius Julianus, who had himself been praetor, compiled a work on the Edict, which was called *Edictum Perpetuum*. Nothing is known of the detail of this work, but it appears probable that it was designed to be a systematic exhibition of the whole body of edictal law, and as such it must have had considerable influence on the subsequent condition of jurisprudence. At what time the *Edicta* ceased to be made by the magistratus is a disputed point. The edictal power certainly existed under the empire, and even after the compilation of the *Edictum Perpetuum* of Julianus, but it must have been comparatively little exercised, as the practice of

making new laws by *Senatus Consulta* prevailed under the *Cæsars* after the time of Augustus, and the Imperial Constitutions are mentioned as one of the recognised sources of law in the time of the Antonines. (Gaius, i. 5.)

With the establishment of the Imperial Constitution begins a new epoch in the Roman law. The *leges* of Augustus and those of his predecessor had some influence on the *Jus Privatum*, though they did not affect the fundamental principles of the Roman law. A *Lex Julia* came into operation, B.C. 13, but it is better known as the *Lex Julia et Papia Poppæa*, owing to the circumstance of another *lex* of the same import, but less severe in its provisions, being passed as a kind of supplement to it in the consulship of M. Papius Mutilus and Q. Poppæus Secundus, A.D. 9. This law had for its object the encouragement of marriage, but it contained a great variety of provisions: it is not known whether it was passed at the *Comitia Centuriata* or *Tributa*. A *Lex Julia de Adulteriis*, which also contained a chapter on the *dos*, is of uncertain date, but was probably passed before the former *Lex Julia* came into operation. Several *Leges Juliae Judiciariae* are also mentioned, which related both to *Judicia Publica* and *Privata*, and some of which may probably belong to the time of the dictator *Cæsar*.

The development of the Roman law in the Imperial period was little affected by direct legislation. New laws were made by *Senatus Consulta*, and subsequently by the *Constitutiones Principum*; but that which gives to this period its striking characteristic is the effect produced by the *Responsa* and the writings of the Roman jurists.

So long as the law of religion or the *Jus Pontificium* was blended with the *Jus Civile*, and the knowledge of both was confined to the patricians, jurisprudence was not a profession. But with the gradual separation of the *Jus Civile* and *Pontificium*, which was partly owing to the political changes by which the estate of the plebeians was put on a level with that of the patricians, there arose a class of persons who are designated as *Jurisperiti*, *Jurisconsulti*, *Prudentes*, and by other equivalent names. Of these *jurisconsulti* the earliest on record is Tiberius Coruncanius, a plebeian *pontifex maximus*, and consul B.C. 281: he is said to have been the first who professed to expound the law to any person who wanted his assistance (*publice profiteri*); he left no writings, but many of his *Responsa* were recorded. Tiberius Coruncanius had a long series of successors who cultivated the law, and whose *responsa* and writings were acknowledged and received as a part of the *Jus Civile*. The opinions of the *jurisconsulti*, whether given upon questions referred to them at their own houses, or with reference to matters in litigation, were accepted as the safest rule by which a *judex* or an *arbiter* could be guided. Accordingly, the mode of proceeding, as it is described by Pomponius, is perfectly simple; the *judices* in difficult cases took the opinion of the *jurisconsulti*, who gave it either orally or in writing. Augustus, it is said, gave the *responsa* of the jurists a different character. Before his time, their *responsa*, as such, could have no binding force, and they only indirectly obtained the character of law by being adopted by those who were empowered to pronounce a sentence. Augustus gave to certain jurists the *respondendi jus*, and declared that they should give their *responsa* 'ex ejus auctoritate.' In the time of Gaius (i., 7) the *Responsa Prudentium* had become a recognised source of law; but he observes that the *responsa* of those only were to be so considered who had received permission to make law (*jura condere*); and he adds that if they all agreed, their opinion was to be considered as law; if they disagreed, the *judex* might follow which opinion he pleased. The matter is thus left in some obscurity, and, for want of more precise information, we can only conjecture what was the precise way in which these licensed jurists under the empire were empowered to declare the law. It is however clear, both from the nature of the case and the statement of Gaius, that their functions were limited to exposition, or to the declaration of what was law in a given case, and that they had no power to make new rules of law as such; further, the licensed jurists must have formed a body or college, for otherwise it is not possible to conceive how the opinions of the majority could be ascertained on any given occasion.

The commencement of a more systematic exposition of law under the empire is indicated by the fact of the existence of two distinct sects or schools (*scholæ*) of jurists. These schools originated under Augustus, and the heads of

each were respectively two distinguished jurists, *Ant. Labeo* and *Atcius Capito*. But the schools took their name from other jurists. The followers of *Capito's* school were the *Sabiniani*, derived their name from *Massurius Sabinus*, a pupil of *Capito*, who lived under *Tiberius* and as late as the time of *Nero*: sometimes they were called *Capitiani*, from *C. Cassius Longinus*, another distinguished pupil of *Capito*. The other school was called *Proculiani*, from *Proculus*, a follower of *Labeo*. If we may take the authority of *Pomponius*, the characteristic difference of the two schools was this: *Capito* adhered to what was transmitted to him; he looked out for positive rules sanctioned by time; *Labeo* had more learning and a greater variety of knowledge, accordingly he was ready to make innovations, for he had more confidence in himself; in other words, he was a philosopher more than an historical jurist. *Gaius* was himself a *Sabinian*, often refers to discrepancies of opinion between the two schools, but it is not easy to determine from the instances which he mentions, what ought to be considered as their characteristic differences.

The *jurisprudentes* were not only authorised expounders of law, but they were most voluminous writers. *Massurius Sabinus* wrote three books *Juris Civilis*, which formed the model of subsequent writers. The commentaries on the *Edict* were also very numerous, and among them are the names of *Pomponius*, *Gaius*, *Ulpian*, and *Paulus*. *Gaius* wrote an elementary work, which furnished the model for the *Institutes* of *Justinian*. Commentaries were also written on various *Leges*, and on the *Senatus Consulta* of the Imperial period; and finally, the writings of the earlier jurists themselves were commented on by their successors. A long series of writers to whom the name of classical jurists has been given, ends, about the time of *Alexander Severus* with *Modestinus*, who was a pupil of *Ulpian*. Some of the titles of their works as preserved in the 'Digest,' and the 'Index Florentinus;' but with the exception of the fragments which were selected by the compilers of that work, the great mass of juristical literature is nearly lost. [Justinian]

Among the sources of law in the Imperial period are the Imperial *Constitutiones*. A *Constitutio Principis* is defined by *Gaius* (i. 5) to be 'that which the emperor has constituted by *Decretum*, *Edictum*, or *Epistola*;' nor has it been doubted that such *constitutio* has the force of law. As the emperor ultimately possessed all the sovereign power, he became the sole source of law. Under *Augustus* and his successors there were numerous *Senatus Consulta*. In the time of the Antonines there were both *Senatus Consulta* and Imperial *constitutiones*, and the latter are referred to by *Gaius* as being of equally binding force with *Senatus Consulta*. After the time of *Gaius*, *Constitutiones* became more common, and few *Senatus Consulta* were passed. The *Decretum* of the emperor was a decision made in a matter of dispute which came before him either originally or by way of appeal. The *Edict*, or *Leges Edictales*, were formed by analogy to the *Edicta* of the magistrates, and were in effect *Leges*. *Rescriptum* was a general term which comprehended *Epistolæ* and *Subscriptiones*. The *Rescripta* were the answers of the emperor, made either to public functionaries or to individuals who consulted him. Sometimes *Constitutio* and *Rescriptum* are used as equivalent. (*Gaius*, ii. 130.) *Decreta* and *Rescripta*, being decisions in particular cases, could not by their form have the force of *leges*; but when the determination made in a particular case was capable of a general application, it gradually obtained the force of law.

With the decline of Roman jurisprudence began a period of compilations, or codes, as they were termed. The earliest were the *Codex Gregorianus* and *Hermogenianus*, which are only known from fragments. The *Codex Gregorianus*, so far as we know it, began with *constitutiones* of *Sept. Severus*, and ended with those of *Diocletian* and *Maximian*. The *Codex Hermogenianus*, so far as it is known, contained *constitutiones* also of *Diocletian* and *Maximian*, and perhaps some of a later date. Though these codes were mere private collections, they apparently came to be considered as authority, and the codes of *Theodosius* and *Justinian* were formed on their model.

The code of *Theodosius* was compiled under the authority of *Theodosius II.*, emperor of the East. It was promulgated as law in the Eastern Empire A.D. 439; and in the same year it was confirmed in the Western Empire.

Valentinian III. and the Roman senate. This code consists of sixteen books, the greater part of which, as well as of the *Novellæ*, subsequently promulgated by Theodosius II., are extant in their original form. The commission who compiled it were instructed to collect all the *Edicta* and *Leges Generales* from the time of Constantine, and to follow the *Codex Gregorianus* and *Hermogenianus* as their model. Though the arrangement of the subsequent code of Justinian differs considerably from that of Theodosius, it is clear from a comparison of them that the compilers of Justinian's code were greatly aided by that of his Imperial predecessor. The valuable edition of the Theodosian Code, by J. Gothofredus (6 vols. fol., Lugd., 1665), re-edited by Ritter, Leipzig, 1736-1745, contains the first five books and the beginning of the sixth, only as they are epitomized in the *Breviarium*; and this is also the case with the edition of the '*Jus Civile Antejustinianum*,' published at Berlin in 1815. But recent discoveries have greatly contributed to improve the first five books. The most recent edition of the '*Jus Civile Antejustinianum*' is that of Bonn, 1835 and 1837.

The legislation of Justinian is treated of under JUSTINIAN'S LEGISLATION.

There are numerous works on the history of the Roman law, but it will be sufficient to mention a few of the more recent, as they contain references to all the earlier works. *Lehrbuch der Geschichte des Römischen Rechts*, by Hugo, of which there are numerous editions; *Geschichte des Römischen Privatrechts*, by Zimmern; *Geschichte des Römischen Rechts*, by F. Walter, 1840; and for the later history of the Roman law, *Geschichte des Römischen Rechts im Mittelalter*, by Savigny.

#### HISTORY OF MODERN ROME.

*Period I.—Rome under the Gothic Kings.*—After the death of Valentinian III., A.D. 455, the foreign mercenary guards disposed of the crown of the West. A rapid succession of puppet emperors followed each other on the slippery throne. At last Odoacer, an officer of the Imperial guards, of Gothic birth, some say of the tribe of the Heruli, revolted against Orestes, another barbarian officer who had assumed the supreme power in the name of his son Romulus, a mere youth, whose mother was a Roman by birth, and whom he caused to be proclaimed Augustus. The appellation of Romulus Augustulus was given him in derision. Odoacer defeated Orestes, took him prisoner, and put him to death. Romulus was deposed, and banished to Campania or Apulia, with a suitable allowance for his support, A.D. 476. Odoacer fixed his residence at Ravenna, as his predecessors had done. He styled himself 'Patrician,' and professed to govern Italy in the name of Zeno, emperor of the East. He did not assume the purple or other imperial insignia, although historians style him 'Rex.' There are no coins struck in his name; nor did he make any new constitutions or enactments. The form of administration continued as before. Rome had its senate, its *præfectus prætoris*, and *præfectus urbi*. The consuls had been appointed, ever since the time of Arcadius and Honorius, separately, one in the East and the other in the West. In the first year after Odoacer's assumption of power, there was no consul named for the West. Zeno refused to appoint one, in order that he might not countenance the usurpation of Odoacer; and Odoacer did not appoint one himself, not wishing to irritate Zeno. At last, in the year 480, on the representation of the senate, Odoacer named Basilius, junior, consul for the West, and he continued to appoint a consul every following year. In the year 483, Simplicius, bishop of Rome, having died, the clergy assembled to elect his successor, in the presence of the *præfect* of the *prætorium*, who signified to the assembly, in the name of Odoacer, that no election of the bishop of Rome should be made in future without the sanction of the *præfect*. Felix was then declared to be elected. In the same year Theodoric, a chief of the Ostrogoths, of the tribe of the Amali, from which circumstance he is called Theodoric Amalus, to distinguish him from another Theodoric, his contemporary, made peace with the emperor Zeno, who appointed him general of his guards, bestowed upon him part of Dacia and Mæsia, and named him consul for the East for the following year. In the year 487 Odoacer defeated and took prisoner Fava or Feba, a chief of the Rugi, who had possessed himself of part of Noricum. Frederic, son of Fava, appealed to Theodoric, who was residing at Novæ in Mæsia, and who was related to him, and this was the origin

or the pretext of the quarrel between Theodoric and Odoacer. It appears that Zeno had entered into a secret agreement with Theodoric to the effect that Theodoric should take Italy from Odoacer, probably however on the condition of acknowledging the emperor of the East as his suzerain. In the year 489 Theodoric moved towards Italy with the whole tribe of Ostrogoths, his subjects carrying along with them in carts their wives, children, cattle, corn, and other provisions, and even their hand-mills. Odoacer met the invaders on the banks of the Isonzo; but being defeated, he retreated to Verona; and after a second defeat he shut himself up in Ravenna. Theodoric advanced to Milan and Pavia; but having met with some reverses, he was obliged to keep himself within Pavia. In the following year, 490, Odoacer advanced against him, assisted by some troops sent him by Alaric, king of the Visigoths of Gaul and Spain. A battle took place, in which Odoacer being again defeated, he withdrew to Ravenna, whither Theodoric followed him, and fixed his camp in the neighbouring pineta, or pine-forest. The siege lasted more than two years, during which all the rest of Italy submitted to Theodoric. At last Odoacer surrendered through famine, in February, 493. Theodoric made his entrance into Ravenna, and was received by the archbishop at the head of his clergy. At first he treated Odoacer with kindness, but he afterwards caused him to be put to death.

Theodoric sent to Constantinople Festus, princeps or president of the Roman senate, to request of the emperor Anastasius, who had succeeded Zeno, the royal robe, or, in other words, the investiture of the kingdom of Italy, which Anastasius granted, and Theodoric assumed the title of king. He fixed his residence at Ravenna, and did not visit Rome for several years after his accession. In the year 498 Anastasius II., bishop of Rome, having died, great disturbances took place on the occasion of electing his successor. The majority of the clergy elected Symmachus, but another party named a certain Laurentius. The two parties came to blows, many persons were killed, and anarchy prevailed in Rome for a long time. Theodoric, who was an Arian, did not, perhaps through policy, interfere in the quarrel. At last, both parties, being tired of dissension and disorder, appealed to him, when he summoned the two claimants to Ravenna, and declared Symmachus to be duly elected by a majority of votes. In the year 500 Theodoric visited Rome, where he was received by Symmachus, and by the senate and the people, with great pomp. He visited the Vatican Basilica and the Senate-hall; and lastly he addressed the people in a place called Palma, promising to maintain the existing constitutions enacted by the former emperors. An old chronicler quoted by Muratori, who has written the life of St. Fulgentius, and who was present at the ceremony, speaks in high terms of the decorum, splendour, and order which prevailed, and of the applauses of the people. Theodoric gave public games in the Circus for the amusement of the people, and an annual donation of twenty thousand measures of corn. He assigned also two hundred pounds of gold annually out of the revenue of the duty on wine for repairing the imperial palace and the city walls. He named Liberius *præfect* of the *prætorium*; and after having published several edicts, and caused the solemn promise that he had made to the people to be engraved on a brass tablet, which was fixed up in a public place, he returned to Ravenna.

The long reign of Theodoric was for Rome and all Italy a period of peace and prosperity. He himself carried on war in Gaul and in Spain, and added part of those countries to his dominions. He gave in marriage his only legitimate child Amalasontha to Eutaric, a noble Goth, who was appointed consul and colleague of the emperor Justinus in the consulship, A.D. 519. Justinus himself sent to Eutaric the consular toga. Eutaric made his sole entrance into Rome on the first day of the year, and was received with great pomp by the senate amidst the applause of the people. The usual gifts were distributed among the people, both Romans and Goths; public games were given, among others fights of wild beasts, which had not been seen for a long time; the beasts were sent from Africa as a present by Trasmund, king of the Vandals. The magnificence displayed by the Romans on this occasion is said to have surprised even the ambassador from the emperor Justinus, who had come to treat of a reconciliation between the Eastern and Western churches, after the schism occasioned by Acacius. The report of this ambassador, on his return to Constantinople, of what he had seen at Rome, seems to have

excited the jealousy and emulation of the Eastern court, and when, two years after (A.D. 521), Justinian was made consul in the East, he strove to rival Eutaric in the splendour of the public games, and the sums which he distributed among the people of Constantinople.

Under THEODORIC more particulars are given of his long and important reign; here we confine ourselves to those which concern more especially the city of Rome. That prudent king strove to win the affection of the people of Rome by his liberality, his respect for their municipal customs and privileges, his deference towards the senate, which was the supreme court of justice in his dominions, and his protection of the Roman church and clergy. The works of Cassiodorus, and the panegyric of Theodoric by Ennodius, bishop of Pavia, are evidence of this. Illiterate himself, Theodoric encouraged literature and science, and it appears, from one of the letters written in his name by Cassiodorus, that a great number of students from distant countries repaired to Rome. Theodoric enacted that the students should not leave Rome till they had completed a certain course of studies according to their respective pursuits, which was probably ascertained by an examination, and this may have led, in course of time, to the establishment of academical degrees. Towards the end of his life Theodoric became suspicious, because he perceived, that notwithstanding all he had done for Italy, there was still in the hearts of the native Italians a dislike of foreign domination. It was then that the patrician Severinus Boethius, being accused of treason, was tried and condemned to death by the senate of Rome, a sentence which was at first commuted by Theodoric into perpetual imprisonment, but after a time Boethius was put to death, and shortly after Theodoric put to death also the patrician Symmachus, the father-in-law of Boethius. John I., bishop of Rome, on his return from Constantinople, whither Theodoric had sent him on a mission to Justinus, was imprisoned by his order, probably on suspicion of treasonable intelligence with the Byzantine court, and he died in prison at Ravenna, A.D. 526. The clergy of Rome having assembled to elect a successor, dissensions arose which threatened a renewal of the disorders that had taken place at the former election of Symmachus. Theodoric wrote to the senate of Rome suggesting Felix, a man of great merit, as a fit candidate, and his suggestion, which was like a command, was complied with. This was one of the last acts of Theodoric. He died at Ravenna, of a violent dysentery, in August of the same year. Before he died, he sent for his grandson Athalaric, then 10 years of age (Eutharic had died before him), and causing his chief officers, both civil and military, to swear allegiance to him, he exhorted them to maintain a good understanding with the emperor of the East, and to cherish the Roman senate and the Roman people.

One of the first acts of Athalaric, or rather of his mother, Amalasontha, and her minister Cassiodorus in his name, was to signify his accession to the senate and the people of Rome. A letter was afterwards written to the senate expressing satisfaction that in choosing Felix for their bishop the Romans had conformed to the desire of his grandfather, which had been expressed with a view to the public good by recommending to them a person well deserving of the pastoral dignity. Some years after, when Boniface II. died, he indicated in his will a certain Vigilius as his successor in the see of Rome. This however was resented by the clergy and people as an improper interference, and being set aside, John II. was elected, A.D. 532. But as much bribery and corruption had been employed by the rival parties at the election, the senate passed a consultum forbidding under severe penalties any bribe or promise for the purpose of obtaining a see, which was declared to be a sacrilegious offence. All such promises were also declared to be void. Election disputes were to be decided by the senate or other judicial courts, but the expenses of the suit were not to exceed the sum of three thousand solidi, if it concerned the see of Rome, and of two thousand if it concerned other metropolitan sees. This decree, with the sanction of Athalaric, was engraved on marble and placed in the front of the Vatican Basilica. Athalaric left to the clergy and the people of Rome the right of electing their bishop, but reserved to himself that of confirming the election.

Amalasontha had begun her regency with great wisdom; she had been carefully brought up, by her father's directions, and she caused her son to be educated, after the manner of the Romans, in the liberal arts. It seems however that the

Gothic officers, who rather despised it as weak and effeminate, that they wanted a doric, who could not and that instead of ought to keep con exercise himself in to give way, and th himself up to drink A.D. 434 or 435. pillage and slaughter A.D. 539. In the year 540, Vitiges, disheartened by the disaffection of his troops, surrendered himself at Ravenna to Belisarius, and was sent to Constantinople, where he was treated with considerable leniency. The Goths however chose another king in the person of Totila, a brave officer, who soon recovered the greater part of Italy, while Belisarius was absent in the East. Rome and Ravenna however remained in the possession of the imperial forces. In 545 Belisarius returned to Italy, but with an insufficient force. Totila laid siege to Rome, and in the following year entered it by the treachery of some Isaurian sentries, who opened the Porta Asinaria to him in the night. He exerted himself to save the inhabitants, of whom comparatively few were killed by his soldiers. He then went to visit St. Peter's church, where he was received by the deacon Pelagius, who pleaded the cause of his countrymen. Totila, having assembled the senate, reproached them with their ingratitude for the protection and kindness that they had experienced at the hands of Theodoric and Athalaric, whom they had deserted for the Greeks, who had treated them much worse than the Goths. He however forgave them, and lived with the Romans, so say Anastasius and the writer of the 'Historia Miscella,' 'as a father in the midst of his children.' Some reverses which his troops sustained in Lucania inducing him to quit Rome, he partly destroyed the walls, but he spared the public buildings. Taking along with him the senators and other principal citizens, he proceeded towards Campania; and Belisarius, re-entering Rome, immediately set about repairing the walls as well as he could, in the expectation of Totila returning, as he did in the following year, 547, but was repulsed before the city. In 548 Belisarius was again recalled, and in 549 Totila laid siege to Rome, which he again entered through the treachery of some Isaurian sentries, who opened the Porta Capena. The Greek garrison were taken prisoners, except 400 men, who shut themselves up in the Mausoleum of Hadrian, determined to sell their lives dear; but Totila having offered them honourable terms, they accepted his conditions, and most of them entered his service.

Totila recalled the senators and other principal citizens from Campania, treated them kindly, and gave them the amusement of the equestrian games. He fortified the Mausoleum of Hadrian, and made a kind of citadel of it, as the city was too large to be effectually defended.

In 552 Narses was sent to Italy by Justinian. Totila advanced from Rome to meet him, and a battle was fought at Tagina in Umbria, in which Totila was defeated and killed. Next to Theodoric, he was the bravest, ablest, and most humane of the Gothic kings of Italy. Narses entered Rome without difficulty, and the garrison of the citadel surrendered. The Goths now elected at Pavia one of their generals, named Teias, for their king. Teias collected an army and marched to the south. The Roman hostages who had been taken by Totila along with him, were put to death by Teias, to the number of 300; but those Roman citizens who had settled in Campania returned home, and Rome, which had become nearly deserted, began to fill again with inhabitants. Narses having attacked Cumæ, then a strong fortress, in which Totila had placed his treasure, Teias marched to its relief. The two armies engaged near Nocera in Campania, and Teias fell in the battle. With him ended the kingdom of the Goths in Italy. [NARSES.] Under the wise administration of Narses, Rome recovered from the long calamities that it had suffered during the Gothic war. Narses, though not constantly resident in Rome, often visited the city. Rome escaped the devastating incursion of a large party of Franks and Alamanni, who overran Italy to its southern extremity, but were defeated with great slaughter by Narses on the banks of the river Volturnus, after which Narses returned in triumph to Rome with an immense booty. It appears however that the Romans complained of the avarice of Narses to Justinus II., the successor of Justinianus, and that this contributed to the deposition of Narses from his governorship, in which he was superseded by Longinus, who was named Exarch of Italy. The Romans seem to have felt some compunction for their ingratitude towards the veteran commander, who had retired to Naples, and sent their bishop John to invite him back to Rome. Narses accepted the invitation, and died quietly at Rome, A.D. 568, being then above ninety years of age.

*Period II.:—Rome under the Exarchs.*—The Exarchs, having fixed their residence at Ravenna, made a consider-

able change in the administration of Italy. The annual consulship, an institution which, though greatly shorn of its former honours and authority, had been perpetuated, at least in form, with some few interruptions, from the time of the ancient republic, fell into disuse after the year 541. During the Gothic war, Basilius was the last consul appointed. Still it was customary at Rome, in Italy, and in the West in general, to date the years from the consulship of Basilius, junior, and this custom prevailed till nearly the end of the 6th century, as is proved by the epitaph of a noble matron called Cesaria, who died at Arles, A.D. 587, preserved by Baronius, in which it is said that she died in the forty-sixth year after the consulship of Basilius junior, and the twelfth of king Childebert. But the distribution and the names of the provinces had remained the same as under Constantine, and they were administered by consules and præsides. Longinus however abolished these magistrates, and instead of them sent an officer called Dux to each town or district, who was changed every year. Rome was not in this respect more privileged than the rest; it had its duke, or patrician, as he is sometimes called, who was sent from Ravenna. Hence the name of Duchy of Rome, which is often mentioned in the chronicles, but the limits of which are not closely ascertained, and perhaps varied at different times in the dark ages. We find Amelia, Orta, Sutri, and Bleda mentioned as belonging to it. Rome however retained its internal municipal administration and laws, and the clergy and bishop of Rome began to exercise a greater influence in temporal matters than they had done under the Gothic kings. Every new bishop of Rome was elected by the joint votes of the clergy, the senate, and the people, but was not consecrated till he received the approbation of the Exarch, or, through him, of the Eastern emperor. [PAPAL STATE—*Modern History.*]

The Longobards occupied a great part of Italy, but they never took Rome, although they threatened and besieged it several times during the two centuries that their power lasted. This remarkable fact may be partly explained by the circumstance of Rome being doubly protected by the presence of her bishop, who was highly venerated in all the West, and by the temporal jurisdiction exercised over it by the Greek emperor. The Longobards never formed a compact kingdom; they did not possess all Italy, as the Goths had; the Eastern emperors retained a considerable part of the country, and their power, though distant, was still considered formidable. [LONGOBARDS.]

The Romans however did not always live on the best terms with the Byzantine Exarchs and their delegated dukes, for we read of several instances in which the dukes committed acts of violence against the clergy, and even against the bishop of Rome [MARTIN I.]; we read of revolts in Rome against the Exarch, sometimes encouraged by the Byzantine delegates; we find in the year 638, the treasury of the Basilica, or church of the Lateran, broken into by the imperial garrison, and the contents partly used for the payment of the troops and partly remitted to the emperor at Constantinople, an act of violence which, Muratori observes, the Longobards never perpetrated in the countries subject to them. The removal of the treasures, it is said, took eight days. The emperor Constans II. visited Rome about A.D. 660, and was received with great honours by pope Vitalianus, but on his departure he took away a quantity of bronzes and other valuable ornaments, among the rest the bronze plates which covered the roof of the Pantheon. (Paulus Diaconus, v. 11.) Occasional disputes between the see of Rome and that of Constantinople, about points of dogma or discipline, served to alienate the Romans still more from their allegiance to the emperors. Lastly came, in the early part of the eighth century, the great schism of the Iconomachi, or Iconoclasts, which led to the total separation of Rome from the Eastern empire. [LEO III., *Isauricus.*]

The people of Rome, those of Ravenna, of the Venetia, and of Italy in general, refused to obey the orders sent by the emperor Leo to remove the images from the churches. Pope Gregory II. condemned the Iconomachi as heretics. Leo, being irritated, laid a capitation tax upon his Italian subjects, but the pope opposed this measure. Duke Basilius, Marinus Spatharius, military commandant, Jordanus Carthularius, treasurer, and other imperial officers at Rome, conspired against the life of the pope, being encouraged, it is said, by the Exarch Paulus; but the people of Rome rose in defence of their pontiff, killed Jordanus and another of the conspirators, and obliged Basilius to become

a monk in order to save his life. The Exarch sent troops from Ravenna against Rome, but they were met on their way by the Longobards of the duchy of Spoleto, and obliged to retire. Luitprand, king of the Longobards, thought of availing himself of these dissensions to extend his own dominion and drive the Byzantines from Italy, and he took the part of the pope. The pope however does not seem, as Theophanes (*Byzant. Hist.*) has insinuated, to have encouraged any open revolt against the emperor, and he is said even to have prevented the imperial troops, which were stationed at Ravenna and in the Venetia, from proclaiming another emperor. (Paulus Diaconus, vi. 49.) Luitprand however besieged Ravenna, and took it, but it was soon after retaken by the Byzantines, with the assistance of a Venetian squadron (A.D. 729). Peace being concluded between Luitprand and the Exarch Eutychius, they both proceeded to Rome, in order to restore that city and duchy, which were in a state of revolt, to the imperial allegiance, which was effected without much opposition, the pope acting as mediator.

Gregory III., who succeeded Gregory II. in 731, continued to maintain the use of images, in opposition to the emperor, who seems not to have had the means of enforcing his orders in Italy, as he had done in the East. The dispute therefore became merely one of words, and Rome remained quiet, and owned, at least nominally, the emperor as her sovereign. About the year 739, Trasimund, duke of Spoleto, having revolted against king Luitprand, the latter marched to Spoleto, and Trasimund escaped to Rome. Luitprand demanded the person of the fugitive, but the pope and the imperial governor, according to Anastasius, in his *Historia Ecclesiastica*, refused to give him up, and, some time after, Trasimund, with the assistance of the duke of Benevento and of the Romans, recovered his duchy. This brought on a rupture between Luitprand and the Romans, and the devastation by the Longobards of part of the Roman duchy, which induced pope Gregory to think of applying for support to Charles Martel, whose fame was great in the West, especially after his defeat of the Saracens at Poitiers. Gregory sent an embassy to Charles Martel, about the year 740, with presents and the keys of the sepulchre of St. Peter, and with an offer of transferring the allegiance of the duchy of Rome from the emperor to him, provided Charles would protect Rome against the Longobards. It does not appear that Charles interfered actively in this business, but he sent an embassy to the pope with rich presents. This however was the beginning of the connection of the popes with the kings of France. On the death of Gregory, his successor, Zacharias, adopted a different course of policy, and, instead of applying for assistance from beyond the Alps, sent an embassy to king Luitprand, to beg of him to let the duchy of Rome have peace, and to propose at the same time to unite the forces of the Romans with his against the duke of Spoleto. It appears that the citizens of Rome, independently of the imperial garrison sent from Ravenna, had their own militia, which must have been of some importance, as we hear repeatedly of its acting in the field, either against or with both Longobards and Greeks. Much confusion however arises through Paulus Diaconus and other old chroniclers applying indiscriminately the word Romans to all the subjects of the emperor in Italy, as well as to his soldiers, for the Eastern empire was still called Roman. Thus we hear of the Romans defeating the soldiers of Luitprand near Ariminum and Fanum, which probably refers to the imperial troops under the exarchs of Ravenna. Luitprand accepted the offer of Zacharias, and the united Longobard and Roman forces compelled Trasimund to submit. Luitprand obliged him to take clerical orders, and appointed his nephew duke of Spoleto.

Pope Zacharias had an interview with Luitprand at Orta, when the king received him with great honours, and restored all the prisoners made in the preceding war, not only those belonging to the duchy of Rome, but also those belonging to Ravenna and its territory. At the same time Luitprand restored several towns and domains belonging to the duchy of Rome, which he had occupied, but he gave them in writing as a donation to St. Peter, and not to the duchy or the empire. The duke of Chiusi and other personages of his court were sent to escort the pope back to Rome.

In the following year, 742, the Exarch of Ravenna, with whom Luitprand was still at war, unable to resist the

Longobards, appealed to the pope to mediate between them, and Zacharias repaired with some difficulty to Pavia, where he prevailed on Luitprand to make a truce with the Exarch, and to restore some districts belonging to Ravenna, and two-thirds of the territory of Cesena; the king was to retain the other third until the return of the ambassadors whom he had sent to Constantinople.

Luitprand died about 743. He was one of the ablest and wisest kings that the Longobards ever had. His successor Ratchis, at the recommendation of the pope, concluded, in 744, a truce of twenty years with the Eastern emperor. Five years afterwards however Ratchis, for reasons which are not known, broke the truce, invaded the Pentapolis, and besieged Perugia. Zacharias with part of his clergy repaired to his camp, and there prevailed on the king to restore peace. Soon after Ratchis abdicated the crown, and retired to Monte Cassino, where he became a monk. His brother Astolphus succeeded him, and peace was maintained as long as Pope Zacharias lived. His successor Stephen III. was either not so conciliating or not so successful, for soon after his accession (A.D. 753, according to others 752), war broke out again in Italy, Astolphus became master of Ravenna, and threatened Rome, demanding her submission and a capitation tax from all the inhabitants of the duchy. After some fruitless negotiations, Pope Stephen repaired to Pavia with John Silentiarius, an imperial commissioner, but Astolphus was deaf to their remonstrances. The pope then went to France, where he crowned Pepin, the son of Charles Martel, king, declaring him and his two sons Charles and Carloman patrons of Rome. [PEPIN LE BREVE.] Pope Stephen at the same time pleaded his cause with Pepin against the Longobards, and it was resolved in a council of the Frankish nobles to make war against Astolphus. Pepin entered Italy with a large army, and Astolphus shut himself up in Pavia. After a short siege, a treaty was concluded, by which Astolphus promised to leave Rome in peace, and to restore the towns of the duchy which he had seized. Pepin, whose forces were led by turbulent nobles, was obliged to recross the Alps, and Astolphus broke his promise, and in the year 755 he besieged Rome and devastated its territory. The pope de-patched by sea messengers with an autograph letter addressed to Pepin, his sons, and the whole Frankish nation, requesting them in the name of St. Peter to defend Rome and the church. Pepin again crossed the Alps. Astolphus retired to Pavia, and soon after concluded a new treaty, by which he engaged to pay a large sum of money, and not only to restore all that belonged to the duchy of Rome, but also Ravenna and the Exarchate to the see of St. Peter. In the mean time Constantine, emperor of the East, had sent ambassadors to the Franks, who, on arriving at Marseille, were surprised and grieved to find that Pepin had already crossed the Alps. One of them, called Gregory, overtook Pepin near Pavia, and urged the restoration of the Exarchate to his master. Pepin replied that he had already given it to St. Peter, and dismissed the ambassador. The act of donation of the Exarchate, the Pentapolis, and the town of Comacchio was made by Pepin. [PAPAL STATE.] In the following year, 757, Astolphus died, and Desiderius, duke of Istria, was proclaimed king of the Longobards. Desiderius refused to observe the stipulations of Astolphus, and retained several towns of the Exarchate; he also refused to restore the domains of the church situated in his kingdom, which went by the name of 'Justitia beati Petri.' A convention however was entered into between Desiderius and the pope about the year 760, and a letter of thanks was sent to Pepin in the name of the senate and the people of Rome for his effectual protection.

In the year 767, after the death of Pope Paul I., a disgraceful scene took place in Rome. Toto, duke or governor of Nepi, entering Rome with a body of men, compelled several bishops to ordain and consecrate his brother Constantine, a layman, and he put him in possession of the Lateran. Others of the clergy escaped, and applied to the Longobard duke of Spoleto, who in the next year sent a party of armed men, who defeated and killed Toto. The clergy then elected Stephen IV., and the mob tore to pieces Constantine and his adherents.

In the year 768 Pepin died, and was succeeded by his two sons, Charlemagne and Carloman, but the latter soon after dying, Charlemagne remained sole king of the Frankish monarchy. A fresh quarrel broke out between Desiderius and Pope Adrian I., and Desiderius advanced with an army as far as Otricoli. The pope sent three bishops to threaten

him with excommunication if he violated the territory of the duchy of Rome, and Desiderius returned to Pavia. Adrian had applied for assistance to Charlemagne, who passed the Alps and besieged Desiderius within Pavia. Desiderius surrendered in 774, and the kingdom of Italy passed under the dominion of the Franks.

*Period III.—Rome under the Emperors of the Carolingian Dynasty, A. D. 774-888.*—Charlemagne, having assumed the iron crown of Lombardy, confirmed Pepin's donation to the pope, who acknowledged him as patriarch of Rome and his temporal superior. In the year 800 the sovereignty of Charlemagne over Rome was confirmed by Pope Leo III., who crowned him at Rome emperor of the West, with the title of Carolus I., Cæsar Augustus, a title which was acknowledged by Nicephorus, emperor of the East, who defined the limits between the two empires. [CHARLEMAGNE.] Those limits in Italy were the old boundary between the Longobard duchy of Benevento and the Byzantine provinces of Apulia and Magna Græcia. Rome and Ravenna were included within the limits of the new Western empire, of which Rome was still the nominal capital. From that time the popes assumed a temporal authority over the city and duchy of Rome, subordinate however to the emperor of the West as their suzerain; and they began to coin money with the name of the pope on one side and that of the emperor on the other. The pope was in fact a great vassal of the empire, but his authority was also limited by that of the senate and the general assemblies of the people and clergy. The name of Roman republic was even occasionally revived. Like other great vassals, the popes made subinfeudations to numerous nobles or barons in the duchy of Rome and the Romagna. [ROMAGNA.] The period of the Carolingian supremacy was upon the whole prosperous for Rome. The Western emperors made ample donations to the papal see, and the papacy being the highest object of ambition in those times, and the fountain-head of clerical dignities, Rome became the resort of numerous applicants, and again assumed the appearance and bustle of a great capital. But the public peace was often disturbed at Rome by factions, especially among the clergy, in which however the lay population took an active part. Instances of the violence and atrocities committed on those occasions are given under LEO III.

Under Louis the Pious, successor of Charlemagne, Lotharius, his colleague in the empire, came to Rome for the express purpose of reforming many abuses. In doing this he acted in concert with Pope Eugenius II. He restored much property to its lawful owners, which had been unjustly appropriated by the papal fiscus under the preceding pope, Paschal I., who was also accused of having caused several of the clergy to be put to death without a regular trial; he dismissed and banished those Roman judges who had been guilty of great extortion, and in lieu of them he appointed judges 'ex latere imperatoris,' who were to hold office as long as the emperor should think proper. Lotharius made several constitutions regulating the privileges of the city and duchy of Rome, and also calculated to prevent the disorder, violence, and robberies which generally took place during the election of a new pope. Imperial *missi*, or commissioners, were directed to be sent every year to bear complaints against the judges, dukes, and officers of the government, and report first to the pope, who was to see justice done and then report to the emperor. They were also to ask the senate and people of Rome by what laws they would be judged, whether by the Roman, the Longobard, the Salic, or the Ripuarian, which were all in force in Italy at the time, owing to the admixture of various nations who had settled in the country. Several nobles having taken possession of church property on the pretence that it was given to them by former popes, Lotharius ordered its immediate restitution. Lastly, and this is not the least curious feature of the times, Lotharius enjoined the inhabitants of the duchy of Rome from committing depredations on the borders of the neighbouring provinces of the kingdom of Italy. Lotharius called into his presence the dukes, judges, and other magistrates who were in Rome, and registered their names and offices; he instructed them on their duties, and enjoined them to pay proper respect to the pope, if they valued the favour of the emperor. According to the continuator of Paulus Diaconus, Lotharius, before he left Rome, required of the clergy and people a solemn oath of fidelity to Ludovicus and Lotharius, emperors, in which there was also a protest against any future election of a

pope which should not be according to the canonical forms, and a promise not to cause the pope elect to be consecrated until he had taken the oath of fidelity to the imperial commissioner. All these reforms, promises, and protestations were however forgotten during the subsequent weakness and decline of the Carolingian dynasty, and the old system of misrule prevailed at Rome more than ever.

Louis II., son of Lotharius, being appointed by his father king of Italy about the year 844, repaired to Rome, where he was crowned, whilst the French soldiers whom he had brought along with him remained outside of the walls plundering the country. In the following year an armament of Saracens or Moors came to the coast of Rome, ascended the Tiber, and plundered the churches of St. Peter and of St. Paul outside of the walls. It was in consequence of this that Pope Leo IV. determined to enclose the Vatican Basilica and its adjoining suburb by a wall; and Lotharius and his brothers sent money for the purpose, besides which a tax was laid on the duchy of Rome. The line took four years to complete it. Under the year 856 is registered a dreadful inundation of the Tiber, followed by a pestilence which destroyed a great part of the inhabitants of Rome.

Louis II., son of Lotharius, who had assumed the imperial crown, as well as that of Italy, after the death of his father, and who must not be confounded with his cousin Louis II. of France, called 'Le Begue,' or the stammerer, son of Charles the Bald, and grandson of Louis the Pious [Louis II. of France], resided in Italy, continually waging war against his great vassals, the dukes of Spoleto and Benevento, and also against the Greeks and the Saracens. He was a good-natured and well-intentioned but weak prince. Under his reign the usual disturbances took place at Rome during the elections of new popes.

Adrian II. being elected pope in 867, without the knowledge of the imperial commissioners, who protested against his consecration, Lambert, duke of Spoleto, entered Rome with a party of soldiers, and, upon the pretence that the people were rebels against the emperor, he plundered the town, broke into churches and monasteries, and carried off many young women. Lambert however was punished by the emperor, being deprived of his duchy, and the election of Adrian was confirmed. Adrian was married before he took priest's orders, and his wife Stephanica was still living separate from her husband with a daughter, who was betrothed to a noble Roman. Eleutherius, brother of Anastasius, rector of S. Marcellus, and bibliothecarius of the Roman see, carried off the girl and married her clandestinely. It seems that the pope undertook to separate them, when Eleutherius, a violent man, went to Stephanica's house and killed both mother and daughter. Adrian demanded a trial of the murderer by the imperial commissioners: Eleutherius was condemned to death, and his brother Anastasius was excommunicated by a council.

The emperor Louis II. died A. D. 875, and his succession was disputed between Louis, king of Germany, and his brother Charles the Bald, king of France. A period of confusion followed, in which the imperial authority in Italy became almost extinct. Charles was proclaimed emperor, but died soon after, A. D. 877; then Carloman, son of Louis of Germany, caused himself to be proclaimed king of Italy by the nobles of Lombardy; and lastly, after his death, Charles the Fat, Carloman's brother, was crowned emperor at Rome, by Pope John VIII., A. D. 880. In 885, after the death of Pope Adrian III., the territory of Rome was ravaged by swarms of locusts from Africa. Stephen V., Adrian's successor, found the people famishing, the granaries empty, and the Lateran palace and the Basilicæ stripped of their treasures in the interregnum between the late pope's death and the installation of his successor. The new pope sold his patrimonial property to relieve the poor. He ordered holy water to be sprinkled over the country in order to destroy the locusts, but finding this insufficient, he promised a reward for every measure of dead locusts brought in by the peasants.

In the year 887 Charles the Fat was solemnly deposed as unworthy of the crown, and in him ended the imperial dynasty of the Carolingians. Arnulfus, a natural son of Carloman, was elected in Germany; Eudes, count of Paris, was proclaimed in France; and Berengarius, duke of Friuli, of Frankish race, was elected king of Italy by the nobles.

*Period IV.—Rome during the disputed succession to the kingdom of Italy, 888-961.*—Berengarius had for a competitor Guy, duke of Spoleto, who collected a large force and defeated Berengarius on the banks of the Trebbia. Guy

was crowned king of Italy, at Pavia, by a council of bishops, and afterwards repaired to Rome, where he was crowned emperor by pope Stephen VI., in February, 891. Pope Stephen soon died, and a double election followed, one part of the clergy and people of Rome choosing a deacon named Sergius, and another electing Formosus, bishop of Porto. Formosus remained master of the field, and Sergius fled to Tuscany. In 894 Arnulfus came to Italy from Germany with a large army, being invited both by pope Formosus and by Berengarius. He took Brescia and Bergamo, the latter by storm; his German soldiers committed the greatest atrocities, which so frightened the other towns of Lombardy, that they opened their gates. On the death of Guy, his son Lambert remained to dispute the crown against both Berengarius and Arnulf. In 895 Arnulf repaired to Rome, drove away the partizans of Lambert, who had occupied the Leonine or Vatican suburb, and was received at the Milvian bridge with great honour by pope Formosus and the Roman senate. He was crowned emperor by Formosus, and received the oath of allegiance of the city of Rome. Retreating to the north, he crossed the Alps into Germany, his troops being harassed on their march by the revolted population of Lombardy. The history of Italy during the latter part of the ninth and the first part of the tenth century is extremely obscure and confused, and it is hardly possible to ascertain dates and facts accurately. In the year 897, pope Stephen VII., who had disinterred the body of his predecessor Formosus, and thrown it into the Tiber, was seized by the revolted Romans, cast into prison, and strangled. [FORMOSUS.] John IX., in a council held at Rome, annulled the election of Arnulf, and confirmed that of Lambert as lawful emperor. In the same council it was again decreed that no pope elect should be consecrated without the Imperial sanction; and it was likewise forbidden, under pain of canonical censure, and of the Imperial displeasure, to strip the pontifical palace at the death of a pope, a practice which was become customary on the part of the relatives of the deceased, not only in Rome, but in other Italian sees.

Pope John then proceeded to Ravenna, where he met Lambert, and held another council of seventy-four bishops, in which, among other things, it was decreed that every Roman should be at liberty to appeal to the Imperial court. Lambert, on his part, confirmed the pope in the possession of the lordship of Rome, the Exarchate, and the Pentapolis. In the following year Lambert was killed while hunting, and Berengarius was acknowledged by most towns as sovereign of Italy.

In the year 899 the Hungarians entered Northern Italy, committed dreadful ravages, and defeated Berengarius. In the same year Ludovic, or Louis, king of Provence, came into Italy, was proclaimed king at Pavia, and in the following year was crowned emperor at Rome by Benedict IV., where he also administered justice to those who resorted to him.

In the year 902 Berengarius re-appeared in the field, defeated Ludovic at Verona, and took him prisoner, but allowed him to return to Provence. After the death of Benedict IV., at Rome, the usual disorders took place on the election of his successor Leo V., who, after two months, was deposed and imprisoned by Christopher, his chaplain, who, in 904, was also driven away by another faction, and Sergius III. was elected pope. Sergius completely restored the Basilica of the Lateran, which had fallen to ruin. The Saracens from Sicily were now devastating Southern Italy; the Spanish Moors, having formed a settlement at Frassineto on the coast of Liguria, overran the neighbouring valleys of Piedmont; and the Hungarians also crossed the Alps to devastate the plains of Lombardy. It was then that Berengarius permitted the towns to fortify themselves with walls, ramparts, and ditches. At Rome, Theodora, a woman of loose character, and her daughter Marozia, wife of Alberic, patrician, were exercising considerable influence in municipal and also in ecclesiastical affairs, and they brought about the election of John X., said to be Theodora's lover. [JOHN X.] This pope crowned Berengarius emperor in the Vatican, with great pomp, A.D. 916. About the same time the Saracens were completely routed and destroyed on the banks of the Liris, by the united troops of Berengarius, and of the dukes of Benevento, of Naples, and of Gaëta.

In the year 921 several Italian nobles and the archbishop of Milan conspired against Berengarius, and called to the throne Rudolf II., king of Burgundy. After much fighting,

Berengarius was assassinated at Verona, in March, 924. He was by all accounts a good, just, and humane prince, in an age of barbarism. Hugh, duke of Provence, being called by a strong party, came into Italy, drove away Rudolf, and was crowned king at Milan, A.D. 926. During this period of confusion Rome was left to itself and its factions. Marozia and her second husband, Guy, duke of Tuscany, supported by armed partisans, and having possession of the castle of St. Angelo, ruled by force. The pope, John X., who had already quarrelled with the marquis Alberic, Marozia's first husband, was also in opposition to Guy. A party of Marozia's satellites entered the Lateran palace, murdered Peter, the pope's brother, and dragged the pope to a dungeon, where he soon after died; it was said that he was smothered. His successor Leo VI. died in a few months, and he also was murdered, according to report. Of Leo's successor, Stephen VII., nothing is known. To Stephen succeeded John XI., son of Marozia. Duke Guy being now dead, his brother Lambert succeeded him as duke of Tuscany; but king Hugh, his half-brother, being jealous of him, seized him, deprived him of his sight, and substituted his brother Boson in the duchy. Hugh, who wished to have Rome in his possession and to be crowned emperor, proposed to marry Marozia, who accepted the offer. Hugh came to Rome, A.D. 931, was received by his bride in the castle of St. Angelo, having left his armed bands outside of the walls. He is said, by Luitprand, to have behaved insolently towards the Roman nobles, and to have given a blow in the face to Alberic, Marozia's son, while the latter, by his mother's desire, was handing him a ewer and basin to wash his hands. Alberic conspired with the nobles against Hugh, and besieged him in the castle, from which Hugh escaped by being lowered down the wall by a rope, and repairing to his camp, quitted the duchy of Rome. Alberic placed his mother in confinement, and let his half-brother John XI. attend to his duties as pope, but he allowed him no share of temporal power, and watched him closely.

Alberic assumed the title of prince and senator of all the Romans, 'Dei gratia humilis princeps atque omnium Romanorum senator.' It is conjectured by some, that the senate of Rome consisted at that time of a certain number of counts, each of whom presided over a region, and that the 'princeps senatus,' or president, was also the head magistrate of the whole city. (Conrigius Curtius, *De Senatu Romano post Tempus Reipublicæ Liberæ*.) Alberic struck money in his name, with the legend 'Albericus P.' He governed Rome till his death, which happened about the year 954, and he appears to have administered it wisely; he reformed many abuses, and above all checked the licentiousness of the clergy and convents. King Hugh then marched against Rome, and devastated its territory, but he could not enter the city. At last Hugh, through his tyranny and debauchery, became odious to the Italians, who called to their deliverance Berengarius, marquis of Ivrea, who had taken refuge in Germany. Berengarius arrived with some troops, and entered Milan, where many Italian nobles and prelates joined him. Hugh, who had retired to Pavia, sent his son Lotharius to Milan, proposing to transfer the crown to that youth. The modest demeanour of Lotharius so pleased the assembled people, that they unanimously proclaimed him king, but Berengarius exercised all the authority in his name, A.D. 946. Hugh returned to Provence, where he died. In the year 949 or 950 Lotharius died, not without suspicion of poison administered by Berengarius, who was proclaimed king, with his son Adalbert as his colleague, and both were crowned at Pavia. Berengarius wished his son to marry Adelaide, the widow of Lotharius, who was only twenty years of age and on her refusal he shut her up in prison. Her sufferings have been sung in Latin verse by a contemporary nun called Rosvida. A priest found access to Adelaide's prison, and led her out in disguise to Adhelard, bishop of Reggio, who gave her in charge to Azzo, lord of Canossa, the great-grandfather of the famous Countess Matilda. Otho of Saxony, king of the Germans, being informed of all this, came to Italy with an armed force, in the year 951, defeated Berengarius, and married Adelaide at Pavia, and in the following year returned to Germany. He however allowed Berengarius to retain the crown of Italy as his vassal, after swearing fidelity to Otho in the presence of the court and army, except Friuli and the March of Treviso, which were kept by Otho under his immediate dominion. Otho himself handed to Berengarius a sceptre of gold, in token of investiture.

From this transaction arose the claims of the kings of Germany upon the kingdom of Italy. Berengarius however soon forgot the lesson that he had received: he laid siege to Canossa, intending to revenge himself upon Azzo, but Otho came again from Germany, defeated and deposed Berengarius, and was himself elected king of Italy, and crowned in the church of S. Ambrose at Milan, with the ancient crown and other insignia of the Longobard kings. [OTHO I.]

Meantime, prince Alberic having died at Rome, his son Octavianus, a mere youth, assumed the title of prince of Rome, and on the death of pope Agapetus II., A.D. 956, he was also elected pope, by the name of John XII. He was the first who changed his name on being made pope. Whilst Rome and its duchy had become in fact independent of the kingdom of Italy, the kings of Italy, on their side, had taken possession of the Exarchate, and Adalbert, son and colleague of Berengarius, had his residence at Ravenna, till he was deposed by Otho.

*Period V. :—Rome under allegiance, real or nominal, to the kings of Germany and of Italy, 961-1278.*—Otho, after his coronation at Milan, repaired to Rome, where pope John XII. crowned him emperor. He swore to respect the authority of the Roman see, and not to encroach upon its temporal rights and possessions. He was acknowledged emperor, and his son as king of the Romans, but the pope remained lord of the Roman duchy as a great imperial feudatory, as in the time of the Carolingians. It has been observed by some writers that the imperial dignity was thus restored to the French kings, as the name of Francia was then given also to Germany, and Constantine Porphyrogenetus (*De Administrando Imperio*) calls Otho king of Saxony and Francia.

In the year 963 Otho returned to Rome, being called there by numerous complaints against pope John, who, it was said, had transformed the Lateran Palace into a brothel, and also by information which he received of intrigues between the pope and Adalbert, son of Berengarius, who had still a party in Italy. John escaped, and Otho assembled a council in the Vatican, which, having heard the charges against John, deposed him, and elected Leo VIII. The clergy, senate, and other orders, styled *Primates Romanæ civitatis*, sanctioned his deposition, and swore not to proceed in future to elect a pope without the emperor's consent. In the following year, after Otho's departure from Rome, John re-entered the town, called together another council, which declared the election of Leo VIII. unlawful, and put to death or mutilated many of those who had taken part in the former council: '*Multa cæde primorum in urbe debacchatus*,' are the words of the chronicler Gerbert. [JOHN XII.] Upon hearing this, Otho marched against Rome, but pope John dying, his faction elected Benedict V., whilst Leo remained with the emperor. Otho then besieged Rome, and reduced it by famine. Benedict was deposed, and exiled to Germany, and Leo was reinstated. Both Leo and Benedict however died soon after, and Otho having sent the bishops of Speyer and of Cremona as his commissioners to be present at the election, John, bishop of Narni, was elected by the clergy and people, A.D. 965. John, styled XIII., however, having incurred the dislike of the nobles by his haughtiness and harshness, was seized by the præfect of Rome, and taken prisoner to a castle in Campania, where he remained ten months, after which, through fear of Otho, he was liberated and restored to Rome. Otho came to Rome, and hanged thirteen of the principal people, styled by some, tribunes, who had taken part in those proceedings; the præfect however escaped.

Rome remained tolerably quiet during the remainder of Otho's reign: but after his death, A.D. 973, it again fell a prey to disorder. A faction, at the head of which were a cardinal called Francone and a certain Crescentius, seized pope Benedict VI., and strangled him. Francone took possession of the papal chair, but he was soon driven away, though not before he had plundered the Vatican Basilica. Benedict VII. was then elected with the approbation of Otho II., A.D. 974. Nothing particular seems to have occurred at Rome till Otho II.'s death, which took place in that city in the year 983.

During the long minority of Otho III. there was anarchy at Rome. Cardinal Francone, who styled himself Boniface VIII., having returned to Rome, put to death pope John XIV., and again usurped the papal chair; but he died suddenly in the year 985, and his body was dragged through the streets by the populace. John XV. was elected his

successor, but Crescentius, who is styled senator of Rome, probably the chief senator, and by others consul, quarrelled with the pope, took possession of Hadrian's mausoleum, and obliged John to run away. Crescentius however soon after recalled him, and went with the senate in a body to ask his forgiveness. The chronicler Romualdus of Salerno says that the nobles, '*Romani Capitanei*,' had usurped the authority in Rome. In the year 989 the empress regent Theophania, young Otho's mother, came to Italy, and visited Rome, from whence she issued several placita and diplomas. We are told that there were at that time within Rome no less than 40 convents of men and 20 of nuns, chiefly Benedictines, besides a vast number of regular canons.

In the year 996 Otho III. came to Ravenna with a numerous army. Pope John XVI. having died about that time, Otho sent to Rome his relative Bruno with the archbishop of Mainz and the bishop of Utrecht, and the Romans elected Bruno by the name of Gregory V. Otho was crowned emperor at Rome. He cited before him Crescentius for his conduct to the late pope John, condemned him to exile, but forgave him at the intercession of the actual pope. But after Otho's departure, Crescentius quarrelled with the new pope, and drove him out of Rome. Gregory repaired to Pavia, where he assembled a council, and excommunicated Crescentius. Crescentius however kept up a correspondence with the Byzantine court, and his design was to place the duchy of Rome again under the allegiance of the Eastern empire. He arrested the legates of Gregory, and caused John, bishop of Piacenza, a Greek by birth, to be elected pope, but he was generally considered as an intruder. In the year 998 Otho came to Italy, and having collected an army, he marched to Rome, taking with him pope Gregory. The Romans in alarm seized the anti-pope John, pulled out his eyes, cut off his nose and tongue, and threw him into a dungeon. When the emperor entered Rome, he was entreated by a certain holy abbot called Nilus to give up to him the person of that unfortunate man, and the emperor was inclined to release him, but pope Gregory insisted upon his being dragged ignominiously through the whole town, for which Nilus threatened him with the vengeance of God. Crescentius, who had shut himself up in the castle of S. Angelo, was taken, but some say that he capitulated; he and twelve of his partisans were beheaded by order of the emperor, and their bodies hung on the castle battlements. In the following year pope Gregory died, and Gerbert, archbishop of Ravenna, who had been Otho's preceptor, was chosen pope by the name of Sylvester II. In the year 1001 a quarrel broke out between the Romans and the people of Tibur, which was the beginning of a long and bitter animosity between the two cities. The emperor took the part of the Romans, and Tibur was besieged and obliged to surrender. In the following year Otho died of fever at Paterno in the territory of Perugia. The story of his having been poisoned by the widow of Crescentius does not seem authentic.

The line of Otho the Great, to whom the Italians had sworn allegiance, having become extinct with Otho III., the Italians considered themselves at liberty to elect another king, and they chose Hardouin, or Hardwig, marquis of Ivrea, who was crowned at Pavia, in February, 1002. Hardouin was violent and overbearing; he maltreated several nobles and bishops, who applied to Henry II., king of Germany, offering him the crown of Italy. Henry came in 1004, by way of Trent; but finding the '*Chiuse*' or defile of the Adige well guarded by Hardouin's forces, he followed another route by the sources of the Brenta, and arriving at Verona, was received by the great feudatories of Italy, who had mostly forsaken Hardouin. He was crowned at Pavia. Unfortunately a quarrel broke out between the Italians and the German troops, much blood was spilt, and part of Pavia was burnt. Henry soon after returned to Germany, and Hardouin recovered Pavia and part of Lombardy, but Milan, Piacenza, Cremona, and other towns remained faithful to Henry, and the two parties continued at war for several years. This was the origin of the great rivalry between the Lombard cities, and especially between Milan and Pavia. At Rome, pope Sergius IV. having died in 1012, Benedict VIII. was chosen for his successor; but another party elected a certain Gregory, who obliged Benedict to leave Rome and to take refuge at king Henry's court in Germany. In 1013 Henry came to Italy with his wife Cunegunda and a large army, and all Italy submitted to him. He then proceeded to Rome, where pope Benedict anointed and crowned him

in 1014. The chronicler Ditmar says that twelve senators, six of whom wore their beards and the other six were shaven, escorted the emperor to church with wands in their hands. At the gate of the Vatican Basilica, Henry was asked whether he would be the defender of the Roman church, to which he replied in the affirmative. An affray however took place between the populace of Rome and the German soldiers, excited, it is said, by John, the son of Crescentius, in which many were killed. Henry returned to the North, Hardouin having withdrawn to a convent, where he died.

In Rome all civil affairs were decided by the senate, but the more important political questions were referred to the pope or his vicar, and to the emperor, or his vicar the prefect of the city (the office having been restored by Otho I.), who acted also as supreme judge in criminal matters, having received the investiture of the sword from the emperor for that purpose.

Conrad II. of Germany, Henry's successor, was crowned king at Milan and emperor at Rome in 1027. On this occasion another affray took place between the Romans and the German soldiers, and many were killed on both sides. The Romans however were obliged on the following day to send to the emperor to beg his pardon: the members of the deputation were barefooted, the freemen with swords hanging at their neck, the serfs with halters. Conrad forgave them. In 1038 Conrad came again to Rome to restore pope Benedict-IX., who had been driven away by a faction.

Henry III., Conrad's successor in Germany, was acknowledged king of Italy, but did not come to be crowned in the latter country for some years. In the mean time pope Benedict IX. had become so odious through his misconduct, and the robberies and cruelties committed by his adherents, that the people of Rome drove him away, and elected for his successor John, bishop of Sabina, who styled himself Sylvester III. After six months Benedict returned with a strong support, and expelled his rival. But continuing in his evil courses, and seeing the general indignation roused against him, he sold the papal chair to John, or Gratianus, who assumed the name of Gregory VI., A.D. 1044. [BENEDICT IX.] Gregory, who is reckoned among the lawful popes, found Rome, on his accession, in a deplorable state. The property of the see of Rome had been plundered and alienated, so that he had hardly enough left for mere subsistence; the roads were infested by robbers, and no one could travel to Rome except with a large armed party, and the offerings made to the churches were seized by the factions. Gregory, after trying exhortations and excommunications without any effect, collected a force of both foot and horse, with which he hunted down the robbers. The people of Rome, accustomed to anarchy, called the pope a sanguinary man, and unfit to celebrate the sacred offices. At last Henry III. came to Italy in 1047, was crowned at Milan, and then proceeding southwards, arrived at Sutri, where he convoked a council, to which Gregory VI. was invited. There were then no less than three popes; Benedict IX., Sylvester II., and Gregory VI. The council deposed them all, and Gregory VI., on rising from his chair, laid aside of his own accord the pontifical robes. Henry entered Rome, and the clergy and the fathers of the council chose Suidger, bishop of Bamberg, who assumed the name of Clement II., and was consecrated on Christmas day: at the same time Henry was proclaimed emperor, after which great feasts were given in the Lateran palace. During the remainder of Henry's reign Rome enjoyed comparative tranquillity. His son, Henry IV., yet an infant, succeeded his father in 1056, under the guardianship of his mother Agnes. His minority was a troubled period for Rome. After the death of pope Stephen IX., in 1058, John, bishop of Velletri, an illiterate man, was tumultuously elected by the name of Benedict X. Pietro Damiano, bishop of Ostia, and other cardinals, protested against the election as illegal, but they were obliged to run away for their lives. The empress Agnes sent to Italy the monk Hildebrand, whose reputation for learning and piety stood very high, charging him to act in concert with Godfrey, duke of Tuscany, in order to adjust the controversy. A council was held at Siena, in which Gherardus, bishop of Florence, was elected pope under the name of Nicholas II. In the following year Nicholas proceeded to Rome, and Benedict of his own accord resigned his claim. Shortly after began at Milan the schism concerning the marriage of the clergy; those of Milan followed the example of the Eastern church, which does not require celibacy of its presbyters. A deacon of the name of Arialdus formed a party against the married clergy, and excited the

people against them. Guido, archbishop of Milan, favoured the married priests, and excommunicated Arialdus. Nicholas sent two legates to Milan, who induced the archbishop to desist, and the marriage of the priests was forbidden. But this arrangement was only precarious, and the schism lasted much longer. Arnulphus and Landulphus Senior have given an account of this famous controversy. (Muratori, *Res. Ital. Scriptores*, vol. iv.) In 1059 pope Nicholas issued a decree limiting the right of election to the cardinals, leaving however to the rest of the clergy of Rome the right of approving of the election. For the origin of and alterations effected in this institution see CARDINAL.

Nicholas died in 1061, and much contention arose about the election of a successor. One party, with Hildebrand at their head, contended for a free election, without waiting for the emperor's consent; another party sent to Germany to ask Henry's approbation. At last Hildebrand prevailed, and Anselmus, bishop of Lucca, was elected and consecrated pope, under the name of Alexander II. Thus the Romans asserted the right of free election, and the imperial confirmation was no longer considered necessary for the consecration of the pope elect. The ministers of Henry, irritated at the conduct of the Romans, refused to acknowledge Alexander, and at the same time the Lombard bishops, especially those who were favourable to the marriage of the priests, had, with the support of the imperial court, elected Cadalous, bishop of Parma, a prelate wealthy, but of loose principles, who assumed the name of Honorius II. Cadalous, having raised with his money an armed force, marched in the following year to Rome, where he had many partizans, among others a certain Pietro di Leone, or Pierleone, a converted Jew, very wealthy, but disliked by the people as a usurer. Cadalous defeated the partizans of Alexander, but Godfrey, duke of Tuscany, having come to his assistance, Cadalous was obliged to retire. He returned the following year, entered the Leonine town on a suburb, and took possession of the castle of S. Angelo, but the people rising in arms, he was unable to enter the Vatican Basilica, and he shut himself up in the castle, where he remained blockaded for nearly two years, and at last escaped by paying a large ransom. Alexander was then universally acknowledged pope. He died in 1073, and was succeeded by Hildebrand, who assumed the name of Gregory VII., by which he is known in history. Soon after the famous quarrel of the investitures broke out between the church and the empire. The events of Gregory's busy pontificate are related under GREGORY VII. Rome was entered by force by the emperor Henry, in the year 1084, and Guibert, archbishop of Ravenna, was consecrated pope by the name of Clement III., and he afterwards crowned Henry emperor in the Vatican. On the approach of Robert Guiscard, with his Normans, Henry withdrew and Robert entered the city, but it seems that his soldiers, and especially the Saracen bands in his service, committed all sorts of atrocities, and that a part of Rome extending from the Lateran to the Colosseum was set on fire. When Robert retired from Rome to his dominions, Gregory, not thinking himself safe, withdrew to Salerno, where he died, A.D. 1085. His successor, Victor III., was opposed by the antipope Guibert, and the imperial party, who had possession of the Vatican and of the Capitol, until the countess Matilda came with her troops, when Victor entered Rome and took possession of the city, which however he was soon after obliged to leave again. He died at Monte Cassino, and his successor, Urban II., finally drove away Guibert. Urban died in 1099, and was succeeded by Paschal II. During his pontificate Henry V. visited Rome to be crowned, A.D. 1110, and a scene of outrage followed, which is related under PASCHAL II.

In 1116 we find Pietro di Leone applying to Paschal to use his influence to have one of his sons appointed prefect of Rome. The people of Rome, who disliked Pierleone and his family, elected the son of the late prefect, a mere boy, and presented him to the pope for his confirmation. Paschal refused, and an affray followed during the holy week between the populace, led by Tolomeo, brother of the late prefect, and the pope's armed men. The country around rose in arms, and Paschal withdrew to Segze. The mob sacked and destroyed the houses of Pierleone and his family.

In the following year Henry V. came again to Rome, and was crowned by the archbishop of Braga, Paschal having fled to Benevento, which had become a favourite place of residence of the popes. Henry won the hearts of the chief Roman nobles by gifts and promises, and even gave one of his

daughters in marriage to one of the Tolomei, a noble family of that time. After Henry's departure from Rome, Paschal came with his troops to Anagni, where he fell ill: he however advanced to the gates of the Vatican, which was occupied by the Imperial party, and while the military engines were being disposed for the attack, Paschal expired, A.D. 1118. He was buried without any opposition in the Basilica of the Lateran, and three days after the cardinals elected Giovanni Gaëtano, cardinal chancellor of the Roman church, who took the name of Gelasius II. Cencio Frangipane, a partisan of the emperor, disapproving of the election, broke open the gates of the Lateran Basilica, seized the pope elect, an old man, by the neck, and kicked him and dragged him to his own house, where he kept him in prison. But the prefect of Rome, many of the nobles, and the people of Transtevere rose against Frangipane and his adherents, and obliged him to release the pope, who was carried in triumph back to the Lateran. Henry however returned to Rome with armed men, and the pope, alarmed, fled by night to Ardea, from whence he went to Gaëta. Henry then caused an antipope to be elected, who assumed the name of Gregory VIII. After a time Gelasius returned to Rome, and a battle ensued between his partisans on one side, and the opposite faction, led by the Frangipani. Gelasius declared that he would remove his residence far from Rome, which he called a new Babel, where everybody wanted to rule. He embarked for France, leaving the bishop of Porto as his vicar at Rome, a Norman, named Stephen, as *consaloniere*, and confirming the son of Pierleone as prefect of the city. He died in the monastery of Cluny, in January, 1119. His successor, Calixtus II., was elected in France by the few cardinals who were there, and his election was approved by the cardinals and clergy of Rome as a matter of necessity, circumstances preventing the election being held at Rome according to custom, as the antipope Gregory had still possession of the city. In 1120 Calixtus came to Italy, and in the following year, with the assistance of the Normans, he entered Rome, and having taken the antipope prisoner, shut him up in a fortress. In 1122 the dispute of the investitures was settled between Calixtus and Henry V. Calixtus died in 1123, and the cardinals elected Lambert, bishop of Ostia, who assumed the name of Honorius II., but a body of bishops assembled in the church of S. Pancratius elected Theobald, surnamed 'Bocca di pecora,' cardinal of Santa Anastasia. The powerful family of Frangipani supporting Honorius, Theobald was induced to resign his claim, and Honorius submitted to a second election by the clergy and people, who confirmed him. This serves to show that notwithstanding the alleged decree of Nicholas II., the cardinals had not yet monopolised the exclusive right of electing the popes. Honorius granted to Count Roger of Sicily the investiture as duke of Apulia and Calabria. On the occasion of the disputed succession to the crown of Germany, between Lotharius and Conrad of Suabia, Honorius excommunicated Conrad, and acknowledged Lotharius. Honorius died at Ostia in 1130. Several of the cardinals elected cardinal Gregory, a man universally esteemed, who assumed the name of Innocent II.; but another, and, it is said, a more numerous party, chose Peter, one of the sons of the said Pierleone, who assumed the name of Anacletus II.; and, being the strongest, they took possession of the Vatican. The Frangipani declared in favour of Innocent, whom they received in their palace, or rather in their buildings, for this family seem to have had possession of a whole district, which they had fortified. Anacletus, with the treasures found in the Vatican and other churches, enlisted a number of mercenaries, attacked the quarter of the Frangipani, and obliged Innocent to escape to Pisa, leaving the bishop of Sabina at Rome as his vicar. Innocent repaired to France, where he was recognised legitimate pope; and at Liège he crowned Lotharius king of Germany and Italy, who promised to assist Innocent in recovering his see. Anacletus was acknowledged by the Milanese, and by Roger of Sicily, whom he caused to be crowned king by his legate at Palermo, in 1130. In 1133 Lotharius and pope Innocent advanced to Rome, and being received by the prefect and several nobles, entered the city. Innocent took possession of the Lateran, Lotharius fixed his residence on the Aventine, and Anacletus shut himself up in the castle of S. Angelo, from whence he sent repeatedly messengers to Lotharius, asking for a canonical inquiry into his election and that of his competitor Innocent. Lotharius refused this apparently reasonable demand,

but as he was not strong enough to drive out Anacletus, whose party occupied the Vatican, it was resolved to crown Lotharius in the Lateran; after which the emperor returned to the north, and Innocent soon after followed. Innocent had a powerful support in St. Bernard, the celebrated abbot of Clairvaux, who induced the kings of France and England, and the people of Milan and other Lombard towns, to acknowledge him as pope. [BERNARD, ST.]

Lotharius, in 1137, after an expedition into Apulia against Roger of Sicily, returned northwards by way of Rome, when Innocent again took possession of the Lateran; Lotharius however did not stay at Rome, but moved on towards Germany, and died at Trent the same year. St. Bernard advised both Innocent and Anacletus to take Roger of Sicily for their umpire, and each to send three cardinals to Salerno. Roger, after listening for four days to the two parties, could not come to a decision, but desired one cardinal on each side to accompany him to Sicily, where he would assemble a council of the bishops and abbots of that kingdom.

Anacletus dying (A.D. 1138), his party elected in his place Cardinal Gregory, who assumed the name of Victor IV.; but St. Bernard by his eloquence persuaded him to renounce in favour of Innocent. The sons of Pierleone also made their submission, kneeling at the feet of Innocent, and swearing allegiance to him, and all Rome acknowledged him as pope. Thus ended (St. Bernard, *Epist.*, 328) this schism, which is one of the most intricate as a question of right in the whole history of the papacy.

The cardinal of Aragon, in his 'Life of Innocent II.,' observes that, through the exertions of Innocent and of St. Bernard, 'a profound peace reigned at Rome, such as was not remembered for a long period.' Innocent led his troops against Roger of Sicily, but was defeated and taken prisoner near St. Germano. Roger treated him with great honour, and obtained of him the confirmation of his title of king, and that of his son as duke of Apulia, A.D. 1139. Innocent returned to Rome, where the people bore impatiently the temporal power which was exercised by him with a firm hand, and a war with their neighbours of Tibur, which broke out in 1141, led to a total change of affairs. The people of Tibur, having surrendered in 1142 to Pope Innocent, gave up themselves and their county or territory, which embraced the valley of the Upper Anio, 'to Pope Innocent and his successors.' This excited the jealousy of the Romans, who requested the pope to raze Tibur to the ground, and to disperse the inhabitants. Innocent refused, and the people, in 1153, ran to the Capitol, restored the Roman senate, of which nothing is heard for a long period previous, as a sovereign council, and declared war again in the name of the senate and people of Rome against Tibur. This insurrection of the Romans is partly attributed to the spread of the republican doctrines preached by Arnaldo of Brescia, who had been banished from Italy by Innocent some years before. [ARNALDO DA BRESCIA.] Innocent, unable to put down the revolt, fell ill, and died in September, 1143. He was a remarkable pontiff for his abilities and determination. His successor Celestine II. died after a few months, and Lucius II., who succeeded Celestine, found himself controlled at Rome by the senate, which sat in the Capitol and exercised sovereign power. As for the nominal Imperial authority, it was utterly obliterated, the crown of Germany being then contested between Conrad of Suabia and Henry Guelph. In 1144 the Romans elected as princeps senatus, and patrician of Rome, Giordano, another son or grandson of Pierleone; as Alberic had been elected two centuries before. In 1145 Lucius attempted to force the Capitol at the head of some armed men, but the senators and the people threw showers of stones upon him, one of which mortally wounded the pope. The cardinals elected Bernard of Pisa, a disciple of St. Bernard, who assumed the name of Eugenius III. The senate however refused to permit his consecration unless he acknowledged their sovereign power, and Eugenius withdrew by night into Sabina with some cardinals, and was consecrated in the monastery of Farfa. About this time Arnaldo da Brescia came to Rome, and added to the popular excitement by his preaching in public on politics. He exhorted the Romans to restore the equestrian order and the other institutions of the antient republic. The mob, who cared little for the equestrian order, or any order whatever, ran to the houses of the cardinals and nobles who were suspected of belonging to the papal party, and sacked and de-

stroyed them. They abolished the office of prefect of Rome, and obliged all the nobles to swear allegiance to the patrician Giordano. Eugenius excommunicated Giordano, and in the following year, being supported by the people of Tibur, he returned to Rome by virtue of a convention in which he recognised the senate as a legislative body, and the Romans agreed to dismiss the patrician, restore the prefectship, and acknowledge the pope as their sovereign. But this concord was precarious, and in 1146 Eugenius was obliged to quit Rome. He returned again in 1149, but was soon obliged to leave it, and take refuge in Campania. St. Bernard, in his book 'De Consideratione,' which he addressed to Eugenius in his exile, observed that the perverseness of the Romans had been notorious for centuries, that they were 'a people unused to peace, fond of tumults, intractable and remorseless, not knowing how to obey unless they could no longer oppose resistance.' In 1152 Eugenius returned to Rome under a convention, the terms of which are not known; and he applied himself to gain the affection of the lower orders by his liberality, and 'he would have succeeded,' says a contemporary chronicler, 'in upsetting the senate, had not death cut him short in the same year.' Before his death he is said to have concluded a convention with the new king of the Germans, Frederic I., by which the latter bound himself not to enter into any agreement with the people or senate of Rome, nor with Roger of Sicily, without the participation of Eugenius or his successors, and to defend the rights of St. Peter; and the pope on his part promised to crown him emperor. (Vitale, *Storia Diplomatica dei Senatori di Roma*.) Of Anastasius IV., who succeeded Eugenius, little or nothing is known. He died in 1154, and was succeeded by Nicholas Breakspere, bishop of Albano, an Englishman, who assumed the name of Adrian IV. The senate was then in the plenitude of its power; money was struck with the heads of St. Peter and St. Paul on one side, and the legend 'Senat. P. Q. R.' on the other; all acts were done in its name, and the years were dated from the restoration of the senate, 'Anno . . . Senatus.' It appears that the senators were fifty-six in number, annually renewed or confirmed, they were elected by a body composed of delegates, ten from each region of the city. The president of the senate was styled 'Dei Gratia Summus Senator'; it appears also that there were consuls chosen from among the senators.

An affray which took place in Rome soon after Adrian's election, and in which a cardinal was mortally wounded, induced the new pope to leave Rome, which city he placed under an interdict, forbidding divine service to be celebrated within its walls. This novelty, which had never occurred at Rome, made a great impression on the minds of the people, who sent away Arnaldo, and invited the pope to return and remove the interdict. In 1155 Frederic I. came to Rome to be crowned, accompanied by an army. Before he entered the city, he gave orders that Arnaldo, who had taken refuge in Campania, should be tried as a heretic. The count of Campania gave him up to the prefect of Rome, by whose sentence he was hanged, his body burnt, and the ashes scattered to the wind. The circumstances attending Frederic's coronation are given under ADRIAN IV. Frederic spoke to the Romans as their master, but he could not subdue them; his soldiers took possession of the Vatican, but the people of Rome kept aloof from the ceremony of his coronation: they even assailed and killed a great number of the German soldiers, and both Frederic and the pope hastened away to Tibur.

The wars of Lombardy prevented Frederic from attending to the affairs of Rome, and Adrian, having quarrelled with him on some points of jurisdiction, had no support to expect from him. Adrian during the rest of his pontificate was generally absent from Rome, where probably his temporal authority was not great. He died at Anagni in 1159. His successor Alexander III., although duly elected by the majority, found a competitor in cardinal Octavianus, who, having had some votes in his favour, and being secretly encouraged by Frederic's missive at Rome, assumed the pontifical robes, and took the name of Victor IV. The Frangipani and the people took the part of Alexander, who however was obliged to quit Rome, and was consecrated at Nisse. The antipope was consecrated by some bishops of his party at Farfa in Sabina. Alexander returned to Rome in 1161, but finding that the antipope, supported by the emperor and by many of the Roman nobles and senators, was master of the field, he went to France. He

left however a cardinal as his vicar at Rome, who took possession of the Vatican. The antipope died at Lucca in 1164, but a successor was appointed through the influence of Frederic, by the name of Paschal III. In 1165 Alexander returned to Rome, and was received by the united senate, clergy, and people with great approval. Alexander was then at open variance with Frederic, the Romans, who disliked that emperor ever since his visit, made common cause with the pope. In 1167 Frederic marched against Rome, but on his way he laid siege to Ancona, which had joined the league of the Lombards against him, and which made a long resistance. The Romans attacked Tusculum and Alba, which towns were the strongholds of the Imperial party. The count of Tusculum appointed Raynaldus, archbishop of Cologne, and Christian, bishop of Mainz, who commanded the emperor's army in central Italy, and a battle took place near Tusculum, in which the Roman militia, to the number, it is said, of 10,000, were completely routed by the Imperial troops and the Tusculum, and their loss has been, by the exaggeration of contemporary chroniclers, compared with that of Cleve. Soon after, Frederic came in person, accompanied by the antipope Paschal; he forced the walls of the Vatican, but found the Basilica strongly defended by the militia of St. Peter's, that is to say, a body of militia raised in the domains of the Roman see. After a week's siege the German soldiers set fire to a tower close to the Basilica, the little garrison capitulated. Frederic beginning to distrust the leaders of the Romans, Alexander thought it prudent to quit the city. The Pisan galleys also came up the Tiber as auxiliaries to Frederic, and the Romans then came to terms. Frederic confirmed the senate in the municipal franchises of the city, and the Romans, on their part, with the exception of the Frangipani, the Leononi, and some other nobles, acknowledged Frederic emperor and king of the Romans. In the oath tendered on the occasion no mention appears of either pope or antipope. The summer brought disease into the emperor's camp, he withdrew to the north, leaving a prefect at Rome. The following year the Romans destroyed Alba; and in 1170 they attacked Tusculum, which, in order to save itself, surrendered to the pope, who was then at Benevento. In 1172 pope Alexander made his peace with the emperor, and acted as mediator at Venice between him and the Lombards. A truce for six years was agreed upon, which led afterwards to the famous peace of Constance (1183). The pope, seeing a good understanding restored between the pope and the emperor, thought it prudent to come to a definitive arrangement with the former, and sent a deputy to invite him to return to Rome. Alexander sent three envoys to confer with the senators on the subject, who agreed, after long debate, that the senate should exist, that on the renewal of that body, at the next September kalends, they should take the oath of allegiance to the emperor and the Roman church, and should swear to do nothing contrary to the papal dignity. The Vatican was restored to the pope, with all the rights of St. Peter. Alexander made his entrance into Rome, A.D. 1179, amidst popular acclamations. In the year 1181, Alexander died; a pontiff distinguished by his great qualities, and the events and length of his pontificate. He was succeeded by Lucius III., a weak man, whose accession the Romans proposed to re-establish the office of Patrician as head of the senate, and as the first magistrate and chief of the administration of the city, independent of the pope. Lucius opposed this measure, and was obliged to leave Rome, and the Patrician was appointed. Lucius died at Verona, in 1185. His successor, Urban III., was elected and consecrated at Verona, and he died in 1187 at Ferrara, without, it seems, having visited Rome. His successor, Gregory VIII., died at Pisa in the following year, and the successor of Gregory was styled Clement III. He came to an arrangement with the Romans; one of the conditions of which was that the senate should be confirmed, but that the senators elect were to receive the investiture 'per mantum' from the hands of the pope. Vitali gives the text of this convention, which is styled 'Concordia,' and is the year 44 of the senate, with the names of all the senators who signed it. The number of senators having been much increased by the ambition of belonging to that body, Celestine III., who succeeded Clement in 1191, determined that in future they should not exceed fifty-six. He at the same time solemnly confirmed the constitution of the senate, which is found in Martini.

(*Antiqu. Ital. Dissert.*, 45). During Celestine's pontificate however the Romans became tired, it is not very clear why, of their senate, and they elected only one senator, whom they made the head of their militia, and their first judicial magistrate; the senatorial palace in the Capitol was his residence. The first senator thus appointed was Benedetto Crisimo, who, after two years, was succeeded by Giovanni Capoccio. The Romans obliged the towns of Sabina and the Campagna to receive in future their magistrates from Rome. Innocent III., who succeeded Celestine in 1198, was not a man to forego an opportunity of asserting and extending his authority. He contrived by his influence to have the senator elected from among his friends, and he dictated the form of the oath which that magistrate was to take to him. The senator bound himself to maintain the pontiff in possession of the rights which belong to St. Peter's see; not to conspire against him, but to reveal to him all conspiracies which might come to his knowledge; and lastly, to provide for the safety of the cardinals and their household within the jurisdiction of the city of Rome. (*Vitali, Storia Diplomatica.*) At the same time, Innocent, under the pretence that the empire was then vacant, and the succession to the German crown dubious, obliged the prefect of the city, who had been till then appointed by the emperor, to receive a fresh investiture from himself, and pay allegiance to him; and he also removed the judges and podestas of the towns of the Campagna, who had been appointed by the senate in the name of the Roman republic, and he appointed others in their places. The authority of the senate and that of the emperor over the city of Rome were thus virtually at an end. [INNOCENT III.]

Under the pontificates of Innocent and his successors Honorius III. and Gregory IX., Rome remained in quiet subjection to the papal authority. After the death of Gregory, A.D. 1241, Frederic II., who had long been at variance with the pope, devastated the territory of Rome; and he was favoured by the powerful baronial family of Colonna, who were of the Guibeline party. The cardinals ran away from Rome; and it was not till 1243 that they assembled at Anagni, and elected pope Sinibaldo dei Fieschi, who assumed the name of Innocent IV. He was haughty and determined; he showed himself bitterly hostile to Frederic; and the papal troops, commanded by Cardinal Octavian, conquered the whole Romagna in 1248. Frederic II. died in December, 1250. Innocent was long absent in France and other places, and when he returned to Rome, about 1253, he found his capital in a state of anarchy. The turbulent barons, emboldened by the absence of the pope, and the dissensions between him and the emperor, had resumed their old habits of plunder and civil warfare. They had fortified themselves in the massive antient monuments, and had also raised lofty towers, in which they kept a number of armed retainers, and from thence sallied to attack their weaker neighbours. The citizens of Rome elected for their senator Brancaleone of Bologna, who for several years hunted down the refractory nobles, razed their towers, and at last restored order. He died in 1258, and his relative Castellano was elected senator in his place. [BRANCALEONE D' ANDALO.]

Alexander IV., who succeeded Innocent IV. in 1254, and who died in 1261, was succeeded by Urban IV., a Frenchman, who determined on the ruin of Manfred, the last scion of the house of Suabia. For this purpose, he offered the crown of Sicily to Charles of Anjou, and made him likewise senator of Rome, the people having conceived the wish of having a powerful prince for their chief magistrate. Urban however died in 1264; but his successor Clement IV., another Frenchman, pursued the same policy, and Charles of Anjou embarked at Marseille, and arrived at Rome, where he collected his troops for the invasion of Naples. The battle of Benevento and the death of Manfred followed. In 1268, young Conradin came to Italy upon his chivalric errand of recovering his paternal kingdom. He entered Rome, where he was received with applause by the Guibeline party, which was strong in that city; but he was soon after defeated at Tagliacozzo, taken prisoner, and beheaded at Naples. Gregory X., Clement's successor, entered Rome with King Charles of Naples, who swore allegiance as a feudatory of the holy see. Nothing particular occurred at Rome during that and several following pontificates; but Cardinal Orsini, being elected in 1277 by the name of Nicholas III., applied to Rudolph of Habsburg, king of Germany, to define by a charter the States of the

Church, and separate them for ever from those dependent on the Empire. He sent him at the same time copies of the former charters of donation, real or supposed, of his imperial predecessors. Rudolph, engrossed with German affairs, and little acquainted with those of Italy, wishing also to oblige the pope, from whom he expected the Imperial crown, defined by letters patent, dated May, 1278, the States of the Church as extending from Radicofani to Ceprano on the frontiers of Naples, and from the Mediterranean to the Adriatic, including the former duchy of Spoleto, the March of Ancona, and the Romagna. He released the people of all those places from their oath of allegiance to the Empire, giving up all rights over them which might still be settled in the Imperial crown, and acknowledging the sovereignty of the same to belong to the see of Rome. This important document, which is found in Raynaldus (*Annales*), was confirmed by the electors and princes of the Empire. Thus ended the former Imperial authority over Rome and its territory.

*Period VI. :—Rome under the sovereignty of the Popes.*—Nicholas, having thus freed himself from all dependence on the emperor, determined to shake off also the importunate interference of his powerful vassal, Charles of Naples, who, in his quality of senator of Rome, exercised a sort of absolute sway over that city and territory. With much difficulty he prevailed upon Charles to renounce his office, and by a constitution he then forbade the election as senator of Rome of any emperor, king, prince, duke, marquis, or other powerful personage. In apparent contradiction to this constitution, he caused himself to be appointed perpetual senator of Rome, and he named as his vicar his nephew Orso. Nicholas embellished Rome with several new buildings; he began the Vatican Palace; but he also enriched his nephews, and the system of nepotism may be said to have begun with him, as well as the rivalry between the Orsini and Colonna parties. He died near Viterbo, in 1281.

After the death of Nicholas a party rose against his nephew Orso, and it was agreed that two senators should be elected, one of the Orsini family and the other of the Annibaldi family. After an interregnum of six months, a French cardinal was elected through the influence of Charles of Naples, and was styled Martin IV., who declared himself perpetual senator, and appointed King Charles as his substitute. Nothing very particular seems to have occurred at Rome till 1293, when, during the interregnum after the death of Nicholas IV., great disorders broke out, accompanied by robberies, murders, and fires. Rome was without a senator for six months, and at last two were appointed, one from each of the two rival parties. The cardinals elected Celestine V., who however soon after resigned on the score of incapacity, and Cardinal Gaetani was elected, by the name of Boniface VIII., A.D. 1295. His was a most stormy pontificate. He quarrelled with Philip le Bel of France, with Frederic of Sicily, and with the Colonna. Two cardinals of the great baronial family of Colonna had opposed his election, and they refused to admit a papal garrison into their patrimonial towns and castles which they had in the Campagna. They were also accused of holding intelligence with Frederic, king of Sicily, who had been excommunicated by the pope. Boniface excommunicated the cardinals Colonna and all their adherents. The Orsini family, rivals of the Colonna, supported the pope. The Colonna fortified themselves in their castles, protested against the election of Boniface as illegal, and appealed to a future general council of the church. Upon this Boniface ordered their palace at Rome to be pulled down, and sent troops to attack their towns and castles in the country. In 1298 he took Palestrina by treachery, and razed it to the ground. [PALESTRINA.] He took likewise Zagarolo and La Colonna, fiefs of the same family. The cardinals Colonna escaped to France. Their uncle, Sciarra Colonna, went to sea, was seized by pirates, and, after a course of romantic adventures, found his way back to Italy, where he had his revenge, and caused the death of the pope, in 1303. [BONIFACE VIII.] In 1300 Boniface celebrated the first Jubilee at Rome, and thus a new source of attraction and wealth was opened to that city. [PILGRIMAGE.]

Benedict XI. succeeded Boniface. By the assistance of Charles II. of Naples, he restored peace to Rome and its territory; he absolved the Colonna and their adherents from the canonical censures, except those who had lifted up their hands against the late pontiff. In the following year,

1304, however, finding that the factions were still active in Rome, and many crimes were committed with impunity, he repaired to Perugia, where he died, and, as it was reported, by poison. The interregnum lasted eleven months, the cardinals being divided between those who wished for an Italian pope, and those who, being in favour of Philip of France and Charles of Naples, wished for a French pope.

The people of Perugia, tired of delay, kept the cardinals in arrest in the Conclave Hall, and threatened to starve them if they did not come to a decision. The French party prevailed, and Bertrand, archbishop of Bordeaux, was elected. It is said that he had promised to Philip le Bel to restore the Colonna cardinals to their dignities and possessions, to allow the king to dispose of the tithes for five years, to appoint a certain number of cardinals according to his pleasure, and, lastly, to remove the papal residence to France. Bertrand, who assumed the name of Clement V., did not go to Rome; he was consecrated at Lyon, and, having summoned the cardinals to France, fixed his residence at Avignon, A.D. 1305. For seventy years after this the popes resided at Avignon; and this period was styled by some Italian writers the Babylonian captivity.

*Period VII. :—The Papal See at Avignon, 1305-1376.*—During this period Rome and its territory were administered, in quiet times, by the popes' legates: the great families Colonna, Orsini, and others held the chief authority in their hands, and the city was often a prey to factions and civil war. Two senators were elected annually by the pope from among the great families, but in turbulent times they were chosen by the people. In 1311, Henry of Luxemburg, king of Germany, commissioned Stefano Colonna to uphold the Imperial or Guibeline party at Rome, preparatory to his going there to be crowned emperor. The opposite party, or Guelphs, led by the Orsini, and supported by Robert, king of Naples, had taken possession of S. Angelo, Borgo, the Vatican, and all Transtevere, and also of the Capitol, and of the tower of the market, which was then at the foot of the Capitol. [ORSINI.] The Colonna party fortified the Pantheon, the Colosseum, the Aventine, and the tower of Milizia, which was afterwards enclosed within the monastery of Santa Catarina da Siena.

The streets were barricaded, and the whole town was in arms. At last Henry came, with a considerable force of men and horse, and partial combats took place between his troops and those of king Robert, but Henry, being unable to take the Vatican, was crowned emperor in the Lateran, by the papal legate, soon after which he left Rome.

When Louis of Bavaria came to be crowned at Rome, accompanied by Castruccio Castracani, in January, 1328, the ceremony passed off more quietly. Louis, supported by Sciarra Colonna, took possession of the Vatican. From the Capitol he harangued the people, who elected him senator and captain of the city for one year. Louis was crowned in the Vatican by two bishops, who however had no papal commission for the purpose, and one of whom was even under an interdict. The emperor appointed Castruccio senator and imperial vicar, and afterwards convoked a 'parlamento,' or assembly of the people, in the square before St. Peter's, in which he summoned John XXII., who was at Avignon, by the name of Jean de Cahors, or any one to answer for him; but no one appearing, a syndic of the clergy demanded that the accused should be tried *en contumace*, as guilty of heresy and high treason, and the emperor pronounced him guilty, and a new pope or antipope was elected by the name of Nicholas V. [JOHN XXII.] It was also decreed by the emperor, with the hearty approbation of the people, that every future pope should reside at Rome; and if absent for more than three months, should be considered as deposed. Louis however left Rome, Castruccio died, Nicholas renounced his claim to the papacy, and pope John recovered the ascendancy at Rome, although he continued to reside at Avignon. It was soon after this that the electors of Germany passed a resolution declaring that in future the king of Germany elect should be considered emperor and king of the Romans, without the sanction or consecration of the pope.

When Peter of Limoges was elected pope by the name of Clement VI., in 1342, the Romans sent him ambassadors, one of whom was Cola di Rienzo, or Nicolas, the son of Lorenzo, a tavern-keeper, to beg the restoration of the papal see to Rome. Petrarca, who was at that time residing at Rome, where he had received the poetical crown in the Capitol

from the hands of one of the senators, also unsuccessfully exerted himself to induce the pope to return to that capital [PETRARCA.]

In 1347 began the insurrection of Cola di Rienzo. Rome, in the protracted absence of the popes, was left a prey to its factions, each of whom chose one of the two senators; and it may be easily imagined that little harmony subsisted between those two head magistrates. Cola was a man of warm imagination, imbued with vague and confused notions of the former glory of Rome, and endowed with natural eloquence. He began to declaim in public against the disorders of the nobles and the tyranny of factions. The people named him by acclamation their tribune. He went to the Capitol, drove away the senators, and assumed the title of 'Nicholas, severe and element, liberator of Rome, zealous for the weal of Italy, friend of the world, tribune august.' He appointed various magistrates, mostly deserving men, and put to death several factious leaders who were guilty of heinous crimes, and obliged the rest to swear obedience to him, under pain of banishment. He also sent ambassadors to various towns and princes, for the purpose of forming a union of all Italy. Perugia, Arezzo, and other cities submitted to him; and he threatened with war Viterbo, which refused allegiance. He summoned Clement VI. with the cardinals to return to Rome; and he also summoned Louis of Bavaria, Charles, king of Bohemia, and the electors of Germany, to state their reasons for pretending to elect the emperor. To the papal vicar at Rome, who remonstrated with Cola upon his presumption, he answered that he was inspired by the Holy Ghost, and that he followed its dictates. He arrested the heads of the families Savelli, Orsini, Colonna, and others, and threatened them with death; but he only banished them. The exiles collected and armed their feudal dependants, and marched against Rome; but the people, led by Cola, issued out of Porta S. Lorenzo, defeated them, and killed several of the Colonna. In the following year however, Cola having met with a check at the siege of the castle of Marino, which belonged to the Colonna, his enemies, stirred by the papal legate, excited a revolt against him. Cola's soldiers were overcome, and he withdrew into the castle S. Angela, from which he escaped, disguised as a monk, into the Abruzzi. The Colonna re-entered Rome; and Stefanuccio, or Stefanello Colonna, restored the city to the papal allegiance, annulled all the acts of the tribune, and appointed two senators, one of the Orsini and one of the Colonna. Cola di Rienzo, being taken, was confined in a prison at Avignon. In 1348 Queen Joan I. of Naples sold Avignon and its territory to the papal see for 30,000 golden florins.

In 1353 a tumult broke out at Rome, in consequence of a scarcity; and one of the two senators, Bertoldo degli Orsini, was killed by the mob. Stefanello Colonna escaped. In the same year Pope Innocent VI. sent Cardinal Gil Albornoz, his legate, to Italy, to restore the papal authority. He took with him Cola di Rienzo, to assist him in quieting Rome. Cola repaired to Rome in 1354, being appointed senator by the pope. Cola took possession of Rome, and put to death Fra Moriale, a famous condottiere, who had been guilty of much violence and extortion. The Colonna however were still his inveterate enemies, and Cola by a rashness ruined himself. He laid a fresh duty upon wine, he caused Pandolfuccio di Guido, a man much beloved by the people, to be beheaded on slight grounds; he became suspicious and cruel; and the people, disgusted with him, rose in September, 1354, burnt his house, attacked him in the Capitol, and having caught him as he was escaping in disguise, stabbed him to death. The acts of Cola di Rienzo constitute a very interesting episode in the history of modern Rome. His life, written in the Romanesco, or dialect of the lower classes of Rome, is inserted in Muratori's great collection.

The papal authority was now re-established in Rome, and in 1358 it was decided that there should be only one senator yearly appointed by the pope, and that he was to be a stranger, and unconnected with any of the patrician families of Rome. But for many years after, Rome being frequently disturbed by insurrections, the pope had seldom an opportunity of appointing the senator, and the people took the appointment in their own hands. In 1367 Urban V. came to Rome, where Albornoz had prepared everything for his reception. [ALBORNOS.] The pope found Rome in a sad state, full of ruins, half deserted, and exhibiting all the traces of half a century of anarchy. In 1370 Urban

left Rome to return to France, induced, as Petrarch says in his epistles, by the advice of the French cardinals, who regretted the easy and loose life which they used to live at Avignon. His successor, Gregory XI., in 1376, came to Rome, and finally fixed the papal residence there again, where it has continued ever since with some trifling interruptions. But Gregory found the Romans rather restive. The twelve caporioni, or heads of districts, would not give up their command, and retained the salaried armed companies called 'banderesi.' At the same time the pope's legate in Romagna gave up Cesena to his mercenary bands for pillage, when 4000 people were murdered, and the young women violated. In the meantime Gregory was busy restoring the churches of Rome, which had become, according to the expression of some historians, the haunts of owls and bats. He died in 1378.

*Period VIII. — Rome after the Restoration of the Papal See.*—After the death of Gregory XI., in March, 1378, the French cardinals, who formed the most numerous part of the conclave, wished to elect a French pope, who should transfer the papal see back to Avignon; but the people of Rome assembled tumultuously in the streets, and called for an Italian, or rather a Roman pope; and the magistrates of the city in alarm sent a message to the conclave to the same effect. At last Cardinal Prignano, archbishop of Bari, a Neapolitan, was chosen. The people, being still dissatisfied, broke into the conclave hall, and most of the cardinals ran away. The magistrates however restored peace, and Prignano was consecrated under the name of Urban VI. The French cardinals however, supported by Queen Joan of Naples, who disliked and feared Prignano for his harsh imperious temper, assembled at Fondi, protested against the election of Prignano as having been compulsory, and chose Robert, cardinal of Geneva, who assumed the name of Clement VII. Thus began a schism which lasted nearly half a century, and which has been called the great Western schism. France, the duke of Savoy, and Queen Joanna of Naples acknowledged Clement; Germany, England, and several Italian states acknowledged Urban. The history of that contest forms part of the history of the church. Its effects upon Rome were most lamentable; for although Urban and his successors were acknowledged there, and have been since considered by the church as legitimate popes, yet Clement and his successors, who resided chiefly in France, had a strong party among the Roman nobles, and this gave rise to civil commotions in the city, from which the pope was repeatedly driven away. The turbulent career of Urban is noticed under URBAN VI. His successor, Boniface IX., 1389-1404, had also a most stormy pontificate. He was driven three or four times from Rome by the Colonna and other factions, and as often re-entered it by force. His return was generally attended by bloodshed and executions. Innocent VII., who succeeded Boniface, was a man of a milder temper; but the Colonna, Savelli, and other factious barons, encouraged by Ladislaus of Naples, who availed himself of these dissensions to extend his power over Rome and its territory, besieged the pope in the Vatican. One of Innocent's relatives having committed an act of treachery by seizing the deputies of the people who had come to a conference with the pope, killing them on the spot, and throwing their bodies into the Tiber, the people became furious, hunted down and killed the adherents of the pope, among others many lawyers, and plundered their houses. Innocent escaped to Viterbo, and the people plundered the pontifical palace. Ladislaus sent his troops to take possession of Rome, but the people shut the gates against them. After a time the pope returned to Rome, the people submitted, and Ladislaus also made his peace through the mediation of Paolo Orsino, A.D. 1406.

Innocent was succeeded by Gregory XII., who wished to have a conference with his rival, Benedict XIII., who was then in France, in order to put an end to the schism. [BENEDICT, ANTIPOPE] A tumult however broke out at Rome to prevent his departure. The Colonna entered the city through a breach in the wall, but were defeated by Paolo Orsino at the head of the papal militia; and several of their party, being taken, were beheaded. The pope then left Rome, and repaired to Lucca, for the purpose of the conference, which however did not take place. In the meantime Ladislaus, with the connivance of Paolo Orsino, took possession of Rome, drove away the papal vicar, and established new magistrates. He likewise invaded

Rieti, Terni, Todi, Perugia, and other papal territories. In 1409 a council assembled at Pisa, deposed both Gregory and Benedict, and elected a new pope by the name of Alexander V. But neither Gregory nor Benedict submitted to the decision of the council, and Gregory escaped to Naples, where he placed himself under the protection of Ladislaus, to whom, according to Sozomenus, he sold Rome and the other states of the church for a sum of gold. Louis of Anjou, who had claims on the throne of Naples, being supported by the new pope Alexander V., whose legate, Cardinal Cossa, accompanied him, marched upon Rome, and took possession of the Vatican and Castle of S. Angelo; but he could not enter the city, which was defended by the troops of Ladislaus and the Colonna party. Louis and the legate retired, leaving Paolo Orsino with a body of troops under the walls. After a time Orsino, assisted by people within, entered Rome by night, and drove away the soldiers of Ladislaus, who only retained possession of two gates, Porta Maggiore and Porta S. Lorenzo.

Rome was now, nominally at least, subject to Pope Alexander V., to whom the keys of the city were sent with a deputation from the people, urging him to come and fix his residence there. Alexander however died at Bologna in May of the following year, 1410, and the legate Cossa was elected in his place by the name of John XXIII. The new pope visited Rome in the following year, together with Louis of Anjou, who afterwards moved on towards Naples with a large force, under the command of Paolo Orsino, Sforza Attendolo, Braccio da Montone, and other celebrated condottieri, and defeated Ladislaus near Roccasecca; but Louis, through want of money and provisions, was unable to follow up his success, and was obliged to return to Provence.

In the following year, 1412, the great condottiere Sforza Attendolo, whom the pope had made Count of Cotignola, having had some differences with Paolo Orsino, abandoned the pope and the Anjou party, and entered into the service of Ladislaus. The pope now thought it prudent to make peace with Ladislaus, to whom it was said that he paid down 100,000 florins. But in 1413 Ladislaus broke the peace, and sent an army under Sforza to invade the March of Ancona, while another body under the condottiere Tartaglia, entered Rome by a breach in the wall: the pope ran away to Viterbo, pursued by the Neapolitans, who killed and plundered several of his retinue. The pope had displeased the people of Rome, by levying heavy taxes, especially upon wine. Ladislaus came to Rome, took the Castle of S. Angelo, occupied the whole Roman state, and afterwards advanced towards Tuscany, threatening Florence, and indeed all the rest of Italy, when he was attacked in his camp near Narni by a contagious disease, of which he soon after died at Naples, A.D. 1414. Upon his death the papal authorities, supported by the nobles and people, recovered possession of Rome. [JOHN XXIII.]

The general council, having assembled at Constance, deposed John XXIII., as well as his two competitors Benedict and Gregory, and named Cardinal Colonna, by the name of Martin V., A.D. 1417.

Rome was in the power of John's legate, when Braccio da Montone, a celebrated condottiere, attacked it, and being introduced by some partisans, assumed the title of defender of the city, saying that he would keep it for the future pope who should be elected. He appointed a new senator, and besieged the castle, in which the legate had shut himself up. The legate applied for assistance to Joan II., who had succeeded Ladislaus on the throne of Naples. Joan sent Sforza, who entered Rome, defeated the troops of Braccio (who retired to Perugia), changed the authorities, arrested Cardinal Stefanacci, who had taken the part of Braccio, and confined him in S. Angelo, where he was probably put to death, being heard of no more. In the next year, 1417, Sforza returned to Naples, leaving a garrison in Rome for Queen Joan. In 1418, the new pope Martin V. came to Rome, Queen Joan having made an alliance with him. During his pontificate, he strove, and in some measure succeeded in restoring order to Rome, and in recovering most of the territories of the church. Martin died in 1431, and was succeeded by Eugenius IV., who did not imitate the wise conduct of his predecessor. Eugenius had been supported in his election by the Orsini party, and he began his pontificate by persecuting the rival family of Colonna, at the head of which were the nephews of the late pope, and he put to death more than 200 of Martin's agents and adherents. Cardinal Colonna left Rome, and his rela-

tives, having collected their feudal retainers, assailed the city; but they could not enter it, and all their houses and those of their friends in the town were plundered by the mob. In 1433, Fortebraccio, a captain of the pope, revolted, seized Tivoli, and threatened Rome; and in the following year Francesco Sforza, the son of Attendolo, pretending to act in the name of the council of Basle, which was at open variance with the pope, occupied the whole of Umbria, as far as Otricoli. Upon this Eugenius sent his secretary Biondo, the historian, to treat with Sforza, and agreed to make him vicar for life of the March of Ancona, and gonfaloniere of the Roman Church.

Another condottiere however, Piccinino of Perugia, urged secretly by Filippo Maria Visconti, who aimed at enlarging his dominions at the expense of the pope, joined Fortebraccio with a body of horse, and advanced to the walls of Rome. The people, excited by the Colonna, and weary of the oppression of the papal officers, ran to arms, arrested Cardinal Condulmero, the pope's nephew, and invested the pontifical palace, from which Eugenius had just time to escape, disguised as a monk, to Ostia, where he embarked for Tuscany. Fortebraccio and his bands entered Rome, and gave themselves up to plunder and bloodshed, and all sorts of violence. The Romans, being weary of this disorder, sent two bishops to the pope, to beg his return; but the pope remained absent, delegating his authority to the Cardinal Vitelleschi, a bold unscrupulous man, who by means of the sword and the halberd, restored peace to Rome and its territory, A.D. 1437. He reconquered Foligno and other towns for the pope, but at last he became suspected of a secret correspondence with the duke of Milan and with Piccinino, and the pope ordered his arrest. Vitelleschi was mortally wounded in defending himself, and being taken into the Castle S. Angelo, died there, A.D. 1440. In 1443, Eugenius returned to Rome, where he opened a council in the Lateran. He formed an alliance with king Alfonso of Naples against Sforza and the Florentines, and thus contributed to keep all Italy in a state of confusion for several years longer. Eugenius died in 1447. His long contention with the council of Basle, and with the antipope Felix, and his other transactions as head of the church, are noticed under EUGENIUS IV. He was the last pope that has been expelled from Rome by an insurrection of the people. He restored many churches and other buildings in that city.

His successor, Nicholas V., is one of the most illustrious in the long series of popes. He restored peace to Rome and to all Italy, ended the schism with the antipope Felix, embellished Rome with useful buildings, restored the walls and the Basilicæ, and began the Vatican library: he may be considered as having begun a new æra for Rome, in which the city recovered from the distractions and calamities of past ages, and became again a seat of learning, of the arts, and of polished society. [NICHOLAS V.] In 1452, Frederic III. of Germany came to Rome, where he was crowned by the pope, with great pomp, first as king of Lombardy and afterwards as emperor. He was the last emperor who was crowned at Rome, and the people were greatly rejoiced and almost astonished to see the coronation of a German emperor pass off without tumult and bloodshed.

The last years of Nicholas's pontificate were disturbed by the news of the taking of Constantinople by the Turks, 1453, and also by the conspiracy of Stefano Porcari, a Roman noble and demagogue, which some writers have chosen to look upon as a patriotic effort to restore liberty to Rome, while others have considered it as the last struggle of the expiring factions led by ambitious nobles, who, flattering the populace by empty words of liberty and a republic, had so often brought Rome to the brink of destruction. Porcari had once made an attempt at insurrection in the Piazza Navona, and the pope had treated him leniently, merely exiling him to Bologna. Here he kept up a correspondence with other exiles and malcontents, and appointed a meeting at his house at Rome, in January, 1453. Escaping from Bologna, he repaired to Rome, attended by several hundred men, with whom he was to attack the Capitol, seize the pope, re-establish the senate, and renew in short the scenes of Crescenzo, Analdo da Brescia, and of Cola di Rienzo. Cardinal Bessarion, legate of Bologna, however, having discovered the flight of Porcari, had sent information to the pope. The conspirators were seized in the midst of their nocturnal meeting, with their arms and other evidence of

their guilt, and Porcari and nine of his associates were on the battlements of the Castle of S. Angelo.

Nicholas V. died in March, 1455. He left the power firmly established at Rome. He entrusted the administration chiefly to churchmen, and this system of archiepiscopal government has continued to the present day. The senator remained a lay magistrate, appointed by the pope. The senator must not be a native of Rome. His jurisdiction has gradually dwindled to almost nothing. The governor of the city, who is a prelate, has the police under his control, and the senator is president of a court of première instance for civil cases, which is composed of himself and three consensory lay judges, generally noblemen, who are appointed by the pope, and renewed every six months, and of the procuratori, or head of the head-boroughs of the districts of Rome. This court, called Tribunale del Podoglio, takes also cognizance of petty offences and misdemeanours. The senator has also the superintendance of the markets, of the annual horse-races, and of the great processions and other public ceremonies.

The successors of Nicholas V., during the remainder of the fifteenth century, consolidated the papal power, and Alexander VI. and Julius II., at the beginning of the following century, extended it to the rest of the diocese of the See of Rome. [PAPAL STATE.]

Nicholas V. was succeeded by Calixtus III., whose pontificate does not exhibit any important feature. The history of the city of Rome henceforth becomes identical with that of the popes, and may be traced, in order, under the heads of PIUS II.; PAUL II.; SIXTUS IV.; INNOCENT VIII.; ALEXANDER VI.; and his nephew CALIXTUS (CESARE); JULIUS II.; LEO X.; and CLEMENT VII.

Under Clement VII., Rome was stormed, in May, 1527, by an army of mercenary and disorderly Germans, led by the Constable of Bourbon, who was in the service of Charles V., but who led his freebooting bands against Rome without any commission from the emperor, and with the sole object than to pay his troops their arrears by giving them the plunder of Rome. [BOURBON, CHARLES DE.] This was the last storming and pillage of Rome, but it was one of the most cruel. From 1527 till 1798 Rome was entered by any hostile army, nor exposed to any pillage or spoliation. Of the popes who sat in the papal chair during this period of nearly three centuries, the most remarkable are: PAUL III., PAUL IV., PIUS V., GREGORY XIII., SIXTUS V., CLEMENT VIII., PAUL V., URBAN VIII., INNOCENT X., ALEXANDER VII., CLEMENT IX., CLEMENT X., INNOCENT XI., INNOCENT XII., CLEMENT XI., BENEDICT XIII., BENEDICT XIV., CLEMENT XIII., CLEMENT XIV., and PIUS VI. Under Pius VI. Rome was occupied without any violence by the armies of the French executive Directory, though not actually pillaged by the soldiery, it was fully plundered in a more systematic manner by the generals, commissaries, and other agents of the Directory. In 1799 it was occupied by the Neapolitans, who made it pay dear for what they called its deliverance from the French.

In 1800 the new pope, Pius VII., recovered possession of Rome, and the memorable events of his long and troubled pontificate are noticed under PIUS VII. Since the restoration of 1814 there has been no material change in the political condition of Rome. The popes who have done most for improving and embellishing Rome are: Nicholas V.; Paul II., who built the Palace of Venice, part of the Corso; Julius II.; Leo X., who began St. Peter's church; Gregory XIII., who founded the Roman College; Sixtus V., who raised most of the obelisks; Pius (Borghese), who built the splendid church of Santa Maria Maggiore, the palace Borghese, and other structures; Gregory XV., who founded the Propaganda; Innocent XII., who embellished the Piazza Navona; Alexander VII., who raised the present building of the University; Innocent XII., who built the palace for the courts of justice at Monte Citorio; Clement XI., Benedict XIV., and, though not least, Pius VI., who created the Vatican Museum. Besides the popes, many cardinals of the Albani, Borghese, Barberini, Farnese, and other families have greatly contributed to the embellishment of modern Rome during the last three centuries. The French administration during its second occupation of Rome, 1810-14, contributed materially to the improvement and ornamentation of the city.

MODERN ROME (*continued*).

A sketch of the actual papal administration, its judicial system, its finances, the manufactures and trade of the country, and other statistical details, are given under PAPAL STATE.

With regard to popular education, Rome has adopted no general and uniform system. The rectors of some parishes, aided by charitable individuals, have established parish school, in which poor boys, from five to twelve, are instructed gratis. Other schools are kept by the Scolopj, the fathers of the Christian doctrine, the Ignorantelli, and other clerical congregations, in which boys are taught, either gratuitously or for a trifling fee, writing, arithmetic, grammar. All the children of each parish are required to attend at the parish church every Sunday afternoon to hear the catechism explained, and to be questioned by the rector on points of religion and morality. Besides this, the curate (*Sotto Curato*) of the parish generally keeps a private school, in which he teaches, for a trifling remuneration, writing and the rudiments of Latin. There are also sixty schools, called *regionarie*, kept by private teachers, in which about 2000 boys of the middle classes, by paying from half a dollar to a dollar a month, are taught reading, writing, arithmetic, and the elements of Latin and French. These schools are subject to the inspection of a deputation of clergymen, who report to the Cardinal Vicario. Several charitable institutions, such as the Orphans' Asylum, that known by the name of *Tata Giovanni*, the foundling hospital, that of *S. Michele* already mentioned, supply elementary instruction to their inmates. Females are instructed in some convents, and in the *Conservatorj*, where a number of poor girls are lodged, boarded, and instructed, and partly defrayed, by the produce of their labour, the expenses of the institution, the remainder being made up by legacies and subscriptions. Some evening schools for the children of the working classes have of late years been opened at Rome by benevolent individuals.

For scientific education there is the university called *Archiginnasio della Sapienza*, which is attended by nearly 1000 students, and has a library, a cabinet of natural history, and other collections: next comes the Gregorian or Roman college, which is now again in the hands of the Jesuits; it has a collection of antiquities and an observatory; and the colleges *Nazareno* and *Clementino*, for boarders chiefly of the higher class. An account of the Gregorian college is given in No. I. of the 'Quarterly Journal of Education.' Several public libraries are daily opened at Rome; the principal are those of the Dominican convent of *La Minerva*, and that of the Augustine convent, called *Angelica*.

Charitable establishments are more numerous at Rome than in any other Italian city. The principal hospitals are those of *S. Spirito* and *S. Michele*, already noticed in the first part of this article; the fever hospital of the *Lateran*; the hospital of *La Consolazione*, at the foot of the *Capitol*, for surgical cases; that of *San Gallicano*, for cutaneous diseases; that of the *Incurabili*, or *S. Giacomo*, near the *Corso*; the lying-in hospital of *S. Rocco*: the hospital of *Santa Trinita dei Pellegrini*, for poor convalescents; and that of the *Ben Fratelli*, in the island of the *Tiber*, already mentioned. The Orphan Asylum, the Foundling Hospital of *S. Spirito*, and the house for the insane, must also be reckoned. The whole annual revenue of these establishments amounts to 840,000 dollars, of which about one-half is derived from endowments, and the remainder is supplied by the papal treasury. The pope distributes yearly out of his own private purse from 30,000 to 40,000 dollars among the poor. A commission of subsidies distributes about 172,000 dollars more among poor families. There is also a society for portioning poor girls on their marriage, which expends about 132,000 dollars yearly for that purpose. It is reckoned that about 1000 girls are yearly portioned in this way. (*Serristori, Statistica; Morichini, Su gli Stabilimenti di Pubblica Beneficenza in Roma.*) See also *Tournon*, b. iv., c. 7.

The lower orders at Rome live generally very poorly, their means of support being scanty and precarious. They depend much on charity, and when years of scarcity or political convulsions occur, the amount of suffering is very great, as was the case when the French overthrew the papal government in 1809. A great part of the population depend, either directly or indirectly, for their subsistence on the papal court, the cardinals and prelates, the nobility, the foreign ministers, and foreigners in general.

The clergy of the city of Rome consisted, in 1838, of 54

rectors of parishes, 1439 priests non-incumbent, 2012 monks or friars, besides 31 prelates, with the rank of bishops, belonging to the papal court. The numbers of nuns was 1456. The whole population consisted of 148,903 individuals, besides 4500 Jews.

The police in Rome is maintained by the *Carabineers*, a well selected and well equipped military body, resembling the French *gendarmes*. They are under the orders of the governor of Rome, who is a prelate.

Rome has an insurance company, a bank, and a savings' bank; these institutions have all been established within a few years. The *Monte di Pietà* is a much older foundation. [MONT DE PIETÈ.]

Rome had no municipal council when the French took possession of it in 1809, its financial administration being in the hands of the home department. Count *Tournon* established a municipal council, consisting of the principal nobles and citizens. Its revenues, derived from various taxes and rent of buildings, amounted to 2,800,000 francs, which was found sufficient for the expenditure. We are not acquainted with the alterations that have been made since the restoration of 1814, except that we find in the *Motuproprio* of *Leo XII.*, 1824, under the head of the 'Organization of the Communes,' that 'with regard to the city of Rome, the rights of the senator and conservatori, and of the Roman people, are maintained in their present state,' which seems to mean the state in which they were before the French occupation.

The population of modern Rome consists of a very mixed race, and the admixture is yearly renewed. The deaths at Rome exceed the births, which is owing in a great degree to the number of people who live in a state of celibacy, not only in consequence of their religious vows, but also from choice. The population is yearly recruited from the provinces; a number of young men come to the capital in quest of employment or to pursue their studies, and many of them settle there. *Tournon* justly observes that it is out of the question to look at Rome for any descendants of the antient Romans, even among the *Transteverini*, who by tradition claim that descent. It is in the elevated country near Rome, among the *Sabine*, *Alban*, and *Cimini* mountains, that we may expect to find the descendants of the antient inhabitants of those districts. The men in the city of Rome are not generally favoured by nature, with the exception of the *Transteverini*, who are usually well made: the women are far superior with regard to form, but after the first period of youth, they become lusty and large, owing probably to their sedentary habits; their busts however are generally handsome.

With regard to their moral qualities, the people of Rome may be said generally to be remarkably keen in their perceptions, disposed to criticism and satire, and yet guarded in the utterance of their sentiments, serious and rather pompous, but withal warm-hearted. Revenge and jealousy are still a source of crimes among the lower orders. 'The modern Romans,' says *Tournon*, 'are full of intelligence; they have a strong feeling of self-respect, and although prone to anger under provocation, they are, in the common relations of life, gentle, benevolent, and warm-hearted, and particularly expressive of their gratitude. In the manifold relations which I have had with all classes of the Roman people—in the meetings for the drawing of the conscription, so obnoxious to a country to which war and its stern necessities had been strangers for ages; in the midst of the popular festivals; in the fairs and markets—nowhere have I seen traces of that turbulence and ferocity which travellers have been pleased to ascribe to the modern Romans. I have found, among the inhabitants of the most secluded districts of the *Campagna*, a remarkable mildness of manners, not unmixed with a certain degree of natural politeness; when often alone among them, or in the midst of the formidable *Transteverini*, my confidence in the good disposition of the people has never been betrayed for a moment, and my own experience, to which I may add that of every other Frenchman in an official situation like myself, has given me a full conviction that it depends entirely upon the government to make these people as orderly and peaceful as those of any country in Europe.' (*Etudes sur Rome*, vol. ii., p. 104.)

The amusements of the people of Rome are chiefly connected with religious festivals. The principal are those of the Holy Week, when the evening service and *Miserere* at the *Sistine Chapel* are celebrated, at which however only a privileged few can be admitted; but then there is the cross

of fire suspended above the Confession in St. Peter's church, whither thousands resort, and the aisles of that vast temple become a sort of fashionable promenade. On Easter Sunday the pope officiates with great solemnity in St. Peter's church, after which he ascends the balcony in front of the building, and gives his benediction 'urbi et orbi.' Then comes the great procession of the Corpus Domini, the Thursday after Trinity Sunday, when the pope and all the clergy walk round the colonnade of St. Peter's. Next comes the festival of St. Peter, on the 29th of June, when, in the evening after the ceremonies of the day, the whole exterior of that magnificent building, with its swelling dome, lantern, and cross, is lighted up first by paper lanterns, which give a soft ethereal light, and then, at a given signal, another set of thousands of bright lamps are suddenly ignited, as if by magic, spreading like a blaze of fire along that vast structure. Then follows the Girandola, or fireworks on the castle of St. Angelo, which are far superior to any other fireworks in the world. The Christmas festivals are also splendid. All these have been described by most travellers who have visited Rome, and some of them most beautifully by Madame de Staël in her 'Corinne.'

The profane amusements are those of the Carnival, with its horse-races in the Corso and the masks in the streets; the inundation of Piazza Navona twice a week, in the month of August; the bull-fights and fireworks during the summer season; and the vignate, or country excursions in the autumn. There are generally two if not three theatres open at Rome, one for the Opera Seria, and another for the Buffa, but although the people are very fond of music, yet their rulers, through regard for their profession, abstain from attending plays, and this renders the amusement less national than at Naples or Milan. The fashionable carriage-drives are along the Corso, and outside of the Porta del Popolo, and along the road to Porta Pia.

We must refer for other particulars concerning the habits and pastimes of the modern Romans to books of travels, and especially to that under the name of Stendhal, 'Rome, Florence, or Naples,' and also the 'Promenades dans Rome,' by the same author, and Miss Waldie's 'Rome in the Nineteenth Century.'

The language of Rome is good Italian, but the lower orders, like those of every other country, fall into grammatical inaccuracies, wrong inflections, &c., and have moreover a drawing way of speaking, which is peculiar to them, and is easily recognised. The popular dialect thus disfigured, though much more intelligible than that of most other countries of Italy, is called Romanesco, and there are burlesque poems written in it. One of these is entitled 'Meo Patacca,' the name of a bravo or leader of the lower class of Rome, who, hearing of the siege of Vienna by the Turks, proposes to march to its relief, but after many delays and episodes, the whole troop vent their courage upon the poor Jews of Rome, whose district they take by storm. The following is a sample of the style:

\* Era quell' ora ch' i Pizzicaroli  
Con le partiche aggiustano le teune  
Innanzi alle lor mostre, e i Fruttaroli,  
E oguun che robba magnaticcia veune;  
Perche pe fa servizio a i Nevaroli,  
E caldo insopportabile se teune,  
E allora il Sol, se non ci son ripari,  
Scalla le robbe, e scotta i Bottegari.'

There is another poem, called 'Maggio Romanesco,' by Peresio, which is founded upon the history of Cola di Rienzo. But most of the popular poems, songs, and ballads of Rome are in good Italian. The 'Ritornello' is a favorite composition of the lower classes, and consists of asonante rhymes, such as follows:

\* Fiore de Pepe,  
E quante mo ne dite e me ne fate,  
E ch' io ve voglio bene non lo credete.'

A collection of popular Roman songs was published by the Cavaliere Visconti: 'Saggio di Canti Popolari della Provincia Marittima e Campagna,' Roma, 1830. The following is a specimen:

\* Palomba che per l'aria vè a volare,  
Ferma, che voglio dirti due parole,  
Voglio cavà una penna a le tue ale,  
Voglio scrive una lettera al mio amore,  
Tutta di sangue la voglio stampare,  
Per sigillo le metto lo mio core;  
E finita da scrive e sigillare,  
Palomba, portacella a lo mio amore,  
E se lo trovi tu letto à riposare,  
O Palomba riposati tu ancora.'

The satirical humour for which the modern Romans have been long celebrated, has been noticed under PASQUIN.

The upper class at Rome consists of two distinct orders: the hierarchy of clerical dignitaries, cardinals and prelates, who constitute the court and cabinet of the pope, and who have in their hands the government, and fill the principal offices in the administration; and the lay nobility, with the titles of princes, dukes, marquises, and counts, who live upon the revenue of their estates, and have little or no influence in political affairs. In the middle class, 'mezzo ceto,' the lawyers form an important order; they are divided into—1, avvocati concistoriali, who alone can plead before the sovereign in concistoro, or papal privy council; 2, avvocati rotali, who plead before the other courts; 3, curiali, or patrocinatori, who are the same as the English solicitors; 4, notaries, who form a corporation under the prefect of the archives. In the early part of the present century, the advocates Bartolucci, Bontadossi, Angelotti, Lasagni, were distinguished among the members of their profession. Among the physicians and surgeons, Bomba, Egidi, Giannelli, Trasmonti, Savetti, had a considerable reputation.

The artists form another important body at Rome. Many of them are foreigners, but they generally live on good terms, and there is a sort of professional fellow-feeling among them all. The life which the artists lead at Rome, their studies, and their meetings, have been described by Stendhal and other travellers. The Academia of S. Luca, of the fine arts, is the connecting bond of all the artists at Rome. France and other countries have their separate academies, or 'pensionats,' where a certain number of artists of their respective nation are boarded and pensioned by their government for a certain period. The antiquarians have also their academy. Among these the names of Visconti, Fea, Nibby, Ré, and others are well known.

The mercanti di Campagna, or great farmers, who rent the vast estates into which the Campagna is divided, belonging to the nobility, or to various churches, convents, charitable institutions, or corporations, are a wealthy class; they live in a good style at Rome, have their counting-houses, and employ numerous agents, clerks, messengers, and servants. The smallest of these farms requires a capital of 2000*l.*, and the largest of above 20,000*l.* Almost the whole of the Roman lowlands, from Corneto to Terracina, are in the hands of about 150 of these farmers, of whom one-third, and those the wealthiest, reside at Rome. Both Châteaueux and Tournon give animated descriptions of the farm of Campomorto, which is among the largest.

Rome is well supplied with provisions; butchers' meat, fish, game, and vegetables are good and abundant; the common country wine is small and light, but the Romans are generally a sober people. Cheese, butter, ricotta, and other produce of the dairy, is plentiful and varied.

In conclusion, there is much that is interesting and much that is good in modern Rome, both materially and morally; but it ought to be borne in mind that the state of society is totally different from what it is in England, Prussia, or France. English travellers have not sufficiently attended to this; they have judged of Roman society after the English standard: they have contrasted its stationary but orderly condition, with the prodigious activity, excitement, and perpetual agitation of the population of Britain. But the human race can accommodate itself to various conditions; it can thrive and be content under very different institutions. It is neither possible nor perhaps desirable to make at once a complete revolution in the habits and ideas of all the nations of the earth; that must be the slow work of time, of education, and of spreading intercourse. This has been the great mistake of the so-called republicans of our age; they have considered man as a plastic being, whom they could remodel at will, without any consideration for his moral feelings, habits of thought, and early impressions, which will not easily bend themselves to the will of another.

The great mass of the population of the city of Rome has shown, of late years, that it is, generally speaking, in tolerable harmony with the form of government. If the government would but take care to accommodate itself gradually to the very slow change which must be taking place even in the minds of the people of Rome, that would be sufficient at present for the purposes of peace, welfare, and good government, without any violent and sudden change in the established form of society. Some remarks on this subject which were elicited by the abortive insur-

rection of the northern papal provinces, in 1831, in which movement Rome and the southern provinces did not participate, may be found at the end of an article upon 'Rome and the Papal Government,' in No. xxi. of the 'Foreign Quarterly Review,' January, 1833.

**RÖMER, OLAUS**, a Danish astronomer, was born at Arhusen in Jutland, in 1644, of parents who, though not in affluent circumstances, were able to give their son the benefits of a scientific education by sending him to the university of Copenhagen, where he applied himself diligently to the study of astronomy under Erasmus Bartholinus.

He was brought into notice by Picard, who, in 1671, was sent from France by Louis XIV. to make celestial observations in the north, and to verify the position of Uraniburg, once the residence of Tycho Brahé. The French astronomer conceived so great an esteem for the talents of the young Dane, that he engaged him to visit Paris, and when there procured for him the honour of being presented to the king. In consequence of this introduction, Römer was appointed to instruct the Dauphin in mathematics, a pension was settled on him, and the next year the Royal Academy of Sciences made him a member of their body.

While in France, Römer was employed, together with MM. Cassini and Picard, in performing geodetical operations for the survey of the kingdom; he also assisted at the Royal Observatory at Paris, and from the observations which he had occasion to make on the immersions and emersions of Jupiter's first satellite, he was led to the discovery of certain inequalities in the times of the occurrence of these phenomena, which had not before been noticed. It was then first remarked, that between the times of the opposition of Jupiter to the sun and the next following conjunction, the emersions of the satellite from the shadow of the planet took place always later than the times indicated by calculation, and that the difference between the observed and the calculated times when the planet was near the points of opposition and conjunction was about fourteen minutes. A contrary circumstance was observed from the time of a conjunction of Jupiter with the sun to the next following opposition; for the immersions appeared to take place more early than the calculated times, the difference of the times, when near the points of conjunction and opposition, being also about fourteen minutes.

There appears however to be some uncertainty whether Römer or Cassini (J. D.) is the astronomer to whom the honour of being the first to perceive the inequality belongs, and Montucla asserts not only that the latter made the discovery, but that he gave an explanation of its cause. He states that Cassini published, in 1675, a paper in which it is shown that the phenomena result from the difference between the times during which the particles of light are passing from the satellite to the earth (the planet being, when in opposition, nearer to the earth than when in conjunction, by the whole diameter of the earth's orbit) and in which it is inferred that the velocity of light must consequently be such as to allow it to pass from the sun to the earth in about eight or ten minutes. On the other hand, it is well known that Cassini at first objected to the transmission of light through a part of space in a certain time as a cause of the observed inequality, on the ground that similar inequalities were not observed in the immersions or emersions of the other satellites. Now it is more probable that the French astronomer should have made objections to the hypothesis of another man, than that he should have abandoned one which himself had formed; and even if such abandonment had taken place, Römer ought in justice to be considered as the real discoverer of this important element in astronomical science, since it is admitted that he took up the subject and gave a precise explanation of the circumstances. The reason why the like retardation or acceleration of the times was not, then, observed in the second and the remaining satellites is, that the theory of the motions of these bodies was in that age so imperfect, that the times of the phenomena could not be determined by computation within the number of minutes to which the optical inequality amounts. It is now well known that the latter takes place similarly in the phenomena of all the satellites.

Römer was as good a mechanic as an astronomer. It is to him we owe the application of the epicycloidal curve in the formation of the teeth of wheels, by which the movement is rendered uniform; and an account of the invention was sent to the Academy of Sciences in 1675. De la Hire afterwards claimed the honour of having first discovered

the advantage of teeth so formed; but Leibnitz, in a letter to John Bernoulli, states that Römer had communicated the invention to him twenty years before the date of De la Hire's publication. Römer is said to have designed several machines for representing the motions of the planets, and particularly one which exhibited the revolutions of Jupiter's satellites; by this machine it is said that the immersions and the emersions might be determined with great precision.

Having remained ten years in France, Römer returned to Copenhagen, where the king, Christian V, made him professor of astronomy. He was at the same time employed in reforming the coin, in regulating the weights and measures, and in making or repairing the public roads. Having acquitted himself in the performance of these scientific commissions to the satisfaction of his sovereign, he was named chancellor of the Danish exchequer, and assessor of the supreme tribunal of justice. At length, under Frederic IV., he became burgomaster of Copenhagen, in which city he died, September 19, 1702, having suffered at intervals from the stone during the three last years of his life.

Peter Horrebow, one of his pupils and his successor in the chair of astronomy, published (1735), under the title of 'Basis Astronomiæ,' the series of celestial observations made by Römer, with a description of the observatory at Copenhagen, and an account of the manner in which the instruments were used.

In determining the apparent places of celestial bodies, it had, previously to the time of Römer, been the practice to observe their altitudes and azimuths, and also their distances from one another or from some body whose place was already found. The trouble of computing the right-ascensions and declinations from these elements was considerable, and the Danish astronomer made an important change in the practice of observing, by which this trouble was avoided. He used what is called a transit telescope, with a clock, and also a mural quadrant; with these he observed directly the differences between the right-ascensions (in time) and between the declinations of the sun and the planets or the fixed stars. It is right to remark however that Picard had somewhat earlier fixed in the plane of the meridian a telescope, by which he could, it is said, obtain altitudes between  $56^{\circ}$  and  $61^{\circ}$ . Now a space equal in extent to five degrees cannot be seen at once in a telescope, and therefore it is probable that this was moveable in altitude to that extent; and if Römer was at any time a witness to the performance of the instrument, he may have taken from it the idea of making a telescope turn on a horizontal axis through 360 degrees in the plane of the meridian. It appears also that De la Hire contended with Römer for the honour of having been the first to fix a quadrantal instrument in that plane.

#### ROMFORD. [Essex.]

**ROMILLY, SIR SAMUEL**, was born in London, on the 1st of March, 1757. His grandfather, a French Protestant, was entitled by inheritance to a considerable landed estate at Montpellier, but he quitted France in consequence of the persecutions which succeeded the revocation of the Edict of Nantes, and established himself in the business of a wax-bleacher, in the neighbourhood of London. His youngest son, Peter, the father of Sir Samuel Romilly, was brought up to the trade of a jeweller, in which he became successful and eminent. Of the numerous family of Peter Romilly, two sons and a daughter alone survived their infancy, of whom Samuel was the youngest. The early education of Samuel Romilly was extremely defective. He was sent with his brother to a day-school, frequented by the children of the French refugees in London, the master of which was ignorant and tyrannical, and incompetent to instruct his pupils in anything beyond reading, writing, and the rudiments of the French language. The elder brother being intended for his father's trade, it was attempted to lead Samuel's inclination to the business of a solicitor; but a disgust implanted in his mind by a view of the discouraging apparatus of an attorney's office in the city, caused the abandonment of this scheme. It was then proposed to place him in the commercial house of the Fludyers, who were near relations of his family, and one of whom, Sir Samuel Fludyer, was his godfather. With a view to this employment he received instruction in book-keeping and mercantile accounts, but the death of both the partners in the house of Fludyer put an end to this promising project, and his father, having failed in several

other schemes respecting him, eventually employed him in his own trade, at first simply for the purpose of furnishing him with occupation, and afterwards with the intention that the two brothers should succeed to the business in partnership upon their father's retirement.

During the intervals of leisure which were abundantly afforded him for several years after he left school, at the age of fourteen, Samuel Romilly applied himself assiduously to literary studies, which were more suitable to his serious and somewhat melancholy disposition than the usual exercises and amusements of youth. Antient history, English poetry, and works of criticism were at this period his favourite objects of pursuit. When he was between fifteen and sixteen years of age, he determined to become acquainted with the Latin language, and by means of hard study, and with the assistance of a master, he acquired so much proficiency as enabled him, in the course of three or four years, to read through almost all the classical writers of Rome. He also applied himself to Greek, but, discouraged by the difficulties of self-instruction, he abandoned the attempt, and contented himself with studying the Greek authors by means of Latin versions. In addition to classical studies, he read travels, and acquired a competent knowledge of geography, and some acquaintance with natural history; and he also attended private lectures on natural philosophy, and the lectures on painting, architecture, and anatomy delivered at the Royal Academy. Thus, though he had not the opportunity of becoming a scholar in the academical sense of the term, he contrived by his perseverance and unaided efforts to refine his taste, and to lay up in his mind a store of elegant and useful knowledge, which enabled him to proceed in the exalted walk of life to which his fortunes subsequently led him, without experiencing those impediments and mortifications which usually arise from an imperfect education.

It is not surprising that a devotion to such pursuits as these should excite aspirations for an occupation more congenial to them than the trade of a jeweller; and his indulgent father, whose pecuniary means had been about this time increased by considerable legacies to his family, and among them a bequest of 2000*l.* to Samuel Romilly, readily yielded to his son's wishes in this respect, and article'd him for five years to one of the sworn clerks in chancery. The mechanical duties of this office, though in some degree enlivened by his master's practice as a solicitor, were scarcely more attractive to Romilly than his attendance upon his father's business; but he devoted his frequent leisure at this period to literary studies, and in particular to strenuous exercises in prose composition. The object of serving a clerkship of this kind was the purchase of a seat in the Six Clerks' Office at the expiration of his articles, and the intended retirement of his master was likely to offer a favourable opportunity for the attainment of this object; but Romilly's dislike to the business, and his disinclination to embarrass his father by withdrawing from his hands the amount of the bequest above mentioned, which would have been necessary in order to purchase the seat, determined him to renounce his prospects in the Six Clerks' Office entirely, and to qualify himself for the bar. Accordingly, in May, 1778, having served his clerkship, and completed his twenty-first year, he entered himself at Gray's Inn, placed himself in the chambers of an equity draughtsman, and commenced with great ardour the study of the law. He still, however, pursued his literary studies and exercises, employing much of his time in reading and translating the Latin historians and orators, occasionally writing political essays for the newspapers, and sometimes attending the houses of parliament for the purpose of exercising his own powers of abstraction, argument, and expression, by composing imaginary answers to the speeches which he had heard there.

Not long after he commenced his legal reading, he was attacked by serious illness, which, aggravated and protracted as it appears to have been by his constitutional disposition to despondency, compelled him to lay aside all severe studies, and threatened wholly to interrupt his professional prospects. Fortunately a family incident induced him to undertake a journey to Switzerland, where he remained several weeks in the society of his brother-in-law and most intimate friend the Rev. John Roget, and, returning by way of Paris, he became acquainted in that capital with D'Alembert and Diderot, and formed intimate friendships with several of the most eminent political philosophers

of that day, whose conversation and correspondence produced a marked effect upon his character and opinions. He arrived in London after an absence of several months with his health entirely restored.

In Easter term, 1783, Romilly was called to the bar, but his entrance upon the practice of the profession was postponed for several months in consequence of a journey to Switzerland, which he undertook for the purpose of attending his sister to England, upon the death of John Roget. In Michaelmas term, 1783, however, he began his attendance upon the courts, and opened his practice with a very inconsiderable amount of employment in drawing chancery pleadings. In the following spring he joined the Midland circuit; but being unknown and without connections of any kind, no encouraging prospect of business appeared for several years. Success at sessions however led to employment on the circuit; and though his progress was by no means rapid, we have his own authority for saying that when the extent of his practice in the Court of Chancery compelled him to restrict himself to the circuit, he had attained to a larger amount of leading business than was possessed by any other counsel upon the circuit. (*Memoirs of Sir Samuel Romilly*, vol. i., p. 34.)

In the year after that in which he was called to the bar, Romilly, through his connections in Paris, became acquainted with Mirabeau. By his means he was introduced to the late Marquis of Lansdowne, who had become desirous of his acquaintance upon learning that he was the author of an anonymous tract, entitled 'A Fragment on the Constitutional Power and Duties of Juries;' and who, from the first conceived a high opinion of Romilly's talents, which continued to be for many years his steady friend and patron. Lord Lansdowne's estimate of his character, and his participation of his eventual success, are evinced by the fact, that in the first years of their acquaintance, and before the commencement of Romilly's professional fortunes had begun to flow, he was twice offered a seat in parliament by that nobleman, which he declined from a feeling of independence. The early introduction of Romilly to the confidence and friendship of many persons of the highest distinction by their station and talents, both in France and England, must be considered as an unquestionable proof of his eminent merit. A young man barely twenty-six years of age, the son of a jeweller, unknown at any public school or university, and a barrister of only a year's standing, could have been indebted to nothing but his own personal character for his admission into such society, and for the esteem and respect with which he was regarded by his superiors in rank, age, and reputation, at the very commencement of his active life.

Soon after his first introduction to Lord Lansdowne, his attention was directed by that nobleman to Madan's 'Thoughts on Executive Justice,' a tract now forgotten, but which at that time excited much notice, and is said to have had considerable influence with the judges in enforcing the execution of capital punishment. The author of this tract relied upon the well-known principle, that as the object of judicial punishment is to deter from crime, the effect of penal laws is in a great measure lost unless execution follows the sentence with certainty. The principle is true in the abstract; but it is absurd to attempt to apply it in practice to laws so strict as at that time existed in England. In answer to Madan's tract, Romilly published some sensible observations upon an anonymous pamphlet, his composition of which was probably the first occasion on which he was induced to call attention to the principles of criminal law.

Romilly's practice, both on the circuit and in the Court of Chancery, within ten years after he was called to the bar, became considerable. The precise period at which he quitted the circuit is not mentioned in any published account of his life; but it must have been subsequent to 1797, in which year he successfully defended at Warwick a deponent of the London Corresponding Society, prosecuted by the government for sedition (*Howell's State Trials*, vol. xiv., p. 595), and was probably previous to the summer of the year 1800, when he was made king's counsel. It is not improbable that upon his marriage, which took place at the commencement of 1798, he may have formed the determination to confine his practice to the Court of Chancery.

After obtaining rank in the profession as king's counsel, his business in the Court of Chancery rapidly increased, and in 1805, we learn from his own evidence, that of the barristers who attended the Court of Chancery, he was the

in the most practice.' (*Memoirs*, vol. ii., p. 111.) About this time the Bishop of Durham gave him the office of Chancellor of the County Palatine of Durham, which he held for many years. In the autumn of the year 1805 he was offered a seat in parliament by the Prince of Wales (afterwards George IV.), who at that time adhered to the Whig party, and whose attention had been particularly drawn to Romilly from the circumstance of his being about that time retained in a cause in chancery, in which the prince was much interested. This offer was declined from the same independent feeling which had induced him to decline two offers of a similar kind previously made by Lord Lansdowne.

Romilly's early association with some of the most distinguished persons interested in the French revolution, and, above all, perhaps his intimacy with Mirabeau, had given him in the outset of life a decided bias towards what are termed popular or liberal opinions in politics. In consistency with his general principles he became a decided adherent of the Whigs, and, long before he obtained a seat in the House of Commons, was in the habit of confidential communication with the leaders of that party. On the formation of the Grenville administration at the commencement of the year 1806, he received the appointment of solicitor-general, and the honour of knighthood, and was brought into parliament by the government for the borough of Queenborough. He was appointed one of the managers for the Commons, on the trial and impeachment of Lord Melville, and summed up the evidence in support of the charge. He states in his diary that he spoke on this occasion for three hours and twenty minutes (*Memoirs*, vol. ii., p. 139); but from the report of his speech in the printed accounts of the trial, it does not appear to have been by any means the most successful of his forensic or parliamentary performances. In truth, the occasion was most unfortunate; and he undertook the task not as a matter of inclination, but of duty, conceiving that in his position with respect to the government and the party under which he had taken office, he could not with propriety decline it. In the course of his first session in parliament he introduced a bill for the amendment of the bankrupt laws (46 Geo. III., c. 135), which passed both houses with very little objection or observation, and constituted a material improvement of that which was then an extremely defective branch of the law of England. After the dissolution of parliament, which took place at the close of the year 1806, he was re-elected for the government borough of Queenborough; and in the early part of 1807, and while in office as solicitor-general, he introduced a bill for the purpose of making real property in all cases assets for the payment of simple contract debts. This just and reasonable measure, although approved by Lord Ellenborough, was strongly opposed in the House of Commons by the Master of the Rolls, Sir William Grant, and rejected by a considerable majority. The opposition offered to this measure by the Master of the Rolls was personally resented by Sir Samuel Romilly with a degree of acrimony scarcely justified by the occasion. A measure founded upon a more limited application of the same principle, by confining it to the freehold property of traders, was, during the next session of parliament, proposed by Romilly, and carried (stat. 47 Geo. III., c. 74). At subsequent periods he made several attempts to carry his proposition into execution to its full extent, but without success. His reply to the Master of the Rolls in the first debate on this bill, and his speech about the same time in favour of the abolition of the slave-trade, established his reputation as a parliamentary speaker of the highest character.

In March, 1807, the Whig ministers were displaced, and with their removal ended the short official employment of Romilly. He retained, however, his seat in parliament, and continued until the end of his life a zealous and leading member of the opposition party. On the dissolution of parliament, which took place after the change of ministers, he purchased his return for the borough of Horsham from the duke of Norfolk—a mode of entering the House of Commons which he characterised as 'detestable' (*Memoirs*, vol. ii., p. 201), but which he justified in his own case as being at that time the only mode by which he could hope to obtain a seat in parliament consistently with that entire independence of action which alone made it valuable to him. In the session of 1807 he opposed the several harsh measures which were passed for the suppression of disturbances in Ireland, and warmly supported Mr. Whitbread's bill for establishing parochial schools; and besides the measures re-

specting the freehold estates of traders above alluded to, he introduced an important practical improvement in the administration of justice, by abolishing an unfair and useless privilege of members of the House of Commons as defendants in equity.

In the early part of the session of 1808, Sir Samuel Romilly lost his seat in parliament for Horsham upon a petition; but after the interval of about a month, he was returned for the borough of Wareham, having purchased his election for 3000*l*.

In the autumn vacation of 1807, Romilly had applied himself to the consideration of the criminal law of England, with a view to remove some of its glaring evils and defects. His attention had been called to the subject at an earlier period, when he composed his observations on Madan's treatise; and he now found himself in a situation, with respect to influence and authority, which justified the hope that he might be enabled to carry into practical operation the doctrines which experience and reflection, together with his acquaintance with foreign laws and the writings of foreign jurists, had long before impressed upon his mind. The English penal law is founded upon no general principles of jurisprudence, and is arranged upon no system, but consists for the most part of a vast number of positive and disconnected provisions, made at different periods of time, and in totally different states of society, so that the harsh and rugged enactments of a barbarous time have been carried on into a period of civilization, to the manners and institutions of which they are wholly unsuited. Unfortunately too, until very lately, it was the practice of the legislature, in making new provisions for particular exigencies, rather to attempt to equalize punishments, by imitating the severity of the ancient laws, than to render them just and consistent by a general revision of the whole system. It was from this cause that, at the time when Sir Samuel Romilly began to apply his mind to the subject, the penal laws of England were far more severe than those of any other European country—nearly 300 crimes of various degrees and qualities of moral guilt being then indiscriminately punishable with death. The necessary consequence was a great uncertainty in the execution of criminal justice, proportionately impairing its effectiveness; for, as Lord Coke long ago observed, 'too severe laws are never duly executed' (3 *Inst.*, 163). To the removal or mitigation of this great evil Sir Samuel Romilly devoted himself with uncommon energy and perseverance during the last ten years of his life. At first his views of practical improvement were limited, and the only measures which he originally contemplated were, first, a provision by which acquitted criminals should be allowed compensation out of some public fund; and, secondly, an enactment raising the amount of the value of property to the stealing of which capital punishment should be annexed. The first of these measures, though just in principle, was liable to many serious difficulties in its application to practice, and being strongly opposed in the House of Commons, was early abandoned, and never afterwards resumed; and the second was modified at the recommendation of the present Lord Abinger, then Mr. Scarlett, who suggested to Romilly, as a much more effectual improvement of the law, the total repeal of all statutes which punish with death mere thefts unaccompanied by any act of violence or other circumstances of aggravation. Though Romilly readily adopted this suggestion, he thought that a proposition for the simultaneous repeal of so large a number of statutes stood no chance of success in parliament, and for that reason he resolved to propose, in detail, the repeal of individual laws, by which punishments of disproportionate severity were enacted, and thus gradually to expunge the whole from the statute book. Accordingly immediately after he had taken his seat for Wareham, in 1808, he brought in a bill to repeal the stat. 8 Eliz., c. 4, which made it a capital offence to steal privately from the person of another; and this measure, after some objection and discussion in the House of Commons, was eventually passed (48 Geo. III., c. 129). His next step towards the attainment of his object was taken in the early part of the session of 1810, when he introduced three bills to repeal several statutes which punished with death the crimes of stealing privately in a shop goods of the value of five shillings, and of stealing to the amount of forty shillings in dwelling-houses or in vessels on navigable rivers; and in order that his views on the subject might be generally understood, he published the substance of the

speech delivered by him on his first proposal of the bills, together with some further arguments, in the form of a pamphlet, entitled 'Observations on the Criminal Law as it relates to Capital Punishments, and on the Mode in which it is administered.' One of the bills introduced by him on this occasion was thrown out in the House of Commons by a majority of two voices, in a very thin house; a second reached the House of Lords, and was there thrown out by a large majority—the lord chancellor (Eldon) and Lord Ellenborough using reasons against it which at the present day cannot be perused without astonishment; and the third bill was withdrawn by Romilly, after having in vain attempted to make a house in order to have it read a third time. Notwithstanding this failure, his confidence in the justice of his principles, added to his characteristic firmness and perseverance enabled him, in spite of all the discouragements arising from the apathy of friends, and the ignorance, prejudices, and party-spirit of enemies, to renew his endeavours to pass these measures in each succeeding session during the remainder of his life; but although several severe laws of a local and special nature were repealed, and although a considerable effect was produced on public opinion by the repeated discussions of the subject, it was not until several years after his death that any substantial improvement of the criminal law was effected.

In the anticipation of a dissolution of parliament on occasion of the king's illness, at the latter part of 1811, Sir Samuel Romilly was invited to allow himself to be put in nomination to represent the city of Bristol. Having accepted this invitation, he went down to Bristol upon the dissolution of parliament at the close of the year 1812, with the most encouraging prospect of success; but an opposition was excited in favour of a merchant of Bristol, whose personal influence and local connections gave him a much more efficient interest among the numerous constituency of that city than that which Romilly had acquired by means of his public character. The consequence was, that after a few days' struggle, he abandoned the contest as hopeless. Upon this failure, he was returned by the duke of Norfolk for his borough of Arundel; and Sir Samuel considered that the objections which he had entertained in early life against accepting a seat in parliament from the proprietor of a borough no longer applied, inasmuch as his public character was now so fully established, that he could never be suspected of intending to speak or vote merely at the dictation of his patron; and because, since the law had declared the former practice of selling seats to be illegal, there was no other means of entering the House of Commons than by the nomination of a patron or a popular election.

In the interval between the dissolution of the former parliament and the meeting of the new one in 1813, he published a small pamphlet, entitled 'Objections to the Project of creating a Vice-Chancellor of England.' This unsatisfactory plan of reforming the evils of the Court of Chancery he in all its stages strenuously though unsuccessfully opposed.

It would exceed the proper limits of the present article to relate in detail the circumstances of the parliamentary career of Sir Samuel Romilly during the last five years of his life. In addition to his proposals for the improvement of the criminal law, he took an active part in all the political questions of the time, generally acting in zealous opposition to the ministers. He supported Mr. Whitbread's resolution against declaring war with France upon the return of Napoleon from Elba in 1815; he opposed the bills for suppressing Irish insurrections, and for the suspension of the Habeas Corpus Act in 1817, and moved resolutions condemning Lord Sidmouth's circular to magistrates respecting the prosecution of seditious libels. He also spoke and voted against the Alien Act, and in favour of an extension of the elective franchise, and of Roman Catholic emancipation.

In the summer of 1818 a dissolution of parliament took place, and Romilly, being solicited to appear as a candidate for the representation of Westminster, was returned at the head of the poll, though he declined to take any part in the canvass, and did not appear upon the hustings until the termination of the election. He died however before the meeting of parliament. Lady Romilly, to whom he was devotedly attached, and whose health had been for some months declining, died at Cowes in the Isle of Wight, on the 29th of October, 1818; and this event occurring to a mind already dangerously excited by recent exertions and anxiety, produced a delirium, under the influence of which

he put an end to his existence on the 2nd of November, 1818.

In his profession Sir Samuel Romilly attained to greater success than has been enjoyed by any advocate since the time of Sir Edward Coke. Nor did his professional reputation at all exceed his merits. He had a familiar knowledge of the principles of English law as administered not only in courts of equity, but in common-law tribunals, an unusual perspicacity of thought and expression, strong power of reasoning, great earnestness in enforcing his arguments, entire devotion to the interests of his client, and singular prudence in the management of a cause. To these qualities were united a deep sonorous voice, and unequalled impressiveness of manner. On the other hand, he is related to have been stern in his deportment to juniors, and unnecessarily severe in forensic altercation. This may have arisen from that contempt for the members of his own profession, which, it appears from his diary, was a prevailing sentiment in his mind, and which he expresses in some instances without sufficient reason. Being himself far in advance of the opinions of his profession, and feeling in his own mind with the certainty of demonstration the truth of those principles upon which he founded his projected improvements of the law, he was too much inclined to treat the ignorance and bigotry which often opposed them with an undue proportion of personal acrimony. Although in his early letters Romilly occasionally expressed in strong terms his aversion to his profession, declaring that he 'every day felt more unfit for it, and disliked it the more the more he met with success in it' (*Memoirs*, vol. i., p. 454.), these feelings do not appear to have been the confirmed sentiments of his mind, and were probably excited by the irksomeness of the mechanical business with which the practice of a chancery barrister commences. At a later period, when the nature of his practice was different, we do not meet with similar expressions of discontent; and it is hardly possible to suppose that his exalted position in the Court of Chancery during the latter years of his life, should not have been a source of just pride and gratification to him. At all events the tradition of the profession ascribes to him much eagerness, both in acquiring and retaining his practice.

As a politician, Romilly was inflexibly consistent in all his general views, and uniformly acted up to his principles. He displayed however more of the mere spirit of party than might have been expected from his enlarged mind and otherwise independent character. In some instances, especially in the case of Mr. Perceval, he suffered the feelings of party to interfere with the friendships of private life; and with a species of bigotry hardly credible, seemed to consider it morally wrong that he should associate cordially with one who differed from him in political opinion. The same rigid attachment to party induced a degree of intolerance in carefully ascribing to corrupt or interested motives the occasional desertion of individuals from the Whig standard; and sometimes, as in the case of his personal attack upon Lord Melville in the debate on Mr. Brand's motion in 1807, led him into expressions of rudeness which his own excellent taste afterwards strongly condemned.

His public speaking was perhaps more deeply impressive than that of any speaker of modern times. He expressed himself with great readiness and fluency. Without aid from artificial means, and without the use of figurative language or ornament of any kind, his simple, correct, and nervous style, supported by his serious and dignified deportment and fine voice, often produced an effect equally surprising to the speaker and his hearers. Romilly mentions in his *Diary* an instance of this kind, which occurred in his farewell speech to the electors of Bristol, in 1812: 'There was nothing,' says he, 'in this speech at all calculated to excite the passions, and I know not to what cause is to be ascribed the effect it produced; but it is certain that before I got to the conclusion, I saw the tears streaming down the cheeks of many of my hearers.' (*Memoirs*, vol. ii., p. 61-2.) The writer of this article was present on the occasion here alluded to, and well remembers the powerful impression produced by the few simple sentences uttered by Sir Samuel Romilly.

Romilly's style in writing displays the same features as his manner of speaking,—clear, easy, forcible, and totally unadorned. In very early life, he acquired the habits of reading with care and reflection, and of thinking clearly and closely; and hence arose the faculties of accurate reasoning, and of distinct and powerful expression, for which he was singularly remarkable.

**ROMNEY and ROMNEY MARSH. [KENT.]**

**ROMNEY, GEORGE**, born at Dalton in Lancashire, December 15, 1734, was the son of John Romney, a wealthy cabinet-maker of that town. As he showed a mechanical turn at a very early age, he was taken away from school in his eleventh year, and placed in his father's workshop. A watchmaker of the name of Williamson, an eccentric man, who was devoted to alchemy, exercised an influence over the mind of young Romney which seems to have left a lasting impression; he endeavoured to initiate him in the mysteries of his favourite pursuits, and our young painter was not an unwilling disciple. How Romney first manifested a talent for the art in which he subsequently attained such distinction, is not satisfactorily shown by his several biographers. His son the Rev. John Romney states that he met with Lionardo da Vinci's treatise on painting, embellished with various illustrations, at a very early age. According to Hayley, he appears to have had a passion for sketching people and taking likenesses, which he exercised by drawing his fellow-workmen in various attitudes upon the deals and boards in his father's workshop. His first effort that attracted any notice was a drawing of Mrs. Gardiner, which induced his father, encouraged by the persuasion of several friends, to place him with a portrait-painter of the name of Steele, who painted heads at Kendal, to whom he was bound for four years, at the age of nineteen.

At Kendal, in 1756, Romney contracted an early marriage with Mary Abbot of Kirkland, by which he displeased his parents; and according to Hayley, although his son denies the fact, he himself shortly afterwards repented of his precipitate step. The result however proved that his choice was eminently worthy of his affections. Having cancelled the indenture with his master, Romney, at the age of twenty-three, commenced painting on his own account. His first production was a hand holding a letter for the post-office window at Kendal, which continued there for many years. His first portraits were two half-lengths of Walter Strickland of Sizergh, and his lady, at whose house he saw a portrait of Sir Walter Strickland, by Lely, and two portraits, by Rigaud, the only pictures by other masters that he had any opportunity of studying previous to his arrival in London. His industry was indefatigable, and nature alone being his guide, he gradually formed for himself a simple and natural style, unblemished by those artificial or adventitious qualities which are so easily acquired from the schools. Through the influence of his friend Mr. Strickland, he obtained considerable employment from the gentlemen of Westmoreland, in some of whose portraits he introduced dogs, painted with great spirit and truth. Besides portraits he painted many fancy pieces, twenty of which he exhibited in the town-hall of Kendal, and disposed of afterwards by lottery, for which he issued eighty tickets at half-a-guinea each. After exercising his talents for about five years in the north, his ambition directed his views towards the capital; and in the spring of 1762, he set out alone for London, leaving his wife and two young children in Kendal, who, according to the painter's son, were to join him when he had established himself in the metropolis; but the sequel casts a shade over the moral character of Romney. He rose rapidly to fame and fortune, and, with Reynolds and Gainsborough, divided the patronage of the great and the wealthy; but his young wife was never called to share the fortunes of her husband; he concealed his marriage from his friends, and only returned to the neglected mother of his children when he was old and feeble, and required a nurse to administer to his wants and bear with his weaknesses.

Romney commenced his metropolitan career by painting heads for four guineas in the city. In 1763 he obtained the second prize of fifty guineas from the Society of Arts for a picture of the Death of Wolfe, but through the influence of Reynolds the decision was revised and reversed in favour of Mortimer, for his picture of Edward the Confessor seizing the Treasures of his Mother. Romney received a present of twenty-five guineas. This circumstance is supposed by some to have been the principal cause of the enmity which ever after subsisted between Romney and Reynolds.

Romney seems to have met with considerable and early encouragement. He soon moved from the city to the west end, and raised his price for a head to five guineas. At this time he paid a short visit to Paris, where he was much struck with the great Mary de' Medici series of pictures by Rubens, in the Luxembourg. Upon his return he painted the portrait of Sir Joseph Yates, one of the judges of the court of

king's bench, a picture which procured him a valuable connection amongst lawyers. Shortly afterwards he obtained a fifty-guinea premium from the Society of Arts for a picture of the Death of King Edmund.

In 1767, in consequence of his rapidly increasing practice, he removed to Great Newport Street, within a few doors of the former residence of Reynolds. Here he added greatly to his reputation by a portrait of Sir George Warren and his Lady, with a little girl caressing a bullfinch. He now not only ranked with the first painters of fancy subjects, but he bid fair to rival the President in portrait.

Romney's intercourse with men of taste and learning was now such as to make him feel the necessity of an acquaintance with the great works of art upon the Continent. He accordingly set out for Italy in 1773, with a letter of introduction to the pope from that great patron of the arts the duke of Richmond. In Rome he paid particular attention to the works of Michel Angelo and Raphael; and during his stay there produced one of his most beautiful pictures, the Wood Nymph, representing a naked female reposing upon the ground with her back towards the spectator.

From Rome he went to Venice, where he painted the portrait of Wortley Montagu in a Turkish dress. He returned to London in the summer of 1775, greatly improved in every respect by his continental tour.

Shortly after his return to London, he took a house in Cavendish Square, and, under the auspices of the duke of Richmond, recommenced his career as a portrait-painter, charging 15 guineas for a head, 30 for a half-length, and 60 for a whole-length; the president's price being at that time 35 guineas for a head. But Romney soon found it necessary to raise his prices, for sitters of all ranks crowded to his studio; and, notwithstanding they were still comparatively low, in a few years he realised an income of nearly four thousand a year by portraits alone.

He subsequently raised his prices considerably: in 1787, to 25 guineas; in 1789, to 30; and in 1793, to 35 guineas for a head, which continued to be his charge during the remainder of his life, the other sizes being charged in proportion.

Romney was now the acknowledged rival of the President in portrait. Reynolds's admirer and biographer, Northcote, says, 'Certain it is, that Sir Joshua was not much employed in portraits after Romney grew into fashion.' Lord Thurlow is also reported to have said, 'Reynolds and Romney divide the town; I am of the Romney faction.' To characterise these two factions technically, we should term them the factions of form and colour, the former being that of Romney. Romney's great success seems to have excited an active jealousy upon the part of Sir Joshua, who, when he spoke of him, used to term him 'the man in Cavendish Square;' and, from a passage in Northcote's 'Life of Reynolds,' we may infer that the President occasionally spoke disparagingly of the works of Romney. Northcote represents Garrick as saying of Cumberland the dramatist, 'He hates you, Sir Joshua, because you do not admire the painter whom he considers as a second Correggio.' 'Who is that?' said Reynolds. 'Why, his Correggio,' answered Garrick, 'is Romney the painter.'

Notwithstanding Romney's great employment in portraiture, he found abundant leisure to lay in fancy pieces, many of which however were left unfinished. The most remarkable of those of the earlier part of his career were, The Tempest; Tragedy and Comedy nursing Shakspeare; the Infant Shakspeare attended by the Passions; the Alope; Children in a Boat drifted out to Sea; Shepherd Boy asleep, watched by his Dog, at the approach of a Thunder-storm; Nature unveiling herself to Shakspeare, &c. Romney is said to have been the originator of Boydell's 'Shakspeare Gallery.' The Tempest and the Infant Shakspeare attended by the Passions were painted for that collection. He made sketches also for five other subjects, but they were never executed; the Banquet and the Cavern Scene in 'Macbeth;' Mrs. Ford and Mrs. Page; Bolingbroke and Margery Jourdain conjuring up the Fiend; and the Maid of Orleans.

Romney was an enthusiastic admirer of the celebrated Lady Hamilton, then the beautiful Emma Lyon. According to his son, he made no less than twenty-three pictures from her, some of which however were never finished. She was painted in various characters, as Iphigenia, St. Cecilia, Sensibility, a Bacchante, Alope, the Spinstress, Cassandra, Calypso, Magdalene, Joan of Arc, and Pythian Priestess.

Romney's ambition appears to have increased with his

years, and in his later days he devoted himself more ardently to fancy subjects than ever. Milton and his Daughters, and Newton making Experiments with the Prism, as a companion to it, were the most popular of these later productions. He sent 100*l.* to Flaxman, then studying in Rome, to purchase casts from the antique for him, who sent him 'the cream of the finest things in Rome.' The group of the Laocoon, the Niobe, the Apollo Belvidere, the Apollo Sauroctonos, groups of the Castor and Pollux, and Cupid and Psyche, the relief on the Borghese vase, several busts, and the best fragments of legs and arms that could be found. These splendid monuments of antient genius tended only still further to excite the emulation and ambition of Romney; he conceived grand designs of painting 'the seven ages,' 'the visions of Adam with the angel,' 'the flood, and the opening of the ark,' and many from Milton, some of Adam and Eve, and others having Satan as their hero.

This constant excitement seems to have been too much for the painter's nerves, and his mind was gradually giving way under it. His observations called forth by the melancholy fate of his friend Cowper seem to have been almost foreboding of the similar fate that awaited himself: 'If there is a situation more deplorable than any other in nature, it is the horrible decline of reason, and the derangement of that power we have been blest with.' The health of his faculties was now rapidly declining, but the return of his friend Flaxman from Rome, of whose talents he had a very high opinion, cheered him for a season. He shortly however became possessed with an idea that his house in Cavendish Square was not sufficiently spacious to admit of the execution of the magnificent designs he had in contemplation, and he accordingly had a house and gallery constructed at Hampstead, upon his own plans and under his own direction. He left Cavendish Square in 1797, after a residence there of twenty-one years, and repaired to his new studio at Hampstead, but not to revel in the dreams of his wild genius, for he was soon oppressed with a degree of nervous dejection that deprived him of all energy. After one or two efforts upon the canvass, he complained of a swimming in the head, and a paralytic numbness in his right hand, and then renounced the pencil for ever.

In the summer of 1799 he was seized with a sudden impulse, and started abruptly for the north, where, in Kendal, his amiable wife still resided, surviving the cold neglect and long estrangement of her husband, and in whom he found an attentive and affectionate nurse, 'who had never been irritated to an act of unkindness or an expression of reproach' by thirty-seven years of absence and neglect, during which long interval he had paid but two visits to the north. The kind attentions of this exemplary woman awakened feelings of intense gratitude in the heart of Romney, and he once again enjoyed real happiness, to which in the long years of his prosperity he had been a total stranger. He gave orders for the sale of his property at Hampstead, and purchased a house at Kendal, where he had resolved to remain. But this bright period was of short duration, for upon the return of his brother, Colonel Romney, from India, which was little more than a year after his arrival at Kendal, he suddenly fell into a state of utter imbecility, and he lingered on for nearly two years, unconscious of existence, until the 15th of November, 1802, when he died, in the sixty-eighth year of his age. He was buried at Dalton, the place of his birth.

In person Romney was tall and strong, 'his features were broad and manly, his hair dark, his eyes large, quick, and discerning.'

Romney attained to greater eminence in two branches of art, history and portrait, than it is the lot of most men to attain in one. According to Flaxman, he surpassed all British painters in poetic dignity of conception; and in portrait he was the acknowledged rival of Sir Joshua Reynolds. His productions in poetic and historic art, finished and unfinished, are extraordinarily numerous, comprising every variety of subject from the illustration of the most simple historical fact, to the endeavour to embody the wildest fictions of the poets. Some of these designs were presented in 1817, by the painter's son, to the university of Cambridge, to be deposited in the Fitzwilliam Museum; and the Cartoons, so much admired by Flaxman, were by the same gentleman presented, in 1823, to the Royal Institution of Liverpool. They consist of eight from the story of Cupid and Psyche, two from that of Orpheus and Eurydice, and

one from each of the following subjects:—Prometheus chained, Descent of Odin, Medea, Birth of Shakspeare, infant Shakspeare, Death of Cordelia, Ghost of Darius, and Atossa's Dream.

The following examples will serve to show how extensively Romney was patronised in portrait:—the Duke of Richmond, the Duke of Portland, the Duke of Grafton, Lord Chancellor Thurlow, Warren Hastings, Cooper, Earl of Chatham, William Pitt, Gibbon, David Hartley, Hyde Parker, Lord Melville, Lord Ellenborough, the Archbishops of Canterbury, York, and Dublin. Dr. Parr, Paley, John Wesley, Thomas Paine, Mrs. Fitzherbert, Jordan, and Flaxman modelling the bust of Hayley.

Romney was not a member of the Royal Academy; he never sent any of his works to its exhibitions. He had several biographers: Cumberland, the dramatist, gave a short account of him; his friend Hayley, the poet, published an elaborate life, for which Flaxman wrote the character of his works; another was afterwards written by the Rev. John Romney; and there is an excellent memoir of him in Allan Cunningham's 'Lives of British Painters,' &c.

The following are extracts from Flaxman's character of the works and genius of Romney:—'When Romney began to paint, he had seen no gallery of pictures, nor fine productions of antient sculpture: but then women and children were his statues, and all objects under the eye of heaven formed his school of painting.' 'His genius bore a strong resemblance to the scenes he was born in: like them it partook of the grand and beautiful; and like them the bright sunshine and enchanting prospects of his life were occasionally overspread with mist and gloom.' 'Painters have left so many examples in their works of tender and delicate affections; and several of his pictures breathe a kindred spirit with the Sigismonda of Correggio. His Cartoons, some of which have unfortunately perished, were examples of the sublime and terrible; at that time perfectly new in English art.' 'His compositions, like those of the antient pictures and basso-relievos, told their story by a single group of figures in the front; whilst the ground is made the simplest possible, rejecting all unnecessary episode and trivial ornament, either of secondary or architectural subdivision. In his compositions the beholder was forcibly struck by the sentiment at the first glance; the gradations and varieties of which he perceived through several characters, all conceived in an elevated spirit of dignity and beauty, with a lively expression of nature in all the parts. His heads were various: the male were decided and grand; the female lovely; his figures resembled the antique; the limbs were elegant and well formed; his drapery was well understood.' 'Few artists since the fifteenth century have been able to do so much in so many different branches.'

ROMORANTIN. [LOIR ET CHER.]

ROMSEY. [HAMPSHIRE.]

RO'MULUS. The numerous legends about Romulus the founder of Rome, may be distributed into two principal classes. One of these represents him as closely connected with the royal family of Alba, and may be considered a native legend which probably originated among the Romans themselves, and was almost universally believed by the Romans. The second, which connects Romulus with the Trojans, is manifestly of Greek origin, and did not become current until a comparatively late period in the history of Rome. According to the latter story, Romulus was sometimes described as the son of Aeneas, and sometimes as his grandson; and while some writers connect Romulus alone, others represent him as having a brother (Remus), or several brothers. (See the various editions of this legend, or rather Greek fabrication, in *Fab. s. v.* 'Roma;' Plut., *Romul.*, 2; and Dionys. Hal., i. 73; Niebuhr, i., p. 210, &c.) This story leaves a vacuum in the history of Rome, which amounts to about three centuries and a half, that is, from the return of the heroes from Troy till the middle of the eighth century before Christ. Various means were devised by antient writers, such as the building of a second, and even of a third Rome, to fill up this gap. But this story, notwithstanding its inaccuracies, has sometimes been adopted even by Roman writers, such as Sallust, who states that Rome was founded by the Trojans, under the guidance of Aeneas. The genuine Roman legend made Romulus and Remus the twin-sons of a shepherd daughter of the Alban king Procas. The royal house of Alba

was in later times represented as descended from Aeneas, while others, preserving the legend more in its original purity, made no mention of its Trojan descent. The main features of the Roman legend which are preserved in Livy (i. 3, &c.; Cic., *De Republ.*, ii. 5; comp. Plut., *Romul.*, 3, &c.; Dionys. Hal., i., p. 61, &c.), are these:—

When Procas, king of Alba, died, he left two sons, Numitor and Amulius. The latter wrested the government from his elder brother, who yielded without a struggle, and lived as a private person in quiet retirement. But Amulius, fearing that the descendants of his brother might punish him for his usurpation, had the son of Numitor murdered, and made his daughter Silvia a priestess of Vesta, an office which obliged her to perpetual celibacy. One day however when Silvia went into the sacred grove to draw water from the well for the service of Vesta, an eclipse of the sun took place, and the maid, frightened by the appearance of a wolf, fled into a cave. Here she was overpowered by Mars, who promised her a glorious offspring. She was delivered of twins, but the god apparently forsook her, for she was condemned and put to death by Amulius, and it was determined that the two children should be drowned in the river Anio. But the river carried the cradle, with the children in it, into the Tiber, which at the time had overflowed its banks. The cradle was driven into shallow water to a wild fig-tree (*Ficus Ruminalis*) at the foot of the Palatine hill. A she-wolf, which came to the water to drink, heard the cries of the children, and suckled them, whilst a woodpecker, which was, like the wolf, an animal sacred to Mars, brought them other food whenever they wanted it. This marvellous spectacle was observed by Faustulus, the herdsman of the flocks of king Amulius, and he took the children and carried them to his wife Acca Laurentia or Lupa. Thus they grew up in the shepherd's straw huts on the Palatine; that in which Romulus was said to have lived was kept up to the time of the emperor Nero. The two youths became the stoutest and bravest among their comrades, with whom they shared their booty. The followers of Romulus were called Quinctilii, and those of Remus, Fabii. A quarrel one day broke out between the two brothers and the shepherds of the wealthy Numitor. Remus was taken by a stratagem, and led to Alba before Numitor, who, struck by his appearance and the circumstance of the age of the two brothers, ordered Romulus likewise to be brought before him. Faustulus now disclosed to the young men the secret of their birth, and with the assistance of the faithful comrades who had accompanied them to Alba, they slew Amulius, and their grandfather Numitor was restored to the government of Alba.

The love of their humble home however drew the youths back to the banks of the Tiber, to found a new city. The district assigned to them for this purpose by Numitor extended in the direction of Alba as far as the sixth milestone, which was the frontier of the original *Ager Romanus*, and where, down to a very late period, the *Ambarvalia* were solemnized. A dispute arising between the brothers as to the site and name of the new city, it was agreed that it should be decided by augury. Romulus took his station on the Palatine, and Remus on the Aventine. Remus had the first augury, and saw six vultures, but Romulus saw twelve. Considering that his double number was a signal proof of the favour of the gods, Romulus and his party claimed the victory. In observance of the rites customary among the Etruscans in the building of towns, Romulus yoked a bullock and a heifer to a plough and drew a furrow round the foot of the Palatine hill to mark the course of the walls and of the pomerium. Over the parts where he intended to build the gates (*portæ*), he carried (*portare*) the plough. The new city thus built on the Palatine was called Roma. Remus, who felt indignant at the wrong which he had suffered, in order to show his contempt of the rude and simple fortifications, leaped over them; and Romulus punished his brother's insolence by putting him to death.

The population of the new city being very small, the gates were thrown open to strangers. Exiles, robbers, runaway slaves, and criminals flocked to the city as an asylum, and found a welcome reception. The only thing they now wanted was women; but none of the neighbouring people were willing to form matrimonial connections with the new settlers. Romulus therefore had recourse to a stratagem; he proclaimed that festive solemnities and games should be held in the city, and he invited his neighbours the Latins

and Sabines to attend them with their daughters. In the midst of the solemnities the females were forcibly carried off: the number thus taken was said to have been thirty. The three nearest Latin towns, Antemnæ, Cænina, and Crustumium, now took up arms against Rome, but Romulus defeated them successively, and having slain Acon, king of Cænina, he dedicated the first *spolia opima* to Jupiter Feretrius. The Sabines, under their king Titus Tatius, likewise made war upon Rome, and the treachery of Tarpeia, a Roman woman, opened to them the gates of the fortress on the Capitol. The Sabines attempted to storm the city, and Romulus in this emergency vowed a temple to Jupiter Stator, in order to inspire his men with courage and to prevent them from flying before the enemy. The war was continued with doubtful success, and finally terminated by the Sabine women throwing themselves between the combatants, and thus restoring peace between their fathers and husbands. Romulus rewarded the women of Rome for their services by the grant of various privileges, and the thirty *curiæ* were called after the names of the thirty Sabine women. The two nations, the Romans on the Palatine, and the Sabines on the Capitoline and the Quirinal, were united as one nation, though each continued to have its own king.

The two kings and the citizens of the two states met in the valley between the Capitoline and Palatine (*comitium*) whenever it was necessary to transact business which was of importance to both nations. This union however did not last long, for Tatius was killed during a national sacrifice at Lavinium, and Romulus henceforth ruled alone over the two nations.

During the period that Romulus was sole king, he is said to have carried on two wars, one against Fidenæ, and another against Veii. Fidenæ commenced the war from fear of the growing strength of its neighbour; but Romulus got a victory over them by stratagem, and took possession of their town. The war against Veii rose out of that against Fidenæ, for both were Etruscan towns. Veii was likewise humbled, but it obtained a truce of one hundred years, after surrendering part of its territory to Rome.

Such are the fortunes and achievements which the old Roman legend ascribed to the founder of the city. Respecting his political institutions, see the article *ROMÆ*. He is said to have died after a reign of thirty-seven years (716 B.C.). His death is represented in as marvellous a light as his birth. On the nones of Quinctilis, or on the Quirinalia, the king, while reviewing his people near the marsh of Capra, was taken up by his father Mars, and carried to heaven. The people in terror fled from the spot; but Romulus soon afterwards appeared as a glorified hero to Proculus Julius, and bade him inform his people that in future he would watch over them as the god Quirinus.

Such are the main features of the story of the founder of Rome, which was handed down by tradition, and commemorated in national songs to the time of Dionysius. (Dionys. Hal., i., p. 66.) Writers both antient and modern have attempted to elicit historical truth from this beautiful and in most parts truly poetical legend, or have struck out some parts of the narrative as altogether fabulous, and retained others which are more in accordance with the events of real history. The mischievous results of such perverse criticism have been clearly shown by Niebuhr (i., p. 235, &c.). The acts and institutions attributed to Romulus which are of any importance to the historian, and which from their connection with events of a more historical age, or with the general state of the nations of Italy, may be considered as history, are given in the article *ROMÆ*.

RONCESVALLES (French, *Roncesvaux*) is the name of a valley formed by the Pyrenees of Navarre between Pampeluna and St. Jean Pié de Port, on the French frontier. It is also the name of a small village in that valley, remarkable only for an antient abbey (*Nuestra Señora de Roncesvalles*), where the tomb of Don Sancho el Fuerte (the strong), king of Navarre, is shown, as well as several antient relics bearing the name of Roland. According to tradition, this hero, and many others of Charlemagne's peers, who had invaded Spain in 778, whilst attempting to regain France, were surrounded by the Navarrese, commanded by Bernardo del Carpio, and put to death. This event however, which forms the subject of many Spanish romances and chivalrous chronicles, is far from being supported by historical evidence.

RONDA, a city in the south of Spain, formerly belonging

to the province of Malaga, is now the capital of a province so called since the late division of the Spanish territory. It is generally supposed, though erroneously, to occupy the site of the antient Arunda (Plin., iii. 1), which stood some miles to the south-west. It is an ascertained fact that it was entirely built by the Moors, with the remains of Acinippo, or Ronda la Vieja (old Ronda), which is two leagues to the north, and where the ruins of an amphitheatre, a temple, aqueduct, and extensive walls are still standing. Ronda is situated in the midst of the lofty mountains of the Sierra de Ronda, and is fourteen leagues from Gibraltar, twenty from Cadiz, and about the same distance from Seville. It is considerably elevated above the sea, being built on a hill, which terminates abruptly just below it to the west. The city is separated into two parts by a very narrow ravine of great depth, called El Tajo (the cut), through which flows the river Guadiaro. Though divided by nature, the city has been united by means of a bridge of most stupendous dimensions, springing from the banks of the river on massive stone piers, and at the height of nearly 400 feet above the bed of the river.

The city of Ronda has a population of about 20,000 inhabitants. The streets are narrow, but clean. There is a public walk, called Alameda, well shaded with trees and shrubs; and a Plaza de Toros (bull-ring), built entirely of stone, and capable of holding eight or nine thousand persons. The Alcazar, or Moorish castle, one of the most extensive and best built in all Andalusia, is now a mass of ruins, having been blown up by the French on their evacuation of Ronda during the Peninsular war. It was considered impregnable as long as the Moors held it, and resisted several sieges, until it was finally reduced by Ferdinand in 1485, towards the close of the Moorish war. [MOORS.] With the exception of a few tan-yards, which are not in a very prosperous condition, Ronda has no trade whatever; the inhabitants occupy themselves chiefly in farming and raising fruits and vegetables for the consumption of Gibraltar. An annual fair, originally instituted for the sale of horses, but which now is not confined to that traffic, is held at Ronda. It is attended by merchants from almost every part of southern Spain.

**RONDEAU** (Fr.), or **RONDO** (It.), a kind of air consisting of two or more strains, in which, after finishing the second strain, the first is repeated, and again after the third, &c., always returning to and concluding with the first. (Rousseau.)

**RONDELETIA**, a genus of plants of the natural family of Rubiaceæ, named after Rondelet, a French botanist of the sixteenth century. It is characterised by having a calyx with a subglobular tube. Corol superior, funnel-shaped, ventricose at the throat. Segments four to five, ovate, obtuse, spreading. Anthers four to five, sessile within the corol. Ovary two-celled. Style filiform. Stigma bifid. Capsule round, crowned with the limb of the calyx. Seeds minute, numerous, or few when abortive. The genus, as formerly constituted, included many shrubby trees which occur in India (Roxb., *Fl. Indica*), but these have been referred by modern botanists to Adenosacme, Greenia, and Wendlandia. The present genus *Rondeletia* occurs chiefly in America and the West Indies.

**RÖNGEBIRGE**. [GERMANY.]

**RONSA'RD, PIERRE DE**, born in 1524, in the district of old France called Vendômois, was the son of a maître-d'hôtel of Francis I., who made him a knight. Pierre studied for a short time in the college of Navarre at Paris, but soon after he entered the service of the duke of Orléans, son of Francis I., in the quality of page. He afterwards attended, in the same capacity, James Stuart, king of Scotland, who had come to Paris to marry Marie de Lorraine, and he accompanied James on his return to Scotland, where he remained three years. On his return to France he resumed his post with the duke of Orléans, who sent him on several missions to Scotland, Ireland, and other countries. He was afterwards sent by Francis I. on a mission to Piedmont. In these several journoys he suffered much, in consequence of which he became deaf. On withdrawing from active life he retired to the college of Coqueret, where he studied the classics under Turnèbe, became a good Greek scholar, and took orders as a priest. He also began writing French poems, and was crowned in the floral games at Toulouse. [CLEMENCY, ISAURE.] He was considered as the successor of Marot, and the chief of the French poets of the time. [MAROT.] Montaigne, De Thou, Scaliger, Murcet,

Pasquier, and others commended him highly; but modern critics have judged him more severely. Boileau says that Ronsard's language was a heterogeneous compound of various languages and dialects, and that his muse spoke Greek and Latin in French verses. Malherbe and La Bruyère have spoken of him in the same strain. Charles IX. bestowed on Ronsard an abbacy and other benefices. His moral conduct however is said not to have been strictly clerical. He died in 1585, in one of his livings near Tours, and a solemn funeral service was celebrated in honour of him at Paris, in the chapel of the college of Boncour. Ronsard had certainly poetical genius, but he was deficient in taste. He was in this respect in France what the satirists of the following century were in Italy and Spain. His poetical works are numerous; they consist of odes, hymns, eclogues, &c.: 'Mascarades, Combats, et Cartels faits à Paris et au Carnaval de Fontainebleau.' He also began a poem, 'La Franciade,' which he left unfinished. His works are now nearly forgotten. The most complete edition of them is that by Richelet, 2 vols. fol., Paris, 1623.

**ROOD**, the quarter of an acre. [ACRE.]

**ROOF**, the covering of a house or other building. The name, in its most extended sense, embraces the external covering itself, and the framework by which it is supported; but, as a term in carpentry, it is limited to the carcass roof or framing.

The importance of this part of a building can hardly be overrated, since on its right construction depends not only the comfort of those for whose shelter it is designed, but also the safety and durability of the edifice itself. For the former of these purposes it is desirable that a roof should exclude extremes of heat and cold, and be impervious to rain or snow. For the latter, the exclusion of water is equally necessary, and it is essential that the framework be so disposed as to throw the least possible strain on the walls. By a judicious arrangement in this particular, a roof may not only be prevented from pressing on the walls in an injurious manner, but may be made to contribute greatly to the stability of the whole structure. In order to the due combination of the requisite qualities, an intimate acquaintance with the principles of mechanical philosophy is indispensable; and a correct knowledge of the strength of different materials, when exposed to various kinds of strain, is necessary to the economical adjustment of the dimensions of the several parts of a roof. A roof of large span forms, indeed, one of the most interesting applications of the science of carpentry, theoretical or constructive.

In order to cover in a building in which the space to be spanned is greater than can be covered by single blocks of stone extending from one point of support to another, it is necessary either to have recourse to the principle of the arch, as in vaults and domes of stone or brick, or to form a framework of timber to support the covering. The former plan is objectionable in the case of ordinary buildings from its expense and weight, and from the great solidity required in the walls, where they have to be used as the abutments of an arch. The principles on which such coverings of masonry are formed are explained under ARCH and DOME, and in this article the more usual kind of roof, that supported by a wooden framing, will be described. Such structures occasionally partake of the character of an arch or dome, but more usually consist of flat planes variously disposed. Roofs formed of one level plane, which are extensively used in eastern countries, are not adapted for buildings in which a large space has to be spanned over, nor to resist the penetration of water; and are therefore unsuitable for climates in which rain and snow are common. A simple inclined plane is well adapted to resist injury from weather, but, as it is scarcely more favourable to an economical disposition of the timbers than a flat roof, it is only suited for small buildings, and is seldom used except as a lean-to. Another objection to its use on a large scale is the disproportionate height it requires in one side of the building. The best figure for a simple roof is that formed of two inclined planes, rising from the two opposite walls that approach nearest to each other, and meeting over the centre of the edifice, so as to form a ridge. By this form, supposing the same slope to be maintained, one half of the height of the single inclined plane is avoided; and, the length of the timbers being diminished one half, their scantling may be considerably reduced. Fig. 1 represents a plan, with side and end views of such a roof, which is called a *common* or *gable-end* roof.

Fig. 1.

Frequently four inclined planes are used, disposed as shown in fig. 2, representing a *hipped roof*, which takes its name from the hips, or inclined ridges formed by the meeting of

Fig. 2.

the sides and ends. Where a hipped roof covers a perfectly square building, the faces all meet in a point, and form a pyramid; but when, as in the diagram, the plan of the roof is oblong, the planes rising from the nearest opposite walls meet in a ridge. Sometimes the inclined faces are not continued upwards till they meet, but the roof is completed by a horizontal plane. Such a roof is called a *truncated, terrace, or cut roof*, and may have two, three, or four inclined faces. Fig. 3 represents a truncated roof hipped at one end, and terminating at the other in a vertical wall, like the gable-ended roof.

Fig. 3.

This arrangement is useful in diminishing the height of a roof, the level platform being covered with lead to compensate for the want of slope. It should be observed however that even this part is not perfectly level, the centre being slightly elevated to throw off water. A similar saving of height is frequently obtained by means of a roof in which each sloping face consists of two planes of different degrees of inclination. This form, which is denominated a *curb roof* (or, from its inventor, a *Mansarde roof*), is very common in London, because it affords more space for the formation of bedrooms in the roof than the simpler forms. A curb roof may be hipped or not, according to circumstances. Fig. 4 represents it hipped at one end only, as the last figure, showing, like the previous diagrams, the plan, and side and end elevations.

Fig. 4.

Such are the principal forms of roof used in covering simple rectangular buildings, but they require many modifications to suit irregularities of shape, or combinations of rectangular forms. Thus in Figs. 5 and 6, which represent the junction of different roofs or portions of roofing at right angles with each other, the lines *aaa* indicate *valleys*,

Fig. 5.

Fig. 6.

or the junction of two planes in such a manner as to form hollows the reverse of hips. When two faces of a roof join so as to form an angle similar to a valley, but in an horizontal instead of an inclined position, the term *gutter* is applied instead of valley.

A further distinction, which it may be well to mention before entering upon the details of construction, is that be-

tween roofs with dripping eaves, and those in which the water is collected in gutters. In the former case the roof projects several inches, or even feet, beyond the walls, and the water running from the roof either drops at once on the ground, or is collected in troughs fixed under the margin of the eaves, and conducted by them to descending pipes. This arrangement has a clumsy appearance, and is perhaps unnecessary where a sufficient projection is given to the eaves, though it is essential to the dryness of the walls when they are of the diminutive size often adopted by modern builders. In gutter roofs the timbers do not extend to the outside of the walls, which are carried up as parapets, of a reduced thickness, to such a height as to conceal the roof either wholly or partially. The gutters, which are troughs of wood covered with lead or other metal, are laid at the bottom of the slopes, just within the parapets, and have a gentle inclination (usually about an inch in ten feet), to cause water to run freely towards the pipes. In extensive roofs it is well to use two or more falls instead of one, that the elevated end of the gutter may cover as little of the roof as need be. Similar troughs are often used in the valleys. Gutters are generally made wide enough for a man to walk along them, and should be sufficiently capacious to avoid all risk of overflowing during a sudden heavy fall of rain.

The degree of slope given to the inclined faces of a roof varies according to the covering material employed, as well as to the climate. The ancient Grecian temples had very low, or pediment roofs, varying from about 12° to about 16°, the height being from one-ninth to one-seventh of the span. In Roman buildings the inclination is somewhat greater, being usually 23° or 24°, or from one-fifth to two-ninths of the span. The general introduction of the pointed style of architecture led to the use of very high-pitched roofs, a very common proportion being that in which the length of the rafters is the same as the span, so that they formed an equilateral triangle. In comparatively modern domestic architecture in this country, it has been considered desirable for the length of the rafters to be three-fourths that of the span, and an angle of 45° is still considered by some to be the best pitch when plain tiles are used. As builders can, in the present day, obtain excellent covering materials, the pitch may be made of any required degree, down to the low Grecian pediment, and it therefore depends on the style of architecture and the taste of the builder; the most common height being from one-fourth to one-third of the span. High roofs discharge rain the most rapidly, and do not retain snow so much as those of low pitch; but where they have gutters they are liable to become choked by snow sliding into them, and to overflow from water running into them faster than the pipes can convey it away. Steep roofs may be covered with small slates, and are less likely to be stripped by violent winds. Low roofs, in consequence of their superior lightness, are less expensive, the timbers not only being shorter, but of proportionately smaller scantling, and they press less injuriously on the walls. The following table, extracted from Tredgold's 'Elementary Principles of Carpentry,' shows the proper angle for roofs covered with the materials specified in the first column, the last column indicating the comparative weight of each kind of covering:—

Covering.	Inclination to the horizon.	Height of roof in parts of the span.	Weight upon a square of roofing.*
Copper or lead . . .	3° 50'	$\frac{1}{12}$	{ copper 100 lead . . . 700
Slates, large . . . . .	22°	$\frac{1}{4}$	1120
Ditto, ordinary . . . . .	26° 33'	$\frac{1}{3}$	900 to 500
Stone slate . . . . .	29° 41'	$\frac{1}{2}$	2380
Plain tiles . . . . .	29° 41'	$\frac{1}{2}$	1780
Pan-tiles . . . . .	24°	$\frac{1}{2}$	650
Thatch of straw, reeds, or heath . .	45°	$\frac{1}{2}$	. . . . .

In describing the timber-work of an ordinary roof, each of the planes of which it is composed may be considered to be bounded by a frame, the parts of which have the general name of bordering pieces. Those which join the wall are the *wall-plates*; that at the meeting of two faces, parallel to the wall-plates, is the *ridge-piece*; and the inclined bars extending from the wall-plates to the ridge-piece are *rafters*, those which form the salient angles in hipped roofs being distinguished as *hip-rafters*. The support necessary for the external covering is given by a series of rafters or inclined bars, extending from the wall-plates to the ridge-piece, and placed

\* A square of roofing contains 100 square feet.

parallel with each other at equal distances. In a hipped roof, the rafters near the ends, being parallel with the others, are necessarily diminished in length, extending from the wall-plate to the hip-rafter instead of the ridge-piece. All such pieces, being shorter than the length between the wall-plate and the ridge-piece, are called *jack rafters*.

It is not usual to vary the scantling, or transverse dimensions of rafters, in any considerable degree, on account of their various lengths; nearly the same scantling being used in all buildings, and the required strength being obtained by introducing intermediate supports between the wall-plates and ridge-piece where the size of the roof renders such necessary. This additional support is supplied by horizontal rectangular bars called *purlins*, placed under the rafters in such a manner as to divide their length into two or more equal parts, the ends of the purlins being fixed to the sides of the bordering frame. Like the rafters, the purlins are not much varied in thickness according to the strain upon them, but they are in turn supported by a series of bars placed equidistant from each other, and parallel with the rafters, but with their upper face in the same plane as the lower face of the purlins. These are called *principal rafters*, or, for brevity, *principals*, to distinguish them from the first described, or *common rafters*. Where it is desirable to save room by reducing the thickness of a

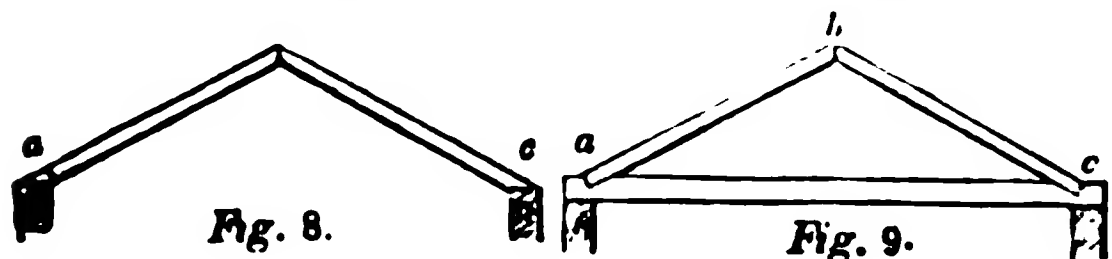

roof, the purlins may, as shown in *fig. 15*, be notched into the principals and common rafters, but this practice is not to be recommended, as it weakens the timbers. Where principals are used, their lower ends are mortised into the ends of a *tie-beam*, which stretches across the building, and rests upon the wall-plates. This beam keeps the lower extremities of the principals from separating, and discharges the weight of the roof on the walls in a vertical direction, relieving them entirely from the lateral thrust of the rafters. The triangular frame formed by the two principals and a tie-beam, with any bars it may comprise for additional strength, is called a *truss*, and such frames being placed at regular intervals, the timber-work between any two of them is called a *bay of roofing*. The lower extremities of the common rafters, being elevated by this arrangement above the wall-plates, are supported by *pole-plates*, or pieces of timber parallel to the wall-plates, resting on the ends of the tie-beams. The supporting frame-work altogether is called a *carcass-roof*.

*Fig. 7*, which represents a small carcass-roof supported by four trusses, and having one purlin only between the wall-plate and ridge-piece, may assist the reader in comprehending the arrangement of the parts enumerated; and their names will be found more distinctly by referring to the representation of a more complicated truss at *fig. 11*.

In this figure the common rafters are represented on one half of the roof only, that the trusses may be more distinctly seen; and the end walls are omitted for the same reason.

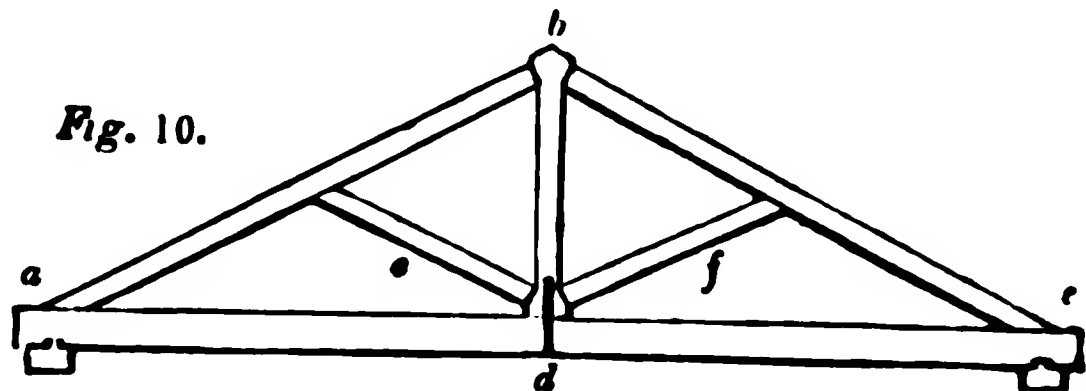

The proper construction of the trusses of a roof, with reference to the size of the building and the weight of the covering, is a matter requiring much scientific knowledge. For the want of this it is not unusual to encumber trusses with much more timber than is necessary or useful; and the disadvantage of this is not confined to the increased weight and cost of the roof, as superabundant timbers frequently occasion injurious strains, and the increased number of joints adds to the risk of derangement by the shrinking and warping common to all timber constructions. The general principles to be acted upon may be illustrated by a few diagrams; but in the limited space devoted to this article no attempt can be made to describe all the modifications required by the ever-varying forms of buildings; in the design of which it is too common, instead of assigning its due importance to the roof, to treat it as an unsightly feature, to be concealed as much as possible from view.

In a roof formed as shown in *fig. 8*, consisting simply of two inclined planes abutting on the walls, it is evident that the weight of the rafters *ab* and *bc*, as well as that of the covering sustained by them, will have a tendency to thrust out the walls. This tendency ordinary walls have not the

strength to resist, and therefore it becomes necessary to add the beam *ac* (*fig. 9*), which, by receiving the outward thrust

of the rafters, relieves the walls of lateral strain. If the tension of the tie-beam *ac* be sufficient to resist the extending force of the rafters without sensible elongation, the only effect that such a roof can have upon the walls is a vertical pressure on each, equal to half its weight; and it cannot fall without the tie-beam, which acts the part of a cord or chain, being pulled asunder, or the rafters being crushed. If the materials were perfectly rigid, no additional parts would be required; but as they are not so in practice, it becomes necessary, when the timbers are of considerable length, to provide means for counteracting their tendency to sinking, or *sagging*. By adding a bar shaped like *bd* (*fig. 10*), the centre of the tie-beam may be suspended from the crown of the roof. This piece is called a *king-post*, but the

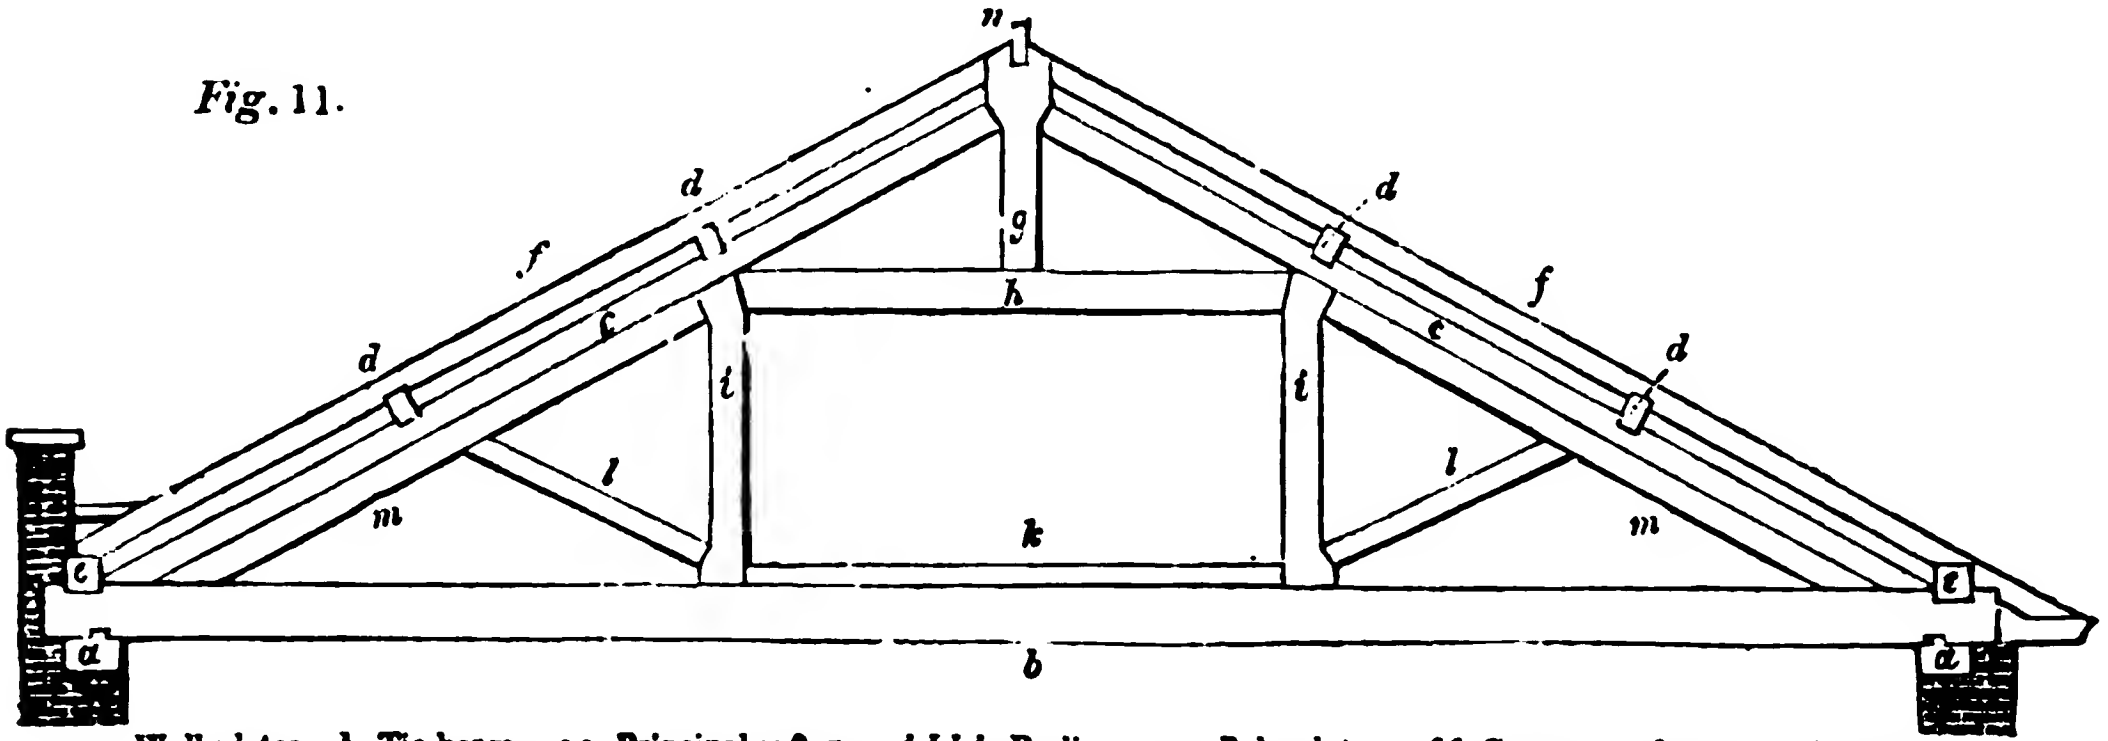

name is perhaps not a good one, as, though it appears like a post to support the ridge or crown of the roof, it is in reality a *tie*, supported by it, and sustaining, instead of resting upon, the centre of the tie-beam. By cutting the king-post out of a piece of wood of larger scantling than the shank of the post itself, projections of the shape indicated in the cut may be formed at its ends. These are called *joggles*, and those at the upper end form a wedge between the heads of the rafters, like the key-stone of an arch. It is evident that a weight pressing on the projecting joggles at the base of the king-post will be by it transmitted to the

rown of the roof. These therefore form fixed points, from which support may be obtained, by means of *struts* or *braces*, *e* and *f*, for the centre of each rafter. Where *purlins* are added, they rest on those points of the principal rafters that are thus supported by struts, as may be seen by reference to *Fig. 7*. It may be observed that this truss consists of two pieces (the tie-beam and king-post) in a state of tension, and four (the two rafters and the two struts) in a state of compression; and that in every well-contrived truss, however the number of its component parts may be increased, every bar is in one or other of these states. Those parts which are in a state of tension, acting merely as cords to bind the truss together, may be and sometimes are

formed of slender rods of wrought-iron; but the others, needing stiffness as well as cohesion, require bars of considerable substance, and are therefore mostly formed of wood or cast-iron. Sometimes the king-post is dispensed with, and its office performed by two similar posts, called *queen-posts*, at equal distances from the centre of the truss. In order to keep these in their right position, a short horizontal beam, called a *collar-beam*, is inserted between their upper extremities, and another, termed a *straining-sill*, between their lower ends. This arrangement is explained by *fig. 11*, which also shows the position of other parts of a truss. One side is represented as a gutter-roof, and the other with eaves.

The *auxiliary* or *cushion rafters*, *m, m*, are pieces occasionally added, in large roofs, to strengthen the principals; and they, with the collar-beam, &c., form a complete truss within them. The trusses of truncated roofs are formed in this manner, the collar-beam forming, as it were, the keystone of the arch, and being surmounted by a *camber-beam*, the upper edge of which is formed into two slightly inclined planes, to give the necessary slope to the lead covering. In such a roof, pieces of wood resembling ridge-pieces are inserted at the angles formed by the meeting of the rafters with the horizontal bars that support the flat.

The following representation of a very simple truss, from Nicholson's 'Carpenter and Joiner's Companion,' illustrates the use of slender king-posts and queen-posts of wrought-iron, and shows how the stress of every part of the roof may be brought to bear on the ridge. The lower ends of the struts rest in stirrups attached to the vertical rods, and the weight

curve; and *a' b' c' d' e'*, in the same figure, represents the corresponding position in which they should be placed in an equally loaded roof. If the rafters *b' c'* and *c' d'* are to

bear a greater weight than *a' b'* and *d' e'*, they will, if proportionately loaded when suspended in a curve, fall in such a way as to increase the angles *abc* and *cde*, and diminish *bcd*, thereby indicating their proper position in the roof. When the roof is to be loaded unequally, and more on one side of the ridge than the other, as it would be if *b' c'* were to be covered with lead, and the other planes with slates, a corresponding weight added to the centre of gravity of *bc* will cause the bars to arrange themselves as *abcde*, *fig. 14*, the angles of which, being transferred to the roof, give the position of equilibrium *a' b' c' d' e'*. This practical method of finding the proper angles of a curb-roof may be applied under all circumstances, the dimensions of the experimental bars being proportionate to those of the rafters, and their centres of gravity being loaded according to the pressure to be sustained by each plane of the roof. The great advantage of curb-roofs consists in the space they afford for chambers in the roof, such chambers being lighted by dormer windows in the lower inclined faces. When the trusses of the roof form partitions between the bed-rooms, their posts and braces are so arranged as to leave one or more doorways for communication between them.

In roofs of very large span it is often desirable, in order to avoid running up to a great height, to form two or more ridges. When intermediate support can be obtained from partition walls, such constructions may be regarded as combinations of two or more distinct roofs placed side by side. *Fig. 15* is an example of a roof of large span without any intermediate support, and having a large available space between the tie and collar beams. It represents the form of the trusses, which were placed fifteen feet apart, of a roof of eighty feet span, erected over Drury-Lane Theatre in 1793.

It is sometimes necessary, in order to obtain additional height inside a building, to raise the tie-beam above the

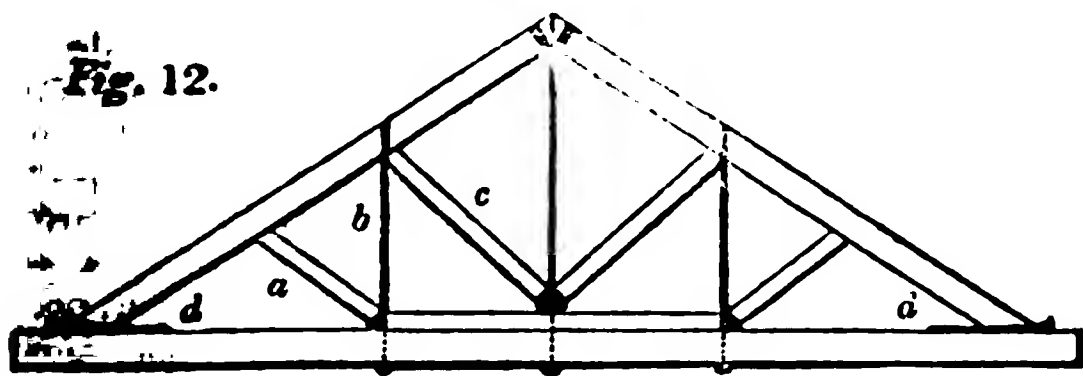

Fig. 12.

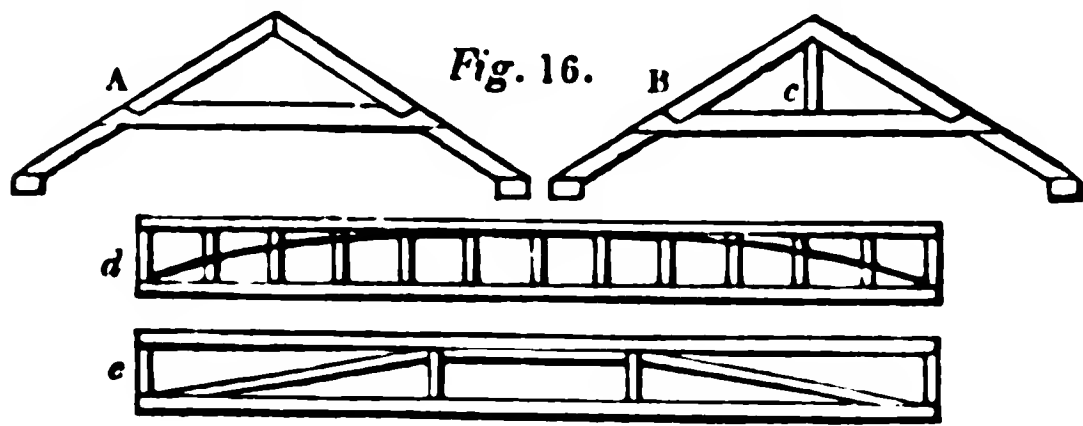

bearing on the strut *a* is imparted, through *b* and *c*, to the king-post. The tie-beam is suspended by bolts from each of the vertical rods, and the ends of the rafters are secured to the tie-beam by iron straps passing round them, and bolted to the beam at *d, d*. Trusses on the same principle may be made of timber only.

In curb roofs the upper rows of rafters are called *curb-rafters*, and the horizontal bars that receive the upper ends of the lower rafters, and the feet of the curb-rafters, are known as *curb-plates*. The proper position of equilibrium for the rafters of a curb-roof may be ascertained by very simple means, within the reach of persons not possessed of sufficient mathematical knowledge for determining it by calculation. If the rafters are to be equally loaded, as in a roof entirely covered with one material, this position will be exactly the reverse of that which they would take by gravity, were they suspended in a chain or festoon, the joints being flexible. If they are framed together in this position of equilibrium, they will balance each other like the stones of an arch; and the tie-beams, posts, and braces will have no other office to perform than that of resisting such irregular strains as might tend to alter their arrangement. The rafters thus suspended would fall into the position *abcde*, *fig. 13*, a line drawn through the angles being a catenarian

level of the top of the walls. In small spans this may be done by the simple arrangement called the *carpenter's bow* (A, Fig. 16), in which a firm union is effected between the beam and the rafters without the use of nails or pins. Such a roof can only press injuriously on the walls by the rafters sinking into a concave form, which however their lower ends are very liable to do. In such a case additional strength may be obtained by inserting a longitudinal truss, as in B, Fig. 16, where *c* represents the end of the truss,

which should be firmly built into the gables. *d* and *e* are side views of two longitudinal trusses suitable for such a situation, the first being stiffened by an arch of iron notched into the short vertical pieces, and the second formed of timber only. Similar trusses are occasionally introduced under the purlins. Roofs without ties may be greatly strengthened by the use of parabolic curves of iron, notched into the rafters of each inclined face, and abutting on the wall-plates, which in such a case are firmly bolted together. The timbers of such a roof may be framed together in planes, each having a distinct ridge-piece, and the ridges being screwed or otherwise firmly connected together. The curves may be cast in short segments, as they are compressed when in use, it being merely necessary to provide that the joints should always abut on a rafter. Tredgold, in his 'Elementary Principles of Carpentry,' recommends the use of similar curves, of either wood or iron, in the trusses of an ordinary roof, by which the derangement often arising from the shrinking of the king-posts and queen-posts may be avoided. In this case the curves take the place of the principal rafters, and, if made of wood, may be constructed of short straight pieces, arranged as shown in Fig. 17, and held together by bolts or wooden keys. When curved tim-

ber can be obtained it is to be preferred, as it reduces the number of joints. For small roofs timbers may be bent into the required form, as it is found that a piece of wood the thickness of which does not exceed  $\frac{1}{16}$ th part of its length, may be bent into a curve rising one-eighth of its span without impairing its elasticity. Two such pieces may be laid together, and bent by twisting a rope attached to their ends, as is done in tightening the frame of a bow or pit saw; and, being bolted together while curved, they will spring back but little when the rope is relaxed. Another mode of forming such a rib is to take a piece of wood whose thickness is about one-sixtieth of its length, and cutting along the middle with a thin saw from each end, leaving about eight feet in the centre solid. The beam may then be bent, and bolted or pinned together as before described. In either case the rib should be bent about one-fourth more than it is intended to remain, to allow for springing back. A parabolic curve is the form most recommended; but a circular arc, rising half the height of the roof, will answer the purpose. Fig. 18 represents the truss of a truncated roof strengthened by a curved rib, the suspending pieces being, when the rib is formed in the manner first described, placed at each joint, and each consist-

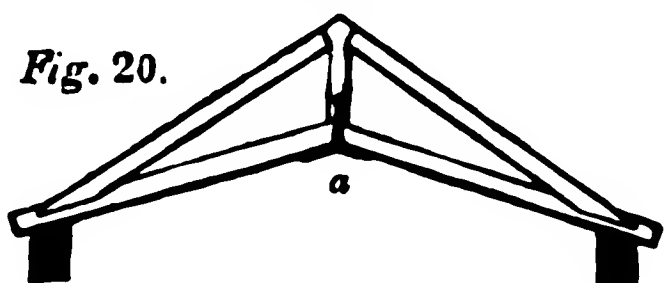

ing of two pieces, one on each side of the rib, notched to it and the beam, and fastened by bolts and straps.

One of the advantages of this mode of construction is that the tie-beams may be suspended from any number of points, which is important in large spans, where the beams have to be formed of several pieces scarfed together. [SCARFING.] Diagonal braces, though unnecessary with parabolic curves, may be added to meet accidental strains, as shown by the dotted lines in the cut. This principle of construction, with an arc composed of several pieces of timber, was followed in one of the largest roofs ever built, that erected in 1791 over a riding-house at Moscow. The span of this roof, which has been said to be the most extensive in the world, is stated by Tredgold at 235 feet, the slope being about  $19^\circ$ , and the external dimensions of the building 1920 by 310 feet. He states that it had sunk so much that it was proposed to add a second curve for additional strength.

A simple and economical roof, invented by Mr. A. H. Holdsworth, and rewarded by the Society of Arts in 1820, is supported by curved ribs of timber applied in a different manner. A detailed description is given in the 38th volume of the Society's 'Transactions,' but Fig. 19 will sufficiently explain the principle of its construction. *a* is a beam

serving as a tie-beam, and also to support the upper floor of the building; *b b* are curved ribs, formed in a similar manner to those just described, the lower ends of which are firmly secured to the tie-beam *a*. The principal rafters rest on these ribs, and their lower ends bear upon short timbers resting on the walls, these pieces being fastened by strong iron straps to the curved ribs, to counteract the outward thrust of the rafters. By this arrangement the whole of the interior of the roof, which is usually encumbered with king-posts, queen-posts, braces, &c., is rendered available for useful purposes, in addition to which it effects a considerable saving of timber.

Wrought-iron straps of various forms are very useful when judiciously applied, in strengthening the joints of a roof. They should be fixed with regard to the unavoidable tendency of the timbers to shrinking, so that while they may, in some cases, counteract or lessen its effect, they may so far yield to it as to prevent a strain which should come upon a timber, being entirely thrown, by its alteration of form, upon the strap. Tie-beams are often suspended to the trussing-posts by means of straps, so arranged as to allow the beam to be keyed up to its true position in case of the roof sinking. When this is not the case, the ties are sometimes drawn up into a slightly convex or cambered form, to meet the same contingency. Height may be gained inside a building by disposing the timbers as in Fig. 20, the want of a continuous tie-beam being compensated

for by an iron strap to unite the ties to the bottom of the king-post at *a*; but it is evident that the safety of the plan must depend wholly on the straps, which alone counteract the outward thrust of the rafters.

In roofing a church with a nave and side aisles, the continuity of the tie-beams may be dispensed with, intermediate support being obtained from columns. It is however necessary to guard carefully against any lateral strain to the columns.

Many of the high-pitched roofs of old Gothic churches and halls are very ingeniously contrived, but they often throw great pressure on the walls, owing to the absence or elevated position of the ties; thereby rendering very solid walls and buttresses necessary. The *Norman roof* is an ingenious contrivance for the construction of roofs of large span with small pieces of wood. *Fig. 21* shows this arrangement, in which all the rafters abut on joggled king-posts, of which there are several, their relative position being maintained by diagonal braces. The timbers of this kind

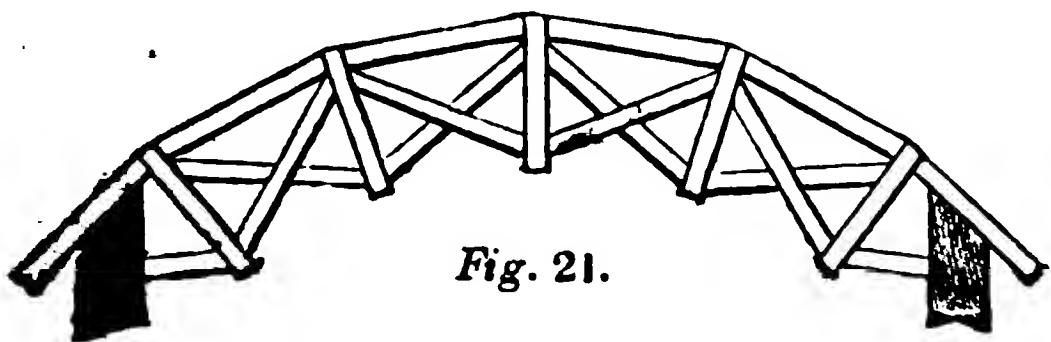

Fig. 21.

of roof are often left visible, being so carved as to have an ornamental effect. Such a roof may be made to exert very little injurious pressure on the walls.

When the space covered in is of an irregular shape, it is best to arrange the inclined planes of the roof in a similar manner to those of a rectangular building, leaving a level platform in the centre, corresponding to the plan of the inclosed space. Where the space covered is circular, elliptical, or polygonal, although the construction of the roof may appear more complicated to the eye, it is, in fact, simpler and easier than that of a quadrangular building, the strain of the roof being more equally distributed. The nearer a roof approaches to a circle in plan, the stronger it will be, the parts deriving that mutual support from each other which forms the distinguishing character of the dome. Domes of wood, of great size, have been made without trussing, simply by forming the timbers into curved ribs abutting on the wall-plates, which then form a circle, and kept in their proper positions by horizontal circles framed with them at intervals. As the ribs approach the upper part of the dome, the intervals between them diminish in width, to allow for which every second or third rib is discontinued at intervals, the ends of the ribs thus discontinued being received by the horizontal circles, which may be compared to purlins, the ribs taking the place of rafters. The wooden dome formerly existing at the Halle aux Blés, at Paris, was a remarkably bold example of this kind, being 200 feet in diameter, and having a large opening in the centre. It was built at the suggestion of M. Moulinau, and, having been destroyed by fire, has been replaced by a similar structure of iron, but of smaller dimensions.

When the roof approaches the circular form, but not sufficiently to have the character of a dome, it may be considered as consisting of several trusses resembling those of an ordinary roof, but so contrived as to intersect each other in the centre; the king-post being common to all the trusses. *Fig. 22*, representing a design for a polygonal roof, from Nicholson, may illustrate this, and exemplify also some of the applications of iron straps: *a* shows the form of the strap by which the ties are secured to the king-post; the post having as many faces, and the strap as many arms, as there are trusses in the roof.

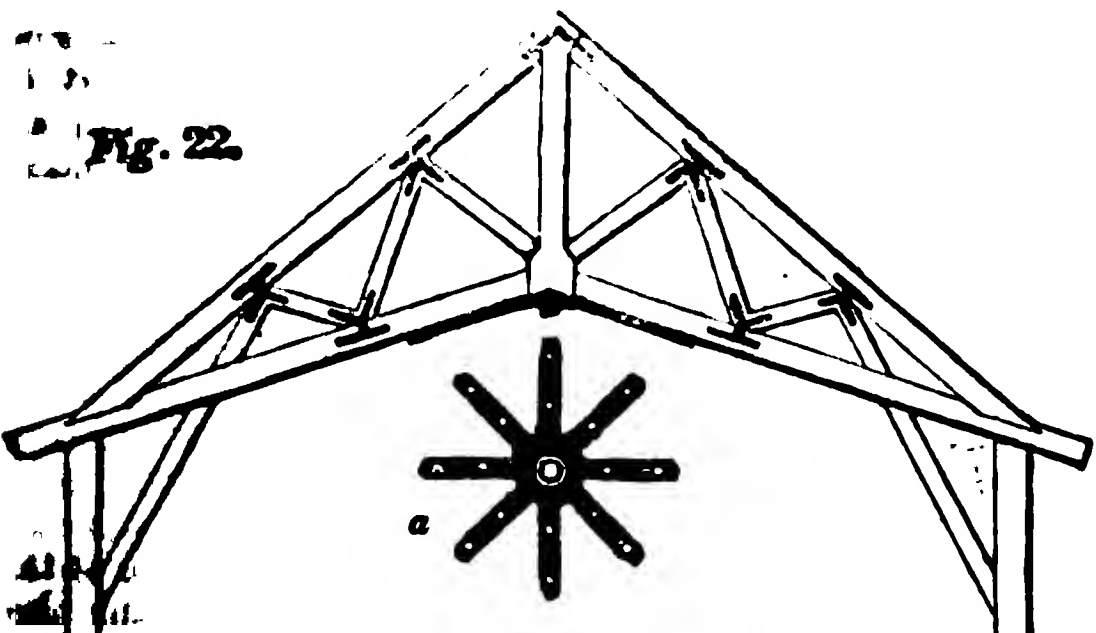

Fig. 22.

Though the number of contrivances for the construction of roofs is very great, as may be seen by reference to various

works on carpentry, allusion can here be made to only one other. It is an admirably simple plan for making a very flat roof, described in the 37th volume of the 'Transactions' of the Society of Arts, in a communication from the inventor, Mr. Smart. The beams or rafters are cut, with a circular saw, as shown at *a*, *fig. 23*, while *b* represents their form when in use, a wedge being inserted between the ends of the parts that are elevated into a sloping position. These may be raised to an angle of 10° or 12°, and will bear a great

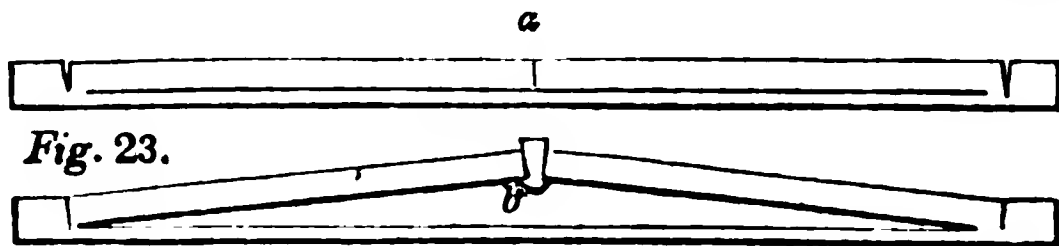

Fig. 23.

weight, as they cannot be depressed without thrusting off the ends of the beam, or breaking the lower part of it by tension. This is called, by the inventor, the *bow and string rafter*, and was used by him to support a roof at the Ordnance Wharf, Westminster Bridge. Strong laths were nailed upon the rafters, and on these a platform of bricks was laid in cement, the whole being covered with tiles also bedded and pointed with cement, and twice coated with hot linseed-oil. The cost of this roof is stated to be not more than half that of lead. For a further notice of the experiments of the inventor of this simple truss, see TRUSSING.

In the valuable practical works of Nicholson, Tredgold, &c. the methods of calculating the strength necessary in the various parts of a roof may be found; and in the 'Principles of Carpentry,' by the latter author, tables are given of the dimensions suitable for different spans. The table here quoted refers to a roof similar to *fig. 7*; the trusses being not more than ten feet apart, and the pitch at an angle of about 27° with the horizon, for a covering of slates. The scantlings are suited for yellow fir, and must be somewhat increased for timber of inferior quality.

Span.	Tie-beam.	King-post.	Principal Rafters.	Braces.	Purlins.	Common Rafters.
Feet.	Inches.	Inches.	Inches.	Inches.	Inches.	Inches.
20	9½ × 4	4 × 3	4 × 4	3½ × 2	8 × 4½	3½ × 2
22	9½ × 5	5 × 3	5 × 3	3½ × 2½	8½ × 5	3½ × 2
24	10½ × 5	5 × 3½	5 × 3½	4 × 2½	8½ × 5	4 × 2
26	11½ × 5	5 × 4	5 × 4½	4½ × 2½	8½ × 5	4½ × 2
28	11½ × 6	6 × 4	6 × 3½	4½ × 2¾	8¾ × 5½	4½ × 2
30	12½ × 6	6 × 4½	6 × 4	4¾ × 3	9 × 5½	4¾ × 2

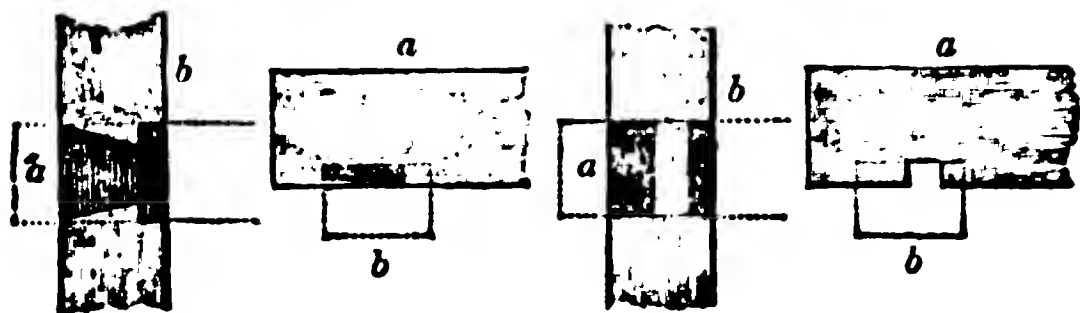

For the strength of different materials, under various circumstances, the reader may consult MATERIALS, STRENGTH OF, vol. xv., p. 8. As a general remark, it may be observed that oak, when exposed to tension, is weaker than fir, and is therefore less adapted for ties. Being however less compressible, it is usually preferred for rafters, straining pieces, and struts; but Tredgold observes that its greater tendency to warping in summer renders it less fit for rafters and purlins than foreign fir. Cast-iron is not much used, except in fire-proof roofs, and each piece requires to be well tested. Wrought-iron is very useful for straps and fastenings, and also for ties and trussing-posts; but care is always necessary to guard against imperfections, which are more likely to pass unobserved than in wood. Wherever iron is applied, provision should be made for its expansion and contraction, and it is desirable to protect it from oxidation by painting. Though iron is far stronger for its size than any kind of timber, it is neither so strong nor so cheap as yellow fir, *weight for weight*.

The joints in the frame-work of a timber roof are of various kinds, according to the nature of the strain they have to resist. They should be formed with great care, and with due regard to such probable changes of form as all constructions of timbers are liable to from shrinking and warping. *Cocking* or *cogging* is the name given to that kind of joining in which one piece of timber, in a state of tension, is so attached to another that it cannot be drawn away without one piece breaking. *Figs. 24* and *25* represent two methods of cocking the ends of tie-beams on the wall-plates, giving a plan and elevation of each. In both figures *a* represents the beam, and *b* the wall-plate. In the first plan, which was formerly much practised, the contraction of the dove-tailed end of the beam would allow it to be

Fig. 24.

Fig. 25.

drawn considerably out of its place, and would therefore permit the walls to spread; but in the second the amount of contraction is diminished, owing to the small width of the rectangular tongue that enters the tie-beam, while its position is such as to prevent the beam being drawn out of its place beyond the actual extent of the contraction of the tongue. The shrinking of the joggles of king-posts and queen-posts is often productive of serious derangement, a circumstance greatly in favour of the substitution of iron for wood for such parts, especially in large roofs. This inconvenience is sometimes avoided by making the upper ends of the principal rafters abut immediately upon each other, as represented in *fig. 12*. A similar arrangement is made, in some cases, where wooden king-posts are used, the king-post and rafters being strapped together with iron. The sinking of a roof, particularly if it be of low pitch, is very injurious to the mortise-and-tenon joints of the struts and rafters, by throwing the strain on the shoulders of the tenons in such a way as to break off the tenons or splinter the wood. To guard against such injuries, it has been proposed by M. Perronet, a French engineer, instead of making the tenons and joggles square, to form them into circular arcs, the centres being at the opposite end of the strut or rafter. This plan appears worthy of general adoption, as it allows the joints to accommodate themselves to changes of form without injury. All the timbers of a roof are usually fitted and framed together on the ground, and taken to pieces again before being elevated to the building.

Allusion has been made in a previous column to the various materials used for the covering of roofs, with reference to the different degrees of inclination suitable for them. Thatched roofs have been considered by some to maintain the most equable temperature in the buildings covered by them, keeping out alike the extreme heat of summer and cold of winter. They are objectionable on account of their harbouring vermin, being easily damaged by wind, and dangerously combustible. The frequent repairs required make thatch also an expensive material. Besides straw, reeds and heath are sometimes used for thatching, and possess the advantage of greater durability. Tiles admit heat and moisture more than good slates. Pantiles, having no holes for nailing through, are simply hung, by ledges, upon laths nailed to the rafters. Plain tiles, laid in mortar, and over-lapping, so as to be double thickness everywhere, make a very good though heavy covering. Tiles of a peculiar form, called *hip-tiles*, are used for covering salient angles; and *gutter-tiles*, which are similar to them, but placed with the concave side upwards, in the valleys or receding angles. Slates are laid in various ways. They are sometimes nailed down on a close boarding; or, if large, on *battens*, or pieces of wood from two and a half to three inches wide, and three quarters of an inch to an inch thick, which are nailed to the rafters at intervals regulated by the length of the slates. Lozenge-shaped slating is occasionally used, and has an ornamental appearance, but is easily injured, as there is but one nail through each slate. It is always laid on boarding. For what is called patent slating the best large slates are selected, and fixed without either boarding or battening, the common rafters being placed at such a width as to come under the joints. The slates are screwed down, the courses over-lapping about two inches. The meeting joints are covered by fillets of slate about three inches wide, set in putty, and screwed down; and the hips and ridges are sometimes covered in the same manner, though it is best in all such cases to use lead. Patent slating, when well executed, is water-tight with as low a slope as one in six. In some districts laminæ of stone are used in lieu of slates or tiles. Shingles, which are like slates, but made of wood, were formerly much used in covering pyramidal steeples, and in roofs of steep pitch. They are still used in the United States, and are usually laid on boarding, in a similar manner to common slates.

Sheets of metal are very convenient for covering domes,

and curved or angular surfaces generally; and also for roofs, or such as have too little slope for slating. Lead is the most common material for such purposes, though copper, iron, tinned iron, and recently zinc, are also used. Lead terraces or flats are commonly laid on brickwork or plaster. The joints are sometimes soldered, but the approved method is to roll or wrap the edges in lead, or other, making allowance for expansion and contraction. A fall of a quarter of an inch in a foot is sufficient for a terrace covered with sheet metal.

Cements of various kinds have been applied to the formation of roofs, and in some cases with success, but they have often been found to crack, and thereby become permeable to water. Mixtures of tar with lime, sand, ashes, &c., have been recommended; and asphaltum has been applied to this purpose, apparently with great advantage. Compositions of tar, resin, and similar substances, spread upon sheets of coarse paper, have also been used.

(Nicholson's *Architectural Dictionary*, Practical &c. &c., &c.; Tredgold's *Principles of Carpentry*; Boscovich's *Mechanical Philosophy*.)

**ROOK** (*Corvus frugilegus*, Linn.), This well-known gregarious and familiar bird (for it seems to affect the neighbourhood of man, and even not to be scared by the atmosphere of great towns) is the *Cornacchia nera* or *cornacchione* of the Italians; *Graye, Grolle, Freux*, &c. of the French; *Corneille Moissonneuse* of the Germans; *Roka* of the Slovaks; *Rook* of the modern British, and *Ydfran* of the ancient British.

Belon and Caius, the latter of whom names the *Spermologus, seu Frugilega*, appear to be of opinion that it is the *σπερμολόγος* of Aristotle (*Hist. Anim.*, viii. 31). Doubtless, as Pennant observes, the *Corvus* of Virgil has happily described a flock of them

'E pastu decedens agmine magno.' (*Georg.*, lib. i., v. 261.)

**Geographical Distribution.**—The Rook is spread over the greater part of Europe; but nowhere does it seem to be more abundant than in Great Britain and Ireland. Wooded and cultivated districts are its favourite haunts. The further north the observer goes in Scotland, the fewer rooks are seen. In Orkney and Shetland there are none, nor are there any in Guernsey and Jersey. They do not appear to be numerous in Denmark, nor in the southern districts of Sweden or in Russia and northern Asia, though they may be there. In Italy the rook is common and permanent; it appears to be migratory over a part of the southern part of Europe. In France it is also common, and the following quatrain appears under the cut of it in the *Portraits des oiseaux*:

'Jamais le Freux ne hante le rivage,  
Et ne se paist que de grains et de vers.  
Il est oiseau commun, gros et pervers,  
Qui vole en troupe, et crie à l'avantage.'

It occurs between the Black and Caspian seas; and Von Siebold and M. Bürger note it among the European birds seen by them in Japan.

**Food, Habits, &c.**—Grain, and insects especially, form the food of the Rook, and there can be no doubt that it repays the farmer for the seed which it takes, by its industry in clearing his land of wire-worms and the larvae of the cock-chaffer (*Melolontha vulgaris*). These last are called Rook-worms in many places, and the birds may be seen following the plough-tail to gather them up as the share exposes them. In the end of May and beginning of June, when the young are able to fly and go abroad with their parents, they may often be seen among the bright green leaves of the horse-chestnut and other trees bending their branches with their weight as they assemble to pick off the cock-chaffers in the winged state. Where these birds have been inconsiderately destroyed, on account of the supposed damage which they had done, a total failure of the crop has made the farmer glad to try to get them back again. The stick-built nest contains four or five pale greenish eggs, blotched with dark greenish brown; these are sometimes palmed upon the undiscerning for Plover's eggs, but are easily distinguished from them. Not that a rook's egg is in any means bad; though far inferior in every respect to any other. The male is most attentive to the female while she is setting, and feeds her assiduously; both are very industrious in supplying their young, and the skin under the tongue may at this season be seen dilated into a large pouch by the collection of food for the young.

they have great squabbles among themselves about their nests. An account of one of their battles with the Herons for the possession of a disputed territory is alluded to in the article HERONS [vol. xii. p. 167]. They frequently visit their nest-trees in the autumn on their way to roost in some distant wood, and come to them for the purpose of repairing their nest, and setting about the business of incubation early in March.

The Rook is not without the power of mimicry granted so largely to the greater part of the true crows, is docile, capable of learning amusing tricks, and becomes much attached to the kind hand that feeds it. It has been heard to imitate the note of a jackdaw (Hewitson) and the barking of dogs so perfectly that if the mimic had been out of sight, no ear could have discovered the deception. (Macgillivray.)

*Varieties.*—White, pied, and cream-coloured. 'A gentleman,' says the charming author of the *History of Selborne*, 'had two milk-white rooks in one nest. A booby of a carter, finding them before they were able to fly, threw them down and destroyed them, to the regret of the owner, who would have been glad to have preserved such a curiosity in the rookery. I saw the birds myself nailed against the end of a barn, and was surprised to find that their bills, legs, feet, and claws were milk-white.' These perhaps were perfect albinos, and might so have continued; but instances are not wanting where the original light colour deepens into the usual sable with age. Mr. Yarrell quotes Mr. Hunt of Norwich, who states that a gentleman of his acquaintance had in 1816 a young rook of a light ash-colour, most beautifully mottled all over with black, and the quill and tail feathers elegantly barred; but when the bird moulted it became a jet-black rook, and in this state was suffered to join its sable brethren in the fields. Mr. Yarrell remarks that this agrees with his own observations, and he adds that accidental varieties will generally be found to be comparatively small and weak birds; as these young birds increase in age and gain constitutional power, the secretions, he observes, become perfect, and the plumage assumes its natural colours, whilst the assumption of white feathers, by old birds, is probably the effect of the converse operation of the physiological law. (*British Birds.*)

Head and Foot of Rook.

It has been, and indeed still is with some, a question whether the loss of the feathers at the base of the beak in the young rook upon the first moult, is or is not a specific distinction, or merely the result of denudation from plunging the bill into the ground in search of prey. It must be borne in mind that some foreign birds resemble the rook in this particular. Mr. John Blackwall's observations (*Researches in Zoology*) touching this matter are full of interest. He refers to a rook preserved in the Manchester Museum, which has its mandibles crossed near their extremities, but so slightly that the malformation could not have interfered materially with the mode of procuring food usually resorted to by rooks, as is clearly shown by the denuded

state of the nostrils and anterior part of the head, both of which are entirely destitute of feathers. But he notices another specimen, in the possession of Mr. R. Wood of Manchester, which has the mandibles greatly elongated and much curved. 'Now,' says Mr. Blackwall, 'it is evident that the bird possessing a bill thus formed could not thrust it into the ground in search of worms and larvæ of insects, as the rook is known to do habitually; and accordingly the plumage at the base of the bill of this individual, and the bristly feathers which cover its nostrils, are very conspicuous, not having sustained the slightest injury. The opinion entertained by many persons that the naked condition of the nostrils and anterior part of the head is an original peculiarity in the rook, is thus satisfactorily proved to be incorrect; indeed, the fact that young rooks exhibit no deficiency in these particulars, is sufficiently conclusive on this point; but the possibility of an entire species being endowed with an instinct destructive of a usual portion of its organization was probably never contemplated by these observers; it is not surprising therefore that the inference deduced from a partial view of the subject should be erroneous.'

ROOKE, SIR GEORGE, ADMIRAL, the eldest son of Sir William Rooke, was born at his father's seat, the priory of St. Lawrence near Canterbury, in the year 1650. He entered the navy as a volunteer, and at the age of thirty had attained the rank of post-captain. In 1689 he was sent out as commodore with a squadron to the coast of Ireland, where his services were such as to induce William III. to promote him to the rank of rear-admiral of the red. He soon afterwards bore a part in the indecisive action between the earl of Torrington's fleet and that of the French admiral Tourville, off Beachy Head.

In 1692 Rooke was advanced to the rank of vice-admiral of the blue, and greatly distinguished himself in the battle off Cape La Hogue (properly La Hague) between the French fleet and the combined English and Dutch fleets under admiral Russell, May 19, 1692; but a part of the French fleet having escaped into La Hogue, and being hauled up so high that the English ships of the line could not reach them, Rooke volunteered on the following day to attack them with the boats of his squadron. This service he performed at night under cover of a fire from his frigates and smaller vessels; and so well was his plan contrived, and so unexpectedly and suddenly executed, that though six French three-deckers were burnt that night and seven other ships of the line on the following morning, the loss of the English only amounted to ten men. For this exploit Rooke was rewarded with the rank of vice-admiral of the red, a pension of 1000*l.* a year, and the honour of knighthood.

After the peace of Ryswick in 1697, Sir George Rooke was elected member of parliament for Portsmouth; and though he was attached to the Tory party, then in opposition to the government, queen Anne, on her accession in 1702, appointed him 'vice-admiral and lieutenant of the admiralty, and also lieutenant of the fleets and seas of this kingdom,' having previously constituted her royal consort prince George of Denmark generalissimo of her forces by land and sea.

The war of the succession had now commenced, and an attack upon Cadiz was resolved upon, the land-forces being under the command of the duke of Ormond, and the combined English and Dutch fleets under Rooke. The attack was begun, but, in consequence of the opposition of the prince of Hesse, was not persevered in. Having received intelligence however that the Plate fleet, under convoy of a French squadron, had taken shelter in the port of Vigo, the duke and Sir George resolved to proceed there. The duke stormed the town with 3000 men, while the fleet took and destroyed seventeen ships; six galleons being taken by the English and five by the Dutch, who burnt five others. The value of the specie and goods taken was estimated at five millions of dollars.

Sir George Rooke having been joined by Sir Cloudesley Shovel, with a large reinforcement from England, they resolved to make an attack upon Gibraltar. On the 21st of July, 1704, the prince of Hesse, with 1800 marines, was landed on the isthmus, while the ships commenced a cannonade upon the fortress, which, having been kept up for about six hours, the Spaniards began to fly from the batteries. The boats were then manned and armed, and the seamen succeeded in making themselves masters of the great platform, which they retained till the following day, when a reinforcement of seamen enabled them to carry un-

other strong battery, which put them in possession of most of the enemy's cannon. The governor then accepted the offered terms of capitulation, and the fortress surrendered.

On the 9th of August, 1704, Rooke fell in with the French fleet under the Comte de Toulouse, who had recently put to sea from Toulon, with fifty-two ships of the line and twenty-four galleys. The French admiral endeavoured to get away, though, according to Rooke's statement, he had a superiority of 600 guns, but on the 13th of August Rooke brought him to action off Malaga. The battle began in the forenoon, and ended with the day, when the French went off to leeward, and, the weather being hazy, escaped. This was a hard-fought battle. The French lost upwards of 3000 men, and the English upwards of 2000.

Sir George Rooke on his return to England was received by queen Anne at Windsor with great distinction, but finding that the government was hostile to him, he resigned his employments, gave up his seat in parliament, and passed the rest of his life at his seat of St. Lawrence, where he died on the 24th of January, 1709, aged fifty-eight, and was buried in the cathedral of Canterbury. He was thrice married. (Campbell's *Lives of the Admirals*; Locker's *Gallery of Greenwich Hospital*.)

ROOKER, MICHAEL ANGELO, an artist of considerable merit as a landscape-painter and engraver, was born in London about the year 1743. His father, Edward Rooker, also a skilful designer and engraver, who excelled in landscapes and architectural views, appears to have been a singular character, having for some time acted as a harlequin at Drury-Lane Theatre. Michael Angelo was taught engraving by his father, and executed the head-pieces to the 'Oxford Almanack' for several years, from his own drawings. In landscape-drawing, which is said to have been his favourite occupation, he was instructed by Paul Sandby, whose style he imitated. His manner is not powerful, but his drawings display much taste and feeling. For several years Rooker painted the scenes for the Haymarket Theatre. He was one of the earliest associates of the Royal Academy, and died on the last day of February, 1801, at the age of fifty-seven or fifty-eight.

ROOS, PHILIP PETER, a painter commonly called *Rosa da Tivoli*, from his long residence at that place, was born at Frankfort in 1655. He was instructed in art by his father, who was in the service of the landgrave of Hesse, by which prince Philip was sent to Italy, and allowed a pension during the period of his study. On arriving at Rome, he applied himself assiduously to painting, and acquired a most astonishing facility of hand; indeed, such was his rapidity of execution, that C. le Blond, who was at the same time at Rome, declares that Roos copied in chalk the arch of Titus within half an hour, and that with a considerable degree of finish. He devoted his talents chiefly to painting animals, which he designed mostly from nature. To facilitate his studies he established himself at Tivoli, where he kept a kind of menagerie for the purpose of drawing from the life with correctness such animals as he required for his pictures. His other subjects generally represent pastoral scenes, with herdsmen and cattle, and works of a similar nature, some of which are executed as large as life. His groups are composed with great judgment; and the landscapes in his backgrounds, his skies and distances, are treated with surpassing truth, and executed in a masterly style. Yet, although he painted with great facility, his productions betray no appearance of negligence or inattention; they are free, without being deficient in finish. His pictures, according to Lanzi, are to be found in the galleries of Vienna, Dresden, and other capital cities of Germany, besides an immense number in Italy and many in England, though we have no specimen by his hand in the National Gallery. He was a member of most of the principal academies of Europe. He is said by Huber to have etched a few plates of pastoral subjects, which are very scarce. M. Périès, in the 'Biographie Universelle,' mentions three pictures by this master which were in the Musée Napoléon, but which were returned to Vienna, whence they had been taken, in 1815. These are a view of the Cascade of Tivoli, a picture of animals, and a wolf devouring a sheep, the landscape in which latter work was painted by Tempesta. (Pilkington's *Dictionary*, by Fuseli; Lanzi, *Storia Pittorica*, ii. 174; *Biographie Universelle*.)

ROOT. The mathematical use of this term has gradually been extended, until it may be defined as follows: every value of an unknown quantity which satisfies a given

equation is called a root of that equation. Thus, 2, 1,  $1 + \sqrt{-3}$  and  $1 - \sqrt{-3}$  are the roots, and all the roots of the equation

$$x^4 = 5x^3 - 12x^2 + 16x - 8,$$

since they are the only algebraical formulæ and arithmetical numbers which satisfy it. On this general use of the term root, see THEORY OF EQUATIONS and INVOLUTION.

The more common use of the term root is as follows: the seventh root of 8 is the incommensurable fraction whose seventh power is 8, or the solution of the equation  $x^7 = 8$ . There are altogether seven such solutions, one only arithmetical, the others of the form  $a + b\sqrt{-1}$ ; the method of obtaining the arithmetical solution has already been discussed in the article INVOLUTION; the importance of the SQUARE ROOT will justify its consideration in an article apart. We reserve for the present article the method of finding and using any root (in the common sense) of any algebraical quantity, a necessary completion of the article NEGATIVE AND IMPOSSIBLE QUANTITIES.

Every algebraical result is of the form  $a + b\sqrt{-1}$  at widest, or may be reduced to that form. Here  $a$  and  $b$  are meant to be real algebraical quantities, that is, reducible to positive or negative whole numbers or fractions, commensurable or incommensurable. Thus, if  $b = 0$ , we have the simple real quantity  $a$ ; if  $a = 0$ , we have the simple impossible quantity  $b\sqrt{-1}$ . It is indifferent, as to the present article, in what light the impossible quantity  $\sqrt{-1}$  is considered; whether, as in NEGATIVE AND IMPOSSIBLE QUANTITIES, upon that extended system of definitions which makes it explicable and rational, or upon the more common system in which it is used without such explanation: for we are now merely considering all algebraic formulæ as results, subject to certain laws by which their use is to be regulated, and without any reference to interpretation.

When we desire to consider only the arithmetical root of an arithmetical quantity, we shall use the symbols  $\sqrt{\quad}$ ,  $\sqrt[3]{\quad}$ ,  $\sqrt[4]{\quad}$ , &c., but the exponential fractions  $\frac{1}{2}$ ,  $\frac{1}{3}$ ,  $\frac{1}{4}$ , &c. will denote any one of the algebraical roots of a formula. Thus  $\sqrt{16}$  means simply 4; but  $(16)^{\frac{1}{2}}$  is an ambiguous symbol standing for either +4 or -4. And when we have an equation which presents an ambiguous formula equated to an unambiguous one, we mean that the unambiguous side of the equation is one of the values of the ambiguous one: in this sense  $(-1)^{\frac{1}{2}} = \frac{1}{2}(-1 + \sqrt{-3})$ . When we use the simple arithmetical symbol  $\sqrt{\quad}$  before an algebraical quantity, as in  $\sqrt{-3}$ , we merely mean to signify that the two values of  $(-3)^{\frac{1}{2}}$  are distinguished into  $+\sqrt{-3}$  and  $-\sqrt{-3}$ .

Let us now take a quantity of the form  $a + b\sqrt{-1}$ . Assume  $r \cos. \theta = a$ ,  $r \sin. \theta = b$ , which gives

$$r = \pm \sqrt{b^2 + a^2} \quad \tan. \theta = \frac{b}{a}.$$

Let us choose for  $r$ , which is called the modulus of the expression, the positive value  $\sqrt{b^2 + a^2}$ . We can then always make the angle  $\theta$  give the equation

$$a + b\sqrt{-1} = r \cos. \theta + r \sin. \theta \sqrt{-1} \dots \dots (1)$$

identically true. If  $a$  and  $b$  be both positive,  $\theta$  must lie between 0 and a right angle, or between 0 and  $\frac{1}{2}\pi$  [ANGLE]; if  $a$  be positive and  $b$  negative,  $\theta$  must lie between  $\frac{1}{2}\pi$  and  $\pi$ ; if  $b$  be positive and  $a$  negative,  $\theta$  must lie between  $\frac{3}{2}\pi$  and  $\pi$ ; and if both be negative,  $\theta$  must lie between  $\pi$  and  $\frac{3}{2}\pi$ . Thus reducing angles to degrees and minutes,

$$\begin{aligned} 2 + 3\sqrt{-1} &= \sqrt{13} \{ \cos. 56^\circ 19' + \sin. 56^\circ 19' \sqrt{-1} \}, \\ -2 + 3\sqrt{-1} &= \sqrt{13} \{ \cos. 123^\circ 41' + \sin. 123^\circ 41' \sqrt{-1} \}, \\ 2 - 3\sqrt{-1} &= \sqrt{13} \{ \cos. 303^\circ 41' + \sin. 303^\circ 41' \sqrt{-1} \}, \\ -2 - 3\sqrt{-1} &= \sqrt{13} \{ \cos. 236^\circ 19' + \sin. 236^\circ 19' \sqrt{-1} \}. \end{aligned}$$

Generally, if  $a$  and  $b$  be positive, and if, returning to the theoretical mode of measuring angles,  $\theta$  be that angle which lies between 0 and  $\frac{1}{2}\pi$  and has  $b:a$  for its tangent, we must use  $\theta$  for  $a + b\sqrt{-1}$ ,  $\pi - \theta$  for  $-a + b\sqrt{-1}$ ,  $2\pi - \theta$  for  $a - b\sqrt{-1}$ , and  $\pi + \theta$  for  $-a - b\sqrt{-1}$ .

Again, since  $\theta + 2k\pi$  has the same sine and cosine as  $\theta$ , when  $k$  is any whole number, positive or negative, if we take  $\theta$  so as to satisfy (1), we find that the following is also satisfied:

$$a + b\sqrt{-1} = r \{ \cos. (\theta + 2k\pi) + \sin. (\theta + 2k\pi) \sqrt{-1} \}; \dots (2)$$

for all integer values of  $k$  positive or negative, but not for any fractional value of  $k$  whatsoever. This and various other results of common trigonometry should be familiar to every student who attempts the present subject.

Common multiplication makes it obvious that

$$\{\cos. x + \sin. x \cdot \sqrt{-1}\} \{\cos. y + \sin. y \cdot \sqrt{-1}\} = \cos. (x+y) + \sin. (x+y) \cdot \sqrt{-1}$$

for all real values of  $x$  and  $y$ ; so that if we represent  $\cos. x + \sin. x \cdot \sqrt{-1}$  by  $\eta x$  we have  $\eta x \times \eta y = \eta(x+y)$ . Now in BINOMIAL THEOREM it is proved that this equation cannot be universally true without giving as a consequence  $(\eta x)^n = \eta(n x)$ , for all values of  $n$ , whole or fractional, positive or negative. We have then

$$\{\cos. x + \sin. x \cdot \sqrt{-1}\}^n = \cos. n x + \sin. n x \cdot \sqrt{-1} \dots (3)$$

an equation which goes by the name of De Moivre's Theorem. It is the key of the present subject.

Let  $\psi$  now be required to raise the  $n$ th power of  $a + b \sqrt{-1}$ ,  $n$  being integer or fractional, positive or negative: this includes every case of raising a power, extracting a root, performing both operations, and taking the reciprocal of any result. Reduce  $a + b \sqrt{-1}$  to its equivalent form  $r \eta(\theta + 2k\pi)$ , or

$$r \{\cos. (\theta + 2k\pi) + \sin. (\theta + 2k\pi) \cdot \sqrt{-1}\},$$

whence  $\{a + b \sqrt{-1}\}^n$  is  $\{r \eta(\theta + 2k\pi)\}^n$  or  $r^n \eta(n\theta + 2nk\pi)$ , or  $\{a + b \sqrt{-1}\}^n$

$$= r^n \{\cos. (n\theta + 2nk\pi) + \sin. (n\theta + 2nk\pi) \cdot \sqrt{-1}\},$$

in which  $r^n$  is found by purely arithmetical operation, and  $\cos. (n\theta + 2nk\pi)$  and  $\sin. (n\theta + 2nk\pi)$  by aid of the trigonometrical tables. So many distinct values as the variation of  $k$  enables us to give to  $n\theta + 2nk\pi$ , so many values do we find of  $\{a + b \sqrt{-1}\}^n$ . Two angles are distinct when they are unequal, and do not differ by  $2\pi$  or a multiple of  $2\pi$ .

Firstly, let  $n$  be a whole number, positive or negative, then  $2nk$  is always an integer even number, and there is only one value, namely,

$$\{a + b \sqrt{-1}\}^n = r^n \{\cos. n\theta + \sin. n\theta \cdot \sqrt{-1}\}.$$

Next, let  $n$  be a fraction in its lowest terms, and, choosing

an example, say  $n = \frac{4}{5}$ . Let us examine all the values of  $k$ , from  $k = -5$  to  $k = +5$ , making  $A_k = n\theta + 2nk\pi$ .

$$A_{-5} = \frac{4}{5}\theta - 8\pi, A_{-4} = \frac{4}{5}\theta - \frac{32}{5}\pi, A_{-3} = \frac{4}{5}\theta - \frac{24}{5}\pi, A_{-2} = \frac{4}{5}\theta - \frac{16}{5}\pi, A_{-1} = \frac{4}{5}\theta - \frac{8}{5}\pi, A_0 = \frac{4}{5}\theta, A_1 = \frac{4}{5}\theta + \frac{8}{5}\pi, A_2 = \frac{4}{5}\theta + \frac{16}{5}\pi, A_3 = \frac{4}{5}\theta + \frac{24}{5}\pi, A_4 = \frac{4}{5}\theta + \frac{32}{5}\pi, A_5 = \frac{4}{5}\theta + 8\pi.$$

Here it would seem as if from this set of the possible values of  $k$ , we get eleven distinct values of the fifth root of the fourth power of  $a + b \sqrt{-1}$ . But a moment's inspection shows that  $A_{-5}, A_0, A_5$ , are not distinct angles, since they differ by multiples of  $2\pi$ : neither are  $A_{-4}$  and  $A_1$ , nor  $A_{-3}$  and  $A_2$ , nor  $A_{-2}$  and  $A_3$ , nor  $A_{-1}$  and  $A_4$ . Also it will be found that for every value of  $k$

$$A_k \pm 5, A_k \pm 10, A_k \pm 15, \&c.,$$

are all angles which differ, each from its predecessor, by  $2\pi$ ; so that there are but five distinct angles in the whole series, which may be found by taking  $A_k, A_{k+1}, A_{k+2}, A_{k+3}$ , and  $A_{k+4}$  with any value of  $k$  positive or negative. And generally, if  $n$  be a fraction whose denominator (when the fraction is reduced to its lowest terms) is  $q$ , it will be found that there are  $q$  distinct values of  $\{a + b \sqrt{-1}\}^n$  and no more.

The most important cases are those in which  $r=1$ , or  $a^2 + b^2 = 1$ , in which  $\cos. \theta + \sin. \theta \sqrt{-1}$  may represent the expression. And of this particular case, the most important more particular cases are

$$\begin{aligned} \theta = 0 & \quad \cos. \theta + \sin. \theta \sqrt{-1} = 1 \\ \theta = \pi & \quad \cos. \theta + \sin. \theta \sqrt{-1} = -1 \\ \theta = \frac{1}{2}\pi & \quad \cos. \theta + \sin. \theta \sqrt{-1} = \sqrt{-1} \\ \theta = \frac{3}{2}\pi & \quad \cos. \theta + \sin. \theta \sqrt{-1} = -\sqrt{-1} \end{aligned}$$

Of these, again, the two first are the most important.

Let  $n = 1 : q$ , and let the question be to find the  $q$  qth roots of 1. Putting unity in the form  $\cos. 2k\pi + \sin. 2k\pi \cdot \sqrt{-1}$ , all these roots are the distinct values of

$$\cos. \frac{2k\pi}{q} + \sin. \frac{2k\pi}{q} \sqrt{-1} \text{ or } \left\{ \cos. \frac{2\pi}{q} + \sin. \frac{2\pi}{q} \sqrt{-1} \right\}^k.$$

$$\text{Let } \cos. \frac{2\pi}{q} + \sin. \frac{2\pi}{q} \sqrt{-1} = \alpha, \cos. \frac{2\pi}{q} - \sin. \frac{2\pi}{q} \sqrt{-1} = \beta.$$

Then  $\alpha\beta = 1$ , as will be found by multiplication, and  $\alpha^k = \beta^{-k}$ :  $\alpha^k = a^{k \pm q} = \beta^{-k \pm q}$ , since  $a^q = 1$ . Consequently, since the series of powers of  $a$ , positive and negative, are successions of  $q$ th roots of 1, the series of powers of  $\beta$  will be the same; and we may therefore select these roots at convenience from either series, or partly from one and partly from the other. Thus, if we would have the ten tenth roots of unity we may form them in pairs, as follows:—

$$a^0 \text{ and } \beta^0 \quad \text{give } \cos. \frac{2 \cdot 0 \pi}{10} \pm \sin. \frac{2 \cdot 0 \pi}{10} \sqrt{-1} \text{ both} = 1$$

$$a^1 \text{ and } \beta^1 \text{ or } a^9 \quad \cos. \frac{2\pi}{10} \pm \sin. \frac{2\pi}{10} \sqrt{-1}$$

$$a^2 \text{ and } \beta^2 \text{ or } a^8 \quad \cos. \frac{4\pi}{10} \pm \sin. \frac{4\pi}{10} \sqrt{-1}$$

$$a^3 \text{ and } \beta^3 \text{ or } a^7 \quad \cos. \frac{6\pi}{10} \pm \sin. \frac{6\pi}{10} \sqrt{-1}$$

$$a^4 \text{ and } \beta^4 \text{ or } a^6 \quad \cos. \frac{8\pi}{10} \pm \sin. \frac{8\pi}{10} \sqrt{-1}$$

$$a^5 \text{ and } \beta^5 \text{ or } a^5 \quad \cos. \frac{10\pi}{10} \pm \sin. \frac{10\pi}{10} \sqrt{-1} \text{ both} = -1$$

Of these twelve forms, ten only are distinct, giving the ten tenth roots required. In this way the following theorems may be easily demonstrated.

1. The  $(2m)$ th roots of unity are  $+1, -1$ , and the  $2m-2$  quantities contained in

$$\cos. \frac{2k\pi}{2m} \pm \sin. \frac{2k\pi}{2m} \sqrt{-1}$$

for all values of  $k$  from  $k=1$  to  $k=m-1$ , both inclusive.

2. The  $(2m+1)$ th roots of unity are 1 and  $2m$  quantities contained in

$$\cos. \frac{2k\pi}{2m+1} \pm \sin. \frac{2k\pi}{2m+1} \sqrt{-1}$$

for all values of  $k$ , from  $k=1$  to  $k=m$ , both inclusive.

3. If  $\mu$  be one of the  $q$ th roots of unity,  $\mu^2, \mu^3, \dots$  are also  $q$ th roots, but do not contain all the  $q$  roots, unless  $\mu$  be made from a value of  $k$  which is prime to  $q$ . Thus, if  $q=12$ , and  $k=1$ , we get

$$a = \cos. \frac{2\pi}{12} + \sin. \frac{2\pi}{12} \sqrt{-1}$$

the list of roots is complete in 1,  $a, a^2, a^3, \dots, a^{11}$ , and  $a^{12}$  is 1,  $a^{13}$  is  $a$ , &c.

But if we make  $k=8$ , or take  $a^8$  for  $\mu$ , we have

$$\mu^2 = a^{16} = a^4, \mu^3 = a^{24} = 1, \mu^4 = a^{32} = a^8, \mu^5 = a^{40} = a^4, \&c.,$$

so that we get no roots from this series but  $a^8, a^4, 1$ , which are only the three cube roots of 1 (cube roots are among twelfth roots). But choose  $a^5$  (5 is prime to 12) and its successive powers are  $a^5, a^{10}, a^{15}$  or  $a^3, a^{20}$  or  $a^8, a^{25}$  or  $a, a^{30}$  or  $a^6, a^{35}$  or  $a^{11}, a^{40}$  or  $a^9, a^{45}$  or  $a^2, a^{50}$  or  $a^7, a^{55}$  or  $a^{10}$ , after which the series recurs in the same order.

4. If  $m$  be any factor of  $q$ , all the  $m$ th roots of unity are among the  $q$ th roots. Thus, if  $q : m = v$ , and if  $a$  be the first of the series of  $q$ th roots, the  $m$ th roots are  $a^v, a^{2v}, \dots, a^{mv}$  or 1. For  $(a^v)^m = a^{vm} = a^q = 1$ , &c. All those powers of  $a$  which have exponents prime to  $q$ , may be called primitive  $q$ th roots of unity: thus the primitive 12th roots are  $a, a^5, a^7, a^{11}$ .

5. The  $q$ th roots of unity exist in pairs of the form  $\cos. \phi \pm \sin. \phi \sqrt{-1}$ . These pairs are  $a$  and  $a^{q-1}, a^2$  and  $a^{q-2}, \&c.$ , or  $a$  and  $a^{-1}, a^2$  and  $a^{-2}, \&c.$

Let the question now be to find the  $q$ th roots of  $-1$ . If we now take

$$-1 = \cos. (\pi + 2k\pi) + \sin. (\pi + 2k\pi) \cdot \sqrt{-1}$$

we have all the  $q$ th roots in the distinct values of the formula

$$\frac{1}{(-1)^{\frac{1}{q}}} = \cos. \frac{(2k+1)\pi}{q} + \sin. \frac{(2k+1)\pi}{q} \sqrt{-1}.$$

Let  $a = \cos. \frac{\pi}{q} + \sin. \frac{\pi}{q} \sqrt{-1}$ , then the  $q$ th roots re-

quired are  $a, a^3, a^5, \dots, a^{2q-1}$ , beginning with  $k=0$ , and ending with  $k=q-1$ . Thus, if  $\mu$  be any one root, all the odd powers of  $\mu$  (positive or negative) are also roots, but do not contain among them all the roots unless the value of  $2k+1$ , from which  $\mu$  is derived, be prime to  $q$ . Thus if  $q=15$  and if  $\mu = a^9$ , we have (since  $a^{30} = 1$ )

$$\mu^3 = a^3 = a, \mu^4 = a^4 = -1, \mu^7 = a^7 = a^2, \mu^8 = a^8 = a^3, \mu^{11} = a^{11} = a^5, \mu^{13} = a^{13} = a^6;$$

so that we only get, from the powers of  $a^q$ , the distinct roots  $a^q, a, -1, a^2, a^3$ , which are also the fifth roots of  $-1$ . But if  $2k+1$  be prime to  $q$ , all the  $q$ th roots of  $-1$  may be obtained from  $\mu$ . And as before, if  $m$  be any factor of  $q$ , all the  $m$ th roots of  $-1$  are among the  $q$ th roots. Also these  $q$ th roots occur in pairs of the form  $\cos. \phi \pm \sin. \phi \sqrt{-1}$ , the pairs being  $a$  and  $a2q^{-1}, a^2$  and  $a2q^{-2}$ , &c., or  $a$  and  $a^{-1}, a^2$  and  $a^{-2}$ , &c.

Every  $q$ th root of  $-1$  is one of the  $(2q)$ th roots of  $+1$ , and the  $(2q)$ th roots of  $+1$  consist of all the  $q$ th roots of  $-1$  and all the  $q$ th roots of  $+1$ .

The following equations will also be easily proved:—

$$\left\{ \sqrt[q]{-1} \right\} = \cos. \frac{(2k+\frac{1}{2})\pi}{q} + \sin. \frac{(2k+\frac{1}{2})\pi}{q} \sqrt[q]{-1};$$

$$\left\{ -\sqrt[q]{-1} \right\} = \cos. \frac{(2k+\frac{3}{2})\pi}{q} + \sin. \frac{(2k+\frac{3}{2})\pi}{q} \sqrt[q]{-1}.$$

As it is not our object here to write on the applications of these formulæ, but only to supply an article of reference for those who may have forgotten or imperfectly learnt the groundwork of this very important branch of analysis, we finish here, referring to SERIES for such applications as fall within the plan of this work.

ROOT is that part of a plant which is sent downwards into the earth, at the same time that the stem is sent upwards into the air. Every part of the plant which exists underground is not root, as large portions of the stem itself may remain under the surface of the earth; and large buds, called bulbs, also exist underground. These parts have been often confounded with the root. The creeping root, and some forms of the tuberous and bulbous roots of older botanical writers, are only so many different forms of the stem. [STEM.]

The root is distinguished by certain structural peculiarities, by which it may be easily known from the stem. First, its ramifications are irregular, not having the symmetrical form of branches, nor are they developed like branches from buds. Secondly, roots generally produce no leaf-buds. When they do appear, which occasionally occurs, they are called adventitious buds. Thirdly, roots never have leaves, scales, or other appendages developed upon their surface; and fourthly, the cuticle of roots is never found to possess stomates, which are frequently very numerous on various parts of the stem.

The smaller divisions of roots are called *fibrils*, which consist of a little bundle of ducts or spiral vessels, surrounded by woody fibres, lying in a mass of cellular tissue. At the apex of the fibril the cellular tissue is loose and devoid of cuticle, from which cause it absorbs more rapidly the fluid by which it is surrounded than the other parts of the root. Although the terminations of the roots cannot be considered as special organs, they have been named by De Candolle *spongelets* or *spongiotes*, in reference to their absorbing power.

The relation between the size and extent of the roots and that of the branches varies very much. In some tribes, as the Coniferæ and Palmaceæ, the roots are very insignificant compared with the size of the stem. In other plants the roots are much the longest, as in the lucern, &c. In the greater proportion of trees the roots extend wider than the branches, but do not penetrate so deep as the stem is high.

The internal structure of the root resembles that of the stem, but in Exogens the roots do not possess a central pith. The cellular tissue of many roots is exceedingly abundant, and on this account they are used as articles of diet. Their nutritive property depends on the saccharine and other secretions which are deposited in the cells of the cellular tissue. Many of these roots, by attention to their culture, may be increased in size; and the growth of esculent roots is an object of importance in the kitchen-garden. The principal esculent roots are: the Jerusalem artichoke (*Helianthus tuberosus*); turnip (*Brassica Rapa*); carrot (*Daucus Carota*); parsnip (*Pastinaca sativa*); red-beet (*Beta vulgaris*); skirret (*Sium Sisarum*); scorzonera, or viper's-grass (*Scorzonera hispanica*); salsafy, or purple goat's-beard (*Tragopogon porrifolius*); radish (*Raphanus sativus*). Besides these, which are commonly cultivated, there are many of our native plants which possess roots yielding a

nutritive matter, and are occasionally used as articles of diet. The arrow-head, common arum, bitter vetch or mouse-ear, earth-nut, meadow-sweet, pilewort, sago, silver-weed, Solomon's seal, and common comfrey, are recorded as yielding edible roots. (*Cyclopædia of Gardening*, p. 882.)

During dry seasons and in dry situations the roots of many plants swell and become tuberous, which seems to be a provision for supplying nutriment to the stem and its appendages.

Roots are called *annual*, *biennial*, or *perennial*, according to their duration. When a root perishes after its first year's herbage and flowering, it is annual; if after the second year's herbage and first year of flowering, it is biennial. If a root endures for many years, although its herbage may perish every year, it is perennial.

There are various forms of roots distinguished by botanists. The *fibrous root* possesses a multitude of small divisions of the fibrillæ, as is seen in the *Poa annua* and many other grasses. The *nodulose root* presents occasional dilatations, as in the *Phleum nodosum*. A *præmorse root* is one in which the extremity of the primary axis has perished, or its development has been prevented by the extension of fibrillæ from its sides, as in the Devil's-bit Scabious (*Scabiosa succisa*). The *fusiform root* is seen in the carrot and turnip; such plants are also called tap-rooted. The term *tubercles* is applied by some to the roots of the orchis and dahlia; the former are *palmated* or *lobed*, the latter are *fasciculated*.

Although most if not all the higher plants possess roots, amongst many of the lowest forms they are not to be distinguished. The lower plants which float about in water, as the *Oscillatoria*, *Diatoma*, &c., and which consist of little more than simple cells, possess no appendages which can be called roots. In many of the *Conservæ* a downward development of the cells of cellular tissue, attaching them to the objects on which they grow, has been observed. Some of the Lichens, as the *L. esculentus* of Pallas, and the lower forms of Fungi, as the *Tremellas*, &c., possess no roots. Many of the floating water-plants, as the *Aldrovanda vesiculosa*, do not develop roots, and derive their nourishment from the medium in which they live by the direct contact of the cellular tissue. In fact we find that the simple cells of cellular tissue in the lower plants perform all those functions which, as we ascend in the scale of organization, are performed by particular parts of the plant. In the *Chara* and the *Marchantia*, the roots become more evidently developed, and the downward growth of the cells is more observable than in the *Conservæ*. On the lower surface of the *Marchantia*, prolongations of the cellular tissue are observed, which Meyen calls root-hairs or capillary fibrils. In the *Equisetaceæ* and Ferns the roots become more perfectly developed, and their surface is almost entirely covered with capillary fibrils. These fibrils are developed on almost all roots, and perform the function of absorption. They are only seen on recently-formed roots, as with the increasing age of the root they drop off; and in old roots none at all are found. They are not so numerous in the roots of the higher plants as in those of the lower, but their number varies exceedingly according to the circumstances in which a plant is placed. The number of these root-hairs is greatest in those plants which derive their nutriment from the earth, and accordingly they may be looked upon as a provision for extending the absorbing surface. They attain sometimes the length of a quarter and the third of an inch.

In many plants the roots, instead of being covered with the capillary fibrils, present a condensed membrane, which also encloses the roots as in a sheath, and extends to the point of the root where the fibrils commence their growth. This structure occurs in most water-plants, and in the roots of those plants which are accidentally projected into water and in some land-plants. It drops off with increasing age in the same manner as the root-hairs. Meyen considers this sheath a modification of the root-hairs, and hence infers that it performs the same function. (Meyen, *Neues System der Pflanzen Physiologie*, band ii.)

What the absorbent vessels are to the animal, the roots are to the plant, and a difference between plants and animals has been pointed out as dependent on the relative situation of their organs of absorption. The animal derives its nutriment, by means of its absorbents, from an internal reservoir, the stomach; whilst the plant derives its nutriment from an external reservoir, the earth. The *spongiotes* of the

roots, as we have already stated, are the active agents in the absorption of nutritious matter from the soil. By some botanists it is supposed that no other part of the root absorbs except the spongiole; but from the observations of Meyen and others it appears that the capillary fibrils and the epidermis of the root have also the power of absorbing fluid, though not in so high a degree as the delicate point of newly developed tissue situated at the extremity of the fibrilla. The power of absorbing by the spongioles is supposed by De Candolle to be due to the capillarity and hygroscopicity of the cellular tissue of which they are composed. Dutrochet explains the absorption of fluids by plants on his theory of endosmose. But whatever theory is brought forward to explain the process, it cannot be considered as merely mechanical, as the process ceases immediately on the death of the plant, and is undoubtedly connected with those more complicated relations of matter whose result we term vitality.

Roots do not absorb everything that is presented to them. It was long ago ascertained by Davy that plants did not absorb particles of charcoal and other substances that he diffused through water. Experiments also by Meyen, Link, and others, prove that the colouring matter of various infusions is not taken up by the roots, and that when this has been supposed to have taken place, it has arisen from mistaking a deposition of the colouring matter on the outside of the tissue for an absorption into it.

When the roots of plants are placed in solutions of gum, sugar, starch, &c., they thrive if the solutions are thin; but if thick solutions of these substances be prepared, the plants die in them. Experiments of this kind were performed by Sir H. Davy, who attributed the non-absorption of the thick solution, and the death of the plant, to the blocking-up of the pores of the vegetable tissue by the thick matter. But the theory of endosmose and exosmose gives a far better explanation of these facts. [ENDOSMOSE.]

When plants are submitted to solutions of various poisonous agents, they take up very varying proportions. De Saussure instituted a series of very careful experiments for the purpose of ascertaining the quantities of earthy and alkaline salts taken up by the roots of plants. For this purpose he prepared solutions of the hydrochlorates, nitrates, sulphates, and acetates of soda, potassa, and copper, and having submitted plants of Polygonum and Bidens to them, he found that the plants constantly absorbed a larger proportion of the water than of the salt, and that the salts were taken up in different proportions. The salts were not absorbed in proportion to their innocuous qualities, as the sulphate of copper, which was the most poisonous, was absorbed in largest quantity. De Saussure concludes that it was not the properties of the salts that determined their relative absorption, but that it depended upon the relative consistence of the solutions. Plants absorb poisons much more quickly when their roots are injured by being torn or cut, and do not suffer much by exposure to weak solutions of poisonous matters. This is a point of some practical importance, and will explain how it is that vegetation does not suffer when exposed to poisonous solutions.

Another function which has been attributed to the roots is that of excretion. Du Hamel first called the attention of botanists to this subject; he found that the roots of plants grown in water gave out a brackish secretion, and looked upon it as a secretion from the fluids of the plant. Brugmans followed up this point, and, in conjunction with Coulon, came to the conclusion, from the experiments they made, that the secretion given out from the roots of plants was a process of a similar nature to the rejection of the excrements in animals, and that these secretions acted beneficially in the nutrition of some plants, and injuriously in others. At the suggestion of De Candolle, M. Macaire prosecuted some researches on this subject, which were published in 1832 (*Mémoires de la Société de Genève*, tome v., p. 287). He confirmed the views of Brugmans and Coulon, and examined more attentively the nature of the different excretions given out by plants of different orders. Thus he found that the Leguminosæ gave out a gum and carbonate of lime; Graminacæ deposited a matter containing hydrochlorates and carbonates of alkalis and earths, and containing but little gum; Cichoracæ, an abundant brown matter analogous to opium; Euphorbiacæ, a gum-resinous matter. It was inferred that these excretions were matters injurious to the plant, which were thus thrown off from the system. This inference seemed to be confirmed by an ex-

periment of Macaire's, in which, having divided the roots of a plant of *Mercurialis annua* into two parcels, he plunged the one into a glass with solution of acetate of lead, and the other into a glass of pure water; in a short time it was found that the acetate of lead had not only been taken up by the roots from the one glass, but that it had been excreted by them into the other.

These researches have been considered to offer a satisfactory explanation of the practice of rotation of crops in agriculture; the rotation being *required* on account of the excretions of a plant being injurious to itself, and *beneficial*, as the excretion of one plant is the food of another [ROTATION.]

The experiments and conclusions of Macaire and De Candolle have however been called in question by some German botanists. Meyen and Unger object to the employment of a plant like the *Mercurialis* for determining the absorption and excretion of poison in water, as in the first place its roots must be injured by removal from the soil, and in the second place water is not its natural medium of growth. They employed water plants, and, having placed them in various solutions, could not detect, by the most delicate re-agents, the rejection of any of the absorbed agents. Meyen considers the excreted matters examined by Macaire to be merely secretions resembling those which are found on various other parts of the plant. He gives numerous instances of plants secreting various matters on the surface of their stems, leaves, &c., when they have been grown in soils which are overcharged with the same substance as that which the plant has secreted. The chalk incrustations of Chara, and those of various Saxifragæ, with the crystals of salt that occur on the plants on salt-plains, are given as examples. (Meyen, loc. cit., p. 530.)

This is a subject of practical importance, and worthy further investigation. In the late 'Report on Organic Chemistry,' by Professor Liebig, the views of De Candolle and Macaire are adopted. (Liebig's *Organic Chemistry*, p. 165.)

Besides the functions of absorption and excretion, the roots serve other purposes in the economy of the plant. It is by means of the roots that a plant maintains its position in the earth; and if for the increasing nourishment of the plant an increase of the absorbing surface is required, it is no less necessary that, for the purpose of maintaining its stem erect and firm, an extension of its holdfasts should take place. In many instances the root appears to serve merely the purpose of holding the plant in the ground, as in the mosses, and many of the plants belonging to the orders Crassulacæ and Cactacæ. By means of the roots the temperature of plants is kept below that of the atmosphere in summer, and above it in winter. This arises from the roots absorbing fluids from some depth below the surface of the earth, where its temperature is not much affected by the changes in the atmosphere. It is thus that the inhabitants of tropical climates are supplied with fruits whose delicious juices, pumped up from the earth, are much cooler than the atmosphere, and thus afford the most refreshing articles of diet.

#### ROOTSTOCK. [STEM.]

ROPE, a combination of fibres of hemp, or other material, so arranged as to form a flexible and tenacious cord or band; retaining, as far as possible, their collective strength. The name Rope is generally confined to the larger descriptions of cordage, such as exceed an inch in circumference, though the principles of formation are much the same for cordage of every size.

If the fibres used by the ropemaker were of sufficient length, the most effectual way of obtaining their united strength would be to lay them side by side, fastened together at each end, so as to form a bundle or skein; but, as the fibres of hemp do not, on an average, exceed the length of three feet and a half, it becomes necessary, in order to obtain a rope of greater length, so to twine them together that the strength of any single fibre shall be insufficient to overcome the resistance caused by the friction of those surrounding and compressing it; so that it will sooner break than be drawn out from the mass. This requisite entanglement is produced by twisting, which causes the fibres to compress each other; and it not only enables the ropemaker to produce cordage of any required length, but also, by making the rope hard and compact, increases its durability, and enables it to resist the penetration of water, which would rapidly impair its strength. While however some degree of twist is absolutely essential to the cohesion of a rope, any twist

beyond that which simply prevents the fibres being drawn out without breaking, is injurious. A skein of fibres, or a rope, may be twisted so hard that any further attempt at twisting would break it, and such a skein or rope will evidently have no power to support a weight, each fibre being already strained to the utmost extent that it will bear. In fact, whatever force is exerted by any fibre in compressing the rest, may be considered the same as a weight hanging on that fibre, and must be subtracted from its absolute strength before its useful effect can be ascertained; the available strength of a rope being the remainder of the absolute strength of its component fibres, after deducting the force exerted in twisting them.

Were a rope to be formed by simply twisting together, in one direction, the whole of the fibres of which it is composed, there would be nothing to prevent its untwisting as soon as left to itself. It is therefore necessary to twist the fibres in comparatively small portions, and so to combine these into a rope that the tendency to untwist in one part may counteract the like tendency in another. Thus the same force which would cause the component parts, if separate, to become loose or untwisted, is employed, when they are combined into a rope, to keep the whole firm and compact.

The first process in rope-making consists in twisting the hemp into thick threads, called rope-yarns. This process, which resembles ordinary spinning, is performed with various kinds of machinery. The common mode of spinning rope-yarns by hand is performed in the rope-ground, or rope-walk, an enclosed slip of level ground six hundred feet or more in length. As many of the operations of a ropery are impeded by wet weather, and by the unchecked heat of the sun, it is not unusual to cover the walk with a slight roof. At one end of this ground a spinning-wheel is set up, which gives motion by a band to several small rollers or whirls. Each whirl has a small hook formed on the end of its axis next the walk. Each of the spinners is provided with a bundle of dressed hemp, laid round his waist, with the bight or double in front, and the ends passing each other at his back, from which he draws out a sufficient number of fibres to form a rope-yarn of the required size; and, after slightly twisting them together with his fingers, he attaches them to the hook of a whirl. The whirl being now set in motion by turning the wheel, the skein is twisted into a rope-yarn, the spinner walking backwards down the rope-walk, supporting the yarn with one hand, which is protected by a wetted piece of coarse cloth or flannel, while with the other he regulates the quantity of fibres drawn from the bundle of hemp by the revolution of the yarn. The degree of twist depends on the velocity with which the wheel is turned, combined with the retrograde pace of the spinner. Great care is necessary in this operation to make the yarn of uniform thickness, and to supply the hemp equally from both sides of the bundle; because, if a considerable body of hemp be supplied to a yarn that is becoming too thin, it will not combine perfectly with it, but form a loosely connected wrapper; and any irregularity in the last-mentioned particular will cause the fibres to bear the strain unequally. The best mode of supplying the hemp is in the form of a thin flat skein. When the spinner has traversed the whole length of the rope-walk (or sooner, if the yarns are not required to be so long), he calls out, and another spinner detaches the yarn from the whirl, and gives it to a person who carries it aside to a reel, while the second spinner attaches his own hemp to the whirl-hook. The hemp, being dry and elastic, would instantly untwist if the yarn were now set at liberty. The first spinner therefore keeps fast hold of it all the while that the reeler winds it up, walking slowly up the walk, so as to keep the yarn equally tight all the way. When it is all wound up, the spinner holds it until another is ready to follow it on the reel. Sometimes, instead of being wound on a reel as they are made, the yarns are laid together in large hooks attached to posts at the side of the walk until about four hundred are collected together, when they are coiled up in a haul or skein, in which state they are ready for tarring.

Attempts have been made to introduce machine-spun yarns, in order to avoid the irregularities and defects of those formed by hand, and the recent improvements effected by Mr. Lang, of Greenock, in the spinning of yarns by machinery, are said to succeed very completely. By his process the hemp is more completely beckled, or divided into fibres, than in the common mode of proceeding; and

the advantage of each fibre being laid at full length the yarn, instead of being doubled, as in hand-spinning, is ensured. By a modification of the usual process fibres of hand-spun yarns may be laid in at full length instead of being doubled, as when they enter the yarn their bight; but experiment has not shown any advantage from such a mode of spinning. That improvement in this operation was needful, may be inferred from the result of a comparison between Mr. Lang's machine-spun yarns and those of equal grist spun by hand, the result showing the strength of the former to exceed the latter by fifty-five per cent. This improved process has been adopted by some of the principal rope-manufacturers of Great Britain.

The common size of rope-yarns is from one-twelfth rather more than one-ninth of an inch diameter; 160 fathoms of white or untarred yarn weighing from two and a half to four pounds.

The next process is warping the yarns, or stretching them to a given length, in order that they may, when formed into a strand, bear the strain equally. When the rope is to be tarred, that operation is usually performed upon the yarns immediately after their being warped; as the application of tar to the yarns previous to their combination is necessary to the complete penetration of the whole substance of the rope. The most common method of tarring the yarns is to draw them in hauls or skeins through the tar-kettle on a capstan; but sometimes the yarns are passed singly through the tar, being wound off one reel on to another, the superfluous tar being taken off by passing the yarn through a hole surrounded with spongy oakum. Great care is required in this process that the tar may boil neither too fast nor too slow, the common heat being from 212° to 220° Fahrenheit. In Huddart's patent of 1800, the covering of the tar-kettle is recommended, to prevent the escape of evaporated matter, which would make the tar too weak. The degree of impregnation necessary depends on the size of the cordage; cables and water-ropes needing a considerable quantity of tar, while for standing and running rigging a sufficient that the yarns be well covered.

In making large cordage, it is not usual to twist together at once, as many yarns as would suffice to form a rope of the required thickness; a suitable number of yarns, frequently from fifteen to twenty-five, are formed into a strand, and three or more such strands are afterwards combined into a rope. The twist of the strand is in the opposite direction to that of the yarns of which it is composed, in order that, as before mentioned, the tendency to untwist in the individual yarns may be counteracted. It is taken advantage of to prevent the untwisting of the rope. In closing or laying the rope, three strands, or sometimes four, in which case a small central strand, or heart, is added, are stretched at length along the walk, and attached at one end to separate but contiguous hooks, and at the other to a single hook; and they are twisted together by turning the single hook in a direction contrary to that of the other three, a piece of wood called a top, in the form of a truncated cone, being placed between the strands, and kept during the whole operation gently forced into the angle formed by the strands, where they are united by the closing or twisting of the rope. As the rope shortens in closing, one end only of the apparatus is fixed, the other being on a moveable sledge, whose motion up the rope-walk is capable of regulation by suitable tackle attached to it, by loading it with weights. The top also is mounted on a sledge, for closing large cordage, and its rate of motion may be retarded, in order to give greater firmness to the rope. The art of the rope-maker, in this operation, consists in so regulating the various movements that the strands may receive separately at one end just as much twist as is taken out of them at the opposite end, by twisting the contrary way in the process of combination.

Such is the method, more or less modified by the kind of machinery employed, of forming a *shroud-laid* or *heart-laid* rope, and such appears to have been the whole process of rope-making until cordage of very large size was required for by the progress of navigation. In making such a rope it is not found advisable to increase the number of yarns in a strand, it being difficult, when their number is very great, to throw an equal strain upon each and thereby obtain the aggregate strength. To obtain this inconvenience, cables or such large ropes as *shroud-laid* are formed by the combination of twisted round the

common axis, just as shroud-laid ropes are composed of strands twisted round their common axis. As cable-laid ropes are harder and more compact than others, this mode of formation is adopted for ropes to be exposed to the action of water, even though their thickness may not be very great.

Ropes formed by plaiting instead of twisting are made use of for some purposes in which pliability is especially needed, they being more supple and less liable to entanglement than those of the ordinary make. Such ropes are preferred for sash-lines, clock-lines, &c., and generally where the rope has to pass over pulleys of small diameter.

Towards the latter end of the last century much attention was directed to the improvement of the rope manufacture, between twenty and thirty patents having been taken out on this subject from 1783 to 1807. The application of machinery, instead of manual labour, to its various departments, has been attended with much benefit. The reader may find a detailed account of many of the ingenious and complicated contrivances for the purpose, in Chapman's *Treatise on the Progressive Endeavours to Improve the Manufacture and Duration of Cordage*, 1808.

Originally all the yarns composing a strand were of the same length, an arrangement extremely defective, as it is evident that when a number of yarns are stretched at length in a cylindrical mass, they will lie at different distances from the centre of the cylinder; so that, when twisted together, as all the yarns must form spirals of the same number of turns, those which are near the outside, forming spirals of large diameter, will be stretched to their full extent; while those near the centre, forming spirals of smaller diameter, will be less shortened by the process of twisting, and must therefore be more or less puckered up, according to their proximity to the centre of the mass. The first successful attempt to remedy this defect by varying the length of the yarns according to their position in the strand, was that under Captain Huddart's patent of 1793, since which time many further improvements have been effected in this essential point.

Flat ropes, which are much used for mining purposes, are either formed of two or more small ropes placed side by side, and united by sewing, lapping, or interlacing with thread or smaller ropes; or of a number of strands of shroud-laid rope similarly united. In either case it is necessary that the component ropes or strands be alternately of a right-hand and left-hand twist, that the rope may remain in a quiescent state. The latter method of making flat ropes was patented by Mr. Chapman, in 1807; and he considered it to afford the strongest possible combination of rope-yarns, his belts or flat ropes appearing to be even stronger than *salvages* (which are skeins of rope-yarns without any twist) of the same number of yarns. This seeming inconsistency is occasioned by the imperfection of hand-spun yarns, because if each yarn bears its own strain unaided, it will break at its weakest part, while, if combined, the mean strength of each will be rendered available.

From the experiments of Réaumur, recorded in the *Memoirs of the French Academy of Science* for 1711, it appears that a well-made small hempen cord broke in different places with 54, 63, 67, and 72 lbs., its mean breaking weight being 65 lbs.; while the three strands of which it was composed bore 29½, 33½, and 35 lbs. respectively; so that the united absolute strength of the strands was 98 lbs., although the average real strength of the rope was only 65 lbs., showing a loss of strength from twisting equal to 33 lbs. It appears that the cord used by Réaumur was of very unequal quality, as another portion of it broke with 72 lbs., while its strands bore separately 26, 28, and 30 lbs.; which shows the diminution of strength from twisting to have been from 84 to 72 lbs., the loss being in this instance only 12 lbs.

The more recent experiments of Sir Charles Knowles indicate a diminution of strength nearly equal in amount to the first-mentioned of Réaumur. He found a white or untarred rope of 3½ inches in circumference break, on an average of several trials, with 4552 lbs.; while the aggregate strength of its yarns, which were 72 in number, and bore on an average 90 lbs. each, was 6480 lbs.; the loss being equal to 1928 lbs., or about 30 per cent.

Duhamel, who tried many important experiments in the dockyards of France, about the middle of the last century, endeavoured to ascertain what degree of twist would produce the most useful effect. He caused some ropes to be made so that only one-fourth of the length of the yarns was

absorbed in twisting, instead of the usual proportion of one-third. These ropes were tried in shipping, and found to be lighter, thinner, and more pliant than those of the ordinary make. The following statement shows the comparative strength of ropes formed of the same hemp, and the same weight per fathom, but twisted respectively to two-thirds, three-fourths, and four-fifths of the length of their component yarns:—

Degree of twist.	Weight borne in two experiments.	
$\frac{2}{3}$	4098 lbs.	4250 lbs.
$\frac{3}{4}$	4850	6753
$\frac{4}{5}$	6205	7397

The result of these experiments led Duhamel to try the practicability of making ropes without any twist, the yarns being wrapped round to keep them together. These had great strength, but very little durability, the outer covering soon wearing off, or opening at bendings, so as to admit water, and occasion the rope to rot. But while such untwisted skeins of rope-yarns, or *salvages*, are unfit for most of the purposes to which cordage is applied, they are used with advantage for the tackle of great guns and some other purposes for which the greatest strength and pliancy are required.

It has already been intimated that the usual reduction of length by twisting is one-third. This applies to shroud or hawser-laid ropes, those which are cable-laid being further shortened, so that 200 fathoms of yarn are required to make 120 fathoms of cable.

Ropes formed in the most common manner, with three strands, do not require a *heart*, or central strand, because the angles formed by the union of the three cylindrical strands are so obtuse that the pressure of the operation of laying or closing the rope causes the strands to fill them up completely; but when the number of strands exceeds three, a heart is essential to keep them equidistant from the axis of the rope, and to fill up the vacuity that would otherwise be left by their not meeting in the centre. The heart can however add very little to the strength of the rope, as its fibres lie much straighter than those of the outer strands, and, not being able to extend with them when the rope is stretched, are soon pulled asunder.

The following simple rule for calculating the strength of ropes is given by Robison:—Multiply the circumference of the rope in inches by itself, and the fifth part of the product will express the number of tons the rope will carry. For example, if the rope be six inches in circumference,  $6 \times 6 = 36$ , the fifth of which is  $7\frac{1}{5}$ , the number of tons which such a rope will sustain.

The following rules for calculating the weight of cordage may also prove useful:—

To find the weight of shroud or hawser-laid rope, multiply the circumference in inches by itself, then multiply the product by the length of the rope in fathoms, and divide by 420, the product will be the weight in cwts. Example: to find the weight of a six-inch hawser-laid rope, 120 fathoms long,  $6 \times 6 = 36 \times 120 = 4320$ , which, divided by 420 gives the weight of the rope, 10 cwt. 1 qr. 4 lbs.

To find the weight of cable-laid cordage, multiply its circumference in inches by itself, and divide by 4. The product will be the weight, in cwts., of a cable 120 fathoms long; from which the weight of any other length may be readily deduced. Example: required the weight of a twelve-inch cable, 120 fathoms long;  $12 \times 12 = 144$ , divide by 4, and the product, 36, is the weight in cwts.

Much attention has been devoted to the discovery of the best method of preserving ropes from decay, especially when exposed to the action of water. The operation of tarring, which has been almost universally practised for this purpose, effects it very imperfectly, and materially diminishes the strength of the cordage. Taking the mean of several experiments by Duhamel, it seems that untarred ropes bore a greater weight, by nearly 30 per cent., than those to which the tarring process had been applied; and he states that it is decided by experience that white cordage in continual service is one-third more durable than tarred, that it retains its force much longer when kept in store, and that it resists the ordinary injuries of the weather one-fourth longer. Notwithstanding these facts, it is found that for cables and ground-tackle, which are much exposed to the alternate action of water and air, tarring is a valuable preservative; though cordage that is only superficially tarred is said to be stronger than such as is tarred throughout, and better able to bear the alternations of wet and dry.

The removal of the defects and bad qualities of common tar was the object of a patent taken out in 1802 by Mr. Chapman. Unsuccessful attempts had been made to substitute oils and various fat substances, which would be insoluble in water, for tar; but they had been found to impede the operation of twisting. Chapman improved the ordinary tar, first, 'by boiling the tar in water one or more times, each of which extracts a portion of its superabundant acid, and its mucilage, which contains a disengaged acid;' and, secondly, 'by continuing these processes until the tar has thrown off a larger portion of its essential oil, and becomes more pitchy than usual; and, finally, by restoring the requisite plasticity through the addition of substances less injurious and less volatile, and therefore more continuous, viz. by the addition of suet, tallow, animal oils, or *suitable* expressed oils.' Of the advantages attending this process, an idea may be formed from the subjoined statement of the relative strength of the cordage without any tar, with common tar, and with Chapman's purified tar. The rope was made on the 10th of August, 1802, and contained twelve yarns in each strand; part was tried immediately, and the rest steeped in water for about three months, then removed to a foundry stove for three months, and finally kept at the ropery till November 3, 1803, the date of the second experiment:

Description of rope.	Aug. 10,	Nov 3,	Portion of original strength retained.
	1802.	1803.	
White	33.4	1.9	5.7
Common tarred	22.2	7.35	33.0
Tarred with purified tar	29.1	12.35	43.8

} per cent.

Satisfactory as these experiments appear, Mr. Chapman's process has not been brought into general use.

Sir Joseph Banks had some ropes tarred with *teak* tar, by way of experiment, and found them to be one-third stronger than those done with common tar. Tanning has been tried for the preservation of ropes, but apparently without realizing any decided advantage. The same may, if the writer be not misinformed, be stated of Kyan's process for the prevention of dry-rot. A solution of caoutchouc, in lieu of tar, has been used with success.

Several other kinds of vegetable fibre have been made use of in the manufacture of cordage, and some appear greatly to exceed hemp in strength. In a comparative trial made at Paris between ropes made of hemp and of the aloe from Algiers, the latter was found to bear 2000 kilogrammes, while the former, of equal size, bore only 400. Ropes have been formed also of long wool, but they are only about one-third as strong as the best hempen cordage of the same size. Ropes composed of fibres of hemp intermixed with threads of caoutchouc are very valuable for some purposes, owing to their superior strength and elasticity. Their power of bearing sudden jerks without injury is a highly important property. It may be mentioned that such a rope has been used with the grapnel or anchor of the great Nassau balloon, and found to arrest the balloon without any unpleasant check when the grapnel catches. Ropes made of thongs of ox-hide twisted together, are used in the rope-bridges of Peru, and for some other purposes.

Ropes formed of iron wire have been, within the last few years, introduced to a considerable extent, and have been found to effect a great saving of expense from their durability and superior lightness. From a paper communicated by Count Breunner to the British Association for the Advancement of Science, in 1838, it appears that such ropes had been introduced about seven years before, in the silver mines of the Harz Mountains, and had been found so advantageous as almost entirely to supersede flat and round ropes of hemp in the mines of Hungary, and most of those in the Austrian dominions. The count observes that these iron ropes are nearly equal in strength to solid bars of the same diameter, and equal to hempen ropes of four times their weight. One of them had been in use for upwards of two years without any perceptible wear, though a common flat rope performing the same work would not have lasted much more than one year. The diameter of the largest rope in ordinary use is stated to be one inch and a half, and it is composed of three strands, each containing five wires of two lines in diameter. Great care is observed in the manufacture of these ropes, that the ends of the wires may be set deep in the interior of the rope, and that two ends may not occur near the same part. In use, it is necessary that the ropes be wound on a cylinder of not less than eight feet diameter, and be

kept well coated with tar, to prevent oxidation. In case mentioned by Count Breunner, so great a saving of power was effected, that four horses were doing as much work with a wire rope as six with a flat hempen rope.

Prior to the date of this memoir, patents had been obtained in this country for the manufacture of wire ropes, and they have since been improved and partially superseded upon. The ropes of Mr. Andrew Smith, who appears most in the introduction of wire ropes in this country, have been used in mines and shipping for some years; and they have been adopted for other purposes, having undergone a factory trial for several months on the London and Birmingham railway, where the trains are drawn by steam engines and ropes. They are formed in various ways according to their intended use. For standing rigging and for small hempen cordage saturated with a solution of caoutchouc, asphaltum, or other preservative from rust, straight wires may likewise be made of straight wires, interwoven or wrapped with hempen yarn, or sewed between them, &c.; but the patentee prefers using them with a twist. Other ropes are formed much in the same way as those of hemp, the wires taking the place of rope yarns, being twisted into strands, and combined into ropes of hawser-laid and cable-laid. The twisting should not be so hard as in hempen cordage; and all the wires must be protected by an anti-corrosive composition, or by coating with tin, zinc, &c. In the patent obtained by Mr. Newall and Dundee, for improvements in wire ropes, coating with the following mixture is recommended:—Tar, six parts; oil, two parts; and tallow, one part: the whole being mixed together, and applied while hot. In this patent it is proposed to twist wires round a core, either of wire, hempen spun yarn, or other material, to form a strand; and several such strands round a similar core when there are more than three strands in a rope. For joining the wires, Mr. Smith and Newall both recommended twisting them together for a few inches; and the latter also suggested the possibility, in some cases, of welding them. Wires may be very conveniently and firmly secured at their ends by passing them through the small end of a conical cone, or doubling up, or *upsetting*, the ends of the wires, which may then be welded into a solid mass, or secured by running melted brass or solder among them. The coils may then be attached, in various ways, to anything with which it is desired to connect the rope; or they may, as suggested in Newall's patent, be screwed together, so as to unite several lengths of rope.

Iron is the material usually employed for wire ropes, but copper and other metals may also be used.

The annexed table, showing the comparative weight per fathom for equal strength, gives the results of experiments with the wire ropes of Mr. Andrew Smith, which may serve to show their great superiority to those of hemp, which they surpass even in flexibility:—

Hemp Rope.			Patent Wire Rope.			Equivalent size of Hemp Rope.
Size.	Weight per fathom.		Size.	Weight per fathom.

RÖRASS. [TRONDHEIM.]

RORQUAL. [WHALES.]

ROSA (from the Latin *Rosa*, through the French *Rose*; the Latin 'Rosa' and the Greek *Rhōsē* are evidently the same), the name of the most generally admired and cultivated genus of plants of the type of the natural order Rosaceæ.

The rose was known in early times, and was as early a favourite among the nations of antiquity as it is in modern times. The rose is found generally in almost every part of the northern hemisphere, both in the Old and New World; from Sweden to the north of Africa; from Tchakta to Bengal, and from Hudson's Bay to the mountains of Mexico. It is not found in South America or in Australia. All the species are included between

19° N. lat. It is found more generally on dry and free soils than on those which are wet and tenacious. In the north of Europe it occurs with single flowers, but in Italy, Greece, and Spain more frequently double.

The characters of the genus *Rosa* are—calyx five-parted, tube fleshy, urceolate; petals five; stamens numerous, attached to the calyx and corolla; ovaries attached to the inner surface of the tube of the calyx; style long, stigma projecting beyond the mouth of the calyx; achenia numerous, hard. They are mostly shrubs with alternate pinnate leaves and beautiful odoriferous flowers. There are few better marked genera amongst plants than this, but as of all plants it has been the greatest favourite, and thus surrounded by the greatest variety of external influences, its species and varieties are the most difficult to distinguish. The best arrangement of this genus is that of Dr. Lindley, in his *Rosarum Monographia*, published in 1820. He arranges the species under eleven divisions, the first of which, including but one species, has since been made into the genus *Lowea*. We shall here give the remaining divisions, and point out the species which, on account of their ornamental flowers or uses, are most frequently cultivated.

1. **FEROCES**, with branches permanently tomentose and naked fruit. They are generally low shrubs, remarkable for thick hoary branches clothed with numerous prickles; and hence their name. There are only three species belonging to this division, of which *Rosa ferox*, the hedgehog rose, is most common. It is a beautiful plant, with fine showy crimson blossoms appearing early in the season.

2. **BRACTEATÆ**. The species of this division have not only their branches, but also their fruit clothed with a persistent tomentum. They have mostly bright green leaves, and their organs of fructification are in the highest state of development of any of the genus. They belong to the class of evergreen roses. *R. bracteata*, the Macartney rose, is a native of China, and was introduced into this country by Lord Macartney. It has upright branches, 5-9 leaflets, stout prickles, with large white terminal solitary flowers, and large globose orange-red fruit. It is a handsome plant, flowering abundantly late in the season. It is however tender, and is best grown against a wall. *R. microphylla*, small-leaved rose, resembles *R. bracteata*, but differs in being smaller, and having prickly fruit and ovate obtuse leaves.

3. **CINNAMOMÆ**, distinguished by their long lanceolate leaflets, without glands, bracteated flowers, and delicate disk, but little thickened. The shoots are either with or without setæ. There are several species in this division, but comparatively few are known out of the herbarium. *R. lucida*, the bright-leaved rose, is not uncommon in gardens, producing its fine red flowers in the latter months of the summer and in autumn. *R. laxa*, loose or spreading Carolina rose, is frequently found cultivated. *R. Carolina*, the true Carolina rose, is a native of the marshes of North America, and is often found enlivening our shrubberies by its beautiful crimson blossoms when few other flowers are to be seen. It is known by its narrow convoluted stipular lanceolate leaflets and entire spreading sepals. It attains a height of about six feet, bearing numerous flowers on short peduncles.

4. **PIMPINELLIFOLIÆ**, branches either crowded with nearly equal prickles or unarmed; leaflets ovate or oblong; bracts absent; sepals connivent and persistent. Although this division approaches the last in artificial characters, it is essentially different in habit. *R. spinosissima*, the Scotch rose, is a dwarf, compact, green bush, with creeping roots; it has unequal prickles, flat, glabrous, simple serrated leaflets, and small, solitary, white, or bluish-coloured flowers. It is found native in the mountainous districts and sea-coasts of Europe, and also in the Caucasus. It was the only rose found by Sir W. Hooker in Iceland. A great number of varieties are found in the gardens of Britain, produced from the wild plant found in the North of England and Scotland. They produce an abundance of seed from which varieties may be easily raised. The seeds should be sown in pots in October, when they will produce plants in the spring, which blossom the next season. *Rosa sulphurea*, the double yellow rose, is one of the most splendid plants in the genus. It has never been known to produce single flowers. Its native country is still unknown; it was procured by Clusius from some of his correspondents in the East, of whom he made inquiry concerning this plant, after having seen a model of it in some little paper gardens sent from Constantinople.

It has linear divaricating stipules, dilated at the apex, glaucous leaflets, and a hemispherical tube. This plant requires some care in culture; it only flowers in open airy situations, and requires to be freely watered whilst in flower. It is grown in greater perfection in Italy than in this country. As its flowers are double, it never produces seeds. *Rosa alpina*, the Boursalt rose, is a native of the Alps of Austria, the South of France, Silesia, and Bohemia. It is destitute of prickles or setæ, has pendulous elongated fruit, bipid peduncles, and solitary, erect, blush-coloured flowers. It attains a height of seven or eight feet, and is well adapted for a pillar rose.

5. **CENTIFOLIÆ**, clothed with bristles and prickles; flowers bracteate; leaflets oblong or ovate, rugous, disk thickened, closing the throat; sepals compound. This division comprehends those species which have ever been most interesting to the florist, as also probably those that were earliest known. Although the garden varieties of this division would probably amount to several hundred, there are only three species.

*Rosa centifolia*, the hundred-leaved cabbage or Provence rose, is known by its large unequal prickles, glandulous leaflets, pendulous flowers, and oblong fruit. This rose has been said to be a native of France, but this is doubtful. It has been found wild in thickets on the eastern side of the Caucasus. It is the same plant as the *R. provincialis* of Miller, under which name most of the varieties in our gardens have been propagated. Seventy or eighty varieties of this rose have been named. They are all characterised by their large pendulous fragrant flowers, seated on slender footstalks, which, when in bloom, have a peculiar graceful appearance. A botanical variety of this species, the *R. centifolia muscosa*, is the parent of the beautiful family of moss-roses. When this variety was produced or discovered is not known, but that it is nothing more than a variety of *R. centifolia* is proved by the fact that plain and moss roses are often seen on the same bush. When moss-roses are removed from our northern climate to Italy, the mossiness disappears. They are universal favourites, and between twenty and thirty garden varieties are enumerated. They are of almost all colours, from white to a dark rich crimson. They flower best in a light soil. The white varieties ought to be grown on a stock of the common dog-rose. They are all adapted for standards. If a succession of blossoms be required throughout the summer, they should be pruned in October and May.

*Rosa Gallica*, the French rose, has equal small prickles, erect flowers, ovate sepals, and globose fruit. It is found wild about Montalbanum, Walzenberg, and Geneva, also in Austria, Piedmont, and the Caucasus. This is supposed to be the species to which Pliny refers (*Hist. Nat.*, xxi., 18, 25, 72, 73). The *R. pumila* of Jacquin is a variety of this species. Upwards of one hundred varieties of this rose are found cultivated in gardens. They have stiff erect shoots, with brilliant-coloured flowers seated on short erect flower-stalks. The spotted, striped, and marbled roses belong to this species. The York and Lancaster rose is a variety possessing white and red coloured flowers. In the garden they will flourish as bushes on their own roots, or they may be grafted or budded on short stems, or grown as standards. In winter pruning, the stray shoots should be shortened to within six or eight buds of the bottom, those that are weak to within two or three buds.

A great number of varieties of roses found in gardens are hybrids between *R. Gallica* and *R. centifolia*. They mostly combine the long graceful shoots of the last with the rich crimson hues of the first. Hybrids are also produced between *R. Gallica* and *R. Indica*, but differ from the last in not being perpetual. They have a pleasing glossy sub-evergreen foliage. Of these varieties that known by the name of George the Fourth is one of the finest.

*Rosa Damascena*, the Damask rose, has unequal prickles; the larger ones falcate, sepals reflexed, fruit elongated. This plant is supposed to have been originally brought from Damascus, and to be a native of Syria. It is much cultivated in gardens, and has not fewer varieties than the two last. The monthly blush, blush damask, red and white monthly, and four seasons, are among the handsomest and best known varieties. The blossoms are exceedingly fragrant. Immense quantities of them in pots are sold weekly in the flower-markets of Paris.

6. **VILLOSÆ**. Root-shoots erect; prickles nearly straight; leaflets ovate or oblong, with diverging serratures, sepals

persistent, connivent; disk thickened, closing the fauces. The best known species of this division is the *R. alba*, white rose; it has rugose glaucous leaves, with simple serratures and acicular unequal prickles, by which it may be distinguished from both *R. tomentosa* and *R. canina*, with which it is liable to be confounded. It is a native of Piedmont, Cochin-China, Denmark, France, and Saxony. Its flowers are very large, exhaling a delicious fragrance. A number of handsome varieties are found in gardens, as the maiden's blush, double, semi-double, single blush, white, &c. In the garden the varieties of this species, varying in the colour of their flowers from pure white to vivid rose, contrast well with beds of darker varieties. They make good standards, bear close pruning, and blossom abundantly. *R. Hibernica*, the Irish rose, belongs to this division, and is interesting to the botanist as being entirely confined to Ireland.

7. RUBIGINOSÆ, unequal and sometimes bristly prickles, ovate or oblong leaflets, with glands and diverging serratures, persistent sepals, thickened disk, and arched root-shoots. To this division belongs the eglantine, or sweet briar (*Rosa rubiginosa*). It is common in Britain in bushy places on a dry gravelly soil. From its extensive diffusion it has been subjected to a variety of changes in external character, and as a consequence of this has received a great variety of names. It is characterized by hooked spines, opaque rugous leaflets, and hairy peduncles and calyces. The Austrian briar (*Rosa lutea*) is nearly allied to the latter, but is known by its foliage existing only at the extremity of the branches, prickles under the stipulæ, and leaflets hollow. The most brilliant yellow roses are produced from this species. They require a moist soil and dry pure air, and will do without severe pruning.

8. CANINÆ, with equal hooked prickles; oval eglandulose leaflets, with connivent serratures, deciduous sepals, and thickened disk closing the throat. To this division belong many of the varieties called autumnal or perpetual roses, on account of their blooming late in the season and continuing in flower a long time. Most of the perpetual roses are highly fragrant, and more so in the latter than the early months of the year. The soil in which they are grown cannot be too rich. In order to secure full blossoms in the autumn, all the flower-buds should be cut off in June, the shoots shortened, and the plants well watered and manured. They should never be planted on dry lawns, and wherever placed they should be manured every year. By retarding and forcing them, these roses may be made to blossom eight months in the year. Of the roses in this group that have afforded varieties for the garden, the *R. Indica*, Chinese rose, stands first. It is known by its whitish green or purple stem, stout falcate distant prickles, stamens bent inwards, and semi-double usually red flowers. It is found wild in China about Canton. It blossoms six or eight months in the year. The varieties of this plant are quite hardy; their colour varies from a delicate blush to a most brilliant red. There is a hybrid variety between this species and the *R. odorata*, which is well known in gardens under the name of tea-scented China rose (*Rosa Indica odorata*). This rose is the parent of a great number of sorts in gardens. They are the roses which are most commonly sold in Paris in little bouquets wrapped round with coloured paper. Most of the varieties of this plant are French, and only a few will grow in this country; they are fleeting in duration, and will not bear the cold well. They blossom best in August and September. When grown on their own roots in moist soils and situations, they must have a raised border in some warm and sheltered place: the border should be a compost of rotten manure or leaves, light loam, and sand, in equal parts, and raised about eighteen inches above the surface. When grown as low standards, they should be taken up in November.

The Bourbon rose (*R. Bourboniana*) is a natural hybrid between *R. Indica* and a variety called red four-seasons. This hybrid was found amongst a number of the latter plants in a hedge in the Isle of Bourbon. It was brought to Paris, and has since produced many beautiful varieties. The flowers of this rose are very handsome, pendulous, with fine colours, and a most delicious fragrance. The varieties are not yet much known to English cultivators. They form a pretty addition to clumps of roses, or may be grown in beds as standards and as pillars. Mr. Rivers, in his 'Rose-Amateur's Guide,' says, 'I consider the culture of these roses only in its infancy; we shall ultimately have

the richest hues combined with perfection of form, and complete plenitude of their flower.'

The Noisette rose was grown from seeds produced by *R. moschata* impregnated with *R. Indica*. It was reared in America. In many of the sorts the dwarf habit and peculiar fragrance of the musk-rose prevail, whilst in others the perfume and magnificent flowers of scented roses are apparent. They form an elegant class of flowers for the rosarium, producing sometimes as many as seventy or eighty flowers in a corymb. They are hardy.

*Rosa Lawranceana*, the miniature or Lawrance rose, named after Miss Lawrance, who published a collection of drawings of roses, belongs to this division. It was brought from China, and is probably only a dwarf variety of *R. Indica* or *R. semperflorens*, which it closely resembles in structure. All the varieties are known by their diminutive size; some of these little 'fairy roses' produce blossoms when they are not more than six inches high. In cultivation they will not bear moisture, requiring in most cases a very dry warm raised border. They form elegant ornaments for the drawing-room. *R. canina*, the dog-rose, is the most common species of the division in this country, and from its varying characters has given origin to a number of names supposed to represent species. This species is used for making conserve of roses.

9. SYSTYLÆ, styles cohering in an elongated calyx, stipules adnate. The habit of the plants of this division is nearly the same as that of the last. *R. arvensis*, the white dog-rose, belongs to this group. It is a very common plant in many parts of England, adorning the landscape with its elegant snowy blossoms. It has cord-like unequal falcated prickles, leaflets glaucous beneath, diverging stipules, and ovate crimson fruit. The varieties of this and allied species, as *R. multiflora* and *R. sempervirens*, produce the climbing roses of the garden, of which there are a great number now to be had. They can be grown underwood, and nothing would add more to the beauty of shrubbery than the introduction of the undergrowth of varieties of these roses. They grow with most vigour, and are prostrate; but can be carried up by a frame, which may be raised into various shapes for the purpose of effect.

*R. moschata*, the musk-rose, is one of the oldest plants of our gardens. It is found native in the North of Africa, and in the temperate and warm provinces of Asia. It has slender recurved prickles, the surfaces of its leaflets of different colours; acute narrow stipules, with narrow white fragrant flowers. It is an autumnal rose, and is generally cultivated on account of the beautiful musky odour of its flowers. It is a tender plant, and our winter weather is generally too severe for it. Its bunches of flowers are frequently very large, requiring props for their support. Its musky odour is most powerful at night. It is supposed to be the famous rose of Persia, in the branches of which the poets of that country delight to describe the *bulbul* (the nightingale) pouring forth her music.

10. BANKSIANÆ, nearly free subulate stipules, deciduous; ternate shining leaflets and climbing stems. This is the last division of the species of roses. The most remarkable species in this group is the *Rosa Banksiana*, Banksian rose, named after Lady Banks. It is a native of China, and has very numerous double sweet-scented flowers, which are arranged in umbel-like corymbs. It is one of the most elegant plants of the genus; it grows well in the open air, but is tender, and requires to be protected against a wall or in a sheltered situation. It grows and blossoms better in a dry than in a moist situation. Its branches should never be shortened, as it prevents the producing flowers. The seeds are not perfected in this country, but are in Spain and Italy.

The rose is more frequently cultivated as an ornament than for its applications to medicine or the arts. It is however astringent and tonic properties which render it useful in medicine. In the East it is extensively cultivated for the purpose of procuring, in a variety of ways, a volatile oil which gives it its delicious fragrance. For these purposes the species that are mostly cultivated are *R. moschata*, *centifolia*, and *damascena*, from all of which the butter, essence, or oil of roses may be procured in considerable quantities. [ATTAR.] The attar of roses forms an object of considerable commercial importance on the coast of Barbary, in Syria, Persia, India, and various parts of the East. Many other perfumes are made from roses, and are

consumed in large quantities, as rose-water, vinegar of roses, spirit of roses, honey of roses, &c.

For those who would wish to know more of this favourite genus of plants, we append the names of some of the best works that have been exclusively devoted to its history and illustration:—Lindley, 'Monographia Rosarum,' 1820; 'A collection of Roses from Nature,' by Miss Lawrence, 1799; 'Les Roses,' by Redoute and Thory; 'L'Histoire Naturelle de la Rose,' by Guilleman, 1800; 'Prodrome de la Monographie du Genre Rosier,' by Thory, 1820; 'Rose-Amateur's Guide, with descriptive catalogue of Roses,' by T. Rivers of Sawbridgeworth, 1836 (a very excellent account of the garden varieties and their cultivation); the article 'Rosa,' in Rees's 'Cyclopædia,' by Sir J. B. Smith; 'Genus Rosa,' in Miller's 'Gardener's Dictionary,' by Don.

**ROSA, MEDICAL PROPERTIES OF.** Of the numerous species or varieties of this genus, three only are indicated in the 'Pharmacopœia' as the sources of the officinal articles; but a very considerable number of them contribute the different materials. Those indicated in the 'Pharmacopœia' are: the *Rosa canina*, or common dog-rose; *Rosa gallica*, the French or red rose; and *Rosa centifolia*, the hundred-leaved or cabbage rose. Of the first, the so-called fruit (hips) is the officinal part. This is truly the enlarged persistent calyx, enclosing the real fruits, which are numerous small achenia, clothed, as well as the inside of the calyx, with silky hairs. The hairs and achenia are to be carefully removed, and the fleshy calyx beaten into a pulp, to which gradually thrice their own weight of white sugar is to be added. The employment of heat in the preparation of this conserve, though directed by the 'Pharmacopœia,' is better omitted. The pulp consists chiefly of malic and citric acids, in combination mostly with some salts, tannin, resins, a small quantity of volatile and fixed oils, fibre, and a large quantity of sugar. The action on the stomach is slightly refrigerant and aperient, its sweetness recommending it to children, and as a vehicle for other medicines. It is apt to candy or concrete by keeping. The fresh hips, freed from the fruits and hairs, bruised, and having a little sugar added, yield, by pouring warm water upon them, a cooling mildly astringent drink, which would be grateful to the poor suffering from autumnal fevers.

The petals of both the *Rosa gallica* and *R. damascena* are supplied to herbalists for medical and chemical purposes. The latter is most extensively cultivated at Mitcham for the London market. The buds are collected before they expand, and the calyx and lower part of the petals, termed claws, being cut off, they are quickly dried. If this last process be conducted slowly, it impairs both their astringency and fine Modena colour. Their astringency and odour are greatest when collected before the process of anthesis, or bursting of the anthers. About 2000 flowers yield 100 lbs. of fresh petals, which when dry weigh only 10 lbs. After drying the odour is faint, the taste bitter and astringent. As by exposure to the light and air they lose their fine colour, and soon become mouldy or worm-eaten, they must be carefully preserved in well-stopped bottles or canisters.

According to the analysis of Cartier, they consist of volatile oil, colouring matter, fatty matter, gallic acid, tannin, albumen, soluble salts of potash, insoluble salts of lime, silica, and oxide of iron. The tannic and gallic acids are the cause of the astringency, and also of the dark colour, which results on adding a solution of any salt of iron to an infusion of roses, and of a slight precipitate when a solution of gelatine is added to the infusion. The property of forming a black compound with iron is taken advantage of by beating the petals with cloves and other spices in an iron mortar, till a thick black paste is formed, which hardens on exposure to the air, and is then polished or turned, so as to form the perfumed beads for necklaces or rosaries. The petals of *R. centifolia* are often preferred. The exact nature of the colouring principle has not been ascertained, but it is not owing to oxide of iron, as the quantity of iron is much greater in white than red roses, Cartier having obtained from 1000 grains of white roses 99 grains of ashes, containing 12.4 of iron, while a similar quantity of red roses yielded only 50 grains of ashes, containing only 4 grains of iron.

The petals of the *Rosa damascena* are the most laxative, except perhaps the *R. imperflorens*, but it is seldom that they are used as aperients, though the petals of the *R. gallica* are formed into a confection which has the advan-

tage over that of the *R. canina*, inasmuch as it neither candies nor becomes mouldy. In forming this or the other preparations, a stone (not an iron) mortar must be used. The chief employment of the conserve of the Gallic rose is as a vehicle for other medicines and as the basis of blue pill.

The infusion of roses is made by pouring boiling distilled water on the petals, and adding dilute sulphuric acid, which are allowed to macerate for six hours, and when strained, refined sugar is to be added. The vessel in which this process is conducted should not be glazed with lead. By this means is obtained an elegant, fragrant, and mildly astringent tonic and refrigerant liquid, which is of great utility, either alone, especially to check the wasting perspirations of consumption, or as a vehicle for most salts which are formed with sulphuric acid. It is likewise employed as a gargle, alone, or with various adjuncts, one of the best of which is the *mel rosarum*, or honey of roses, made with the petals of this kind of rose. A syrup is sometimes made with them, which is only used to sweeten and colour other medicines.

The *Rosa centifolia*, hundred-leaved rose, especially the variety of it termed the *Provence* or *cabbage rose*, is cultivated both on account of its exquisite perfume and the uses to which it, with its products, can be applied. The petals are the officinal article. They are directed to be collected when the flower is full blown; and to be plucked off, not allowed to fall off. It is better to collect them before the flower is fully expanded, as the odour rapidly diminishes as the anthesis proceeds; 100 parts dry into 18 only. They are to be dried in the open air, and not in an oven, as desiccation impairs their fragrance, while it heightens that of the *R. gallica*. When dried, they are of a pale red, with a faint rose odour and an astringent taste. They easily part with their colour, and are therefore to be protected from air and light: if salted, they may be preserved unimpaired for years. With the addition of salt, pepper, and cloves, they are used to form the rose-pots which adorn the apartments of the rich, but which may equally be made to contribute to the enjoyment of the poor, as the expense of this perpetual feast is so small as not to be felt by the poorest occupier of a room. The colouring matter extracted by alcohol furnishes a most delicate test for the presence of alkalis.

A syrup is also made of this sort, but the chief use of it in England and France is to yield by distillation rose-water, the medical properties of which are too slight to merit further notice here. In hot countries a large quantity of volatile oil is elaborated by the flowers of this and several other species, such as the *rosa moschata*, *rosa damascena*, and in Italy the *rosa sempervirens*, which constitutes the *athar*, *ather*, *attar*, *utter*, or *otto* of roses. *Athar* or roses is said by Donald Monro to be procured by merely macerating the petals in water. The failure of Trommsdorf to procure it by this means is not conclusive against its accuracy, since less oil is found in cold countries, and it is less easily separated. But most writers describe it as being the result of distillation, and this is the mode generally followed. The quantity obtained varies with the season and the care observed in the process. Bishop Heber observes, 20,000 pounds of rose-leaves yield attar equal in weight to a rupee. Jackson states that from one lac of roses it is generally calculated that 180 grains, or one tolah, of attar can be procured. Polier states that to procure something less than three drachms of attar from 100 lbs. of rose-leaves, the season must be very favourable and the operation carefully performed. The same authors state that 4366 pounds of rose-leaves yield by repeated distillations 8 ounces of attar. The oil concretes and floats on the surface of the distilled water when cold. Even in England a crystalline volatile oil with a faint odour of attar (English attar of roses) is frequently obtained when distilling rose-water from the petals of *R. centifolia*. The high estimation in which this perfume is held, and the price which it bears, offer great temptations to increase the quantity of oil. In some parts of India this is done by mixing the freshly plucked rose-leaves with the seeds called *Geuzely*, and also those of a sort of *Digitalis* termed *Sisama*, in successive layers, allowing them to remain ten or twelve days, and then placing the seeds in contact with fresh rose-leaves; and after repeating this process eight or ten times, the seeds are subjected to pressure. A dirty oil results, which on standing for some time forms

several distinct layers, the upper one of which is sold as rose-oil. The Chinese adopt a similar expedient. Genuine attar of roses at all temperatures below 80° Fahr. is a crystalline solid, and generally colourless. At 90° Fahr. its specific gravity is 0.832. It consists of two volatile principles, one solid, the other liquid, at ordinary temperatures, in the proportion of one part of the first to two of the latter. The first is a stearopten, the last an eleopten. The entire oil, according to Göbel, consists of carbon 69.66, hydrogen 16.06, and oxygen 14.28; but the analyses of Saussure and Blanchet do not correspond with this: Saussure says it contains nitrogen also. This proves the variable nature of the article sold as attar, which is almost constantly adulterated. When mixed with any essential oil, such as that of an Indian grass (*Andropogon*, *Acorus Calamus*), or of sandal-wood, or of rhodium (from *Convolvulus Scoparius*), the sophistication is not easy of detection, but if with fixed oils, blotting-paper will reveal their presence. Alcohol is no criterion of the purity; for when castor-oil has been used to adulterate the attar, it is as soluble as the rose-oil in alcohol of sp. gr. 0.815. Attar of roses is chiefly brought from Constantinople and Smyrna. It is subject to a duty of 1s. 4d. per lb. In 1838, 973 lbs. and in 1839, 754 lbs. paid the duty.

(Pereira's *Materia Medica*.)

ROSA SALVA'TOR was born at Renella or Arenella, a village in the environs of Naples, on the 20th of June, 1615, and he was originally intended for the church. Whilst yet a boy he manifested a strong propensity for drawing, and in order to cure him his parents procured his admission as a student in the college of the congregation of Somasca in Naples; but before the expiration of the usual period of residence, he was either expelled or voluntarily quitted the college. On his return to Renella he devoted his time to the study of music, and cultivated his talent for poetry, and on the marriage of his eldest sister with Francesco Francanzani, a disciple of the Spagnuololetto school, he attended the studio of that artist. He also studied from nature in oil-colour, and in 1633 went from Naples on a tour through the wild scenery of La Basilicata, La Puglia, and Calabria. During his absence he associated with banditti. At this period Salvator seems to have fostered and matured his taste for romantic scenery, and the studies which he made of groups and single figures whilst with the bandits served him as valuable materials for his future works. Soon after his arrival at Renella his father died, leaving the family dependent upon Salvator, who was then certainly not more than eighteen years of age, for their support. To perform this duty, he executed with great rapidity subjects on primed paper, his poverty not enabling him to purchase canvas, and sold them to the dealers who keep the stalls in the Strada della Carità in Naples. One of these, representing the story of Hagar and Ishmael, was seen and purchased by Giovanni Lanfranco, who was then in the city decorating the church of Gesù Nuovo for the Jesuits. The admiration of that painter was valuable to Salvator, for his works rose in price accordingly, but at the same time it laid him open to the malice and envy of other Neapolitan artists. They ridiculed the efforts of a man who had been obliged to seek the patronage of mean dealers, and he retorted upon them in epigrams, and satirical verses which he set to music and sang. He however obtained the friendship of Aniello Falcone, an eminent painter of battles, the first and best of the pupils of Spagnuololetto, who gave him instruction, and after a time introduced him to the notice of that great painter, from whose advice and practice he derived great benefit.

On the invitation of his former friend, who was in the establishment of the Cardinal Brancaccio, he repaired to Rome. Here he enjoyed the patronage of the cardinal, who took him to the bishopric of Viterbo, where he painted an altar-piece representing the incredulity of St. Thomas, for the Chiesa della Morte, and other works. In 1639 he went again to Rome. The reputation of Salvator was now at its height; he was esteemed as a painter, a poet, a musician, and an actor, for the plays which he performed were written by him, the music composed by his hand, and the principal character represented by himself. As an artist, he was most extensively patronised, and at very high prices. In 1647, on the breaking out of the revolt of Masaniello at Naples, Salvator Rosa returned to that city, and became a member of the band. On the suppression of the revolt, he made his escape from Naples in the train of the

Prince Carlo Giovanni de' Medici, with whom he was employed by the grand-duke of Tuscany, and he spent some time in Florence, where he was employed by the grand-duke to paint in the Pitti Palace. Here he associated with the literati and the principal nobility. After residing several years at Florence, he returned to Rome, where he was again extensively employed. In 1663 he exhibited three pictures for the exhibition of San Giovanni; the first was the philosopher Pythagoras on the sea-shore, the second was the philosopher recounting his visit to the infernal regions, and the third the Prophet Jeremiah thrown into a pit for having prophesied the fall of Jerusalem; and soon after he painted his most celebrated picture, the Catiline Conspiracy, in 1668, at the annual exhibition of the Feast of San Giovanni Decollato, he placed his Saul and the Witch of Endor in competition with the works then shown of the elder Salvator. He did not execute many important works after this, and died of an attack of the dropsy, on the 15th of March, 1673. He was buried in the vestibule of the church of Santa Maria degli Angioli, which was erected over the ruins of the baths of Diocletian, by Michel Angelo. Salvator left one son, by Lucrezia, a mistress, who accompanied him from Florence, and to whom he was married shortly after his death.

Rosa possessed great invention, and had a wonderful facility of execution. He is superior when he confines himself to works of the easel size, and his figures are the most spirited in drawing and spirited in design. Such is the execution of the picture of Atilius Regulus, formerly in the Palazzo Barberini at Rome, and now in the possession of the earl of Devonshire. Of his landscapes, it may be observed, that he was not so much affected by the simplicity and amenity cultivated by Claude Lorraine, by Poussin, and indulged in gloomy effects and rugged forms; nor are his sea-pieces less forcible; in these he presents the desolate shores of Calabria, and frequently adds interest to his works by the terror of a wreck. According to Sir Joshua Reynolds, he had a peculiar cast of nature, which, though void of the elegance, and simplicity, though it has nothing of the elevation and dignity which belong to the grand style, yet that sort of dignity which belongs to savage and untamed nature; and Fuseli says, that though Salvator was without choice of form in design or much precision of conception, and though his talent was better adapted to smaller dimensions, he could fill a large canvas with effects, of which the Conspiracy of Catiline, formerly in the Casa Martelli, and now at the Pitti Palace at Florence, is a powerful instance. The subject of the Witch of Endor has been by some persons extravagantly praised, but the celebrated acute critic has observed that the toads, bats, and other accessories are vainly accumulated to supply the want of dignity and pathos in Saul, and of sublimity in the apparition. He however admits that in landscape painting Salvator was a genius.

There are a great number of his pictures in England, several of which are in the collections of the Marquis of Westminster, Lord Francis Egerton, the Duke of Devonshire, the Earl of Darnley, the Duke of Buckingham, and others. The Finding of Moses, at Stowe, was purchased from the Orleans collection for 2500l. His etchings are to the number of about ninety in number, executed in a spirited and masterly style. The chiaro-scuro is admirably managed, and the heads of the figures are full of expression. His monogram is composed of an S and an R combined, the former letter drawn over the straight line of the latter.

Some of the music-books of Salvator Rosa were, as well as other musical manuscripts, purchased by Dr. Burney at Rome, and amongst many airs and cantatas by different masters there were eight entire cantatas, written and transcribed by the painter himself. From the strength of his talents for music there given, there seems to be no doubt that he had a truer genius for this science, in point of melody, than any of his predecessors or contemporaries. There is a strength of expression in his verses which always place him above the middle rank of poets. To his other accomplishments he added architecture, which, according to Pascoli, he understood perfectly, and he excelled as a comic actor, an improvisatore, and a performer on several musical instruments. (*Biographie Universelle*; *Lives of the Times of Salvator Rosa*, by Lady Morgan; *Bryan's* *Strutt's Dictionary*, &c.)

ROSA DA TIVOLI. [Rosa]  
ROSA'CEA. (Malacology.) [Diphyphid]  
ROSA'CEÆ, a natural order of

with 4- or 5-lobed calyx; 4 or 5 regular petals; indefinite perigynous stamens; exalbuminous seeds; and alternate stipulate leaves. The plants of this order are allied to (Chrysobalanaceæ, from which they may be distinguished by their styles proceeding from the side of the ovarium near the apex, and not from the base, and by their regular petals and stamens. They are distinguished from Fabaceæ (Leguminosæ) by their regular petals and stamens, and especially by the odd segment of the calyx being posterior, and not anterior, as in that order. The genera of this order may be arranged under four groups or suborders, the principal distinctions of which will be seen in the following analysis:—

Carpels numerous.

Ovaries superior. ROSACEÆ (proper).

Ovaries inferior. POMEÆ.

Carpels solitary.

Fruit a drupe. AMYGDALÆÆ.

Fruit a nut. SANGUISORBÆÆ.

Rosaceæ proper include the true Roses (Roseæ), the Cinquefoils (Potentillæ), the Spiræas (Spirææ), and the Neuradas (Neuradæ). They are herbaceous plants or shrubs. This family includes about 570 species and 20 genera, principally inhabitants of the temperate and cold zones of the northern hemisphere of the New and Old World; a very few are found on high land within the tropics, and a small number in the southern hemisphere. None of the plants of this section of the order are unwholesome; they are characterised by the presence of an astringent principle, which has led to the use of many of them in medicine.

Pomeæ are known by the adhesion of their ovaries to the sides of the calyx, forming the fruit called a pome. Their ovula are always in pairs. The tendency of the flowers of this family to revert to their normal state frequently affords instructive examples of morphological changes. The fruit of many of the species contains a considerable quantity of malic acid, which gives to the fruit its peculiar flavour. The apple, pear, medlar, quince, service-tree, and mountain-ash belong to this family. They are inhabitants of Europe, Northern Asia, the mountains of India, and North America.

Amygdalææ have but a single carpel, which, when ripe, is a drupe; but they are also distinguished amongst Rosaceæ by their leaves containing hydrocyanic acid, and their bark yielding gum. They are natives exclusively of the northern hemisphere, where they are found in cold or temperate climates. Many of the species are poisonous, on account of the hydrocyanic acid they contain. They yield however some of our most valued fruits, as the peach, nectarine, plum, apricot, cherry, and almond, which last is the seed of the *Amygdalus communis*.

(*Spiræa argentea*.)

a, Flower, showing the perigynous arrangement of the stamens; b, fruit, showing its apocarpous structure; c, one of the follicles separate from the fruit.

Sanguisorbææ are not only known by their solitary carpels, but they are destitute of petals, and have a hard thick-  
P. C., No. 1251.

ened calyx. They are found wild in heaths, hedges, and exposed places in Europe, North and South America beyond the tropics, and the Cape of Good Hope. Their principal property is astringency, and some of the species may be used as fodder.

ROSACIC ACID, a name given by Prout to a peculiar acid which he imagined to exist in the lateritious sediment deposited in urine during fever. Dr. Prout is of opinion that it contains some purpurate of ammonia, and consequently, if this opinion be correct, no such substance as the rosacic acid exists.

ROSALI'NA. [FORAMINIFERA, vol. x., p. 348.]

ROSAMOND, FAIR. [HENRY II.]

ROSARIO. [MEXICAN STATES.]

ROSARY. [BEADS.]

ROSAS, a small seaport town of Spain, in the province of Gerona in Catalonia, not far from Cape Creus, on the north side of a gulf in the Mediterranean known as the Gulf of Rosas; in 42° 15' N. lat. and 3° 11' E. long. Rosas was founded by a colony of Rhodians, who called it Rhodope. (Strabo, p. 160.) But the reading in this passage of Strabo is evidently corrupt, and should be Rhode. The town is mentioned under the name of Rhode by Stephanus Byzantinus (v. 'Ρόδη), by Livy (34, c. 8), and by Mela (2, c. 6). It has a good and capacious harbour, which was formerly defended by a strong fort and batteries. The town itself is surrounded by a very thick wall and towers built by the Arabs. The fort however was blown up by the French on their evacuation of the Peninsula. During the sixteenth and seventeenth centuries the port of Rosas carried on a brisk trade with the Spanish colonies. It is now reduced to a mere fishing-town, the population of which, according to Miñano (vol. vii., p. 566), did not exceed 2200 inhabitants in 1830.

RO'SCIUS, QUINTUS, a celebrated Roman actor, was born near Lanuvium (Cic., *De Div.*, i. 36), but at what period is uncertain. He is frequently mentioned in the writings of Cicero, who was his friend and warm admirer. His talents also obtained for him the friendship of Sulla, who, during his dictatorship, presented him with a gold ring, the mark of equestrian rank (Macrob., *Sat.*, ii. 10), which honour was the more remarkable, as many passages in the Roman writers prove that the histriones were generally held in great contempt. So perfect however was Roscius in his art, that his name became almost synonymous with excellence in any other branch, and thus when an orator produced a great impression on his audience, it was customary to say 'a Roscius is on the stage.' (Cic., *De Orat.*, i. 28; *Brut.*, 84.) Actors frequently received instruction from Roscius, who used to say however that he had never had any pupil with whom he was satisfied. (*De Orat.*, i. 28.) Macrobius relates (*l. c.*) that Cicero and Roscius used to try which of the two could more frequently express the same thought, the one by his eloquence, the other by his gestures; and that Roscius derived from this exercise such a high opinion of his own art, that he wrote a work, in which he compared eloquence with the art of acting. Macrobius also states that Roscius received about a 1000 denarii a day for his acting (upwards of 35*l.*). He died about B.C. 61; since Cicero, in his oration for Archias, which was delivered in that year, speaks of his death as quite recent (c. 8). There is an extant oration of Cicero, though considerably mutilated, in defence of Roscius. The subject of the oration is a claim of 50,000 sesterces against Roscius, by C. Fannius Chaerea (*Ueber die Rede des Cicero für Q. Roscius*, Zeitschrift, i., p. 248).

ROSCOE, WILLIAM, born in 1753, near Liverpool, received a common school education till he was twelve years of age, after which he continued to improve himself by reading. When in his sixteenth year he was apprenticed to an attorney in Liverpool, and in 1774 he was admitted an attorney of the Court of King's Bench, and began to practice as such. In the meantime he wrote some poems, among others one on the origin of the art of engraving, which made him known to Sir Joshua Reynolds, Fuseli, and other distinguished artists. In 1784 he was elected honorary member of the Manchester Literary and Philosophical Society. He also turned his attention to the subject of the slave-trade, and wrote several pamphlets recommending its suppression. When the French revolution first began, Roscoe was one of its warmest partisans in this country. He wrote 'Strictures' on Burke's 'Two Letters addressed to a Member of the present Parliament,' reflecting in severe terms

upon what Roscoe considered as an apostacy in Burke's political conduct. In 1796 Roscoe published the 'Life of Lorenzo de' Medici, called the Magnificent,' a work which established his literary reputation. The subject was happily chosen, and the author treated it well. The work went through several editions, and was translated into Italian, German, and French. It was generally well received on the Continent, but its spirit was criticised by two classes of writers: one of them, of which Sismondi may be considered as the representative, see nothing but perfection in a republican government, and cannot forgive Lorenzo for having controlled and curbed the Florentine democracy. Sismondi charged Roscoe with having deceived himself and others with regard to the character of his hero, who in Sismondi's eye was an insidious and crafty tyrant. It is curious to see Roscoe, who at one time was the advocate of the French revolution, accused of being the panegyrist of the tyranny of the Medici. The grounds of this controversy are adverted to in FLORENCE, HISTORY OF, and MEDICI, HOUSE OF. Another class of critics was angry with Roscoe for having exposed the part which Pope Sixtus IV. took in the conspiracy of the Pazzi, which led to the murder of Giuliano, Lorenzo's brother, and also for having spoken unfavourably of Cardinal Barbo, afterwards Paul II. On the subject of the Pazzi, Sismondi joined the papal advocates in representing that conspiracy as a laudable deed, justifiable under the circumstances in which it took place. After many years Roscoe replied to his various critics in pointed though temperate language in his 'Illustrations, Historical and Critical, of the Life of Lorenzo de' Medici,' 4to., London, 1822. He inserted in the appendix, among other documents, an important letter written to Sixtus IV. by the signoria, or executive, of Florence after the failure of the Pazzi conspiracy, which letter was discovered in the archives of Florence by the Rev. F. H. Egerton, and printed at Paris in 1814.

The second historical work of Roscoe is his 'Life and Pontificate of Leo X.' In this also the author has been charged with undue partiality for his subject. He has reflected with much severity upon the great reformers of the sixteenth century, because, while they struggled against the overgrown absolutism of papal Rome, they could not divest themselves at once of the habit of intolerance which they had derived from early education. Count Bossi translated the 'Life of Leo' into Italian, adding notes in which he rebutted several of the charges brought against Roscoe's former work concerning Lorenzo: 'Vita e Pontificato di Leone X., di Guglielmo Roscoe, tradotta e corredata di annotazioni ed altri documenti inediti, dal Conte Luigi Bossi, Milanese,' Milan, 1817.

Considered as works of erudition and of general interest, the lives of Lorenzo and Leo by Roscoe stand deservedly high. They introduce the reader to a splendid period of modern history, among a chosen society of scholars, poets, statesmen, and artists, who gathered round the hospitable board of Lorenzo, and afterwards in the more pompous court of his son Leo. Numerous anecdotes and other particulars concerning those individuals make the reader familiar with their persons; and poetical extracts and valuable historical documents add to the value of the work. The style is remarkably pleasing and fluent. These merits of Roscoe's biographies have been universally acknowledged, even by those who have censured the general spirit of his works.

Roscoe contributed greatly to encourage among his countrymen a taste for Italian literature and the fine arts. In his own town of Liverpool, the Royal Institution owes its formation to Roscoe's exertions.

Roscoe was returned to parliament for Liverpool in the Whig interest. In the latter part of his life he became partner in a banking-house, in which however he was not successful. He died at Liverpool, in June, 1831. A biographical notice of him is appended to a new edition of his Life of Lorenzo, by his son.

ROSCOEIA, a handsome genus of the highly ornamental family of Scitamineæ or Zingiberaceæ, which was named by Sir J. E. Smith, in honour of the historian of the Medici, who elucidated the plants and remodelled the genera of the Scitamineæ in his beautiful work on that family. The species have been figured by Smith, Wallich, and Royle.

The genus consists of only a few species, which are confined to the Himalaya Mountains, and is characterised by having spathaceous flowers, a single-leafed tubular calyx, corol ringent, limb double, the outer tripartite, with the up-

per segment erect and arched. Inner limb two-lipped, ovary inferior, style enclosed in the furrow of the anther, which is two-lobed, incurved, surrounding the style with an appendage split at the base.

The species of Roscoeia, belonging to so tropical a family as the Scitamineæ, are generally accounted showy stove plants: but they are found only on the slopes of the Himalayas during the rainy season, when there is moisture with uniformity of temperature, and a much less degree of heat than is usually thought necessary is found to be sufficient for the growth of tropic-like plants, and therefore less would suffice for the cultivation of these plants than is generally supposed; indeed Roscoeia purpurea has been flowered in a drawing-room in London, under a glass case, and without any artificial heat. Dr. Graham mentions its springing up in the open air every year in the Edinburgh Botanic Garden. But the genus Roscoeia is that, of all the Scitamineæ, which is found at the greatest elevations. *R. alpina* is found at as great an elevation as 9000 feet above the level of the sea, and on places whence the snow had just melted, like the snowdrop in early spring in European countries. (Royle's *Himal. Bot.*, p. 357.)

ROSCOMMON, an inland county in the province of Connaught in Ireland, bounded on the north and north-east by the county of Leitrim, on the east by that of Longford, and on the south-east by those of Westmeath and King's, from all which it is separated by the river Shannon, except just on the north side; on the south-west it is bounded by the county of Galway, on the west by that of Mayo, and on the north-west by that of Sligo. The river Suck, a tributary of the Shannon, separates it along the greater part of the border from the county of Galway; and the Curlew mountains for a short distance from that of Sligo. The form of the county is irregular; the greatest length is nearly from north to south, from the border of the county of Leitrim west of Lough Allen to the junction of the Suck with the Shannon, 60 miles; the greatest breadth, at right angles to the length, is from the junction of the three counties of Galway, Mayo, and Roscommon to the bank of Lough Forbes near Tarmonbarry, 40 miles. The area is estimated by MacCulloch (*Statistical Account of the British Empire*) at 952 square miles, or 609,405 English acres, of which 453,555 are in cultivation, 131,063 unimproved mountain or bog, and 24,787 lakes. In the return of the population for 1831, the area is stated to be 557,100 acres. We believe MacCulloch's statement, which is taken from a table furnished by Mr. Griffith, the engineer, to the Lords' Committee on Tithe, to be the most exact. The population in 1831 was 249,613, giving 262 inhabitants to a square mile. In area it is rather below the average of the Irish counties, but in amount and density of population rather above the average. Roscommon, the capital, is 20 English miles in a direct line west by north of Dublin, or 25 English miles by the road through Mullingar, Longford, and Lanesborough, or by Mullingar, Ballymahon, and Lanesborough.

*Surface, Geology, Hydrography, Communications.*—The surface of the county is partly undulating, but along the banks of the Shannon and the Suck, and in other parts, it is very flat. There are some mountains. The principal groups are the Braulieve, or Braughlieve, and Sliebh Curkagh mountains (estimated at 1000 or 1200 feet high), which enter from the counties of Leitrim and Sligo on the north-west, and extend a little way into the county west of Lough Allen; the Curlew mountains, on the borders of Sligo near Boyle; the Sliebh Bawn mountains, 839 feet in the northern part, and 857 feet high in the southern, parallel to the Shannon, and not far distant from it, on the east side of the county; the hills between the Shannon and the Suck in the south; and Sliebh Aelwyn, between Castlerock and Ballinlough in the west. The Braughlieve and Sliebh Curkagh have steep rugged acclivities and broad perpendicular faces of rock near their summits. The eastern side of the Sliebh Bawn mountains slopes gradually down to the bogs in the valley of the Shannon at their base; the western side is more broken; the district at the foot is varied with wood.

The level parts of the county are for the most part occupied by the formations belonging to the great carboniferous limestone district of central Ireland. The impure argillaceous limestone, or 'calp,' the black shale, and the sandstone, which form one of the subdivisions of the limestone group, and the lower limestone, which constitutes another subdivision, subjacent to the calp, are found in this county. The

hills west of Castlerea are composed of the yellow sandstone which is the lowest member of the limestone group. The Braughlieve and Slievh Curkagh mountains are composed of shales and sandstones, with three beds of coal resting on beds of the millstone-grit series, from which good ironstone is obtained. The coal of this district is not extensively diffused; it forms two fields partly or wholly in this county, separated from each other by the river Arigna, which flows between Braughlieve and Slievh Curkagh. There are some other coal-fields in other adjacent counties round Lough Allen. The coal answers well for smelting iron, and is used in the Arigna iron-works (the only iron-works in Ireland) in this county. Cast-iron of the best quality is produced at these works at a moderate expense. The company by which they are worked are in possession of the most extensive and valuable coal-fields of the neighbourhood.

The Curlew mountains and the Slievh Bawn mountains consist of rocks of the old red-sandstone formation. (Griffiths, 'On the Geological Structure of Ireland,' in *Appendix to Second Report of Irish Railway Commissioners; Parliamentary Papers* for 1837-8, vol. xxxv.) Good limestone is quarried for building. Potters'-clay and pipe-clay are found in various parts of the county.

The county belongs to the basin of the Shannon, except a very small portion at the western extremity, which is drained by the Moy, which flows into Killala Bay. Lough Allen, which the Shannon enters about five miles from its source, and through which it flows, is on the north-eastern boundary of the county. From the southern extremity of this lough the Shannon flows along the eastern boundary of the county to Carrick-on-Shannon, where it receives a stream from Lough Gara and Lough Key. From Carrick the Shannon pursues its course along the border, passing through Lough Corry, Lough Boderig, or Bodarg, Lough Boffin, and Lough Forbes to Lanesborough, below which it enters Lough Ree. It quits the southern extremity of Lough Ree just above Athlone, and runs southward to the junction of the Suck, where it quits the county, after a course along its eastern side, including the loughs through which it passes, of about 75 miles. The fall in this distance is very trifling. Lough Allen is only 160 feet above the level of the sea, and the fall between Lough Allen and the lower end of Lough Derg, which is above 40 miles below the junction of the Suck, is not more than about 62 feet, or about six inches to a mile. The Suck, the only important tributary of the Shannon, rises just within the county of Mayo, but its course is almost entirely within or upon the boundary of Roscommon; its length may be estimated at more than 60 miles.

Both the Shannon and the Suck are navigable. The navigation of the Shannon commences in Lough Allen, from whence to Battle Bridge, about seven miles and a half below the Lough, a canal is cut for the purpose of avoiding the difficulties of the natural channel. Other short canals are cut to avoid rapids or other difficulties in the lower part of the course. Agricultural produce, turf, coal, timber, bricks, flags, stone, slates, sand, and manure are the chief articles conveyed by the river. The navigation through Lough Ree is difficult, owing to its shoals and sunk rocks, notwithstanding which a great number of pleasure-boats are kept on it. The Royal Canal opens into the Shannon opposite Tarmonbarry in this county; the Grand Canal, just below the junction of the Suck. The traffic on the canals consists chiefly of corn and butter sent to Dublin, and English manufactures and general goods sent in return. The navigation of the Suck commences at Ballinasloe (county of Galway) for light flat-bottomed boats; small row-boats ascend higher. But a canal is cut parallel to it on the Galway side of the river, from Ballinasloe to the Shannon. Both the Suck and the Shannon abound with fish, especially eels, of which great quantities are taken in weirs and sent to Dublin. Those of the Suck are peculiarly fine.

The principal roads are the mail roads from Dublin to Sligo and to Galway. The Sligo road just crosses a corner of the county between Drumsna and Jamestown, re-enters at Carrick, and passes north-west through Boyle. The Galway road enters the county at Athlone, and crosses it in a south-west direction to Ballinasloe in Galway. The roads are excellent. Another road to Sligo, which branches off from the mail road at Longford in Longford county, passes through Tarmonbarry, Strokestown, and Elphin, and rejoins the mail road at Boyle. The road from Dublin to

Roscommon (whether by Ballymahon or Longford) enters the county at Lanesborough, and runs south-west nearly eleven miles to Roscommon. Generally speaking the roads of the hilly district in the northern part of the county are inferior to those in the more level districts of the centre and south.

The principal lakes are Lough Allen (8 miles long from north to south, and 3 miles broad); Lough Bodarg, or Boderig, and Lough Boffin (forming one sheet of water of intricate form, 5 miles from the northern extremity to the south-eastern, and 7 miles to the south-western); Lough Forbes and Lough Ree (17 miles long from north to south, and 7 miles broad), all on the Shannon; Lough Gara (5 miles long from north to south, and 5 miles broad); Lough Key (otherwise Rockingham Lough); and Lough Oakport, all communicating with the Shannon by a stream called the Boyle Water; Lough Skean and Lough Meelagh, also communicating with the Shannon, and situate, as well as those just mentioned, in the northern part of the county; Lough Glin or Glynn, Lough Cloonagh, and Lough Aelwyn, all small, in the western part; Lough Funcheon and Lough Ballynceny, in the southern part; and several others in the central and eastern part. The line of lakes on the Boyle Water, Lough Glynn, and Lough Meelagh are surrounded by picturesque and beautiful scenery. Besides these there are a number of 'turloughs,' or temporary lakes, formed in the hollows of the limestone tracts. They usually disappear in summer, but not always; and when dry early in the season, such as have grassy bottoms produce abundant crops. The water is drained off by fissures and passages in the limestone rock, which get choked by the vegetable matter washed into them by the first winter floods, and are cleared next summer by the decay of this obstruction. The size of these 'turloughs' varies with the season: some of them are of considerable extent.

The soil in the limestone district is commonly fertile; there is however a large extent of bog or other waste. The amount of pasture land is considerable: the natural pastures, which are esteemed to be some of the best ground in the county, are in the limestone districts, especially between Tulsk, Castlerea, and Boyle. Rich deep loams are met with; and there are, especially along the limestone ridges between the Shannon and the Suck, extensive tracts of light shallow soil, so shallow indeed that in some parts the plough cannot be used. These tracts are commonly used for sheep-feeding. The surface of the mountains is commonly wet and boggy, but there are intervening spots of dry ground covered with heath. Some of the soil in the sandstone districts, as in the Curlew Mountains, near Boyle, is very poor, but is capable of great improvement from the admixture of lime, or rather of a compost of lime and bog earth, which is to be had readily. Much may be done in this way, as well as by draining cold wet lands, whenever capital comes to be employed more extensively than at present in agricultural improvement.

The extent of the unimproved mountains and bogs has been estimated at above 130,000 English acres, the bogs being dispersed over the face of the country in patches of various size and in almost every variety of situation: they are found on the tops of the highest mountains, on the banks of the loughs and rivers, and in the bottoms of the valleys. Several of those on the uplands are comparatively dry, and afford in their natural state coarse pasturage for young and hardy cattle. Something has been done by spirited individuals towards reclaiming some portions of this large amount of waste land, but nothing has been done upon a large scale or upon any plan of co-operation.

Many of the estates in the county are large, some belonging to resident landlords, others to absentees. Rents vary; on farms of several hundred acres, 20s. and 25s. per acre are usual, but, sometimes 30s. and 35s. are given, and, in the immediate neighbourhood of towns, as much as 60s. and 80s. Tillage has been much extended of late years, and the quantity of food raised is probably greater than at any former period; but, excepting on the land held by a few wealthy individuals, the state of agriculture is very wretched, especially on the smaller farms. 'To say nothing of the deficiency of produce attributable to bad ploughing, unskilful sowing, want of manures, and an utter inattention to the alternation of green crops with those of corn, potatoes alone excepted, the loss upon what the land actually does yield is considerable, from bad and careless stacking, and the general want of barns. The stacks are commonly made

very small, resting upon the earth; for in a country so bare of timber and hedgerows, boughs and bushes are scarce articles. If wet weather comes on and continues long, much of what lies below, next to the earth, perishes by attracting moisture: from the want of a broad and firm basis, the frail structure is liable likewise to be swayed by the wind; and the tops and sides losing their original form, and being no longer capable of throwing off the rain, still more damage ensues. To such losses are likewise to be added the depredations from vermin, rats, mice, and small birds, whilst the corn remains out of doors.

'As for barns, in the English and Continental acceptation of the term, they are literally unknown. The floor of some outhouse, or perhaps even that of the family room, may be used for threshing; but a vast proportion of the grain is beaten out in the open air, very commonly near the road side, where there happens to be a dry spot. These observations, it must be understood, apply to the small holdings; but upon such is raised a considerable quantity of the corn which is thrown into the market from the county of Roscommon.' (Weld's *Statistical Survey of the County of Roscommon*, 8vo., Dublin, 1832.)

The common ploughs of the small farms are very wretched: whether the instrument works well or ill is a matter of chance, and the plough is commonly followed by a man with a spade, or rather a 'loy,' to turn back the earth, which would else, after the plough had passed, revert to its former bed. However, on the lands of the principal gentry examples may be found of excellent tillage, with Scotch ploughs of the most approved construction, drawn by a pair of horses and driven by the ploughman. The 'loy' mentioned above is a sort of curved spade or shovel, of clumsy form, and with a handle of unusual length, far inferior to the spade in general utility, but not ill adapted for use in turning up a light shallow soil in rocky districts, where the plough cannot be used. In certain districts of the county where spade labour is common, the labourers unite in companies, and work for each other in rotation. This is the case especially in busy times, such as potato planting or digging, and lightens their toil by the cheerfulness which prevails.

'Wheat is commonly sown immediately after the crop of potatoes has been dug out. After the wheat, two or three crops of oats are taken, all for the one manuring for the potatoes; and then the ground is sometimes laid down with grass seeds, in a state unquestionably too poor for the purpose; sometimes "let out," in the phrase of the country, that is, left to nature to be clothed with grass of spontaneous growth, a process which is sure in time to be accomplished, though always more tardily than if the seeds were sown.' (Weld, *Statistical Survey of the County of Roscommon*.) This practice of 'letting out' is very injurious; and it is supposed that by the introduction of stall-feeding, and the cultivation of the artificial grasses and other green crops, the productiveness of the soil might be increased twofold.

The extensive grazing-farms of the county contrast favourably with the tillage land; yet, even in these, much improvement is needed. Thistles are allowed not only to remain, but to spread; so that it is no unfrequent circumstance for sheep to be pricked in the eye and blinded by them. The highest quality of pasture land consists commonly of natural grass. The favourite breed of oxen seems to be the long-horned Leicester. The principal graziers supply themselves at fairs for summer feeding: they raise only a few head themselves, and those of some superior breed. It is common also to have brood-mares on the large grazing-farms, and several fine horses of good blood are bred. There are no dairies on a large scale, but butter is made more or less in every part of the county. The sheep are considered to be far better than those reared in the adjacent counties, a result attributable partly to the superior skill and intelligence of the sheep-farmers, and partly to the dry and wholesome nature of their sheep-walks. The favourite breed is a cross between the old Connaught sheep and the Leicester, 'which produces an animal little inferior in size to the former, with a greater disposition to fatten in a short space, and with less waste or offal on the carcass.' (Weld, *Statistical Survey of the County of Roscommon*.)

The 'con-acre' system is general, but in some parts of the county is not carried to any great extent. The consolidation of the small farms into large has not been much practised; in some instances where it has taken place the

tenants who were dispossessed were assisted to emigrate. Emigration has taken place in most parts of the county, but not to any great extent: the emigrants have been from various classes. They have gone chiefly to Canada or to the United States, but a few have gone to Australia. (*Appendix to First Report of Commissioners for inquiring into the State of the Irish Poor*.)

The condition of the peasantry, or 'cottiers,' is very miserable. In some places they occupy cabins without paying any rent; but more commonly they pay for a cabin, without land, a yearly rent varying with the locality, frequently rising to 1*l.*, in some cases to 1*l.* 10*s.*, and in the town of Boyle, as high as 2*l.* 10*s.*; with land, the yearly rent rises occasionally to 3*l.* and 3*l.* 10*s.* The rent is paid sometimes in money, sometimes in labour, in which cases the rate of wages is about 6*d.* a-day, and occasionally 8*d.* or 9*d.* The cabins are wretched hovels, built of mud or sods; or, where stone is abundant, with stone walls, either dry or with mortar, and thatched with straw or potato-stalks. The furniture is of the most miserable description, made up of a table, three or four stools, a box, and a pot or two. Bedsteads are comparatively rare; and the bedding consists of straw, having a blanket, perhaps only a sack, with the addition of the sleeper's day-clothes for a covering. In some parts of the county it is common for two families, or even more, to reside in one of these wretched habitations. The condition of the peasantry has very generally deteriorated since 1815, partly in consequence of the linen manufacture having declined. Disturbances have been frequent in many places, while in others the people have been very peaceable. There are a few charitable loan societies, some of them established from the funds raised in England for the relief of the Irish in 1823. Illicit distillation is prevalent, especially when corn is at a low price. Employment is scarce, and only a small portion of the peasantry have constant work. Wages are commonly 8*d.* or sometimes 10*d.* a-day without diet; or 6*d.* with diet, in summer; and 6*d.* a-day without diet in winter. In busy times, and in the neighbourhood of the towns, higher wages are paid. The average yearly gains of a labourer are variously estimated, but commonly from 7*l.* or 8*l.* to 10*l.* a year. Women and children get little employment, except at busy seasons, such as potato setting and digging, and in harvest, when they earn 4*d.* or 5*d.*, or even 6*d.* a-day without diet. Herdsmen are usually better off. On a farm of fifty acres, they get a cabin, an acre of potato or cabbage garden, and grass for a cow; on a farm of a hundred acres, two acres of garden, and the grass of two cows, with the opportunity besides of keeping a pig or a few geese. The diet of the peasantry consists of potatoes, with the addition, in some cases, of milk, or buttermilk, red herrings, and oatmeal for gruel. Their clothing is commonly of the most wretched character.

*Divisions, Towns, &c.*—The county is divided into six baronies, or half-baronies, as follows:—

	Situation.	Pop. 1831.
Athlone . . . . .	S.	56,863
Ballintobber* . . . . .	W.	70,597
Ballymoe (half barony) . . . . .	S.W.	7,353
Boyle . . . . .	N. & N.W.	66,103
Moycarne or Moycarnon (half-barony) S. . . . .	S.	7,243
Roscommon . . . . .	Central	41,450

There are, in the county, the assize and market town of Roscommon; the market and post towns of Boyle, Castlerena, Elphin, Frenchpark, and Strokestown; and the post towns of Athleague, Keadue, and Mount-Talbot. Portions of the borough of Athlone [ATHLONE], and of the towns of Ballinasloe [BALLINASLOE], Carrick-on-Shannon, and Jamestown [LEITRIM, COUNTY OF], and Lanesborough [LONGFORD, COUNTY OF], are also within the border. The principal villages are Lough-Glynn, Ruskey, Knockcroghery, Tarmenbarry, and Castle Plunket.

Roscommon is in one of the detached portions of the barony of Ballintobber. It appears to have derived its origin and its name (Ros-Coman, 'the pleasant place of Coman') from an abbey founded about A.D. 550, by St. Coman or Comanus. Another abbey of greater magnificence was founded here for the order of Preaching Friars, about A.D. 1257, by O'Connor, king or prince of Connaught; and a few years after, a strong castle was built by Sir Robert de Ufford, one of the early English adventurers. Of these last

\* The principal part of the barony of Ballintobber is on the west side of the county; but there are two other large portions quite detached from it, on the banks of the Shannon and Lough Ree.

two edifices there are considerable remains; the castle is on the north side of the town, and the abbey on the south side. Both are on level ground, while the town occupies the eastern and southern slopes of an intervening eminence. The castle is an oblong quadrangle, with a tower at each angle, and two additional towers to defend the gateway, which is on the eastern side. The town consists of three or four streets irregularly laid out, having in the centre an open space opposite the old gaol, a building situated on the summit of the eminence on which the town stands, but now disused as a prison from want of sufficient space. Near this is the old court-house, now converted into a Catholic chapel. A new court-house, a substantial and commodious building, but deficient in architectural correctness and effect, and a new gaol, have been built, and near them are some good new houses; but with the exception of these, the town presents an appearance of wretchedness and decay; four-fifths of the houses are mere cabins. There is a neat church with a square tower. The town is ill supplied with water. There is a county infirmary near the new court-house, a plain brick building. The ruins of the Abbey church are of various dates; they contain a tomb, said to be that of O'Connor, founder of the abbey, with a mutilated effigy recumbent on it, and effigies of Irish gallow-glasses (antient light-infantry) sculptured in relief on the perpendicular sides of the tomb. The interior of the church is still used as a burial-ground.

The parish extends into the barony of Athlone; the entire population in 1831 was 8374, of whom 3306 were in the town. The shops are numerous, but business does not appear to thrive as in some other towns in the county. Coarse pottery is manufactured near the town. There is a weekly market on Saturdays, well attended, at which corn, the materials of clothing, and articles of clothing made up, are sold to a considerable extent. There is no direct communication with Dublin; but there are cars to Athlone and to Killashee on the Royal Canal. Mendicity and prostitution prevail to a frightful extent. There is a barrack not far from the town.

The assizes for the county are held here; and also the Epiphany and Midsummer quarter-sessions for the division, which comprises the baronies of Athlone, Ballymoe, Moycarne, and part of Ballintobber, and petty sessions for the district. The town was formerly a parliamentary borough, but was disfranchised at the Union, since which time the corporation has become extinct. There were in 1835 six schools connected with the Kildare-place Society, the London Hibernian Society, the London Ladies' Hibernian Society, or supported by endowment or contribution; a classical school, and eleven hedge-schools: in all, eighteen schools.

Boyle is about 108 miles from Dublin, on the mail-road to Sligo, and on the stream (the Boyle Water) which flows from Lough Gara into Lough Key. The town appears to have risen under the protection of a Bernardine abbey, which was transferred to Boyle, A.D. 1161, and attained great wealth. The ruins exist on the left or north bank of the Boyle Water, about a quarter of a mile below the town bridge; they are tolerably extensive, and include the remains of the church and of some of the monastic buildings, now enclosed in a private garden. Some of the arches were walled up after the suppression, when the abbey was for a time occupied as a military post. The older part of the town stands on the northern side of the river; the more improved part on the southern. The newer houses are in this part; they are built of limestone or sandstone. Of about five hundred houses, three-fifths are miserable thatched cabins, and half the remainder are little better. The town is inconveniently laid out. The bridge over the river is a handsome structure, 100 feet long and 42 feet wide, of three arches, and lately built in place of an older bridge, which had five low narrow arches. A new bridge of one arch has been thrown over the river a little below the town bridge, and just above the ruins of the abbey; and a third bridge lower down. The church is capacious, but the architecture is not in good taste. There are two Roman Catholic chapels, one or two dissenting places of worship, a new sessions-house, a bridewell, and a barrack; the last was formerly a nobleman's mansion. The old sessions-house has been pulled down, and a building for religious and charitable purposes erected on its site.

The population of the town, in 1831, was 3433; of the whole parish, 12,597. The town is fairly provided with shops, and is the mart of the surrounding district. Corn, and but-

ter, which is sold in firkins for exportation, are the staple articles of trade. The butter-market is on Monday; but the principal market, at which a considerable quantity of linen yarn is sold, is on Saturday. Heavy goods are chiefly brought from Sligo, lighter ones from Dublin. There are six fairs in the year.

Boyle was formerly a parliamentary borough, but the privilege of returning members was lost by the Union; and the corporation has been dissolved by the late Irish Municipal Reform Act. There were in the parish, in 1835, seventeen day-schools, including two private boarding-schools, two national schools, one school supported by the Baptist Society, four schools partly supported by subscription, four private day-schools, and four hedge-schools. There were beside four Sunday-schools. A weekly newspaper is published at Boyle.

The quarter-sessions are held here twice in the year, for the division which comprises the baronies of Boyle and Roscommon and part of the barony of Ballintobber; petty-sessions are also held. There is a barrack for the county constabulary, of whom a body are stationed here. There are a charitable loan society, and two dispensaries, one maintained by Lord Lorton, whose beautiful mansion and demesne of Rockingham are on the banks of Lough Key near the town.

Castlereagh is in Kilkeevan parish, in the barony of Ballintobber, 17 miles north-west of Roscommon, on the river Suck, which runs through the town, and divides it into two parts; a small stream, a feeder of the Suck, also runs through the town, and joins the river just below. The town consists principally of one long street, the continuity of which is interrupted by two bridges over the Suck and its feeder. Many of the houses are new, nearly one-half of the southern side of the street has been rebuilt, and new cottages for the peasantry are springing up on every part of the estate of Lord Mountsandford, whose demesne and residence are close to the town. The population of the town, in 1831, was 1172; that of the whole parish, 10,867. Of about 170 houses, nearly 70 were mere cabins, and about 25 were thatched houses of two stories; but the cabins are better than in most other towns in the county, and some of them are remarkably neat. There are several neat cottages with gardens in the neighbourhood.

The market is on Wednesday for corn, and on Saturday for provisions. There are a malthouse, a distillery, and a tan-yard, and a number of small shops. There is a market-place, with convenient shambles. There are four fairs in the year. The Easter quarter-sessions for the Boyle division of the county are held here. The sessions-house stands near the market-place; and there is a bridewell. Petty sessions are also held. The parish church of Kilkeevan is close to the town, and there is a Catholic chapel.

The parish had, in 1835, twenty-three day schools, including two national schools, one school chiefly supported from Erasmus Smith's fund, nine supported by Lord Mountsandford, one supported by the Catholic clergy of the parish, a classical school, and nine hedge-schools. There are a loan fund and a dispensary.

Elphin is in the barony of Roscommon, 11 miles south by east of Boyle. The town extends along the summit of a ridge, and runs nearly east and west: more than two-thirds of the houses are mere cabins, many of them of the most wretched character; there are scarcely any slated houses. The cathedral stands at the eastern end of the town, and the Catholic chapel at the western. The cathedral, a modern building, of barn-like appearance, about 80 feet long and 28 broad, with a slated roof, is little in harmony with the tall dilapidated square tower with which it is united. It is used as the parish church, and is neat in its internal appearance. The bishop's palace is a spacious and comfortable country-house, with a lawn in front. The Catholic chapel is commodious, but not elegant.

The population of the town, in 1831, was 1507; of the whole parish, 6643. The shops are small and ill-supplied. A market has been established within the last few years by the bishop. There is a dispensary. There were, in 1835, three day-schools, supported, one by the clergy and the Society for Discouraging Vice, and two by the London Ladies' Hibernian Society, and nine hedge-schools. The diocesan school, founded by Bishop Hodson, A.D. 1685, is not noticed in the Parliamentary Returns. There are two yearly fairs at Elphin.

French-park is in the barony of Boyle, 9 miles south south-west of Boyle. It is a small place, containing about

a hundred houses, most of them mere cabins, at the junction of four roads. There are a Catholic chapel, a school-house, and a sessions-house; and a market-house has been erected within the last few years. The mansion and demesne of French-park, the seat of the French family, are close to the town; and about half a mile distant, on the verge of a bog, are the ruins of Clonshanvill Abbey. The ruins consist of the walls of the church, with its steeple, two detached chapels in the burial-ground, and the remains of a square building belonging apparently to the habitable part of the abbey. The ruins, from their situation in a flat open country, form a striking object at a distance, but are neither very picturesque nor of much antiquarian interest when viewed nearer. In the burial-ground, which is still used, is a lofty cross. The population of the town, in 1831, was 447; that of the parish of Tybohan or Taughboyne, in which it stands, was 16,460. Butter, yarn, and pigs are sold in the market, which is held on Thursday. There are three yearly fairs. Good sandstone is quarried in the immediate neighbourhood, and limestone in the town itself. Petty sessions are held here. French-park has a dispensary.

Strokestown is in the barony of Roscommon, between Elphin and Lanesborough. It contained, in 1831, about two hundred and sixty houses and 1547 inhabitants. The town consists of two streets crossing at right angles; the one which runs east and west is nearly 150 feet wide, and has Lord Hartland's demesne and mansion at one end, and a new church at the other. Three-fifths of the houses are mere cabins, and more than another fifth are thatched cottages, little better than cabins. The rest are built of limestone or sandstone, both of which are procured near the town, and are roofed with Welsh slates, imported into Sligo, and brought from thence by land carriage. Trade is prosperous, and the market is well attended; a considerable quantity of wheat, for the growth of which the soil round the town is particularly favourable, is sold; and the country-people bring in linen, linen yarn, tow, woollen stockings, flannels, and a peculiar kind of woollen stuff which is dyed and dressed in the town. The market is also well supplied with lake and river fish, and some sea-fish, and goods of all kinds are sold in stalls. There are four yearly fairs. There are a sessions-house and bridewell, and the quarter-sessions for the Boyle division of the county are held here once in the year. There is also a dispensary. The old mansion-house of Lord Hartland has been modernised: in the grounds, at a short distance from the house, are the roofless walls of an old church, used as the family burial-place. Races are held at Ballynafad, three or four miles south of the town.

Athleague is a small place, containing, in 1831, eighty-seven houses and 488 inhabitants: there is a long bridge, or rather series of bridges connected by a long causeway, carried obliquely across the river Suck, which here flows in a divided channel. Athleague is a dull place, with little trade; there is a flour-mill. Four fairs are held in the year. The church is an old building in bad repair; there is a Catholic chapel in the town. Keadue is in Boyle barony, ten or eleven miles north-north-west of Carrick-on-Shannon; it consisted, in 1831, of about forty houses, chiefly cabins. A market-house was then building; and the place was increasing in prosperity from the neighbourhood of the Arigna iron-works. There are ten yearly fairs. Keadue has a dispensary. Mount-Talbot is in Athlone barony, on the banks of the Suck, and takes its name from the demesne of the Talbot family, which is close to the village. It is a small place, pleasantly situated. Mount-Talbot has four fairs in the year. Petty sessions are held both here and at Keadue.

Lough-Glynn had, in 1831, about fifty houses, chiefly cabins, but superior to those commonly met with; there were a Catholic chapel and a dispensary near the village, and a parish church at some distance: the population was 254. Ruskey or Rooskey is in Ballintobber hundred, and on the Shannon, over which is a bridge of nine arches; the village extends across the river into Leitrim and Longford counties. The church of the parish of Tarmonbarry is in the village; also a Catholic chapel. Knockcroghery (pronounced Nockroghery) is in the barony of Athlone, about 5 miles south-east of Roscommon, not far from Lough Ree. It has a new church and new school-houses. A considerable manufactory of tobacco-pipes is carried on; and there are two yearly fairs, one of them a large one. Tarmonbarry is in Athlone barony, on the right bank of the Shannon, which is here divided into two arms, over each of which

there is a bridge: these bridges are connected by a causeway over the intervening island. The Royal Canal terminates in the Shannon at Richmond harbour opposite Tarmonbarry: there are extensive basins, docks, and warehouses on the Longford side of the river. Castle-Plunket is a miserable place of about forty miserable cabins. Lough-Glynn and Tarmonbarry have each four fairs in the year; Castle-Plunket has three.

*Divisions for Ecclesiastical and Legal Purposes.*—The number of parishes in the county is differently stated; we believe the correct number to be fifty-six. These, with some of the adjacent parishes in the next counties, make up thirty-one benefices; of which twenty-seven are in the diocese of Elphin, one in that of Clonsfert, one in Ardagh, and two in Tuam. All these dioceses were in the ecclesiastical province of Tuam, except Ardagh, which was in the province of Armagh; but by the late alterations in the Irish church, all are now in the province of Armagh.

The county is included in the Connaught circuit: the assizes are held at Roscommon, where is the county gaol. The county is divided into two parts for the sessions business: the division of Athlone comprehends the baronies or half-baronies of Athlone, Ballymoe, Moycarne, and part of Ballintobber; the division of Boyle comprehends the baronies of Boyle, Roscommon, and the rest of Ballintobber: the sessions for the first are held alternately at Athlone and Roscommon; those of the second, twice in the year at Boyle, once at Castlerea, and once at Strokestown. The county gaol is at Roscommon, and there are bridewells at Athlone, Boyle, Castlerea, and Strokestown. The discipline of the county-gaol is very defective; the great objects of prison discipline are altogether lost sight of; nor is the size of the gaol or the number of the cells sufficient. The bridewells of Athlone and Boyle are clean and well ordered. Those of Castlerea and Strokestown are for the temporary lodgment of prisoners. The constabulary force, on 1st January, 1838, amounted to 244, viz. 1 subinspector, 6 chief constables, 7 head-constables, 43 constables, and 187 subconstables.

There is a county infirmary at Roscommon, and dispensaries at Athlone, Boyle, Castlerea, Elphin, French-park, Strokestown, Keadue, Lough-Glynn, Croghan, Tulsk, and Fallyleague. The county is included in the district of the Connaught lunatic asylum, which is at Ballinasloe.

Two members are returned for the county, who are elected at Roscommon. Athlone, which is partly in this county, is the only parliamentary borough. The number of voters on the register for the county in 1834-5 was 1864; for the borough of Athlone 274.

The amount of grand-jury presentments in the year 1837 was 27,051*l.* 18*s.* 3*d.*, viz.: for new roads, bridges, &c., 2502*l.* 3*s.* 6*d.*; for repairing roads, bridges, &c., 7884*l.* 2*s.* 11*d.*; for building or repairing gaols, bridewells, and houses of correction, 41*l.* 10*s.*; for prison and bridewell expenses, 1915*l.* 15*s.*; for the police and expenses of witnesses, 4196*l.* 0*s.* 10*d.*; for salaries of county officers, not included in the foregoing heads, 3376*l.* 18*s.*; for public charities, 1454*l.* 17*s.* 2*d.*; for the repayment of government advances, 510*l.* 6*s.* 10*d.*; and for miscellaneous expenses, 572*l.* 3*s.* 10*d.*

*History, Antiquities, &c.*—In the earliest historical period this county appears to have been partly or wholly in possession of the Auteri, a people mentioned by Ptolemy, and supposed by Sir James Ware (*Hist. of Ireland*, vol. ii. ch. vi.) to have inhabited some part of the counties of Galway and Roscommon. At a later period it was occupied by the sept or clans of O'Connor Ruadh (red), Rough, or Roe; and O'Connor Dhunne (brown) Dunn, or Don, whose territories comprehended respectively the baronies of Roscommon and Ballintobber; and by the sept of the Macdermots, whose territories now constitute the barony of Boyle; the parts bordering on Galway were occasionally encroached upon by the O'Dalys and the O'Kellys of Galway. The territories of the two tribes of the O'Conors were called Hy-Onach; those of the Macdermots were called Moylurg or Moylurg; and those of the O'Dalys and O'Kellys, Hy-Maine or Mainech. Part of the county was included, with a portion of Galway, in Clanckonow, the territory of the Bourks: the most northern part was included in Corcahbann, the territory of the O'Hanlys and O'Broenans; between the Suck and the Shannon was the district of Dealtra Nuadhat; Hy-Briun Sinna was another district along the bank of the Shannon; and a district called Kierrigmac, afterwards Clan-Kethern, was included in the county, but

in what part is not specified. (Ware, *Hist. of Ireland*, chap. vii., sec. 1.)

Of the earliest period there are few memorials, the raths (hill-forts or earth-works) are the principal. Of these there are more than four hundred and seventy. They are always upon natural eminences. They contained within their ramparts the dwelling-places of the chieftain and his family, commonly constructed of earth and hurdles, but having sometimes wooden walls upon a foundation of earth. At Oran, between Roscommon and Castlerea, is one of the round towers whose use and origin are so uncertain. It is only about twelve feet high, and bears the appearance of never having been finished, rather than of having been thrown down. Its interior diameter is 11 feet 3 inches; and the thickness of the walls 4 feet 6 inches. It is built of limestone; the stones are well cut, fit closely, and are laid in even courses.

Seven years after the English invasion of Ireland, the county was attacked by Milo or Miles de Cogan, one of the most active and warlike of the English adventurers. Roscommon formed at that time part of the kingdom of Connaught, and was governed by Roderic O'Connor, recognised as sovereign of Ireland. De Cogan advanced with 40 knights, 200 other horsemen, and 300 archers to the town of Roscommon, where he was joined by Murrugh, son of Roderic, at the head of a body of malcontents. The natives however, by driving away their cattle and laying waste their country, reduced De Cogan and his army to great danger from famine, and obliged them to retreat. In 1204 the county was again ravaged by William Bourke (or de Burgo) Fitz-Aldelm, lord of Limerick and the neighbouring country: in 1216, the castle of Athlone, on the frontier, was erected to secure a ford of the Shannon, and in 1268 that of Roscommon was built to secure the quietness of the county, at that time assumed to be subject to the English, and included in a grant of Connaught, made by Henry III. to the family of De Burgo, or De Burgh, who held also the earldom of Ulster. The native princes of the country, though recognising the supremacy of the English crown, were not disposed to submit to such wholesale spoliation, and the castle of Roscommon was twice taken by them, A.D. 1272 and 1276. This part of Ireland appears to have been long in a state of anarchy, the Irish septs struggling for independence with the De Burgos, their Anglo-Norman masters. In A.D. 1315, Richard de Burgo, earl of Ulster, and Fedlim or Phelim O'Connor, Irish prince of Connaught, advanced in conjunction from Roscommon, to repel the invasion of the Scotch under Edward Bruce; but O'Connor, seduced by the offers of Bruce, entered into a secret treaty with him; and returned home to guard his own inheritance against his kinsman Roderic, who sought to usurp it. Fedlim, whose treaty with Bruce was not known, was supported by the English, and by their aid he defeated Roderic, who fell in the battle. He now avowed his alliance with the Scots, but was entirely defeated by the English under William de Burgo, brother of Earl Richard, and Sir John Bermingham, at Athenry in Galway, A.D. 1316. The victory utterly broke the power of the O'Conors, who split into clans or septs, of which two have been noticed as occupying portions of Roscommon. These two septs became rivals, and wasted their strength in mutual hostilities. Meanwhile, the inheritance of the De Burgos came by marriage to Lionel, duke of Clarence, son of Edward III., whose descendants afterwards came to the throne in the person of Edward IV., except such of the territories of the family in Connaught as were usurped by some of the younger branches.

Of this troubled period there are several memorials, in the ruined castles and monastic buildings which exist. Roscommon Castle, and Roscommon, Boyle, and Clonshanvill abbeys, the last near French-park, have been noticed. Between Roscommon and Castlerea are the ruins of Ballintobber Castle, the antient stronghold of the O'Connor Dhunne or Don. The walls enclose a quadrangle 270 feet by 237 feet, and are strengthened by polygonal towers resembling those of Caernarvon Castle. The walls and the towers are tolerably complete externally; but the towers are little more than shells. There are the walls of the church and of some of the dependant buildings of Tulsk Abbey standing. There was formerly a strong castle at Tulsk, and there was one at Ballynafad near Strokestown, of which the ruins are still visible: it was the stronghold of O'Connor Ruadh. A very remarkable ruined fort of unknown antiquity is to be seen near Lough Glynn. The keep of Athlone Castle, which is

yet standing, is a decagon, and is in the Roscommon part of the town. There are several remains of small castles, especially of one on Castle Island in Lough Key, but none of them deserving particular description. There are considerable ruins of Coote Hall, a fortified mansion of the middle ages, between Lough Key and the Shannon.

In the reign of Elizabeth, Connaught was formed into counties, and the county of Roscommon divided into baronies. This measure is ascribed by some to the earl of Sussex lord-lieutenant (A.D. 1562-64); by others to his successor, Sir Henry Sidney, lord deputy (A.D. 1665-67); while Mr. Weld (*Statistical Survey of the County of Roscommon*) ascribes it to Sir John Perrot, lord deputy, whose administration was considerably later (A.D. 1584-88).

In the rebellion in Elizabeth's reign, the O'Conors remained faithful to the English. Boyle Abbey was besieged by the Ulster insurgents in the war of 1641. The county fell into their hands, and the O'Connor Dhunne now took part with them: some severe encounters took place, especially in 1642, when Callaugh O'Connor was defeated by the English. The insurgents long retained possession of the county, but on the termination of the war their chiefs were deprived of their estates, which were confiscated, and divided among English and Scotch adventurers. At the Restoration O'Connor Dhunne or Don obtained the greater part of his property again, and his descendants are among the few native Irish families who have retained their lands. In the war of the Revolution, the principal events connected with this county were the first ineffectual siege of Athlone by a body of William's army, under General Douglas (A.D. 1690), and the subsequent siege and capture of that city (A.D. 1691) by the main body of William's troops, then under General Ginkell. [ATHLONE.] This was followed by the decisive battle of Aghrim [AGHRIM], fought in the adjacent county of Galway. Roscommon gives the title of earl to the noble family of Dillon.

(Weld's *Statistical Survey of Roscommon*; Ware's, Cox's, Gordon's, and Moore's *Hist. of Ireland*; *Parliamentary Papers*; Lewis's *Topographical Dictionary of Ireland*.)

ROSCOMMON, WENTWORTH DILLON, EARL OF, was born in Ireland about 1633. He was the son of James Dillon, third earl of Roscommon, and Elizabeth Wentworth, sister to the earl of Strafford, who was godfather to his nephew, and gave him his own family name. Upon the breaking out of disturbances in Ireland, Strafford sent for him, and placed him at his own seat in Yorkshire, where he had him instructed in Latin, which Dillon is said to have learned so as to write it with purity and elegance, though he was never able to retain the rules of grammar. When the storm had overtaken Strafford, Dillon was sent to Caen, where he prosecuted his studies under Bochart. He afterwards travelled into Italy, where he examined with care the most valuable remains of classical antiquity, and he acquired uncommon skill in the knowledge of medals. He returned to England at the Restoration, and was made captain of the band of pensioners, a preferment which led him into the habit of gaming and the loss of much of his fortune. He was subsequently appointed master of the horse to the duchess of York, and he married the Lady Frances, daughter of the earl of Burlington, and widow of Colonel Courtney.

Wood says of Roscommon that he 'was educated from his youth in all kind of polite learning,' and that he 'was accounted most excellent in the art of poetry.' He was nominated at Oxford to be created LL.D., May 23rd, 1683, but did not appear at the time appointed. Whether he had previously been connected with the University is uncertain. He formed the intention of escaping apprehended evils at home by retiring to Rome, but he was delayed by the gout, which, through improper medical treatment, occasioned his death. At the moment in which he expired, he uttered, with an energy of voice that expressed the most fervent devotion, two lines of his own version of 'Dies Iræ':

'My God, my Father, and my Friend,  
Do not forsake me in my end.'

He died in 1684, and was buried with great pomp in Westminster Abbey.

Roscommon wrote the following works: 1, 'An Essay on translated Verse,' London, 1680, 4to.; 2, 'Prologues and Epilogues to Plays,' &c., collected 1684, 8vo.; 3, Horace's 'Art of Poetry,' translated into English blank verse, 1680, 4to.; 4, 'Dr. Wm. Sherlock's case of Resistance of Supreme Powers,' translated into French, 8vo. A short time before his death, Roscommon, among other literary projects, formed

the plan of a society for refining the English language and fixing its standard, and he is said to have been assisted in the design by John Dryden; but no particulars upon this subject are recorded.

(Wood's *Poeti Oxonienses*; Johnson's *Lives of the Poets*; Walpole's *Royal and Noble Authors*, Park's edition.)

ROSE. [ROSA.]

ROSE-COLOURED OUZEL. [STURNIDÆ.]

ROSE-ENGINE TURNING. [TURNING.]

ROSEMARY. [ROSMARINUS.]

ROSEN, FREDERIC AUGUSTUS, was born on the 2nd of September, 1805, at Hanover, and died in London on the 12th of September, 1837. He received his earliest education from his father, who still lives at Detmold in Westphalia, where he holds a high official situation in the government of the prince of Lippe Detmold. He afterwards went to the gymnasium at Göttingen. In the year 1822 Rosen went to the university of Leipzig, and two years afterwards to Berlin. The energy with which he applied himself to all branches of science and literature, and his great powers for acquiring knowledge, encouraged his friends to form the highest expectations of his future career. At an early period he had become distinguished for his classical attainments and his knowledge of the Semitic languages; but it was not until the year 1824 that he turned his attention to the Sanscrit, a language which at that time was almost unknown in Germany, although its importance in all questions connected with the early history of civilization had been pointed out by the two Schlogels, Creuzer, and William von Humboldt. During a short visit which he paid to his family, he made himself acquainted, with his father's assistance, with the antient language of the Brahmans, in which he received further instruction at Berlin from Professor Bopp, who had just returned from London, and been appointed professor of Sanscrit at the university of Berlin. William von Humboldt, who devoted his time to the same pursuits, also encouraged him to proceed in his Sanscrit studies. The total want of all useful aids towards obtaining a knowledge of this difficult language, suggested to Rosen the idea of supplying the deficiency, which his acquisitions rendered him well able to do. Accordingly, in 1826, when he took his degree of doctor of philosophy, he published his *Corporis Radicum Sanscritarum Prologus*, which was only the forerunner of his larger work *Radices Sanscritæ*, Berlin, 1827. This work, which abounds in learning and sound criticism, has contributed more than any other to recommend and facilitate the study of the Sanscrit language in Germany. It is now out of print, and the author had prepared a second edition, in which he had remodelled his original plan, in order to adapt his work to the then advanced state of Sanscrit literature. Rosen also had applied himself, with the greatest success, to the study of Arabic and Persian; and he had prepared for publication several large episodes of the *Shâh Nâhmah*, the great epic poem of the Persians. This intense application to the literature and the languages of the East gave birth to a strong desire to visit Asia. A favourable opportunity presented itself, and he was appointed attaché to the Prussian embassy at Constantinople. Shortly before he started however he received a flattering invitation to become Professor of Oriental Languages in the University of London (now University College) then just established. He accepted the offer, hoping to find in this country a wide field for his literary labours. Before going to London, he visited Paris, in order to become acquainted with De Sacy, Remusat, and De Chézy; and after a short stay in that city he came to London. But his expectations of honour and profit were greatly disappointed; for though he had a few pupils in Sanscrit, Arabic, and Persian, it soon became evident that a teacher of the Hindustani language was more wanted at the London University than a professor of Oriental languages as the term is understood in Germany. His energy did not however fail him; and seeing that he could be useful in a secondary capacity, he applied himself for several months with great industry to the Hindustani, in order that he might qualify himself to teach the language. Some years afterwards he resigned his professorship of Oriental languages; but subsequently accepted the Sanscrit professorship in University College. The high opinion which the College entertained of his services may be collected from the Annual Report of the College for the year 1837-38, which was made after his death.

He derived more satisfaction from his occupation as ho-

norary foreign secretary of the Royal Asiatic Society, as secretary to the Oriental Translation Committee just established. This brought him into communication with that great Oriental scholar Colebrooke, for whom he entertained the highest admiration. By Colebrooke's suggestion he published, under the sanction of the Translation Committee, the Arabic text of the *Algebra of Mohammed Musa*, with an English translation, accompanied by excellent notes [MUSA]; he also prepared for publication a great *Biographical Dictionary* of Ibn Khallikan, as well as another work, in which he intended to give a comprehensive view of the system of Indian jurisprudence, which was never completed.

Amidst these various occupations he had not time to concentrate all his attainments. Having discovered the character of the Indian literature and language, he only be completely understood by tracing them back to the earliest periods to which the *Vedas* belong, he determined to remove the obscurity by which they are surrounded. In 1830 he published his *Rig Vedæ Specimen*, London, and from that time his principal attention was directed to this great object. In order to understand the obsolete language of these antient writings, he had to consult the oldest of the grammatical works of the Hindus. To do this, he applied himself to the Commentaries, of which he had a full knowledge of which the texts are quite unintelligible. All this was done under very disadvantageous circumstances, and it is a matter of great regret that he was not in a situation which would have made other labours necessary.

Among his various literary labours at this period was the revision of the *Dictionary, Bengali, Sanscrit, and English*, published by Sir Graves Houghton, London, 1831. He also made the *Catalogus Codicum Manuscriptorum et Carshunicorum in Museo Britannico*, which has been published, since his death, under the care of Mr. Forshall, who in his address to the reader has attributed to Dr. Rosen all the merit of this catalogue. Unfortunately Dr. Rosen's name does not appear on the title-page of this catalogue, nor after the preface which he wrote, and which is printed at the head of the catalogue. To qualify himself for this labour, Rosen made himself master of the Syriac language, with which he was imperfectly acquainted. At Colebrooke's request he took the collection of his *Miscellaneous Essays*, to which he added an excellent index, 2 vols., London, 1827. He wrote all the articles relating to Oriental literature in the *Encyclopædia*, from the article *Abbasides*, to the article *Eastern Language*, both included, together with several articles in *Eastern Geography*, such as *Arabia* and *Armenia*. He revised the work on the Hindus, which was published in the *Library of Entertaining Knowledge*; the chapters on Hindu literature is entirely by his hand. For the *Journal of Education* he wrote a review of Bopp's *Vergleichende Grammatik*, &c. (vol. viii.), and two reviews of *Etymologische Forschungen* (vols. 9, 10). He maintained a constant correspondence with almost all the distinguished scholars on the Continent, and for the last ten years of his life no important publication connected with Eastern history or geography was projected on the Continent to which he did not contribute either by his advice or by the supply of materials. His worth was fully appreciated on the Continent, and a desire was often expressed that he should return to his native country; but being anxious to accomplish his design of publishing the *Vedas*, and considering that he was placed in a wider sphere of utility in England, he preferred remaining in London, where he found the most valuable treasures of Oriental literature.

In the year 1836 he began to print the collection of hymns of the *Rig Veda*, giving the Sanscrit text, an English translation, and explanatory notes. In the autumn of 1836 he had advanced so far that he intended to publish a second volume, when his sudden death, in the prime of life and in the full vigour of his intellectual powers, interrupted the undertaking for which no man in Europe was so well qualified or prepared as himself. The Translation Committee published the book after his death, as far as it was completed, under the title *Rig Veda Sanluta Liber Primus Sanscritæ et Latine*, London, 1838, 4to. Those who hereafter profit by the study of this work, should be at what price it has been obtained: it is only a fragment, but it contains the energy of a whole life. Rosen's

mous papers and collections have been confided for publication to the able hands of Professor Lassen of Bonn.

Although Rosen had acquired so honourable a rank as an Oriental scholar, his position in society was no less distinguished. The highest admiration for his talents and attainments was accompanied with universal respect for his virtues. The simplicity of his pure and elevated mind, the gentleness of his manners, and, above all, the genuine kindness of heart which formed the striking feature of his character, secured for him, in an eminent degree, the affection of all who knew him. His readiness on all occasions to aid and advise his literary friends, at any cost of labour, is well known to many who will read this notice.

The loss of such a man will always be severely felt by all, but especially by those who were intimately acquainted with him. His numerous friends, both English and Germany, have presented his father with a marble bust of his son, by Richard Westmacott, as a mark of their esteem for his character and regret for his loss, and have erected a monument to his memory in the cemetery at Kensall Green near London, where he is interred.

ROSENMÜLLER, JOHN GEORGE, was appointed Professor of Divinity in the University of Leipzig, and superintendent in the Lutheran church at the same place in 1785, and died in 1815. His chief works are: 1, 'Historia Interpretationis Librorum Sanctorum in Ecclesia Christiana, ab Apostolorum Aetate ad Literarum Instaurationem,' 3 parts, 8vo., 1795-1814; and 2, 'Scholia in Novum Testamentum,' 5 vols. 8vo. The latter is a useful work, especially for young students, but the author cannot be placed in the first rank of commentators. His labours were more directed to the explanation of particular words and phrases than to the general comprehension of the sacred writings. He seldom gives a satisfactory solution of any formidable difficulty.

ROSENMÜLLER, ERNEST FREDERIC CHARLES, son of the preceding, was born in 1768, and died on the 17th of September, 1835, after having for many years held the office of professor of oriental languages in the University of Leipzig. His chief works are: 1, 'Scholia in Vetus Testamentum,' 23 vols. 8vo., which is a philological and exegetical commentary on the Pentateuch, Isaiah, the Psalms, Job, Ezekiel, the minor prophets, Jeremiah, the writings of Solomon, Daniel, Joshua, Judges, and Ruth. The first edition was published 1795-1826, the second 1823-31. In the second edition several Rationalistic interpretations which appeared in the first are greatly modified. Rosenmüller's profound oriental learning and untiring industry have made this work one of the very best commentaries upon the Old Testament. In some cases he leans too much to the interpretations of the Jewish Rabbis. A 'Compendium of the Scholia,' in 5 vols. 8vo., containing the Pentateuch, Isaiah, the Psalms, Job, Ezekiel, and the minor prophets, has been executed by Dr. J. C. S. Lechner, under the author's superintendence. Rosenmüller did not live to complete his larger work. 2, 'Handbuch der Biblischen Alterthumskunde,' 4 vols. 8vo., 1823-31. This work was also left incomplete at the author's death. The volumes published are, three on the geography and one on the natural history of the Bible. Translations of parts of this work are published in the 'Biblical Cabinet,' namely, 'The Geography of Central Asia,' 2 vols., and 'The Mineralogy and Botany of the Bible,' 1 vol. 3, 'Institutiones Linguae Arabicae,' the best manual of Arabic grammar, chiefly founded upon De Sacy's 'Grammaire Arabe.' 4, 'Analecta Arabica.' 5, 'Vocabularium Veteris Testamenti.' 6, 'Das Alte und das Neue Morgenland,' 6 vols. 8vo.

ROSETTA, or EL RASCHID, a town of Lower Egypt, is situated in 31° 25' N. lat. and 30° 28' E. long., on the left or west bank of one of the principal branches of the Nile, and about four miles from its mouth. It is said to have been built by the son of the celebrated Haroun-al-Raschid, about A.D. 875; but it did not become a place of any note till the decline of Damietta, owing to the increase of the bar at the mouth of the Nile, which prevents large vessels from entering the river.

Rosetta at the present day is not so large as Damietta: its population amounts to about 9000, among whom are several Greeks and Copts. The country around Rosetta is a complete garden, but the town itself does not deserve the praises which have been bestowed upon it by some travellers. It contains several large mosques; the streets, which are exceedingly narrow, not more than two yards

wide, lie parallel to each other in a line with the river, and are irregularly intersected by others which are shorter. Between the houses and the Nile there is a wide space, which is the promenade of Rosetta. The houses, which are built of a dingy red brick, are two or three stories high; the bazaars are narrow, dirty, and dark. Rosetta carries on a considerable trade both with Europe and the Levant; but the passage of the bar at the mouth of the Nile is always attended with some danger, as the sands are constantly shifting, and the surf is high.

ROSETTA STONE is the name given to a stone in the British Museum, which was originally found by the French among the ruins of Fort St. Julien, which is near the Rosetta mouth of the Nile. It was delivered up to the British on the capitulation of Alexandria, and was brought to England in the year 1802. This stone, which is a piece of black basalt, contains parts of three distinct inscriptions: the highest on the stone is in what we generally call hieroglyphics; the second is in that character commonly called the 'enchorial,' or 'the characters of the country;' and the third, which is in Greek, declares, at the end, that the decree which this stone contains was cut in three different characters, the 'sacred characters,' 'those of the country' or the 'enchorial,' and the 'Greek.' In its present state the stone is much mutilated, chiefly at the top and at the right side. Its greatest length, in its present condition, is about three feet, measured on the flat surface which contains the writing; its breadth, which in some parts is entire, is about two feet five inches. A large part of the hieroglyphic inscription is broken off, but it probably contained in its entire state about twenty or at the utmost twenty-one lines; the enchorial or second inscription consists of thirty-two lines, but the beginning of the first fifteen lines are wanting, and the Greek text contained, when entire, fifty-four lines, but the end of it is at present mutilated. We learn from the Greek text that the Rosetta stone was erected in the reign of Ptolemy V., Epiphanes, and probably about B.C. 193. Epiphanes succeeded to the throne on the death of his father Philopator, B.C. 205, when he was a child only four or five years old. In this monument the acts done during the prince's minority are attributed to him, and he is commended for his piety, his liberality to the temples, his remission of the arrears of taxes and diminution of the imposts, his victories over the rebels, and his protection of the lands by dams against the inundations of the Nile.

The discovery of this stone with the triple inscription upon it excited hopes that we should be able by means of it to decipher the numerous monuments of ancient Egypt. Dr. Young, in the article 'Egypt,' in the supplement to the 'Encyclopædia Britannica,' was the first who deciphered several proper names in the enchorial and hieroglyphic inscriptions, and he was followed in his investigations by Champollion. This triple inscription however is not of so much value as it appears at first sight, since it is almost certain that the enchorial text is not faithfully represented by the Greek. It is, on the contrary, more probable that the Greek is not a translation either of the hieroglyphic or enchorial text, but expresses only generally the same substantial meaning.

The preceding account has been taken from the 'Egyptian Antiquities' of the British Museum, in the *Library of Entertaining Knowledge*, vol. ii., chap. 10, in which the whole subject is fully investigated. Compare also the articles CHAMPOLLION and HIEROGLYPHICS in this work.

ROSHEIM. [RHIN, BAS.]

ROSIKRUCIANS is the name of a secret society whose existence became first known to the public in the 17th century, by means of several publications which have been attributed to John Valentine Andreæ, a German scholar, born at Herrenberg, in the duchy of Würtemberg, in 1586, who, after studying at Tübingen, became a minister of the Lutheran church, and in course of time was made almoner of the duke of Würtemberg and abbot of Adelberg. Andreæ died in 1654. He was a man of a mystical turn of mind, who had conceived the idea of effecting a general reform of mankind. He wrote many works, chiefly on mystic subjects. It is doubtful however whether those particular works which would establish his connection with the Rosicrucian Society are really his. The following are the titles of three of these works:—1, 'Elucidarius Major, ueber die Reformation der ganzen weiten Welt, F. C. R. auss ihren chymischen Hochzeit,' 1617, in which there is a mixture of precepts of alchemy with maxims of ethics. 2, 'Fama Fraternitatis des löblichen Ordens des

Rosenkreuzes,' Frankfurt, 1617, in which there is a story of a certain Christian Rosenkreuz, a German noble of the fourteenth century, who, after travelling long in the East, returned to Germany; and there established a fraternity, or secret society, of a few adepts, under certain regulations, living together in a building which he raised under the name of Sancti Spiritus, where he died, at 106 years of age. The place of his burial was kept a profound secret by the adepts, and the Society renewed itself by the admission of successive new members in silence and obscurity, according to the last injunction of its founder, who directed the following inscription to be placed on a door of Sancti Spiritus:—' Post CXX. annos patebo.' 3, ' Confessio Fraternitatis Roseæ Crucis ad Eruditos Europæ,' which is appended to the preceding, and in which it is stated that the Order does not interfere with the religion or polity of states, but only seeks for the true philosophy; that many absurd fables have been told of the fraternity, either by its enemies or by fantastic people. It states also that once a year the members are to meet at appointed places to converse together upon secret matters, and that new members are to be admitted to supply the place of those who are deceased, and to work for the common purpose of the Order, giving no clue however for discovering what that purpose was. In fact the secret, if secret there was, has been effectually kept to the present day. This appearance of mysteriousness has given rise to various surmises. Some have ascribed to the Rosicrucians the same hostile plans against all established churches and monarchies which have been also attributed to the Illuminati, Freemasons, Carbonari, and other secret societies. (Barruel, *Mémoires pour servir à l'Histoire du Jacobinisme*.) Others say that the order of Rosicrucians is identical with that of Freemasons, one of whose degrees or dignities is called in some countries the degree of the Red Cross. The Rosicrucians have not been heard of as a separate order for nearly a century past, but some have thought that they continued to exist under the name of the Illuminati, who were much talked of in Germany and France in the latter part of the eighteenth century. Barruel, after describing the ceremonies with which candidates were admitted to the degree of Red Cross in some Freemasons' lodges, which however, he says, vary in different countries, observes that these ceremonies, which were apparently allusive to the Passion of Jesus Christ, were differently interpreted, according to the dispositions of the candidates; that some saw in it a memento of the Passion, others an introduction to the arcana of alchemy and magic, and others at last a blasphemous invective against the founder of Christianity, which the Rosicrucians had derived from the Templars of old. This assertion however has been contradicted by others. The reader who wishes to investigate this obscure subject may consult F. Nicolai, 'On the Crimes ascribed to the Templars;' Chr. Murr, 'On the True Origin of the Rosicrucians,' 1803; and J. G. Buhle,

Ueber den Ursprung und die vornehmsten Schicksale der Orden der Rosenkreuzer und Freymaurer, Göttingen, 1804. Buhle seems to think that the Rosicrucians are but a branch or affiliation of the Freemasons. The impostor Cagliostro pretended that he was a Rosicrucian. [CAGLIOSTRO.]

#### ROSIN. [TURPENTINE.]

ROSMARINUS, a genus of plants belonging to the natural order Lamiaceæ. It is one of the genera belonging to this order that are perennial and possess the character of shrubs. It is known by the following characters:—calyx ovate, campanulate, with two lips, the upper of which is entire, and the lower two-parted; corolla not ringed in the inside, the throat slightly inflated with two lips, equal, the upper one emarginate, the lower two-parted, the middle lobe very large and hanging down; stamens two; filaments slightly toothed at the base; style with the upper lobe very short.

*Rosmarinus officinalis*, the common Rosemary, is an inhabitant of the southern parts of France, Spain, and Italy, the basin of the Mediterranean, and some parts of Asia Minor. It is a very leafy shrub, growing to the height of three or four feet; the leaves are sessile, linear, quite entire, revolute at the edge, and covered with white hairs beneath; the flowers are few, and in abort axillary racemes; the corolla has a dull leaden blue or white colour, with the tube protruding a little beyond the calyx, the flower-leaves or bracts are shorter than the calyx. The cultivated and garden plants differ very much in the shape and number of their leaves, on which account Miller described them as two

species, the *R. angustifolia* and the *R. latifolia*. The size of the leaves varies according to the soil and situation in which the plant grows. It is generally observed that the broader and longer the leaves, the more vigorous is the plant. The rosemary is a very desirable plant for the garden, both on account of its evergreen character and its flowers, which appear from January to April. There are three varieties known in gardens, the green or common, the gold-striped, and the silver-striped, which are distinguished principally by the colour of their leaves. The green variety is the hardiest, and is most generally used. It may be propagated by seeds, or slips or cuttings of the young shoots. The striped varieties may be best propagated by layers of the young wood. They should be planted in a warm situation, as they are much more tender than the green. They are only cultivated as ornamental plants on account of their variegated leaves. The rosemary abounds in the district of Narbonne in France, where it is used to form hedges for gardens, &c. It is supposed to be the aroma of this plant gathered by the bees that gives to the honey of this district its peculiarly fine flavour.

Rosemary was formerly held in high estimation, especially on the Continent. In the songs of the troubadours it is frequently mentioned as an emblem of constancy and devotion to the fair sex. It was thought to be a comforter of the brain, and a strengthener of the memory; and on the latter account used as a sign of fidelity amongst lovers. Shakspeare makes Ophelia say,—

' There's rosemary for you; that's for remembrance.'

In some parts of Germany rosemary is grown in large quantities in pots for the purpose of selling small sprigs of it when in blossom, in winter and early spring, for various religious purposes.

ROSMARINUS OFFICINALIS, Rosemary, called also Anthos, a term which is apt to lead to the confounding of Rosemary with the *Ledum palustre* or wild marsh-rosemary, which has very different and even dangerous properties. Genuine Rosemary is a shrub, a native of the south of Europe, Asia Minor, and China. The officinal part is the tops or upper part of the twigs. The leaves are about an inch long, linear, slightly revolute at the margins, dark green and reticulate on the upper surface, hoary and white on the under. The leaves and calyxes of the flowers have a strong, penetrating, aromatic odour, which is rendered stronger by bruising them; and a bitter, burning, camphor-like taste. They owe this to the presence of tannic acid, bitter matter, perhaps resin, and especially to a volatile oil, of which one drachm may, by distillation, be obtained from one pound of the leaves.

Oil of Rosemary (*Oleum Rosmarini*, or *Ol. Anthos*) is chiefly prepared in Spain and the south of France, by distillation of the leaves and flowers. At first it is nearly transparent and very limpid, but by time it becomes both yellowish and thicker. It possesses the strong penetrating odour of rosemary, with a camphor-like intermixture, and a burning taste. It has an acid re-action. The specific gravity varies with the purity and age of the specimen; it is commonly 0.91, but by rectification with alcohol it is brought to 0.89 or 0.85. It mixes with alcohol of 83 in every proportion. By evaporation or by shaking with potash it deposits a stearopten, or rosemary-camphor. Hydrochloric acid gas blackens it, but does not form an artificial camphor. With iodine it partially explodes.

The oil of rosemary of commerce is an artificial preparation of oil of turpentine distilled with rosemary; it is adulterated with spike oil, obtained from the *Lavandula Spica*. This may always be distinguished from the genuine by not reddening litmus-paper.

Rosemary possesses valuable stimulant and carminative properties; but it is chiefly employed as a perfume, entering into the composition of the Queen of Hungary's Water, Eau de Cologne, and aromatic vinegar. It is also used to promote the growth of hair and prevent baldness.

ROSS and CROMARTY SHIRES, two Scotch counties, intimately connected both locally and otherwise. Ross comprehends a considerable area on the mainland of Scotland, together with the large island of Lewis, one of the Hebrides; and Cromarty is composed of a number of detached portions, either interspersed among the inland parts of Ross or lying along its border. The mainland part of the two counties approximates in figure to a triangle, having its vertex (Tarbet Ness) towards the east, and extending the north, extending from Tarbet Ness to Lar

**Enard**, 59 miles in a direct line between its extremities; another side, fronting the south-east, extending from **Tarbet Ness** to the narrow strait which separates **Skye** from the mainland, 83 miles; and the base or third side, fronting the west, 62 or 63 miles. The northern side is for the most part conterminous with **Sutherlandshire**, the south-eastern side with **Inverness-shire**; but towards **Tarbet Ness**, **Ross** and **Cromarty shires** are separated from **Sutherlandshire** by **Dornoch Frith**; and from **Inverness-shire**, and also from **Nairn** and **Elgin shires**, by the **Moray** or **Murray Frith**. The **Frith of Cromarty**, between these two, penetrates 10 miles inland, forming a long narrow inlet, little more than two miles wide in the broadest part, and communicating with the open sea by a passage of scarcely more than half a mile. The third side is formed by the coast of the Atlantic, and is characterized by bold headlands separated from each other by deep but generally narrow inlets or lochs. There are several small islands, the **Summer Islands**, **Martin**, **Eilan-Clearach**, **Longa**, the **Croulin Islands**, &c., off this coast. The island of **Lewis** is to the north-west of the mainland part of the county: the distance between the nearest point of the island and the nearest point of the mainland, across the **Minch**, or intervening channel, is about 25 miles. **Lewis** is not, strictly speaking, an island of itself; it forms the northern and by far the larger portion of the principal island of the **Hebrides**, sometimes, though rarely, called the **Long Island**; the southern portion, called **Harris**, belongs to **Inverness-shire**. **Lewis** is 39 miles long from north to south, from the northern promontory, called the **Butt of the Lewis**, to the border of **Harris**, and 31 miles broad from east to west: its coast-line is as irregular as that of the mainland. The islands of **Bernera** and **Scarpa** lie close to **Lewis** on the western side. The **Shiant Isles** are a group of small islands or rocks between **Lewis** and the main, but much nearer **Lewis**.

The area of the two counties is given by **Dr. Playfair** (*Description of Scotland*) thus:—**Ross-shire**, 2070 square miles, or 1,324,800 acres; **Cromartyshire**, 105 square miles, or 67,200 acres; **Lewis** (including the fresh-water lakes), 557 square miles, or 356,480 acres: total, 2732 square miles, or 1,748,480 acres. **Mr. MacCulloch's** estimate (*Statistical Account of the British Empire*) is as follows:—**Ross-shire**, 2069 square miles, or 1,324,160 acres of land; 60 square miles, or 38,400 acres of lakes: together, 2129 square miles, or 1,362,560 acres. **Cromartyshire**, 256 square miles, or 163,840 acres of land; 10 square miles, or 6400 acres of water: together, 266 square miles, or 170,240 acres. The isles belonging to **Ross** and **Cromarty**:—560 square miles, or 358,400 acres of land; 20 square miles, or 12,800 acres of lakes: together, 580 square miles, or 371,200 acres. The total is 2885 square miles, or 1,846,400 acres of land; 90 square miles, or 57,600 acres of lakes: together, 2975 square miles, or 1,904,000 acres. The population, in 1821, was 68,828; in 1831 it was 74,820, showing an increase in ten years of 9 per cent., and giving, on **Mr. MacCulloch's** statement of the area of the land (viz. 2885 square miles), nearly 26 inhabitants to a square mile. The shires taken together exceed in area all the counties of Scotland except **Inverness** and **Argyleshire**: in amount of population they are ninth in order, standing next below **Inverness**, and next above **Dumfries**; in density of population they are exceeded by all the counties of Scotland, except **Inverness** and **Sutherland**. **Tain**, the county town of **Ross**, is near the southern shore of **Dornoch Frith**, in 57° 48' N. lat. and 4° 3' W. long., 134 miles in a direct line north by west of **Edinburgh**, or 201 miles by the road by **Queensferry**, **Kintross**, **Perth**, **Dunkeld**, **Muir-Atbol**, the valleys of the **Garry** and the **Spey**, to **Inverness**, and from thence by **Beauley**, **Dingwall**, and **Invergordon**.

The district of **Ferrintosh**, which is a portion of **Nairnshire**, is included in the boundaries we have given, but not in the statements of area and population.

**Surface; Coast-line; Islands.**—A general description of this district is given elsewhere [*GREAT BRITAIN*, vol. xi, p. 402, col. 2], where it is described as 'the country south of a line joining **Loch Broom** and the **Frith of Dornoch**.' It is sufficient here to notice that, excepting the two peninsulas formed by the three friths **Dornoch**, **Cromarty**, and **Moray**, and the parts immediately adjacent to them, it consists of mountains irregularly grouped, with deep intervening gorges or ravines. **Ben Wyvis** is 3720 feet above the level of the sea; **Kea Cloch**, near **Little Loch Broom**, 3600 feet; **Ben Dorag**, one of the **Ben More** hills, near the head of

**Loch Broom**, 3551 feet; **Ben Lair**, near **Loch Maree**, 3000 feet; **Ben Attow**, on the border of **Ross-shire** and **Inverness-shire**, is said to be nearly 4000 feet.

The three friths just mentioned are three branches of that great bay which penetrates Scotland from the north east, between **Duncansby Head**, the north-east point of Scotland, and **Kinnaird's Head** in **Aberdeenshire**. **Dornoch Frith**, the most northern of the three, extends about 24 or 25 miles inland to **Bonar Bridge**, on the road from **Inverness** to **Wiek** and **Thurso**. It is about 10 miles across at its entrance between **Tarbet Ness** and **Brora**. **Moray Frith** extends about as far inland as **Dornoch Frith**, but is 14 miles across at its entrance between **Tarbet Ness** and **Burg Head**. **Cromarty Frith** is an inlet of **Moray Frith**. **Loch Beauley** is an extension of **Moray Frith** inland: we know not exactly where the line separating the loch from the frith is drawn, but there is a sheet of water extending 16 or 17 miles inland from **Fort George**, where **Moray Frith** is contracted to a narrow strait, and three or four miles broad at the widest part. There are cliffs on each side of the entrance of **Cromarty Frith**, and again at **Tarbet Ness** and some miles south of it.

The principal inlets on the western or Atlantic coast are **Loch Enard**, at the north-west extremity of the two counties; **Loch Broom**, **Little Loch Broom**, **Loch Greinord**, **Loch Ewe**, **Loch Gairloch**, **Loch Torridon**, **Loch Carron**, with **Loch Kishorn**, which is a branch of it; and **Loch Alsh**, with its branches, **Loch Ling** and **Loch Duish** or **Duich**. They occur in the order in which we have enumerated them from north to south. **Loch Broom** and **Loch Carron** extend about 15 miles inland, but are both narrow. **Lochs Enard**, **Greinord**, **Ewe**, **Gairloch**, and **Torridon** are not so long, but are wider. **Loch Greinord** is about four miles across at the mouth. There are cliffs on the shore of **Loch Enard** and at the headland of **Ru-mone** or **Ru-more**, at its western side, and on part of the shores of **Loch Broom** and **Loch Carron**. The islands along this coast are small. The western coast of **Cromarty** and **Ross** is described at considerable length in the second volume of **MacCulloch's** '**Highlands and Western Isles**.'

The principal inlets on the coast of **Lewis** are **Loch Carlowa**, **Loch Bernera**, **Loch Roig**, **Uig Bay**, and **Loch Resort**, on the west side, occurring in the order in which we have enumerated them from north to south; and **Loch Tua**, **Loch Gremishader**, **Loch Luerbost**, **Loch Hourn**, **Loch Shell**, **Loch Brolum**, **Loch Valumis**, **Loch Clay**, and **Loch Seaforth**, occurring in the same order, on the eastern side. The three lochs **Carlowa**, **Bernera**, and **Roig** are three branches of one great inlet, about nine miles across at the entrance, and extending about nine miles inland: in the middle of it is the island of **Bernera**, five miles long from east to west and three miles wide, and a number of smaller islands. The boundary between **Lewis** and **Harris** is drawn across the island from the head of **Loch Resort** to the shore of **Loch Seaforth**, but not at the head of the loch. There are cliffs at the northern extremity, and on a great part of the eastern and some part of the western coast of **Lewis**. It will be observed that these 'lochs' are not, as the name would seem to imply, lakes, but inlets of the sea. The headlands of **Lewis** are the **Butt of Lewis** at the northern extremity; **Tolsta Head**, near it; and **Tiompan Head**, at the extremity of the peninsula which forms the southern and eastern sides of **Loch Tua**, on the eastern side of the island; and **Gallan Head**, at the south side of the entrance to **Loch Roig**, on the western side. **Lewis** is as mountainous as the mainland, though the peaks are not so lofty: the mountains form a range extending north and south, with lateral branches. The **Barvas Hills**, near the centre of the island, are 780 feet high; and **Suaneval**, on the western side, between **Loch Roig** and **Loch Resort**, 2760 feet.

**Hydrography and Communications.**—The two counties have no very large rivers. The **Oikel** rises at the foot of **Ben Mohr** in **Sutherlandshire**, just on the border of **Ross-shire**, and flows for twenty-six miles along the border of the two counties till it unites with a stream from **Loch Shin** in **Sutherlandshire**. It then expands into a narrow lake five miles long, called the **Kyle**, which opens into **Dornoch Frith**. The **Repath Water** and **Carron Water** are one stream twenty-three or twenty-four miles long, which joins the **Kyle** at its lower end. A number of streams flowing eastward unite above **Dingwall**, just below which they fall into **Cromarty Frith**. The longest of these streams rises in the western part of the county, and has a course of forty miles to **Ding-**

wall, watering Strath Bran, and passing through several lakes, among which is Loch Luichart, nearly five miles long by one broad. Loch Fannich, eight miles long and a mile broad, is drained by another of these streams: it is near the centre of the counties. Loch Monar, five miles long by one mile broad, is drained by a stream which belongs to Inverness-shire; Loch Glass, five miles long, and many other lakes, most of them very small, are drained by streams flowing into the friths of the eastern coast. All the above-mentioned lakes have their greatest extension from east to west.

The streams on the western coast have a shorter course than those on the eastern. There are several lochs in this part. Loch Maree, the largest fresh-water lake in the counties, extending twelve miles in length, and two miles or two miles and a half across in the broadest part, is drained by the Ewe, which flows into Loch Ewe. Loch Na Shallag, three miles long; Loch Fair or Fuir, three miles long and above a mile wide; Loch Dambh or Damff, four miles long; Loch Lundie, three miles long; and Loch Clunie, partly in Inverness-shire, nearly four miles long, are drained by streams which flow into the sea on the west coast.

Lewis abounds in lakes; but they are all small, except Loch Langavat, which extends in length nearly ten miles from north to south, between Loch Seaforth and Loch Resort. The streams in Lewis have all a very short course.

The two counties have very few roads. The greater part of them, including those of chief importance, are on the east side, and lead to different places farther north. One leads near the coast from Inverness, by Fortrose, Cromarty, and Tain, to Dornoch, Wick, and Thurso, the communication being made in several places by ferries over the lochs and friths. Another road from Inverness, to Wick and Thurso runs more inland, passing round the heads of Loch Bealey and the Frith of Cromarty, and through the town of Dingwall, which is at the head of Cromarty Frith: it crosses into Sutherlandshire by Bonar Bridge, which is thrown over the Kyle at the head of Dornoch Frith. There are several roads communicating between these two. A road from Dingwall leads across the country through Strath Bran to Loch Carron, a distance of 49 miles, sending off branches on the right to Ullapool on Loch Broom, to the heads of Loch Gairloch and Loch Ewe, by the side of Loch Maree, and to Loch Torridon. The road from Inverness to the Isle of Skye, with a branch to Loch Alsh and Loch Carron, runs through Rhiabuie and Glen Shiel, in the southern parts of the county of Ross; and that from Dornoch and the east coast to Loch Assynt just passes through the northern part of the same county. The greater part if not the whole of these roads are under the direction of the commissioners of Highland roads and bridges.

*Soil; Agriculture.*—The arable land of the two counties is almost entirely confined to the eastern part, comprehending the two peninsulas, 'An Oilean Dubh,' or the Black Isle, between Loch Bealey and Cromarty Frith; and Easter Ross, between the Cromarty and Dornoch friths, together with the comparatively low and level tract immediately adjacent to these. The central and western parts are 'wild, rugged, and mountainous, interspersed with lakes and narrow glens that afford pasture for sheep and black cattle.' (MacCulloch, *Statist. Acct. of Brit. Empire.*) Since the commencement of the present century, agriculture has improved in a most extraordinary manner. 'The fields were formerly detached pieces of land, ploughed irregularly, as the ground with the least labour suited. The carts generally used were of the poorest description, with a kind of tumbler or solid wheel, and wicker conical baskets; little or no lime was used for agricultural purposes.' 'I succeeded to a farm in this country about thirty years ago (says Major Gilchrist, of Opisdale, Sutherlandshire), when the working strength consisted of sixteen oxen and twenty-four small horses called garrons; this farm is now laboured by three pair of horses.' (*Appendix to Fourteenth Report of Commissioners of Highland Roads and Bridges; Parl. Papers for 1828, vol. ix.*) The individual who introduced the ploughing of land in regular ridges, and the division of fields into anything like systematic arrangement, was living in the employ of Major Gilchrist at the period of the above Report. 'The total amount of wheat then (viz., at the commencement of the present century) raised in the county was not equal to what is now produced on many single farms. It was not until 1813 that the first barley-mill north of the

Cromarty Frith was erected, and in 1821 the first flour-mill (at Drummond, on the estate of Fowlis) by the same individual. To such an extent however has cultivation of late been carried, that the growth of wheat alone is now (viz. 1830) estimated at 20,000 quarters annually; and the exportation of grain to London, Leith, Liverpool, &c. during the last year amounted to upwards of 10,000 quarters; besides the supply of the extensive and populous pastoral districts of the county (of Ross), and the towns of Dingwall, Tain, Inverness, &c., to which places I am credibly informed upwards of 10,000 bolls of flour are now annually sent for the consumption of the inhabitants. Among other exports may be mentioned the produce of various extensive whiskey distilleries, situated in different parts of the county, and a considerable quantity of salted pork from the ports of Cromarty and Invergordon.' (*Appendix to Report, as above.*)

The soil in the peninsula of the Black Isle is various, and much of it poor. The cultivated portion consists chiefly of clayey loam, good black mould, and sandy loam. In Easter Ross there is a considerable extent of clayey loam and light sandy soil. Around Dingwall the soil is clayey. There are more than the usual number of gentlemen's seats and plantations in the cultivated part of the two counties. The usual fences are hedges and ditches, sometimes however stone fences are employed. There is some good timber in the hedgerows. Turnips are grown equal to those of more southern counties. The crops are clean, and for the most part rich. The houses of the principal farmers are neat and commodious, and the cottages of the peasantry have much improved of late years. Many of the mansion-houses are well situated, and surrounded by ornamental plantations, shrubberies, or fine timber-trees. Many of them have excellent gardens; and a spirit of horticultural improvement is very general. The gardens of the farmers, though small, are well stocked; and the cottagers are fond of having a garden, whenever they have a suitable piece of ground. Much, very much of the improvement in agriculture is to be ascribed to the improved communications formed and maintained by the government commission for Highland roads and bridges. In some parts indeed, ignorance, or prejudice, or perhaps poverty, has induced an adherence to ancient practices and a sturdy rejection of improved methods.

'A marked improvement in domestic animals of every description has taken place in the northern counties since the improved communication with the south. I need hardly allude to the introduction of the Cheviot sheep, to the progress taken in improving the breed of cattle by the importation of the most improved sorts from the West Highlands and of cows from Ayrshire. Considerable attention has been recently paid to the breed of horses, both for the purposes of agriculture and draught; and, in some instances, those of the finest description have been successfully reared. Nor has the breed of pigs been neglected; several valuable species, both pure and crosses, having been introduced.' (*Appendix to Report, as above.*) The original native breed of cattle is hardy and compact, adapted to the climate. Cattle were formerly more numerous than at present, and were much employed in agricultural labour, but this use of them is now almost entirely given up. The diminution of their number is ascribed to the greater attention paid to sheep-farming.

The western side of the county, where it has not been thrown into large sheep-farms, is occupied by a poor class of tenants. They have some arable land, in which potatoes, barley, and oats are raised; but the number of acres under cultivation is not great, nor has planting been carried to any extent. The greater part of the country is an open waste. The houses of many of the peasantry, including the small tenantry and the cottiers, are very poor; some are built of turf, others with stone, with or without mortar, and have a roof of turf with heather or fern above it. They are commonly destitute of chimneys; the fire is kindled by the wall, or a stone in the centre of the room; the smoke escapes, as it can, by roof, door, or windows, which last are closed at will with wooden shutters. The floor is made of mud or clay. In many houses the cattle dwell under the same roof, and even enter at the same door with the family, from which they are separated by a partition of boards, stones, or wattles, having a door in the middle. Some of the people are getting into the way of building separate sheds for their cattle. The food of the peasantry consists of potatoes, barleys, and oatmeal gruel. Those in better circumstances

have, in addition, butter, cheese, oatcake; and in winter and spring, have broth and mutton, in place of herrings. Peat is the common fuel, but the better class of farmers have coal. There has been much improvement in agricultural implements. Iron ploughs, drawn by two horses, and directed by the ploughman without a driver, are now in use, instead of the old plough with four horses, a ploughman, a driver, and two other persons to keep down the plough in the ground and level the rigs. The crooked spade is still used where there is but little pasture for horses or where the ground is too rough and rocky for the plough. Along the coast the peasantry are to a considerable extent engaged in the herring fishery. Smuggling and illicit distillation were at one time common, but are now given up in most places. Poaching is comparatively rare. Deer are tolerably numerous in some places, not in others; roes and hares are not numerous. The fox, badger, polecat, weasel, marten, mole, rat, and mouse are common; as are the eagle, raven, and a variety of hawks and owls. Plovers are frequently met with; grouse are perhaps diminishing. The smaller tenants usually possess a considerable extent of grazing-ground, sometimes near their arable land, sometimes remote from it; they occupy the straths or valleys.

There are stone-quarries in some parts of the two counties, but these mineral productions are comparatively unimportant. They have limestone, but no coal.

The herring fishery is carried on along the eastern and western shores; but this branch of industry has declined on the western side. The salmon fishery is carried on in the rivers and estuaries of the eastern coast.

*Divisions, Towns, &c.*—The two counties are divided into thirty-three parishes, two of which extend into the adjacent counties, viz. Urquhart, a portion of which (the district of Ferrintosh) constitutes a detached part of Nairnshire, surrounded on every side by Ross-shire; and Urray, of which a small portion is in Inverness-shire. The parishes are all large, as compared with the average extent of English parishes; but those on the eastern and more cultivated side are not by any means so large as the Highland parishes of the west, which have in some cases an extent of twenty, thirty, or even forty miles. There are four royal burghs, viz. Tain, Cromarty, Dingwall, and Fortrose, and one burgh of barony, viz. Stornoway, in the isle of Lewis.

Tain is on the shore of Dornoch Frith, in the north-east part of the county. The parish extends nine or ten miles in length from north-east to south-west, and above four miles in breadth. Tain appears to have been incorporated very early, it is said by Malcolm Canmore; but the earliest charter extant is of James VI., A.D. 1587. It was early celebrated for a chapel of St. Duthus, bishop of Ross, which had right of sanctuary. The sanctuary was violated and the chapel burnt, A.D. 1427 or 1429, by a Highland chieftain from Sutherland: the chapel was never rebuilt. The town is situated on a ridge or terrace chiefly composed of a stratum of red clay overlying the sandstone which forms the higher ground of the parish, and overlooking a low plain which extends from the foot of the terrace on which the town stands, to the present shore, a quarter of a mile distant. This low plain consists of a bed of peat, in which are observed the trunks of trees, chiefly oaks, the remains of a forest, the decay of which has formed the peat-bed; over which extends a bed of sand and shells, and over that a cultivable alluvial soil, on which the sea is gradually encroaching, and which is in some parts already converted into waste by the sea sand with which it has been overblown. One or two brooks rise near the town and flow through the plain into the sea, and on the east side of the town another stream, the 'Tain,' larger than these, flows also into the sea. Tain is ill paved, and is irregularly built, but has much improved of late years, the streets having been somewhat straightened and the more unsightly buildings removed. The houses are chiefly built of a fine white sandstone quarried in the upper part of the parish: the quarries are the common property of the burghers. There are a large substantial church, built in 1815, at the east end of the town; a handsome manse, or parsonage-house; an academy erected and endowed by subscription in 1813, one of the most tasteful edifices in the north of Scotland; a handsome town and county house; and a prison, serving for part of the county, but under the direction of the burgh magistrates.

There are the ruins of St. Duthus's or St. Duthac's chapel, on the low plain east of the town, near the little river Tain; they are composed of granite cemented with lime,

and are remarkable for the strength and simplicity of their architecture: a church dedicated to St. Duthus, and now deserted, stands in the centre of the town; it is a large Gothic building, and was erected, A.D. 1471, forty years after the destruction of the chapel. There are the ruins of an old prison tower with five spires, once the most conspicuous edifice in the town, but destroyed by fire some years ago.

The population of the parish, in 1831, was 3078, about one-sixth agricultural; a subsequent enumeration (*New Statistical Account of Scotland*, 1837) makes them amount to no more than 2915, of whom 1725 were in the town, 151 in the village of Inver, a fishing station in the eastern part of the parish, and 1039 in the country. The principal trade of the town consists in the supply of the surrounding parts of Ross, Cromarty, and Sutherland shires. There are an iron-foundry, a brewery, a saw-mill, a flour-mill, a carding-mill, and a dyeing-mill. Fishing, chiefly for haddocks and flounders, is carried on at Inver. The salmon-fishing and mussel-fishing are carried on by strangers, who purchase the right to them from the corporation. There are two weekly markets on Tuesday and Friday, and three fairs in the year, held at Lammas, Midsummer, and Michaelmas. The chief fuel is English coal and peat, which are frequently used together.

There are the parochial school, the academy, two female boarding and day schools, one of them supported by the burgh funds, two private English schools, and a private 'class' for young children of both sexes in the town, and a Gaelic Society school in or near the village of Inver, in the parish: the whole number taught in these schools, in 1837, was 302 boys and 184 girls; together 486. There is a library attached to the academy, and there is a public reading and news room. The Northern Missionary Society, which embraces in its operations the counties of Inverness, Ross, and Sutherland, has its seat at Tain; the yearly meeting of the Easter Ross Ladies' Missionary and Bible Society is also held here; and there are a society for the relief of the destitute sick, and three friendly or benefit societies. There are two coaches daily, the mail and another, to and from Inverness, and a mail-gig to Bonar Bridge.

The council of the burgh consists of a provost, two bailies, a dean of guild, a treasurer, and ten counsellors; in all, fifteen members. The burgh unites with Kirkwall, Wick, Dornoch, Dingwall, and Cromarty in returning a member to parliament.

Cromarty is on the south side of Cromarty Frith, near the entrance, on the peninsula of the Black Isle. The parish is from five to seven miles long, and from two to three broad. The eastern side of the parish is the highest, and it presents to the Moray Frith, by which it is bounded on that side, a range of lofty cliffs, in one part 300 feet high, composed of granitic gneiss, veined with white quartz rock, and lined with blocks of hornblende. Towards the centre and western parts of the parish these primitive rocks are overlaid with sandstones and other secondary formations, the latest being towards the west. East of the town is a large accumulation of peat, with trunks of trees embedded.

The name of Cromarty occurs early: Macbeth was thane of it. The town was peopled by lowlanders, who, from their advanced position, were exposed to frequent hostilities from the neighbouring highland clans, by a combination of which, early in the reign of James IV., it was plundered. It is likely that the admirable position of the town near the entrance of the Frith, which forms a secure and land-locked harbour, had caused it to be selected as a place of settlement by lowland merchants, and that the townsmen had early carried on trade with Flanders and France. After the union of the crowns it declined, but revived after the Revolution by means of the herring fishery. It appears to have again suffered after the Union, but since this depression has again revived.

The town stands on a low alluvial tongue of land jutting out into the Frith. 'It is irregularly built, exhibiting in its more ancient streets and lanes that homely Flemish style of architecture characteristic of all our older towns of the north.' (*New Statistical Account*.) There are a plain church, a Gaelic chapel, and a town-house; the last a substantial building with a hall in the upper story and a prison in the lower, and surmounted by a dome or clock-tower. The harbour, formed by a pier, is near the extremity of the point on which the town stands. Vessels of 400 tons can come up to the quay.

The population, in 1831, was 2901, about one-fourth agricultural: the population of the town itself was 2215, that of the country part of the parish 686. There are a hempen-cloth manufactory which employs in all six hundred persons, two hundred of them in the factory itself, and a brewery. A considerable trade is carried on with England in salt provisions; and in 1831, about fifty men were engaged in the herring or white fishery. There are a branch bank and a post-office. Communication is maintained by an omnibus with Inverness, and by steam-boats with Leith and London. Some ship-building is carried on. There are a market on Friday and one yearly fair.

Cromarty was antiently a royal burgh, but was disfranchised at the request of the burghers, A.D. 1672, and was accounted only a burgh of barony. Its privileges as a royal burgh have been restored by the Scotch Burgh Reform Act, but the magistrates can effect little from the want of funds; the antient property of the burgh having been alienated before its disfranchisement. It unites with Kirkwall, Wick, Dornoch, Tain, and Dingwall to return a member to parliament.

Dingwall is at the south-western extremity of Cromarty Frith, 23 miles from Inverness by a circuitous road, and 178 miles (according to Chambers's *Gazetteer of Scotland*) from Edinburgh. The parish comprehends an area of above ten square miles, three-fifths of it moorland or upland pasture, and the remainder cultivated. Dingwall was probably a Danish settlement: it was erected into a royal burgh by Alexander II., A.D. 1227, and, by pavements and other traces of buildings which have been found, appears to have been more extensive than it is now. It was the principal residence of the powerful earls of Ross, and appears to have declined after the extinction of that earldom. Some traces of the antient castle of these earls, comprehending the earthworks and a small portion of the massive walls, may be seen on the north-east side of the town. In the early part of the last century Dingwall was in a deplorable condition from poverty and neglect, and the public tranquillity was repeatedly broken by the frays of hostile clans. Subsequently to the suppression of the rebellion of 1745 great improvements took place, and the town has especially improved of late years. It consists at present of one main street running east and west, and one or two smaller ones branching from it; the streets are paved, but either not lighted or very imperfectly so; and the police is too imperfect to enforce cleanliness, so that even in the main street dunghills are sometimes seen in the front of the houses. Cleanliness is however gaining ground, and there are some good houses and shops. The kirk is a neat and commodious building, just out of the town: near it is a pyramidal obelisk fifty-seven feet high and six feet square at the base, erected on a large artificial mound, by a former earl of Cromarty, to mark out the burial-place of himself and his family: the town-house, a curious old building with spire and clock, is near the centre of the town; and there is a small and wretched gaol and an episcopal chapel.

The population of the parish, in 1831, was 2139: about one-fifth agricultural. There are good roads, and a short canal from the frith enables vessels with coals and other merchandise to come quite up to the town. There is a coach communication daily with Inverness, and steam-boats weekly from Edinburgh, and every second week from London, touch at Invergordon, distant fourteen miles. There are a weekly market (on Friday) and three yearly fairs.

The burgh council consists of fifteen members, including a provost, two bailies, a dean of guild, and a treasurer; the burgh unites with Kirkwall, Wick, Dornoch, Tain, and Cromarty in returning a member to parliament.

There were, in 1837, a parochial school, an infant-school supported by subscription, and three other daily schools in the parish; also one large Sunday-school.

Fortrose is in the parish of Rosemarkie, and on the shore of Moray Frith, just within the narrow passage by which that frith is contracted opposite Fort George. It was antiently the cathedral town of the bishopric of Ross, and is still sometimes called Canonry or Chanonry of Ross; it was erected into a royal burgh by James II., A.D. 1444, and annexed to the previously existing and adjacent burgh of Rosemarkie. The present burgh consists of the two thus united. Fortrose is a small town, with little manufacture and very little trade; and Rosemarkie is an insignificant fishing-village; the two places are about three-quarters of a mile distant from each other. There are some remains of

the antient cathedral at Fortrose, comprehending an aisle or chapel which was an appendage to the main part of the church; an antient building, probably a vestry, with an arched vault beneath; some tombs in niches in the walls, with effigies of the bishops, carved in stone, and much defaced; and an antient bell, now hung in a spire of modern erection. There are an episcopal chapel and a prison. The parish church is at Rosemarkie. For a long period the chief employment of the poor of Fortrose has been shoe-making; of Rosemarkie, weaving: the inhabitants are engaged also in fishing. There is a ropewalk at Rosemarkie, and a distillery at Fortrose. There is communication with Fort George by a ferry; and with Aberdeen, Dundee, Leith, and London by trading vessels.

The population of Rosemarkie parish, in 1831, was 1799. The burgh council consists of a provost, three bailies, a dean of guild, a treasurer, and nine other members; fifteen in all. The burgh unites with Inverness, Nairn, and Forres to return a member to parliament.

Stornoway, the only town in the isle of Lewis, is situated at the head of a bay on the east side of the island. The parish is extensive, extending sixteen miles in one direction and ten in another; with a population, in 1831, of 5422, of whom three-fifths were in the town or its immediate vicinity. Stornoway consists of several streets. The houses are in general good, with slate roofs, and many not only well but even elegantly furnished. There is a handsome kirk, built in 1794, and lately repaired; there are a neat custom-house, a town-house, and an assembly-room. The houses in the country parts of the parish are in general miserable and indescribably filthy habitations. The principal employment of the inhabitants of the parish is fishing. 'The season is divided between fishing, farming, and kelping, and most families have a share of a boat and a lot of land.' (*New Statist. Account of Scotland*.) Cod and ling are caught and cured, and shipped for Ireland or the manufacturing district round Glasgow. Haddocks are caught and cured for home consumption; and flounders, hakes, soles, turbot, and conger-eels, and occasionally whales, grampuses, and porpoises, are taken.

Stornoway was founded by James VI. of Scotland and I. of England, for the purpose of introducing civilization into the Highlands. The harbour is good and much frequented. Sixty-seven vessels, with an aggregate tonnage of 3059 tons, and fifteen hundred boats, belong to the port and its district. There are a corn-mill, a saw-mill, and a wool-carding mill, a ropewalk, and a large distillery. Kelp-making and the manufacture of coarse pottery are carried on. There is a well-frequented yearly fair for cattle. Sheriff and commissary courts, bailie, excise, and justice of peace courts, are held regularly. There are thirteen schools in the parish, viz. the parochial school, seven supported by the charity of societies or individuals, two 'supported by the country people,' and three without any extraneous support. There are a circulating library and two friendly societies.

*Divisions for Ecclesiastical and Legal Purposes; State of Crime, and Education.*—The thirty-three parishes in the two counties are comprehended in the five presbyteries of Tain, Dingwall, Chanonry (i.e. Fortrose), Lochcarron, and Lewis. The presbytery of Tain comprehends nine parishes, in or adjacent to the peninsula of Easter Ross; that of Dingwall, seven parishes in and round Dingwall; that of Chanonry, six parishes, in the peninsula of the Black Isle; that of Lochcarron, seven parishes, on the west coast (beside the parish of Glenelg, in Inverness-shire); and that of Lewis, four parishes, in the island of Lewis. The presbyteries of Tain, Dingwall, and Chanonry are in the synod of Ross; those of Lochcarron and Lewis, in the synod of Glenelg.

Sheriff courts are held at Tain and Dingwall, in the mainland of Ross-shire; in Stornoway, in Lewis; and at Cromarty in Cromartyshire. The two counties are under one sheriff. There are four prisons, viz. Tain, Dingwall, Fortrose, and Cromarty; they are all bad. Crime is not frequent in the two counties, and has diminished considerably within the last seventy or eighty years. Highway robbery and cattle-stealing, which were common for some time after the rebellion of 1745, have entirely disappeared, and violent assaults and child-murder, which continued to be common till a much later period, have become rare. Sheep-stealing still goes on; but the most common offences are minor assaults, committed under the influence of whiskey, and petty thefts. The diminution of crime is ascribed

to the improved condition of the people, the spread of education, and the more efficient administration of justice. The most serious offences are usually committed by hawkers, tinkers, and other vagrants. The police, though improved, is still inefficient; and there is still a good deal of pauperism and mendicancy. (*Inspectors of Prisons' Second and Fourth Reports*, 1836 and 1838; see *Parl. Papers* for 1837, vol. xxxii., and 1839, xxii.)

Ross-shire and Cromartyshire unite to return one member to parliament. The number of voters registered in 1834-5, was 594; in 1835-6, 621. Dingwall, Tain, and Cromarty unite with Kirkwall, Wick, and Dornoch to return a member; the number of electors registered for the district, in 1834-5, was 571. Fortrose unites with Inverness, Forres, and Nairn; the number of registered voters, in 1834-5, was 699, exclusive of those for Nairn, of whom no return had been received. (*Parliamentary Papers* for 1837, vol. xlix.)

Education has been greatly extended and improved of late years. In 1833-4 there were thirty-three parochial schools, with as many teachers, and one hundred and twenty-four schools not parochial, with one hundred and twenty-nine teachers; total, one hundred and fifty-seven schools and one hundred and sixty-two teachers. The greatest number of scholars in these schools during the year was 5118 boys and 2880 girls, together 7998 children; the least number, 1958 boys and 1043 girls, together 3001 children. The number of children under fifteen who could read or were learning to do so was 9718; the number who could write or were learning to do so, 3021. (*Parl. Papers*, 1837, vol. xlvii.) The schools established during the last few years, by the General Assembly, are in particular reported as working well. In these schools the improved system of teaching introduced among the poorer classes by Mr. Wood, of Edinburgh, is, it is said, generally adopted; so that the children, instead of being stuffed with a quantity of crude, indigestible matter, as heretofore, are now led to analyze and clearly understand all they are taught. Small libraries too are often appended to these schools. Tain appears to be distinguished for the increased attention paid to education. In addition to the regular parochial school, a public academy has been opened during the last few years, in which an education of a superior kind is given. A great many of the adult population are unable to read easily, or indeed to read in any way. On the western side of the county it is difficult to find a person forty years of age (of course, excepting the richer classes) who is able to read. Under these circumstances it is not surprising that there is in fact but little reading among the people at present, although the taste is on the increase. The only library for the labouring classes is a small one at Lochalsh, supported partly by the subscriptions of the members and partly by donations. (*Second Report of the Inspectors of Prisons*.)

*History and Antiquities.*—At the earliest historical period this country appears to have been inhabited—the western part by the Creones, the eastern part by the Cantæ (Κάνται), and the centre by the Caledonii (Καληδόνιοι) of Ptolemy; but it is impossible to assign the limits of their respective territories. The Bay Volsas (Ὀυόλας κόλπος) of the same geographer may be identified with Loch Broom. The æstuary (ἰσχυραίς) of Varar (Ὀβάραρ), or Varase, as it is in some editions of Ptolemy, which is mentioned also by Richard of Cirencester, was probably the Moray Frith. The *Aræ finium Imperii Romani* of Richard may perhaps be fixed on the ness or promontory of Taret, and the Abona æstuary of the same writer may be identified with Dornoch Frith.

Of this early period Ross-shire contains several remains. In Kincardine and Fearn parishes are some Druidical circles; and on the eastern shore of Loch Roig, in Lewis, are the very entire remains of a Druidical circle, the stones of which, some of them very large, stand on end, at a distance of five or six yards from each other, and are in a rough state as when taken from the shore. There are cairns in different places on the summits of hills. The Druidical origin of the circles is disputed by Dr. M'Culloch ('*Highlands, &c. of Scotland*,' vol. iii., p. 229, seq.). To the long period of darkness which extends over this part of the island after the departure of the Romans, may be assigned the duns, or dounes, or Picts' houses, as they are termed, which some suppose to be Danish forts, though some ascribe them to an earlier period than that of the Danish ravages. Stone coffins, vitrified ruins, stone obelisks, on or near the

eastern coast, and the traces of habitations in the caves of the western coast, belong to early but unascertained periods.

At a subsequent period Ross became an earldom, which was united with the lordship of the isles (i.e. the Western Isles) by the marriage of Donald M'Donald, the lord of the isles, with the daughter of the earl of Ross. These honours were held, about the middle of the fifteenth century, by Earl John, who allied himself with Edward IV. of England (A.D. 1461), rebelled against the government of Scotland during the minority of the king James III., and proclaimed himself king of Ross and the Hebrides. He was supported by Donald Balloch, lord of Isla, and by the earl of Douglas, now in banishment. The rebellion was attended by the most dreadful atrocities; but Ross was assassinated in the course of it, in the castle of Inverness, and the rebellion came to an end without its chiefs having attained their object.

The succeeding earl appears to have inherited the turbulence of Earl John. He was involved in hostilities with the earl of Huntley, another powerful Highland chieftain, and, adhering to his predecessor's English alliance, rebelled against James III. But the extent of the king's preparations induced him to submit to the royal clemency (A.D. 1476). He was deprived of the earldom of Ross, the lands of Knapdale and Kintyre [ARGYLE, vol. ii., p. 313], and the hereditary shrievalty of Inverness and Nairn, which were all annexed to the crown. He was in return created a peer of parliament with the title of John de Isla, lord of the isles. During this period Ross gave title to a bishopric, erected by David I., king of Scotland; the cathedral was at Fortrose.

There are several remains of ancient castles in Ross-shire. Lochlin Castle is on an eminence six miles east of Tain; it consists of two square towers sixty feet high, united at one corner of each, with a staircase at the point of junction, and large turrets raised upon the towers. Craighouse Castle, on the southern shore of Cromarty Frith, is an ancient tower of five stories; the castles of Killcoy and Redcastle are on the shore of Moray Frith, or rather of Loch Beaulay. There are some ruins of Cadbole Castle on the east coast, between Cromarty and Moray friths, and of Donan Castle, on the shore of Loch Alsh, on the west coast. There are also some ecclesiastical ruins. Lochlin Abbey (or Fearn Abbey) is near the castle of that name, east of Tain; and there are the ruins of a number of ancient chapels in Lewis, especially of St. Mulvay's chapel, in the north part of the island.

In 1649 the M'Kenzies of Ross broke out into rebellion, to revenge the execution of Charles I., but were defeated. The last battle fought by the gallant Marquis of Montrose was in this county, at Craighenichan (i.e. the rock of lamentation), in Kincardine parish, just on the northern border of the county, where he was defeated by Colonel Strachan; he swam over the Kyle into Sutherlandshire, was apprehended in Assynt, in that county, and afterwards executed at Edinburgh (A.D. 1650). The earl of Seafort having forfeited his estates, which lay in the west side of the county, by his share in the rebellion of 1715, and the military not being able to penetrate into so inaccessible a district and levy the rents for the crown, the faithful clansmen regularly paid theirs to an agent, who transmitted them to the earl, then in exile. In 1718, Donan Castle was seized by the earl of Seafort and one or two other Jacobite noblemen, who arrived on the coast in two Spanish frigates, with a small body of Spanish troops; a few Highlanders took arms and joined them, but they were defeated in Glenshiel by the government troops, and the leaders compelled to make their escape. 'Rob Roy' was engaged among the insurgents in this conflict.

ROSS. [HEREFORDSHIRE.]

ROSTELLA'RIA. [STROMBIDÆ.]

ROSTELLUM, a botanical term applied occasionally to very different parts: 1, it is most frequently used as a diminutive of rostrum, to express any small beak-shaped process; 2, it is applied to the short beak-shaped process found on the stigma of many violets, as *Viola hirta*, *V. odorata*, and *V. canina*, &c.; and Orchidaceæ, as *Orchis*, *Spiranthes*, *Listera*, &c.; 3, some writers have also used this term to indicate the radicle or descending element of the embryo of the seed.

**ROSTOCK**, the largest town in the grand-duchy of Mecklenburg-Schwerin, is situated in  $54^{\circ} 5' N.$  lat. and  $12^{\circ} 20' E.$  long. It stands on an eminence, in a flat and very fertile country, on the bank of the river Warnow, which is there 2400 feet broad, and forms the harbour. The Warnow falls into the Baltic at Warnemunde, nine miles below the town.

Rostock consists of three parts, the old, the middle, and the new town, besides the suburbs, and it is surrounded with antient fortifications. A great part of the city is built in the old fashion of the free German cities, with the gable ends toward the street, but it has been very much improved within the last twenty-five years by the erection of many large and elegant houses. Most of the streets are straight and pretty broad, and well paved. On the whole the old town is the most irregular, the middle town the handsomest, and the new town the most regularly built. The principal public buildings are the grand-ducal palace, more remarkable however for its extent and its admirable situation than for the style of its architecture; the university, a very extensive building; the court of justice, and the town-hall, both modern edifices; the theatre, and the churches of St. Mary and St. Peter. The church of St. Mary is 300 feet long, 240 broad, and 96 feet high up to the cupola. It has one of the finest organs in Northern Germany. This church contains the tomb of Grotius. St. Peter's church, which was founded at the end of the twelfth century, is chiefly remarkable for its fine steeple, which, with the very lofty conical spire, is 420 feet in height. The university was founded in 1419. It has 23 professors, but only about 110 students. The library consists of above 80,000 volumes, including many very rare and valuable works, and has been much increased by the collection of Professor Tychoen, especially in Oriental and Spanish literature; likewise a cabinet of medals, a museum of natural history, a botanical garden, and an anatomical theatre. There are also a theological seminary, a Bible Society, and other useful institutions. The number of inhabitants is 18,200.

Rostock was a town of the Wends, or Vandals; it was taken in 1161, by Waldemar, king of Denmark, and burnt, with its celebrated idol. In 1323 it was annexed to Mecklenburg, joined the Hanseatic League in 1630, and was for a long time the next city in rank in the Baltic after Lübeck. Great privileges were granted it by the dukes of Mecklenburg, many of which it still retains, such as the right of choosing its own magistrates, the right of taxing itself, of coining money, the jurisdiction over all its inhabitants, and their estates in the country. Though its commerce is not so considerable as in the time of the Hansa, it is still the principal trading port of Mecklenburg: it has about 150 ships, which sail under its own flag, and the number of ships that arrive every year is about 600, the foreign vessels being mostly English, Russian, Swedish, and Danish. The exports are chiefly corn and wool. The imports are colonial produce, wine, and bay salt. There are manufactures of canvas, linen, baize, ships' anchors, soap and vinegar, and some breweries, distilleries, and sugar refineries.

(Cannabich, *Handbuch*; Stein's *Lexicon*; Stein's *Handbuch*, by Hörschelmann; Hempel's *Mecklenburg*.)

**ROSTOU.** [YARASLOW.]

**ROSTRUM**, or, more properly, **ROSTRA**, was a platform or elevated space of ground in the Roman forum, from which the orators used to address the people, and which derived its name from the circumstance that after the conquest of Latium the beaks (rostra) of the Antiatian ships were affixed to the front of it. (Liv., viii. 14.) The rostra was between the Comitium, or place of assembly for the Curiae, and the Forum, properly so called, or place of assembly for the Comitia Tributa. Bunsen, in his work on the Roman Forum, quoted by Arnold (*History of Rome*, vol. ii., p. 165), judging from the views of the rostra given on two coins in his possession, supposes that it was a circular building, raised on arches, with a stand or platform on the top, bordered by a parapet, the access to it being by two flights of steps, one on each side. It pointed towards the Comitium, and the rostra were affixed to the front of it, just under the arches. Its form has been, in all the main points, preserved in the ambones, or circular pulpits, of the most antient churches, which also had two flights of steps leading up to them, one on the east side, by which the preacher ascended, and another on the west side, for his descent. Specimens of these old pulpits are still to be seen at Rome, in the churches of S. Clement and S. Lorenzo fuori le Mura.

The orators appear to have walked up and down the rostra in addressing the people, and did not, like modern speakers, remain standing in one spot. Down to the time of Caius Gracchus even the tribunes in speaking used to front the Comitium; but he turned his back to it, and spoke with his face towards the Forum. (Niebuhr, *History of Rome*, vol. i., note 990; vol. iii., note 268.)

**ROSTRUM**, a botanical term applied to any rigid prolongation of remarkable length, or to any additional process at the end of any of the parts of a plant. Under this term are included most processes and long points of an irregular character, as the thin apices upon the operculum of the sporangium of many mosses, the lengthened tube of the calyx upon the achenia of Scabiosa, Tragopogon, Lactuca, and many other Compositae, also of Scandix and Anthriscus, the remaining and often enlarged style upon many fruits, as of Brassica, Sinapis, Saxifraga, and many other prolonged points, as those upon the utriculate indusium of Carex flava and C. ampullacea. The term *cornu* is often applied to parts similar to rostrum.

**ROT, DRY.** [DRY-ROT.]

**ROTA'LIA.** [FORAMINIFERA, vol. x., p. 348.]

**ROTATE**, a botanical term applied to either the calyx or corolla, when the tube is very small or entirely wanting, and the petals or sepals are united and spreading. Examples are seen in the genera Anagallis, Lysimachia, Borago, Solanum, Verbascum, Galium, and Rubia.

**ROTATION** (*Rota*, a wheel). The popular conception of a body in rotation is vague, except only in the case in which the rotation is made about an immoveable axis. This subject has accordingly been usually treated by mathematical methods; and mathematicians, content with their results, and with their power of interpreting them, did nothing towards the improvement of the manner of presenting the elementary view of rotation. Within the last seven years however, a French philosopher of a truly remarkable genius for simplifying the elements of mechanics, M. Poinsot,\* has presented the subject in a point of view which would excite wonder that ideas so simple should never have occurred to any one before, if it had not been so often seen that simplicity is not a fruit of the first growth. In this article it is to be remembered that we confine ourselves to notions connected with motion, independently of its producing force, reserving the latter for **THEORY OF COUPLES**—an arrangement dictated rather by our desire to keep in our article what may be accessible to the general reader, than by its own intrinsic propriety. For the mathematical part of the subject, so far as we enter into it, see **VIRTUAL VELOCITIES**.

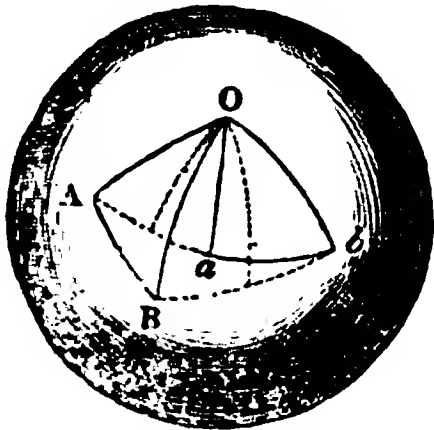

There is this parallel between the conception we form of the simple motion of a point and that of a solid body, namely, that each has a case of peculiar simplicity, by which others are rendered more easy to describe. A point may move in a straight line, or may preserve its direction unaltered; a body may revolve round a fixed axis, or each point may preserve its circle of revolution unaltered. But, owing to the comparative simplicity of the motion of a point, it is easy [DIRECTION] to carry with us, when it moves in a curve, the idea of its still having a different direction at every point of the motion, namely, that of the **TANGENT** of the curve. It is not so easy to see that whenever a body moves about a fixed point, no matter how irregularly, there is always, at every instant of the motion, some one axis which is, for that instant, at rest. This notion of an instantaneous axis of repose, not continuing to be such for any finite time—answering to that of an instantaneous direction in curvilinear motion, which does not continue for any finite time to represent the direction—must be first distinctly formed, before any satisfactory account of the rotation of a body can be given.

Let us suppose a uniform sphere, with a fixed centre, but otherwise free to move in any way. Let a succession of forces act upon it, gradual or not, in such a manner that it will never move round one axis for any finite time during the continuance of their action. At a certain moment, let all the forces cease entirely, leaving the sphere to itself. It is easy enough to see that from and after the moment of discontinuance, the sphere will move round an axis which remains unaltered; or, if this be not perfectly perceptible, the geometrical considerations presently to be given, will

\* In a Memoir read to the Academy of Sciences, May 19, 1834, of which there is an extract, explaining general considerations and results, has been published, Paris, Bachelier, 1834.

make it so. There must then, at the very moment of discontinuance of the forces, have been an axis which was for that moment at rest, namely, the axis on which the motion is to continue after the forces cease. In this way, knowing that curvilinear motion would become rectilinear the moment that the constraining forces are removed, we might form an idea, if we had not one otherwise, of the tangent of a curve, the line of direction for the time being, and which would continue to be the line of direction if the forces were removed.

Now let the sphere, the centre being fixed, have moved from any one position (P) into any other (Q), but not round one axis. If a point were to move from A to B, however curvilinear the intermediate path might be, it *might* have moved from A to B in a straight line, the chord of the curve. Similarly, it may be shown that however *unaxial* the manner in which the sphere moves from position (P) to position (Q), it might have been changed from the one to the other by a motion of simple revolution. To show this, remember that, the centre being fixed, the positions of any two points of the sphere, not opposite, give the position of the sphere, so that, if any two such points chosen in the position (P) can be transferred to their places in (Q) by a simple revolution of the sphere round an axis, the whole sphere is transferred by that same revolution. Suppose

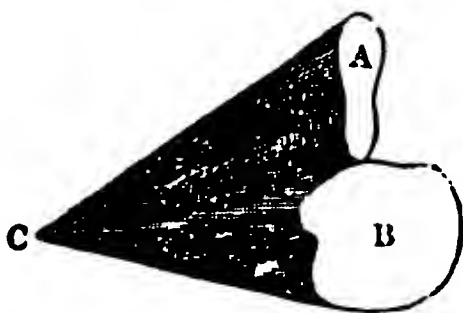

that AB, an arc in the position (P), comes to *ab* in the position (Q). Bisect *Aa* and *Bb*, and let great circles drawn through the points of bisection meet in O. Then it is easily proved that  $OA = Oa$ ,  $OB = Ob$ , whence  $AOB$ ,  $aOb$ , are triangles with the sides of one severally equal to those of the other. Hence the angles  $AOB$ ,  $aOb$ , are equal, whence the angles  $AOa$  and  $BOb$  are also equal. If then the sphere should revolve round an axis passing through O and the centre, A would be brought to *a* at the same moment at which B is brought to *b*; whence the change from (P) to (Q) can be effected, as asserted, by a simple axical revolution.

If then we suppose *ab* ever so near to AB in position, the same thing is still possible, and by placing *ab* infinitely near to AB, or finding the limit of the point O during a motion of the sphere which is diminished ad infinitum, the position of the instantaneous axis of repose may be determined at any point of the motion of the sphere. And if we suppose this sphere to be merely cut for convenience out of any solid body, with the fixed point of that body for its centre, the instantaneous axis of repose of the body may be found, being always that of the sphere.

One of M. Poinsot's remarkable propositions is the following:—Any motion of a system round a fixed point may be attained by cutting a cone (in the most general sense of the word) out of the body, with the fixed point for a vertex, and fixing in space another cone for it to roll upon, also with the fixed point for a vertex.

Thus, if in the adjoining diagram, the cone A be made to roll upon the cone B, both being supposed destitute of impenetrability, so that the contact of the curves of A and

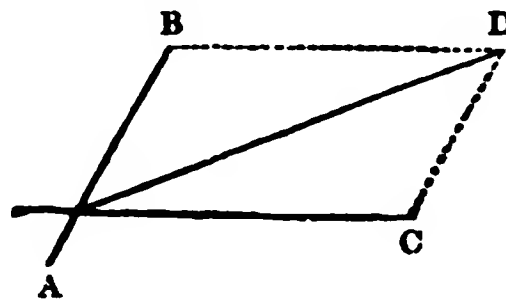

B can always be made, and if the system out of which A is cut be then restored (also without impenetrability), there will be a complete geometrical representation of one possible motion of the system about C. Moreover, there is no possible motion which might not be represented in the same manner by properly choosing the cones A and B, and the axis of repose for the instant is the line in which the two cones touch.

P. C., No. 1253.

If we suppose no fixed point in the system, so that motion of translation, as well as of rotation, is possible, M. Poinsot has given another equally distinct notion of the state of the motion during an infinitely small time. The most simple notion which we can form of a combined translation and rotation is the screw-like motion, in which a uniform motion of translation is accompanied by a uniform motion of rotation round a line parallel to the motion of translation. M. Poinsot has shown that every motion of a system must be, at any one instant, either a simple motion of translation, or one of rotation, or the screw-like motion above described. That is to say, at every point of time in the motion of a system there exists a line (whether internal or external to the *material* system matters not, as long as they are immovably connected) along which the system is at that instant dropping, while all the rest of the motion at that instant is simple rotation about that *slipping axis*. There will perhaps be some difficulty in the first reception of these ideas; but when they are once understood, the precision they will give to the conception formed of the motion of a system will be found highly valuable.

In every solid system, whether regular or not, can be described an ellipsoid [SURFACES OF THE SECOND DEGREE] which is called by M. Poinsot the *central ellipsoid*. Its centre is the centre of gravity of the system; its three principal diameters have their squares inversely proportional to the MOMENTS OF INERTIA about these diameters as axes; and the position of these three diameters depends upon the distribution of the masses of which the system is composed. If the centre be fixed, these diameters are the only axes upon which the system can permanently revolve without the axis being also fixed; and they are called the principal axes of the system. When these diameters all differ in length, the revolution about the greatest and least axis is stable [STABILITY], and about the mean axis unstable. The conception of the effect of given forces upon a system is much facilitated by the use of this ellipsoid. [THEORY OF COUPLES.]

Let us now suppose a system to receive at the same time two motions, round two different axes of repose: that is to say, given two different motions, required the motion which will result from the sufficient causes of the two motions being impressed on the system at once. There will be at the first instant an instantaneous axis of repose, which it is required to find. First let the two axes pass through the same point A, and choose the angle BAC out of the four angles made by the two axes, in such manner that points of the system lying in the angle BAC would be elevated by the rotation round BA, and depressed by that round CA

or *vice versa*. On the axes take AB and AC, lines proportional to the angular velocities about those axes, complete the parallelogram AD, and draw the diagonal AD. Then AD is the axis of repose at starting (which however it may not continue to be), and AD represents the angular velocity round that axis at starting, in the same manner as AB and AC represent the impressed angular velocities about AB and AC. [COMPOSITION.]

Next let the axes be parallel to one another, say perpendicular to the plane of the paper, passing through A and B. If the rotations are such that A and B would both rise, or both fall, on the paper, each by the rotation about the other, take a point C in AB continued, nearest to the axis about which the angular velocity is greatest (say that of A), and such that CA is to CB as the angular velocity about B to

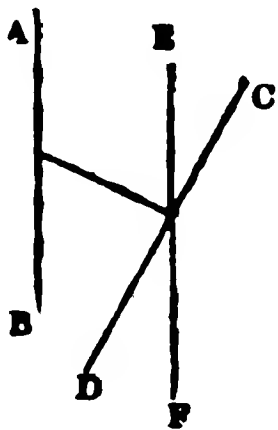

the angular velocity about A. Then the axis of repose at starting is a line passing through C parallel to the former axes, and the angular velocity is the difference of the angular velocities about A and B, and in the direction of the greater. In this case the directions of the rotations about A and B [DIRECTION OF MOTION] are different. There is one remarkable case, namely, when the rotations about A and B are equal. In this case the rule would lead us to a rotation equal to nothing

made about a point at an infinite distance—one of those extreme conclusions which require interpretation. The fact is that these two rotations give only a simple motion of translation =  $AB \times \text{Angular Velocity per second}$ , and such as to make the system move upwards or downwards on the paper according as the separate rotations would make the points A and B move upwards or downwards. This particular case will be more intelligible when looked at with the help of the THEORY OF COUPLES.

But if the rotations be in the same direction, so that A will be lowered and B raised, or *vice versa*, each by the rotation about the other:—Take a point D, dividing AB so that AD is to DB as the angular velocity about B is to that about A. Then will the axis of repose at starting be a parallel drawn through D to the axes passing through A and B, and the angular velocity will be the sum of the angular velocities about A and B, its direction being that which lowers A on the paper and raises B, or *vice versa*, according as is done by the given angular velocities.

Lastly, let the axes be neither parallel nor intersecting, as AB and CD:—Through the point in which CD meets the common perpendicular draw EF parallel to AB, and at the

instant at which the rotations round AB and CD commence, give a couple of equal and contrary rotations about EF, each equal to that about AB. This last pair produces no effect, so that the composition of the four rotations gives the same result as that of the two. Now, as above stated, the rotation round AB, and its equal and contrary round EF, produce nothing but a motion of translation, while the remaining rotation about EF, compounded by the first rule with that about AB, gives what would be an axis of repose, if it were not for that translation. The whole result then is, that the system begins to move about an axis, which axis begins to undergo a translation in space.

There is no work to which we can refer the reader for a simple demonstration of these rules, apart from higher considerations. But the student of mechanics who does not pay attention to the simple phenomena of translation and rotation, will rarely find himself able to attain a complete comprehension of the equations by which these phenomena are applied in physics.

**ROTATION OF CROPS.** It has been observed in a former article [ARABLE LAND] that a repetition of the same crops in succession has a peculiar effect on the soil, so that if grain of the same nature be sown year after year in the same ground, it will not produce the same return of the seed, even when abundantly manured. The reason of this is not satisfactorily explained, but the experiments which have been made by men of science lead us to conclude that the real cause will be gradually discovered; and considerable advances have been made towards a rational solution of the question. It has been observed that it is the formation of the seed which principally causes the deterioration of the soil; for if the crop be fed off in a green state, or mown before the seed is formed, the same may be safely repeated, and no diminution of the plants is apparent. Thus grasses in a meadow which are mown before the blossom is faded or the seed formed, will spring up again vigorously; but if the seed is allowed to ripen, the roots die away, and the best grasses gradually disappear. It is thus that when a meadow is mown year after year for hay, and the earliest grasses are allowed to ripen their seed, the crop will be later and later, and all the earliest grasses will disappear. Irrigation prevents this, and seems to restore to the land whatever the grasses require for their continuance. Feeding of the meadows does the same; and this leads to the conclusion that water restores the power of production; and that, the grasses not being permitted to run to seed, the deteriorating effect is not produced.

If it had been a mere exhaustion of the nutritious particles in the soil which caused the deterioration of the subsequent crops, some kind of manure might restore the fer-

tility; but this is not the case. However judiciously the land may be manured, it is not practicable to raise a crop of wheat or clover, or of many other plants, on a soil which has shown that, as the farmers say, it is *tired of that crop*; but clover grows well after wheat, and wheat after clover, so that the same effect is not produced in the soil by these two crops. Experiments have been made by eminent chemists, particularly by Macaire of Geneva, at the request of De Caudolle, which lead one to suppose that, in the formation of the seed or other nutritious parts of plants, the sap is digested, that it takes up certain elements and deposits others, which are the residue of the process; and these being no longer necessary to the formation of the seed, are rejected by the vital action of the plant, and exude by the roots. Thus certain inferior animals, which in many respects have some analogy with vegetables in their growth, as the polypi, take in nourishment by the same openings or pores by which the excrements are voided after digestion; and the different constitution of different animals enables one class to feed on the excrements of another; whereas no animal in a healthy state can derive nourishment from that which it has already digested and voided. Our ignorance of the functions of vegetable life prevents us from foreseeing the effects produced on the sap by the expansion of the blossom or the ripening of the seed; but experience leads us to perceive that certain plants thrive best after certain others; and that in this case they are always of distinct and different natures. A plant which has fibrous roots, and throws up a seed-stem with few leaves, thrives best after one which has a fleshy root and many succulent leaves on a branching stem. Thus, wheat thrives after beans, vetches, or clover; barley and oats after turnips, carrots, or potatoes. Independently of the manure which may be put into the ground, the crops will be better where the proper succession is attended to, than where plants of a similar kind are made to follow each other. To ascertain the cause of this, Mr. Macaire and some other scientific men observed the change which took place in the water in which wheat had been made to grow. They found a deposit in the water of the nature of a bitter extract; and this they concluded to be excrementitious. Whether these experiments were conclusive or not, they found that beans grew well in the water in which wheat had deposited this supposed excrement; and, on the other hand, wheat thrives in the water in which beans had grown. This confirmed the well-known fact that heavy soils of a rich quality and well manured will bear alternate crops of wheat and beans without the intervention of a fallow for a long series of years, as is practised in some parts of Kent. The effect of fallowing land is explained on the same principle; the excrement is washed out by the rains, or is decomposed by the light and air to which it is exposed by the repeated ploughing. Thus the land is said to be *sweetened*, an expression very common among those farmers who adhere to the fallowing system.

If the chemical nature of the excrement of each plant cultivated could be accurately ascertained, artificial means might be discovered, by which the same effect might be expeditiously produced, which now requires a whole season of fallowing. But experience and observation have anticipated science, as is often the case; and a judicious rotation of crops has been found to prevent the bad effects of the change in the constitution of the soil which is caused by the growth of particular classes of plants; whether it be that they deprive it of peculiar salts, as some will have it, or deposit deleterious particles, according to others. However interesting it may be to the curious inquirer to ascertain the real cause, it is sufficient for the practical farmer to learn by experience what crops succeed best after each other, and how soon the same kind of seed may again be sown in the same ground with a reasonable prospect of its producing a good crop; and this after all can only be learned from actual experiment and observation.

In all countries where peculiar attention has been paid to agriculture, the most advantageous succession of crops is generally known; and if any deviation takes place, it is as an exception to the rule, and is not looked upon as a model for imitation, but rather as an experiment of a doubtful result. Certain general principles are commonly admitted as fully established; the chief of these is, that a plant with a naked stem and farinaceous seed should follow one with a branching stem and a fleshy root, which has been taken from the ground by mowing or feeding before the seed was ripe; or if all these conditions cannot be obtained, that some of them

at least should be complied with. Wheat sown after clover, which is allowed to be the best succession on light soils, fulfils all the conditions: when it is sown after beans, the condition of the preceding crop not ripening its seed is given up; and consequently this succession is inferior to the other. Potatoes, at first sight, appear to fulfil all the necessary conditions; but although they do not often ripen the seed above ground, the bulbs of the roots contain so much farina, that in the formation of these the soil is notoriously deteriorated; and farmers well know that, except in peculiar cases which form exceptions, wheat never thrives so well after potatoes as it does after clover, even when the ground has been so richly manured as to contain more organic matter in a soluble state than there is in the roots of the clover.

A knowledge of the different plants which may succeed each other on the same land is of great importance in forming a judicious rotation, so as to obtain the most valuable produce from any given soil, in as quick recurrence as possible without the risk of failure. In the triennial system, which could only be profitable where much of the land remained in a state of pasture, two crops of corn were taken in succession after a complete fallow. But even here it was found advisable to have different kinds of grain, and not to repeat the same crop without a fallow intervening. In very rich soils wheat and barley were the usual crops after the fallow; and the manure was obtained by means of cattle or sheep kept on the pastures in summer and on hay and straw in winter. Repeated ploughings were indispensable; and the farmer who stirred his land the most was the most certain of good crops. But when pastures were broken up, this system soon exhausted the soil for want of manure, and it became indispensable to devote some portion of the land to raise food for the animals whose dung is required to keep up the fertility. Hence the introduction of roots and artificial grasses. It was soon observed that the crops of corn were much better on the land which had borne these roots and grasses, even with less manure, than after crops of grain; and a rotation was adopted in which green crops were raised between every two crops of corn. In process of time the fallows were found to be superfluous wherever green crops could be raised with advantage; and the land was kept clean by careful weeding and hoeing. The effect of a judicious rotation on the produce raised in a given time was so evidently advantageous, that it gave rise to a notion that in this alone consisted the whole art of the farmer, even to the neglect of manure; and clauses were introduced in leases prescribing the rotation to be strictly adhered to, often with detriment to the land and loss to the tenant, when the circumstances required a deviation from the rule.

In order to find the crops which may advantageously succeed each other in rotation, many circumstances must be taken into consideration. First of all the quality of the soil, and its fitness for particular crops; next the wants of the farmer and his family, and the maintenance of the stock required to produce a sufficient supply of manure. It is unreasonable to expect poor light land to produce wheat and beans, although by high cultivation these crops may be forced. Rye, oats, and roots may give the farmer a better profit, by being raised at a less expense than more valuable crops, which must be forced with manure, and at best are precarious in soils not adapted to their growth. In moderate loams wheat may recur every fourth or fifth year, whereas in very rich compact loams it may recur every third, and even every alternate year. Clover and many artificial grasses do not succeed well if they recur oftener than every sixth year, or with even a longer interval. Rape, flax, and potatoes require a still more distant recurrence on the same ground. All these considerations lead the farmer to the selection of the most advantageous rotation for the soil of his farm; and where the land in a considerable district is nearly of an uniform quality, experience soon establishes a course which no one finds it prudent to deviate from. It happens frequently however that a great variety of soils, very different in their nature and fertility, are intermixed; and then, unless the farmer can apply the true principles of rotations, he may greatly err by following the course, which may be very judicious for the prevailing soil of the district, but not at all suited to some of his fields. Here the old advice to a young farmer, to 'look over his neighbour's hedge,' may not be a prudent one to follow; and even if there were no difference in the nature of the soil, or in the state of fertility in which it is at the moment,

a blind adherence to the practice of others will never lead to any improvement: for such improvement can only be effected by some knowledge of the reasons on which any practice is founded. Hence a knowledge of the crops suited to any particular soil, and the order in which these crops should succeed each other, is indispensable to the advantageous cultivation of a farm.

That which forms the food of man is always the principal object in the cultivation; and, excepting rice, which only grows in warm climates, there is no food more universally used than that which is made from wheat. Rye, barley, oats, and pulse are only substitutes where wheat cannot be raised in sufficient quantities. Next to grain comes meat, chiefly beef, mutton, and pork, of which the consumption increases with the wealth of a nation and the advance of its agriculture. Wheat and fat cattle are therefore primary objects with every good farmer; and he who can raise most wheat and fatten most oxen or sheep or pigs will realise the greatest profit.

Many circumstances may indicate a deviation from the course which, as a general rule, is most advantageous. The facility of purchasing manure from neighbouring towns may allow of more frequent crops of corn, and of nutritious roots which require much manure, such as potatoes, and which give no return to the land in the shape of dung. But we must lay down rules for those who are to rely on their own resources to recruit the land with manure, so that it may give the greatest produce without diminishing in fertility; and this can only be done by a judicious feeding of live-stock.

The simple rotation of wheat and beans alternately would be by far the most profitable in rich clay soil, as both these crops always obtain a good price in the market; but if a whole farm were so cropped, nearly all the manure must be purchased; for, after a few crops, the wheat-straw and bean halm would not produce half the manure required for the land. Hay and oats must be purchased for the horses required for the tillage, which might not be procured so readily or so cheap as they may be raised on the farm. On very light sands wheat or beans cannot be raised, except by a very expensive mode of cultivation; but rye, oats, peas, buckwheat, and roots for cattle must be substituted. On chalky loams the principal crops are barley and artificial grasses for sheep. In short, no particular rotation can be prescribed without a complete knowledge of the soil, the locality, and every circumstance connected with any particular farm. As the most universal rule, it may be laid down that every alternate crop should be consumed by animals on the farm, and that, as much as possible, the plants which succeed each other should be of different natural botanic families. Experience has generally shown the time that should be allowed to intervene between the recurrence of the same kind of crop, and we have only to form our plans accordingly.

In order to prove that the principles we have here laid down are not formed on mere theory, we have only to show that experience and observation have led to the same practical results, and that those rotations which have stood the test of the longest experience have been gradually brought to a considerable perfection in consequence of the failures which generally followed any great deviation from the true rational course.

Of the old triennial course (fallow, wheat, barley or oats) it must be observed that the two corn-crops so rapidly deteriorate the soil, that a complete year of fallow is required to purify it, and a good manuring to keep the land in heart, and that all the industry of the farmer cannot keep up the fertility of the land without extraneous help, either from the manure made in towns, or in the farm-yard by cattle bred and kept in commons or pasture-grounds. This system, which prevailed so long, cannot be called a rotation; and no real improvement was introduced into agriculture until the notion of its perfection was exploded, and tenants were permitted to deviate from it. The rotations adopted in the place of this old system necessarily partook at first of its main defects. Green crops were introduced of necessity to supply the loss of the commons and pastures, which, as the population increased, were gradually cultivated as arable land: but the two white crops remained in succession, and even now, such is the force of habit and early impression, that one of the most difficult points to be gained with mere practical farmers is to make them have patience when their land is in a good state, and to prevent their sowing a white

crop, which is immediately profitable and obtained at little or no expense, instead of a green crop, which will keep the land in heart and improve it for future crops, but which does not figure in the account of sales. Yet it can be clearly shown, that in most cases the second corn-crop is dearly purchased by the expense required to restore the land to the state in which it was when the seed was sown a second time; manure alone will not do this; fallowing and repeated ploughing can alone effect it: and whether you plough several times before a crop, or are forced to do so after it, there is no difference in the expense of labour, although there may be much in the value of the subsequent crops.

The Norfolk course (turnips, barley, clover, wheat), which is so well known and deservedly in repute for light sands, has only one defect, which is the too frequent recurrence of clover. Rye grass, the usual substitute in sandy soils, unless it be fed off young, is far inferior to clover as a preparation for wheat, and this accords with the theory; for wheat and rye grass are both of the natural family of the *gramineæ*. Tares or vetches are a good substitute in heavy soils, as well as beans, both of which are *leguminosæ*, but not well suited to light sandy soils. Peas are sometimes introduced; but they are apt to encourage weeds, unless the crop be very heavy, and then they exhaust the soil, and leave little vegetable matter behind them in their roots.

In many countries there are other vegetable products which are required for the food of the inhabitants, or as the raw materials of manufactures: these must be introduced into the rotations, according to their effect on the soil, and the cultivation they require. Indian corn, or maize, and French beans, for their seed, are cultivated in more temperate climates as field crops. Potatoes are now an essential product in some districts, and one which, after maize, produces the greatest quantity of food for man from a given parcel of land. But potatoes require much manure, and cannot be cultivated to a very great extent as a farm crop, nor repeated on the same land, for any length of time, more than once in eight or ten years; they should however enter into the rotation in that portion of the land which is to be much worked, cleaned, and manured after the corn. Flax, colsa, hemp, and many other plants are cultivated in various districts. By a little management a variety of produce may be introduced with some regard, and, as a specimen, we will give a rotation which is generally adopted in the neighbourhood of Lille in France, and noticed in the 'Journal of the Royal Agricultural Society of England,' vol. i., part iii., page 292.

The quantity of land is 15 *bonniers* (about 60 acres). Each *bonnier* is divided into 16 cents; each consequently one-fourth of an acre.

The tares, rye, winter barley, and clover are mostly cut green for fodder.

In this rotation there are a great many different crops, but the chief is wheat, which occupies 18 acres in 60, and thus recurs nearly every third year on the same ground. It invariably follows clover, flax, colsa, and beans, all plants of different families from the *gramineæ*. After the wheat, various green crops follow, and, excepting a very small portion of winter barley and rye, which are generally cut green for the cattle, all these are likewise of different families from wheat. Then come colsa, beans, and oats, all but the last of different families from the two preceding; and it must be observed that the colsa plants raised to be transplanted are followed by beans, and the turnips and cow-cabbage by oats, while the colsa for seed comes after tares, rye, winter barley, and clover. This rotation is not a theoretical one, but actually and strictly adhered to by all those who are considered good farmers in the district where it has been the rule for a century and more. It is not the result of physiological theories, but it is most probably the parent of the theory which is now almost universally adopted by all scientific agriculturists.

Mr. Blackie, who may be considered as very good authority

in modern British farming, was requested, when he was to recommend a course of cropping or a rotation in the northern portion of France. Probably with a knowledge of what was actually the practice in a particular district, he composed a table of crops, which he considered to be adapted to a very rich soil in a very genial climate; and if we compare this with the foregoing rotation, we shall be enabled to find how nearly they agree in principle. It was first published in the 'Gardeners' Magazine,' vol. ii., and afterwards in a paper by Mr. Towers in the second part of the 'Journal of the Roy. Agr. Soc. of England,' as it is an interesting agricultural document, we give it in the following page.

It will be remarked in perusing this rotation, that the true principles are strictly adhered to:—wheat, clover, vetches, beans, and potatoes; and after these we have roots and green crops. The only remark which strikes a practical farmer is that ten acres of wheat are succeeded by potatoes, and these by wheat again. There is very little land in Great Britain which will bear so good a cropping, without much more manure than a farm

Mr. Thomas Blackie's scheme of Rotation upon a Farm of 100 Acres, as proposed to the French government.

\*(To be ploughed up after seven years, and followed by wheat.)

acres can afford for a tenth part of it but this is very easily modified by substituting a green crop for a portion (perhaps one-half) of the potatoes, and letting the potatoes be succeeded by barley or oats instead of wheat. The rotation will then be less scourging, and better adapted to land of moderate fertility, where extraneous manure cannot be depended upon. We give it as an example of the application of the true theory of rotations, and it is remarkable how nearly it accords with that which was the result of practice alone without theory. We have ourselves for many years adopted a rotation without being tied down to any positive rule, which has been suggested by circumstances, and in some measure regulated by our conviction of the truth of the theory we have attempted to elucidate. In a clayey loam on an impervious subsoil, but mostly completely drained, we have had turnips and Swedes on high ridges, tares, mangel-wurzel, potatoes, and a portion of rye to cut up green; succeeded by barley and oats sown with clover, rye-grass, and other biennial grass seeds. These were mown for hay the first year, and sometimes the second also, but generally depastured one year at least; then followed beans, and after these wheat. The green crops were put in after repeated and deep tillage, and with an ample allowance of manure. The whole of the layer was top-dressed with peat or coal ashes in the first year, and what manure could be got or spared was put on the second year before winter, when it was ploughed up. All the corn crops were put in upon one shallow ploughing. We have had no reason to repent of pursuing this course: but we allow that one year only in clover would probably be more profitable. The land is not sufficiently fertile by nature to bear wheat after the first year of clover, instead of feeding or making it into hay. This would bring it to some of the rotations adopted in rich alluvial soils. It is a rule which should never be transgressed, that after every crop reaped there should be a remnant of manure sufficient to ensure a good crop the next year; and that this should always be in the land, and considered as stock in trade or capital invested at good interest. By means of judicious rotations and tillage a much greater quantity of produce may be raised at a certain expense of labour and capital, than by any desultory and experimental mode of cropping. The farmer should find it his own interest to cultivate his land according to the most approved principles, and the landlord should impose only such restriction as will prevent the tenant from injuring himself by diminishing the produce of his farm.

ROTATION, INTERCELLULAR. [SAP.]

ROTATO'RIA. One section of the Infusorial animals is thus termed by M. Ehrenberg. It is arranged in the diplo-

neurose division of the animal kingdom by Dr. Grant, a view which has been many times suggested to original observers, from the figure, division, and movements of the body. Ehrenberg's classification of these minute but often highly organised creatures is formed upon the same general model as that of the Polygastrica, there being in these the same double series of analogous nude and loricated forms.

*General Character.*—Swimming invertebral animals, apodal, often caudate, capable of executing rotatory movements by the aid of peculiar ciliated organs. No true heart, but a dorsal vessel, and transparent vessels in which no movements appear. No distinct branchiæ. Many nervous pharyngeal ganglia (cerebral); in general a cervical nervous ring and an abdominal nerve. Very often eyes coloured red. Alimentary canal distinct and simple; sometimes a stomach, in other cases cœcal appendages; pharynx almost always armed with jaws, which often carry teeth. Sexual organs distinct, hermaphroditic; reproduction oviparous and viviparous, never fissiparous, as among Polygastrica.

Order 1. Rotatoria nuda. Order 2. Rotatoria loricata.

Section I. Monotrocha.

Ciliary Circle simple and entire, and not variable.

Monotrocha nuda. Monotrocha loricata.

1st Fam. Ichthydina.

A, No eyes.

a, Body smooth.

\* Tail simple, truncated, and flexible.

Gen. *Ptygura*.

\*\* Tail bifurcate and very short.

Gen. *Ichthydium*.

aa, Dorsal part of the body hairy.

Gen. *Chaetonotus*.

B, Two eyes.

Gen. *Glenophora*.

Section II. Schizotrocha.

Ciliary circle simple, divided in parcels.

Schizopoda nuda.

Schizopoda loricata.

1st Fam. Megalotrocha.

1st Fam. Floscularia.

A, One eye.

A, No eyes. The envelope of the body gelatinous.

Gen. *Microdon*.

B, Two eyes, which are effaced with age.

a, Rotatory organs bilobate or quadrilobate.

Gen. *Megalotrocha*.

Gen. *Lacinularia*.

aa, Rotatory organ multi-  
fid.

\* Rotatory organ quin-  
quefid, mandibles  
dentate.

Gen. *Stephanoceras*.

\*\* Rotatory organ with  
6-8 divisions, mandibles  
edentate.

Gen. *Floscularia*.

B, Two eyes, which are ef-  
faced with age. Envelope  
of the body membranous  
and granular. Rotatory  
organ bilobate or quadri-  
lobate.

Gen. *Melicerta*.

Section III. Polytrocha.

Several small ciliary circles.

*Polytrocha nuda*.

1st Fam. *Hydatina*.

A, No eyes.

a, Mandibles dentate.

Gen. *Hydatina*.

aa, Mandibles edentate.

\* Mouth direct, terminal.

Gen. *Euteroplea*.

\*\* Mouth oblique, inferior.

Gen. *Pleurotrocha*.

B, A single eye.

b, Eye frontal, tail bifur-  
cate.

Gen. *Furcularia*.

bb, Eye dorsal.

\* Tail simple, hairy.

Gen. *Monocerca*.

\*\* Tail bifurcate.

† Frontal ciliæ similar.

Gen. *Notommata*.

†† Frontal ciliæ dissimilar.

§ With ciliæ and styles.

Gen. *Synchaeta*.

§§ With ciliæ and hooks.

Gen. *Scaridium*.

C, Two eyes.

c, Eyes frontal.

\* Tail bifurcate.

Gen. *Diglena*.

\*\* Tail simple, front with  
two cirri.

Gen. *Triarthra*.

cc, Eyes dorsal.

\* Tail simple.

Gen. *Rattulus*.

\*\* Tail bifurcate.

Gen. *Distemma*.

D, Three eyes.

d, One eye dorsal, and  
two frontal.

Gen. *Eosphora*.

dd, Three dorsal eyes.

Gen. *Norops*.

E, Several eyes.

e, Eyes in a circle on the  
neck.

Gen. *Cycloglena*.

ee, Eyes in two cervical  
groups.

Gen. *Theorus*.

Zygotrocha.

Two small ciliary coronæ.

*Zygotrocha nuda*.

1st Fam. *Philodinæa*.

A, No eyes.

a, Tail bifurcate and cor-  
niculate (a frontal pro-  
boscis).

Gen. *Callidina*.

*Zygotrocha loricata*.

1st Fam. *Brachiomæa*.

A, No eyes.

Gen. *Noteus*.

aa, Tail bifurcate, not cor-  
niculate.

\* Rotatory organs, sup-  
ported on frontal pedi-  
cles of great length  
(no frontal proboscis).

Gen. *Hydrias*.

\*\* Rotatory organs sessile  
and lateral (no frontal  
prolongation).

Gen. *Typhlina*.

B, Two eyes.

b, Eyes frontal.

\* Tail bifurcate, and with  
two pairs of horns  
(thus becoming six-  
pointed); a frontal pro-  
boscis.

Gen. *Rotifer*.

\*\* Tail trifid, and with a  
single pair of horns  
(thus becoming five-  
pointed); a frontal  
proboscis.

Gen. *Actinurus*.

\*\*\* Tail bifurcate, and  
without horns; no  
frontal prolongation.

Gen. *Monolabis*.

bb, Eyes dorsal.

(Tail bifurcate, and  
with ten pair of cor-  
nicles; a frontal pro-  
longation.)

Gen. *Philodina*.

In illustration of this classification, we present draw-  
ings of—

*Notommata centrura*, as an example of nude Polytro-  
chous Rotatoria; and of—

c

*Branchionus urceolaris*, as an example of loricate *Zygotrochus Rotatoria*.

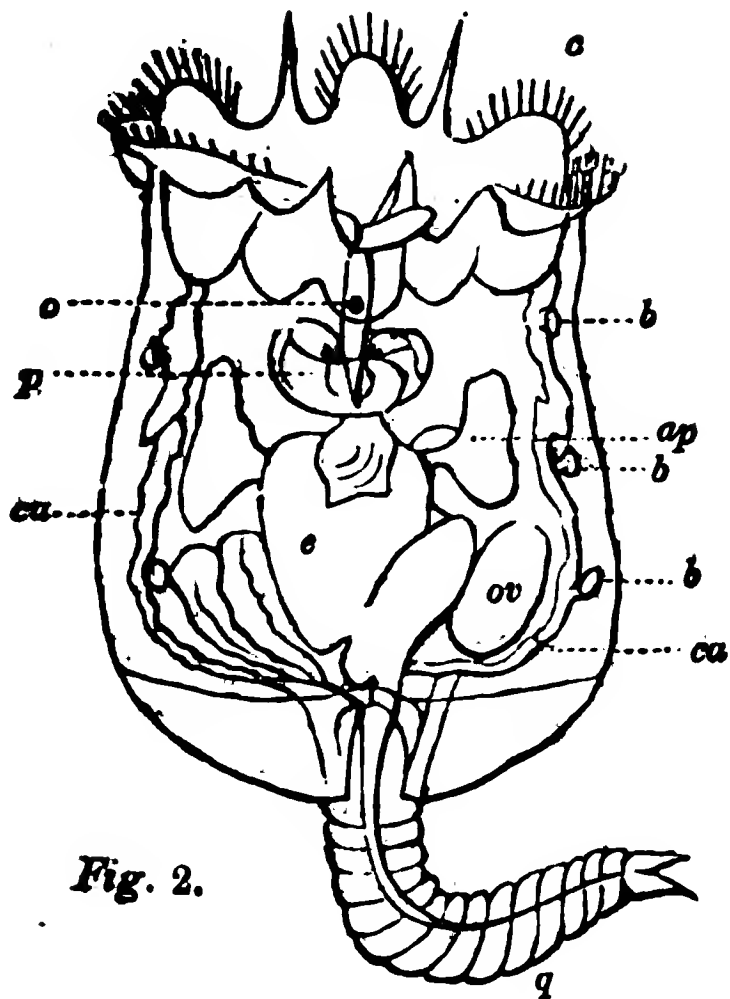

Fig. 2.

*Branchionus urceolaris*.

a, cilia rotatoris. p, pharynx. e, stomach. ap, appendages to stomach. ca, ovarium. o, eye. m, muscles. q, tail. bb, internal branchium. ca, branchial canal.

**ROTE**, a musical instrument of former times, mentioned by the early French writers of Romance, and by Chaucer, as well as others among our early poets: it seems to have been similar to what the French call a *vielle*, and the English a hurdy-gurdy.

**ROTELLA**, a genus belonging to the *Turbinacés* of Lamarck. [TROCHIDÆ.]

**ROTHER**. [SUSSEX; YORKSHIRE.]

**ROTHERHAM**, a parish and market-town in the south-western part of the West Riding of Yorkshire, 6 miles from Sheffield, 12 from Barnsley, 12 from Doncaster, 160 from London by the road, and 171 by railway. The Don, after receiving the Rother at the eastern extremity of the town, takes a westerly direction, and Rotherham occupies an elevated situation which rises from the northern bank of the river. On the western side of the town the river bends to the north-west. The parish comprises an area of 12,810 acres (nearly 10 square miles), and consists of the townships of Rotherham, Kimberworth, Brinsworth, Catcliffe, and Dalton, and the chapelries of Tinsley and Greasbrough. The populous suburb of Masbrough is on the left bank of the Don, but is comprised in the township of Rotherham, with which it is united by a handsome stone bridge of five arches.

About a mile south of the town, on the south bank of the Don, there are some Roman remains, which consist of a rectangular encampment called Temple Brough; and, at a distance of 300 yards higher up the river, there is an earthwork, which it is conjectured formed part of a larger work. Roman coins, bricks, and pottery have been found on both these sites. The station 'Ad Fines,' on the great road from Little Chester to Castleford, is fixed at Temple Brough by the best authorities. There is however nothing to give Rotherham a claim to a Roman origin, but it probably originated very early in the Saxon period. The church at Rotherham was in that period the only ecclesiastical edifice in an extensive district, and tithe was paid to it from lands now forming the parishes of Ecclesfield, Sheffield, Handsworth, Treston, and Whiston, in addition to those which are comprised within the parish at the present time. (Hunter's *South Yorkshire*.) A weekly market and annual fair were held before the Conquest; the Saxon lord of the manor had his corn mill; and these were sufficient, with its ecclesiastical superiority, to render Rotherham a vil of some importance. The Saxon possessor of the manor being displaced at the Conquest, Nigel Fossard, a Norman, was subinfeudated under the earl of Morton. In the reign of Henry III. (13th century), the manor and church were granted to the monks of Rufford Abbey, in Nottinghamshire, with the rights which had been exercised by the former feudal possessors, such as regulating weights and measures, the assize of bread and beer, punishment of crimi-

nals, for which purpose they had a pillory, tumbrel, and gallows. In 1307, Edward I. granted the town another market and a second fair. The parish church was built in the reign of Edward IV. (15th century), and is one of the handsomest in the diocese. Thomas Rotherham, archbishop of York, a native of the place, born in 1423, lent his assistance towards rendering it a model of ecclesiastical architecture. There are several good engravings of the church. The living is a vicarage, and the average net income in 1829-30-31 was 170*l*. An old font, supposed to have belonged to the Saxon church, at present stands in the churchyard. To Archbishop Rotherham also his native town was indebted for the foundation of a college, the remains of which still exist, and are used as an inn. This college was founded in 1482 for a provost, three fellows, and six scholars, who were lodged at the college, and accommodation was at the same time provided for the several priests officiating in the different chantries in the church. Grammar, poetry, rhetoric, music, singing, writing, and arithmetic were taught in this college, which was suppressed in the reign of Edward VI. The bridge-chapel on the Don, which does not appear to have been endowed, is now used as the town gaol. The old road from London to Carlisle passed through Rotherham. Charles I. during the civil war passed a night in the town: to one of the inhabitants, who held the stirrup while he mounted his horse, he gave as a memorial a coin of Richard I., which is still in possession of the family of Clarke residing in Rotherham.

There is no single constituted authority for the purposes of municipal government. The 'feoffees of the common lands of Rotherham' are the most important local body. They consist of twelve inhabitants elected for life by the freeholders and rate-payers of the township, and they have the management of certain lands bought by the inhabitants of Queen Elizabeth. The total income at their disposal is at present about 600*l*. a year, a considerable proportion of which is expended in the improvement of the town and in other objects of public utility. Mr. Hunter states (*South Yorkshire*) that he has inquired in vain for the decree or patent under which the feoffees act. The town is lighted under a local act obtained in 1801. A gas-company was established in 1833, but is not incorporated, nor is the water-company, which was formed in 1827. The police is regulated by a general local act (3 and 4 Wm. IV., c. 90), and consists of a day and night watch, for which the township only is rated. The county magistrates sit in petty sessions every Monday, and offenders are committed temporarily to the town gaol. The Midsummer quarter-sessions for the West Riding are held at Rotherham. A court of requests was established in 1839, and its jurisdiction extends to places in the vicinity. Rotherham is the centre of a union under the Poor-Law Amendment Act. The expenditure for the relief of the poor averaged 2808*l*. for the parish, before the union, and in 1838 the expenditure was 1790*l*.

Great improvements have recently taken place in the general appearance of the town. Streets have been widened, old houses pulled down, and many good buildings erected. The materials for building are abundant, the town itself standing upon a mass of the old red-sandstone. Besides the parish church, there is a chapel at Tinsley, a small antient edifice; a church at Greasbrough, built in 1826, with the aid afforded by the Church-Building Commissioners and voluntary contributions; a new church at Thorpe; and a new church at Kimberworth will be completed in 1842. The oldest chapel for Protestant dissenters was built by the Presbyterians in 1705, and is now used by the Unitarians; it was repaired and enlarged in 1840. The Independent chapel, situated in Masbrough, was built towards the end of the last century, and has been once enlarged. The Wesleyan Methodist chapel, built in 1805, has been twice enlarged. A Primitive Methodist chapel has been opened since 1820. In 1836, a handsome Baptist chapel was erected; and within the last three years the service of the Roman Catholic church has been performed in a building formerly occupied as a theatre. The court-house, in which the Midsummer quarter-sessions are held, was built by the county in 1827, and is the most convenient in the Riding. The library, news-room, and dispensary occupy a plain substantial building erected in 1828. The dispensary was established in 1806, and affords medical aid to between 500 and 600 patients yearly. Almshouses for four poor unmarried women were founded in 1780 by Mrs. Mary Bellamy.

Rotherham possesses many important advantages calculated to encourage manufactures. Extensive beds of coal, of a quality suitable to manufacturing processes, exist in nearly every part of the parish, and iron-ore is also abundant. Leland notices, in the sixteenth century, that a mile from Rotherham 'be veri good pittes of coal;' and also that in the town 'be veri good smithes for all cutting-tools;' but it was not until about a century ago that any extensive manufacturing operations began to be carried on. In 1746, the Walkers established a work for the manufacture of cast-iron goods of all kinds; and at the large establishments which originated in their enterprise, great part of the cannon used in the navy during the American and French wars was cast, and for a considerable period nearly the whole country was supplied by them with cast-iron goods. The iron bridges at Sunderland, Yarm, Staines, and the Southwark-bridge over the Thames were cast at their works. After a period of inactivity which followed the close of the war, the various branches of the iron-manufacture are again carried on with great vigour, many new establishments have been commenced, and a greater variety of articles is produced. Stoves, fenders, engineering and millwork, and many kinds of hardware goods are now made. Glass, earthenware, starch, soap, naphtha, pyroligneous acid, are manufactured at Rotherham. There are two extensive ale and porter breweries, and vessels of 50 tons burthen are occasionally built in yards adjoining the Don. A flax-mill has been carried on for several years. The markets for corn and cattle are held on Monday: both are of great importance; but every alternate Monday the cattle-market is one of the largest in the county, and is attended by buyers from Manchester and other towns at a great distance. There is a covered stone building in the market-place for the accommodation of the dealers in butter, poultry, and eggs; and the feoffees are intending to render it more convenient by enclosing one of the sides. The shambles occupy the northern sides of the market, and were built by the feoffees. The fairs are for horses and cattle chiefly, and in November there is a statute fair for hiring servants.

Besides the various natural advantages which the manufacturers of Rotherham enjoy, there are few places possessing such extensive facilities for traffic. The Don was made navigable from Doncaster to Tinsley (the latter place situated between Rotherham and Sheffield) in 1720; and in 1820 the navigation was extended from Tinsley to Sheffield by a canal. The Don gives to the town the means of exporting and importing commodities by water to and from all the great manufacturing towns of Yorkshire and Lancashire, and it communicates with the Trent by the Stainforth and Keadby canal. The Sheffield and Rotherham railway was opened in 1838. It commences in West-gate, Rotherham, where a handsome station is building, is carried across the Don by a wooden bridge, receives a branch from the Greasbrough collieries, and another from the North Midland Railway, and terminates in the Wicker, Sheffield. Trains depart from each terminus every hour during the day; and the distance between the two towns, which is 5½ miles, is performed in about fifteen minutes: the lowest fare is sixpence. Upwards of a million of passengers had been conveyed along the line in the two years ending October 1840. The Rotherham station on the North Midland Railway is one of the most important on the line, being used by Sheffield on the one hand, and by Rotherham and an extensive district eastward: it is a handsome stone edifice with a spacious waiting-room and offices. This railway, which connects Leeds, York, and Hull, and the counties of Durham and Northumberland, with the midland and western counties and the metropolis, passes through a considerable portion of the parish, and has greatly increased the value of property adjacent to it. At the Ickles, a hamlet in the parish, it is carried over the Don and the Sheffield road by a fine viaduct of twenty-five arches. The communication between London and Rotherham is effected in about 8½ hours.

The population of the parish and township at the four periods when the census was taken, was as follows:—

	1801.	1811.	1821.	1831.
Township . . . . .	3070	2950	3548	4083
Total of parish	8418	8671	9623	10,387

The population of the parish is at present estimated at 12,000, and that of the township, at 5000: in the latter the rent of houses is rising, though many new houses have been lately built. The population of the different divisions of the

parish, in 1831, was as follows:—Rotherham (as before stated), 4083; Kimberworth, 4031; Greasbrough, 1290; Tinsley, 368; Brinsworth, 229; Catcliffe, 196; Dalton, 167; Orgreave, 35.

The establishments for education at Rotherham are:—1. The Independent academy, situated in Masbrough, at which 25 young men are educated for the Independent ministry, under a tutor in theology and a tutor in classics: the institution is supported by voluntary contributions. 2. The grammar-school, founded in 1584: the classics are taught gratuitously to the boys of the town. The master has a house rent-free, and the total endowment is about 30*l.* per annum, to which the feoffees, who are the trustees, add a gratuity. The scholars have a claim to a fellowship and two scholarships in Emmanuel College, Cambridge, in case the same are not occupied from the free-school at Normanton; and there is a fellowship at Lincoln College, Oxford. 3. Hollis's School, founded in 1663, by Thomas Hollis, a Nonconformist, for the education of thirty children. 4. The Feoffees' school: 26 boys and 20 girls are educated and instructed in reading, writing, and arithmetic. 5. A school on the Lancasterian system, for 200 boys and 200 girls. 6. Boarding, common day, and dame schools. 7. Sunday-schools. We have no accurate information respecting the two latter classes of schools. Lending libraries are attached to the Sunday-schools of nearly each denomination. The public library was established in 1775, and contains about 3000 volumes, including the publications of the 'Record Commission.' There are nearly 90 annual subscribers. Rotherham was one of the earliest towns in establishing a subscription library, but there is neither a mechanics institute, mechanics' library, nor savings'-bank in the town. There is a small library of theology in the church, for the purchase of which the sum of 100*l.* was left a century ago.

**ROTHERHITHE. [SURREY.]**

**ROTHERSAY, or ROTHSAY,** a burgh in Scotland, in the island of Bute, chief town of the county of Bute, 22 miles from Glasgow, or 19 from Greenock; in 55° 51' N lat. and 5° 1' W. long.

Rothersay owes its origin to a castle erected here about A.D. 1098, by Magnus, king of Norway, to secure the Western isles of Scotland, which he then held. Under the protection of this castle a village was formed, and, under the patronage of the Stuart family, to whom it belonged, rose to importance. Robert III. raised it from being a burgh of barony to the rank of a royal burgh, and James VI. A.D. 1595, further augmented its municipal privileges. It suffered much in the wars of the middle ages, and was repeatedly taken and plundered by the English, the Norwegians, and the Lords of the Isles. It was seized by the Duke of Argyle in his invasion, A.D. 1695. - In the early part of the last century many of the inhabitants left it, in order to settle at Campbelltown, and the town appeared like a desert; but since then it has much revived.

The town stands on the east side of the island, at the bottom of a small bay. It consists of several streets and lanes, and has been enlarged along the shore on each side of the old part of the town, by the addition of villas and lodging-houses for the accommodation of the bathers who resort here in the summer from Glasgow, and to whom the place is recommended by its mild and healthy climate and pleasant situation.

Rothersay Castle, a tall heavy-looking ruin, consisting of a circular enclosure with massive walls flanked with round towers built of red stone, stands in the middle of the town. The town-hall and county buildings, a handsome castellated structure with an elegant tower, and the prison for the county, are adjacent to the castle. The kirk is a modern building about a mile from the town. There are two chapels-of-ease, one of them Gaelic; a third chapel-of-ease, of elegant architecture, has been built by the Marquis of Bute in the northern part of the parish. There are three or four dissenting places of worship in the parish. Close to the parish church are the ruins of the ancient church of St. Mary, once the cathedral of the bishopric of the Isles: the walls of the choir, and one or two ancient monuments, are standing.

The population returns of 1831 were as follows:—

	Inhabit.	houses.	Families.	Formers.
Burgh . . . . .	549	1148	4917	
Rest of parish . . . . .	208	242	1267	
	757	1390	6184	

About one-third of the population of the part of the parish

not included in the burgh is agricultural. By a subsequent account carefully taken in 1837, the population was given at 4924 for the burgh, and 1165 for the rest of the parish; total 6089.

There are a cotton mill and a power-loom factory, a tanyard, two boat-building yards, and several cooperages. The herring fishery is carried on. There are three banks, branches of the Greenock, the Renfrewshire, and the Royal Bank. The harbour was formed A.D. 1822, and has a slip and building dock, either now finished or in course of construction, adjacent to it. The exports are cotton yarn and cotton goods, herrings, fresh fish, barley, turnips, potatoes, rye-grass seeds, small timber, and leather; the imports are raw cotton, cotton yarn, hides, wheat, oats, flour, beans, bone-dust, lime, freestone, coals, salt, and barrel staves. There were, in 1837, 58 vessels belonging to the port, of from 15 to 300 tons, total registered tonnage 2950: men 255, employed in the coasting trade, foreign trade, or fishery. There is a communication by steam-boats with Glasgow. There is a weekly market, and there are three fairs of little importance. Port Bannatyne, a village in the parish, with a population of about 300 persons, has 25 small vessels engaged in the herring fishery.

The parish is in the presbytery of Donoon, in the synod of Argyle. There were, in 1840, fifteen schools in the parish, including one parochial school with three assistant teachers, two schools endowed by the Marquis of Bute, and three others which are partially assisted. The number of scholars in these schools, in the spring of 1840, was 921, nearly one-sixth of the whole population. The management of the schools is considered to be very good, and there is scarcely a young person brought up in the parish who cannot read and write. There are in the parish six public libraries and two public reading-rooms. A periodical publication, 'The Bute Record of Rural Affairs,' has lately been established: it is useful to agriculturalists. There are several friendly societies, and a savings' bank.

The burgh is governed by a provost, two bailies, a dean of guild, a treasurer, and twelve councillors. Burgh courts, sheriff and justice of the peace courts, and county meetings are held here. The burgh formerly united with Ayr, Irvine, Campbelltown, and Inverary in returning a member to parliament. By the Scottish Reform Act it was disfranchised as a parliamentary burgh, and added to the county of Bute; but by way of compensation, that county, which had previously returned a member alternately with Caithness, was allowed to return one constantly. (*New Statistical Account of Scotland; Parliamentary Papers.*)

**ROTTBOELLA**, a genus of the tribe Rottboelliaceæ, of the very natural and extensive family of grasses, named by Mr. Brown in honour of C. F. Rottböll, a Professor of Botany at Copenhagen, who died in 1797, and who published several works, one in particular on exotic species of Gramineæ and Cyperaceæ. The genus is distributed throughout Asia, especially India, New Holland, and the tropical islands, and extends also to Egypt. The species are usually tall, erect, and flat-leaved, with the spikes round and jointed; spikelets two in each joint, pressed close to or sunk into a hollow in the rachis; of these one is sessile, the other stalked. The species are not relished by cattle, with the exception of *R. glabra*, of which they are said to be fond in India.

**ROTTEN-STONE** occurs massive. Fracture uneven. Colour greyish, reddish, or blackish brown. Dull, earthy, and opaque. Soft, soils the fingers, and is fetid when rubbed or scraped. Found near Bakewell, Derbyshire, in Wales, and at Albany in the state of New York.

It is employed in polishing metals, &c.

**ROTTENHAMER, JOHN**, was born at Munich in 1564, and received instruction in the rudiments of painting from an obscure artist named Donhaur or Donower. Early in life he went to Rome, and became known for small historical compositions painted on copper in a style of most minute finishing. Emboldened by success, he undertook to paint for one of the churches of Rome a large altarpiece, representing several saints and a glory of angels, a work which, when completed, excited astonishment at the P. C., No. 1254.

extent and versatility of his talents. This work he afterwards repeated for the church of Santa Croce at Mantua. He visited Venice, and studied the colouring of Tintoretto, whose style he imitated with great exactness. Whilst at Venice, he painted some pictures for the public edifices, two of which are mentioned by Lanzi, namely, a Santa Cristina at the Incurabili, and an Annunciation at San Bartolomeo; but that writer speaks in slighting terms of these works, and generally so of the talent of the painter. During his stay in Italy, which lasted several years, he was patronised by Ferdinand, duke of Milan, for whom he painted, amongst numerous works, a picture of Nymphs dancing, which was much admired.

He returned to his native country, and established himself at Augsburg, where he was much employed. For the emperor Rudolph II. he painted a fine picture of the Feast of the Gods, a composition of many figures, gracefully designed, and coloured with the splendour of the Venetian school. Many of his backgrounds were painted by John Breughel, and some by Paul Bril. He was partial to the introduction of gaudy accessories into his pictures, which he frequently enlivened by naked figures designed with taste and coloured with delicacy. His heads are expressive, but present too much sameness of appearance, and his design, though tolerably correct, is generally formal and mannered. There were eight of his important pictures in the gallery of the Louvre, which were removed in 1815, and returned to Prussia, Holland, and Austria, whence they had been taken. Though greatly employed, Rottenhamer died in poverty, and was buried by subscription at Augsburg, where he died in 1604, or, according to Bryan, in 1606. Lanzi says that he visited England, and that he died here, but this appears to be a mistake, as we find no mention of him in the 'Anecdotes of Painting,' and it is very improbable that so industrious an investigator as Mr. Vertue would have omitted in his memoranda any mention of an artist so generally known, if he had resided in this country.

(*Bryan's Dict.; Biographie Universelle; Lanzi, Storia Pittorica*, iii. 123.)

**ROTTERDAM**, the capital of the province of South Holland, in the kingdom of the Netherlands, is situated in 51° 55' N. lat. and 4° 29' E. long., on the north bank of the river Maas, about twenty miles from the mouth of that river, which here resembles an arm of the sea. It is in the form of a triangle, the base of which, about a mile and a half in length, extends along the bank of the Maas; it makes a very striking appearance, especially when it is approached by water from Dordrecht. It derives its name from the little river Rotte, which runs through the middle of the city, and falls into the Maas. The town is not fortified, but is surrounded by a moat, and has six gates towards the land and four towards the water. The part called the Binnenstad (i.e. the inner town) has many narrow streets, and is separated by the High-street from the outer town (Buitenstad), which contains the fine houses of the rich merchants, and is intersected by numerous canals connected with the river, on which the largest merchantmen can come up and unload at the very doors of the warehouses. Along the Maas are many fine quays, the handsomest of which, called the Boortjes (from the rows of trees with which it is planted), consists of a long row of stately houses facing the river, with a broad and deep canal in the rear, parallel to the river. A canal from Helvoetsluys to Rotterdam was made in the years 1827 to 1830. The iron railway, already completed between Amsterdam and Haarlem, is to be prolonged to Rotterdam. The great church of St. Lawrence contains the tombs of admirals De Witte, Kortenaar, Brukel, De Liefae, and others, most of whom fell in the wars with England and France, between 1660 and 1674. Besides this church there are many churches and chapels of the Dutch and Scotch Calvinists, French Protestants, English Episcopalians, Presbyterians, Baptists, Roman Catholics, a Jews' synagogue, &c. The Exchange is larger and handsomer than that of Amsterdam. The other principal buildings are the town-house, a very antient edifice, the Admiralty, the Academy, the Dutch theatre, the magazines of the East India Company, and some manufactories. The commerce of Rotterdam extends to all parts of the world, and embraces almost every kind of produce and manufacture. In the year 1840 the number of ships that entered inwards was 1671, of which 1543 were with cargoes amounting to 321,308 tons, and 128 (of 8276 tons) in ballast. The number that cleared outwards

was 1835, in all 354,334 tons, of which 1394 were with cargoes to the amount of 279,517 tons.

Rotterdam contains many valuable collections of works of art, an academy of sciences, a public library, and other useful institutions. Rotterdam is the birth-place of several celebrated men, among whom are the great painter Adrian van der Werf, and the learned Erasmus, a bronze statue of whom, ten feet high, stands in the great market-place. The population of Rotterdam has much increased of late years; in 1840 it amounted to 78,098, of whom 51,765 were Protestants, 23,295 Roman Catholics, and about 2800 Jews. (Stein; Hassel; Hörschelmann; *Dutch Official Journal*.)

ROTTERDAM, NEW, is one of the islands which constitute the group of the Friendly or Tonga Islands, and is situated in 20° 15' S. lat. and 174° 48' W. long. This island was discovered by Tasman (1643), and named New Rotterdam, but it is now better known as Annamooka, or Namoooca, as Mariner writes it, which is the name given to it by the inhabitants. The island is about twelve miles in circumference, and in the middle there is a lagoon which is a mile and a half across. The island is low, and surrounded by a sea with regular soundings. At a distance of from two to three miles from the shore, the depth varies between 25 and 30 fathoms. On the north-western side there is a roadstead called Van der Luys by Tasman, on which Cook anchored in 1773 and 1777. As to its productions and inhabitants see FRIENDLY ISLANDS. (Cook's *Voyages*; Mariner's *Account of the Natives of the Tonga Islands*; Krusenstern's *Atlas de l'Océan Pacifique*.)

ROTTI. [TIMOR.]

ROTTLE'RA, a genus of plants named in honour of Dr. Rottler, a native of Denmark, who was sent out to India by the Church Missionary Society, and was distinguished there for his labours as a missionary for the space of nearly 50 years, as well as for his acquaintance with the Tamul language, on a dictionary of which he was long engaged, as also for the attention he paid to botany, having formed one of the knot of early botanists at Tranquebar, who, with Koenig, were the first since the time of Rheede to study that science in the peninsula of India. Dr. Rottler's extensive Indian Herbarium is deposited in the museum of King's College, London.

The genus belongs to the natural family of Euphorbiaceæ, but the same name was applied by Vahl to one of the Cyrtandaceæ. It is characterised by having male and female flowers upon different plants. Male:—Calyx 3-5 partite. Corol none. Stamens 30 to 40, inserted into the convex receptacle. Filaments free or united at the base. Female:—Ovary 2-3-4 celled, each one-seeded. Style deeply, 2-3-4 partite, lacinated. Capsule 2, 3, or 4 coccous, each one-seeded. The genus, which is found in the tropical parts of Asia and throughout India, contains handsome moderate-sized trees. *R. tetracocca* grows in Silhet, and yields a hard and valuable timber. The capsules of *R. tinctoria*, a native of the Coromandel coast, and extending to the forests of Northern India, are covered with short stiff hairs, which, when rubbed off, have the appearance of a powder of a fine red colour, which is employed in India in dyeing silk of a scarlet colour, and therefore forms an article of commerce in that country. Dr. Royle, 'Illustr. Himal. Bot.,' p. 329, states that this strigose pubescence is also employed in India as an anthelmintic in the same way that cowhage is, and, like it, probably acts mechanically in expelling intestinal worms.

ROTUNDA, a term applied to buildings which are circular in their plan both externally and internally, or else to halls and other apartments of that shape, included within and forming merely a portion of the edifice containing them. The technical application of the term is however restricted to circular buildings whose height does not much exceed their diameter, for we should not describe a lofty cylindrical edifice, such as a round tower, by the term rotunda; while on the contrary it is frequently employed to designate polygonal buildings which approach in their general form to the circle: for instance, the Colosseum in the Regent's Park, London, might without any great impropriety be classed among rotundas, it being a polygon of sixteen sides, which accordingly form very obtuse angles.

We need not here repeat what has been said on the subject of circular plans in the article ROMAN ARCHITECTURE, and therefore proceed to remark, that notwithstanding their beauty, there are very few instances indeed of what can strictly be termed rotundas. In fact, such shape is utterly

unsuited to buildings in general, whatever their particular purpose may be, unless it be one for which nothing more than a single spacious hall or area is required internally. It does not admit of being divided within into regular-shaped rooms, without very great loss of space, and therefore although plans of the kind have occasionally been attempted upon paper, they are to be looked upon chiefly as ingenious architectural exercises and experiments. We have however an instance of a plan of the kind being carried into execution at the Marquis of Bristol's seat at Ickworth, near Bury St. Edmund's, the body of the mansion (115 feet by 100) being an elliptical and therefore a round structure, though not perfectly circular; but striking as the external effect certainly is, too much is sacrificed to it. In the Rue de Pigalle, Paris, is a rotunda-house, about 50 feet in diameter, built by the architect Henry, in 1788. Even among public buildings there are very few for which the circle can with propriety be adopted as the figure of the entire plan: accordingly instances of it are very rare. It is applicable only where a large space is to be provided as a place of public rendezvous or assemblage, where it is desirable to have compactness and an area unobstructed by columns, which in a square one of the same superficial extent would be indispensable in order to support the roof. Therefore though it is well adapted for an Exchange, a market-hall, or similar places, and can hardly be made available for any others, it is nevertheless very rarely resorted to even for them. The Halle des Blés, or Corn-Exchange, at Paris, is almost the only example of the kind that occurs to us.

In ecclesiastical architecture circular and polygonal structures were by no means uncommon among the early Christians, especially for baptisteries and sepulchral chapels. The tomb of Theodoric, or what is now called Santa Maria Rotunda, at Ravenna, is a singular example, having a flattened or segmental dome (about 34 feet in diameter) cut out of a single block of stone. Of San Stefano Rotondo and Santa Costanza mention has been made under ROMAN ARCHITECTURE, and to them may be here added the Rotunda or Church of Santa Maria Maggiore at Nocera, a work of about the same period. While it greatly resembles Santa Costanza in plan, having coupled columns placed on the radiating lines from the centre, and with arches springing from them, it differs altogether in section from both those examples, there being no cylindrical wall or tambour above the colonnade, but the dome springs immediately from the columns, and the arches groining into it. Consequently the proportions are much lower, the diameter of the space enclosed by the columns being 39 feet, and the height to the top of the dome 42,—proportions differing very little from those of the Pantheon. The extreme internal diameter is 78 feet. The earlier edifices of this class are, for the most part, of moderate dimensions, but others were afterwards erected on a larger scale, and among them is the celebrated Baptistery at Pisa [BAPTISTERY], which is externally about 120 feet in diameter, and 100 in height, exclusively of the dome. Besides being remarkable on account of its style, this edifice presents other architectural peculiarities, one of which is that the central area is covered by a conical roof the upper part of which is carried up so as to pierce the external dome, and, except that it has no openings, to appear like a lantern placed upon it. Woods therefore conjectures that the interior cone originally formed a spire, and that the external dome was an after addition to the structure. [BAPTISTERY.]

The rotunda became afterwards in a manner incorporated with or added to the cruciform plan, being raised aloft and placed over that part of it where the transepts intersect the body of the edifice. Nearly all modern cupolas may be described as rotundas elevated above the rest of the building and viewed by looking up into them from below. Thus supposing there was a floor at the level of the whispering gallery at St. Paul's, the dome and space beneath it would form a perfect and well proportioned rotunda, whose height and diameter would very nearly be the same.

In itself alone the rotunda form does not accommodate itself to the purposes of a church; it does not afford space for the processions and occasional ceremonies required by the Roman Catholic worship; nor is it better fitted for the Protestant service, since besides that nearly all its beauty would be destroyed by the floor being covered with pews, it requires an amphitheatrical arrangement of seats in concentric curves. Neither is it a form that can be enlarged to any required capacity, for 140 feet is almost the maximum

of diameter that can be adopted for a space to be covered by a dome. Even the Pantheon at Rome, which may be taken as that maximum, is but of moderate size—an area scarcely at all exceeding the core of St. Peter's, the Duomo at Florence, &c., that is, merely the central part beneath the cupola. Rotundas are accordingly rare even in Roman Catholic churches, yet although such structures are necessarily limited by their form to a moderate size, they derive from it also a grandeur which would not be produced by the same scale according to any other plan. Neither grandeur nor beauty however results as matter of course from the plan alone, because whatever charm that possesses may be nullified by other circumstances. There is, for instance, nothing of the one and not very much more of the other in the rotunda interior of St. Peter-le-Poor's, London, the only instance we are acquainted with of such plan being adopted for a Protestant church. The arrangement of the pews and seats in parallel rows, strikes as a disagreeable contradiction to the shape of the building; besides which the vaulted dome, which is almost essential to such plan, is wanting, a cove and lantern with windows being substituted for it; owing to which the character of the whole becomes something different. A better example of a rotunda may be seen in that of the Bank of England.

Of late years one or two structures of the kind have been erected, viz. the church designed and built by Canova at his own expense at Possagno; that of San Francesco di Paola, by Bianchi, at Naples; the Madre di Iddio, Turin; and the new Catholic church at Darmstadt, by Moller. The first mentioned of these, the first stone of which was laid in July, 1819, ranks high among the few architectural works of importance which Italy has produced within the present century, and is remarkable for its portico being almost the only instance of the application of the Athenian Doric in that country, certainly the only one upon so large a scale. As a plan of the portico is shown in PORTICO, fig. 2, all that we need mention in regard to that feature is, that the columns are 35 feet in height; the entire height from the ground to the apex of the pediment, 79; and the breadth of the portico, 90; therefore the dimensions of the order are very nearly equal to those of the Parthenon, the difference in the height of the columns being only 10 inches. The rotunda itself is about 45 feet less in its internal diameter than the Pantheon, but is still sufficiently ample to be imposing. In its proportions, and in its coffered dome, the centre of which has a glazed opening to light the whole interior, it resembles the Roman structure; not so however in design, for the architecture errs as much in being too plain and cold, as that of the other building does in being broken into too many parts, and too much cut up by heavy ornament. Like the Pantheon, the plan is divided into eight compartments, all of which form as many arched recesses; that within which is placed the door, and the opposite one (forming a deep sanctuary for the high altar), being rather loftier than the rest. The arches themselves are quite plain, without either keystones or archivolts, and, except the tabernacles or altars within the recesses, the only decoration is that produced by the panels filled with sculpture, in the spaces between the arches. Nevertheless, taken altogether, it is a noble monument, especially when it is considered that it was raised by a private individual.

Instead of attempting to describe other examples of rotundas in a similar manner, we shall put our notices relative to them into a condensed form, and for convenience sake shall include those already mentioned, as their relative sizes can thereby be more readily compared.

*Pantheon, Rome.* External diameter 188 feet, internal 142, internal height 142. [ΠΑΝΘΕΩΝ.]

*Temple of Minerva Medica.* External diameter 110 feet. Interior a decagon 78 feet in diameter and 105 high.

*Santa Costanza, Rome.* Extreme internal diameter 140 feet; diameter of rotunda within the peristyle and beneath dome 70, height of dome 130.

*Nocera, Santa Maria.* Extreme internal diameter 78 feet, diameter of dome and peristyle 39, height 42.

*Rotunda, Forum Caracalla.* Exterior diameter about 100 feet. Corinthian portico hexastyle, triprostyle. Interior diameter 80 feet, height of order 48, entire height 90.

*Rotonda at S. Pietro in Montorio, Rome.* (Bramante.) Exterior enclosed by a Doric peristyle of 16 columns. Interior diameter 22 feet, height 48. This edifice is generally admired as a classical piece of architecture, but it has many

striking defects, and the balustrade (without pedestals) over the peristyle is intolerable.

*Madonna di Campagna, Verona.* (Sanmicheli.) Exterior 74 feet in diameter, nearly surrounded by a low Doric peristyle of 28 columns, making the entire diameter below 118 feet. Interior an octagon 64 feet in diameter and 101 high.

*Capella Pelligrini, Verona.* (Sanmicheli.) Elegant in plan, but enormously disproportioned in section. External diameter 40 feet, internal 30. Two orders within. Height to spring of dome 46 feet, entire height 64.

*La Maddelina, Venice.* (Temanza.) Internal diameter 55½ feet, height to spring of dome 36, entire height 63, or 7½ more than diameter. Arrangement hexagonal, i.e. six arched compartments.

*Halle des Blés, Paris.* (De Mezières.) External diameter 228 feet, interior diameter of the rotunda beneath the dome 127, height to spring of dome 42½, to summit 105.

*Possagno.* (Canova.) External diameter 116 feet; width of portico 90, projection of portico 55, height of stylobate 10½, internal diameter 90, height 90.

*Madre di Iddio, Turin.* (Buonsignore.) A rotunda about 130 feet in diameter, with hexastyle, diprostyle, Corinthian portico. Internal diameter 74 feet, height 100; plan four semicircular tribunes, with two Corinthian columns in front of each, bearing the entablature continued over those spaces. Attic with a long panel over each of the four recesses.

*Museum of the Vatican, Rotunda.* (Simonetti.) Divided into ten recessed compartments: diameter 50 feet.

*Berlin Museum, Central Hall.* (Schinkel.) Diameter 67 feet, height of gallery supported by a peristyle of twenty Corinthian columns, around the lower part 21; height to spring of dome 42 feet, entire height 70.

*Catholic Church, Darmstadt.* (Moller.) Extreme internal diameter 135 feet, peristyle of twenty-eight Corinthian columns supporting dome; diameter of dome and peristyle 102 feet, height to spring of dome 48 feet, to summit 102.

*Radclyffe Library, Oxford.* (Gibbs.) Basement a polygon of 16 sides, and 104 feet in diameter. Extreme exterior height 140 feet, interior diameter 88, interior diameter of central space and dome 52, height 90.

ROUBAIX, a town in France, in the department of Nord, about 6 miles north-east of Lille, and 146 north-north-east of Paris. It is of no historical interest; it owes its prosperity to its manufactures, which were introduced under the ministry of Colbert. The town stands about midway between the Escaut or Schelde and the Lys, but at a considerable distance from both. It communicates however with the Lys by means of the canal of Roubaix, which opens into the Deule canal. [NORD.] The town consists of large, neat, and well-built houses. The population in 1831 was 12,443 for the town, or 18,187 for the whole commune. The staple business of the place is the cotton-manufacture, which is carried on in all its branches with considerable activity. Some woollens are also manufactured. Archil (or litmus), and azure (or finely powdered smalt), and machinery of various kinds are made; and dyeing and tanning are carried on. There are twenty-five fairs in the year. The manufactures of Roubaix render it a place of great resort for merchants, both of France and other countries. There are a chamber of manufactures and an hospital. The town long laboured under a want of water, but the deficiency has been supplied of late years by means of Artesian wells. The manufactures of Roubaix are exported to the French colonies and to South America.

ROUBILIAC, LOUIS FRANÇOIS, an eminent sculptor, born at Lyon in France, but long resident in England, where all the works by which he gained his reputation were executed. It is not known at what period Roubiliac came to this country. The earliest notice of him as an artist is that he was recommended by Sir Edward Walpole to execute several busts for Trinity College, Dublin. He was afterwards employed, through the same interest, on the monument of John, duke of Argyle, in which he was so successful, that his claims to the highest honours of his profession were at once admitted, and, as he became the fashion, his practice was soon greater than that of the most popular artists of the day. Rysbrach, who also was settled in England, and who, till Roubiliac and Scheemacker appeared, was employed in all important works in sculpture, was neglected, and his merits forgotten in the desire to

do honour to the new favourite. Roubiliac's chief works are the above-mentioned monument of the Duke of Argyle, that of Sir Peter Warren, and of the Nightingale family, all in Westminster Abbey; those of the Duke and Duchess of Montague, in Northamptonshire; and one in memory of Bishop Hough, in Worcester cathedral. His principal statues are of George I., at Cambridge; of George II., in Golden Square, London; of Handel, the composer, in Westminster Abbey; and those of the Duke of Somerset and Sir Isaac Newton, both at Cambridge. His busts are very numerous.

Of the high merit of Roubiliac there can be no doubt. The monuments of Mr. Nightingale and his lady, the statue of Eloquence in the Argyle monument, the draped figure in Bishop Hough's monument, and the statue of Newton, are proofs of great power both in invention and expression, and are remarkable also for minute and careful execution. At the same time they are deficient in the repose, simplicity, unity, and breadth which are found to characterize the finest works in sculpture, and which alone can ensure the lasting reputation of productions in this art when the interest that may have been felt in the individual subjects, the fashion of the day, and the popularity of the artist, have passed away. In the absence of these principles we find sufficient reason for the (comparatively) low estimation in which the sculpture of the Rysbrach and Roubiliac schools is now held by all real judges of art.

The most striking defect in the Nightingale monument (to illustrate criticism by reference to a well-known work) is, that the limits which separate poetry and imitative art are transgressed, and the result is confusion and incongruity. The sentiment of a husband endeavouring to shield a beloved wife from the approach of death is just; it appeals to our sympathies, and the mind at once comprehends it; but the attempt to give form to this idea by representing a common-life figure, in modern dress, warding off a palpable and material dart about to be hurled by a grim *skeleton*—making that an agent which is the result or consequence of dissolution—is so obviously wanting in truth and keeping, that it is only necessary to refer to it to show its impropriety. The statue of Newton, though possessing great merits, is open to objections of another kind. The attitude is intended to express thought and calculation, and the action of the hands is finely conceived and perfectly in harmony with this feeling; but the impression is weakened by the general air of the figure, which, critics have justly observed, is not that of a grave philosopher; and the drapery, though executed with great mechanical skill, and with minute attention to correctness of costume, is equally wanting in the repose appropriate to the subject. The sacrifice of simplicity to attitude and flutter, and the ambition to display skill in mere execution—the sure indication of the decline of pure taste—also detract from the general merits of the statues referred to in the monuments of the Duke of Argyle and Bishop Hough. Roubiliac's faults are however the faults of the age; and artists, unfortunately, are too often tempted or driven, against their better judgment, to adopt the mode, however opposed to pure taste or sound principles, by which alone they can expect to gain public notice.

Roubiliac died on the 11th of January, 1762, and was buried in the parish of St. Martin's.

ROUEN, capital of the department of Seine Inférieure, 65 miles in a direct line north-west of Paris, 76 miles by St. Denis, Pontoise, and Magny, or 83 miles by Meulan, Mantes, and Vernon; in  $49^{\circ} 27' N.$  lat. and  $1^{\circ} 5' E.$  long.

The first mention of this town is by Ptolemy, who speaks of it as the capital of the Vellocasses, a Celtic people. The name is variously written: Rotomagus, Rothomagus, Ratomagus (in the Antonine Itinerary, probably by a transcriber's error, Latomagus); in the Peutinger Table, Ratumagus; and in Ammianus Marcellinus in the plural form, Rotomagi. This name remained when most other capitals had their own proper designation superseded by that of the people to which they respectively belonged, and was in subsequent times shortened into Rotomum or Rodomum, whence the modern Rouen. Under the Romans it was the chief town of the province of Lugdunensis Secunda. Some Roman antiquities, but of little importance, have been discovered at various times. In the early history of France, Rouen appears as the scene of some of the cruelties of Fredegonde. It suffered much from the incursions of the Northmen or Normans, whose capital it became, when, by virtue of the treaty between Rollo and

Charles the Simple (A.D. 911 or 912), they settled a part of France. [NORMANDIE.] Under the dukes of Normandy, it increased on the south side, where great building was obtained by contracting the bed of the Seine. Louis d'Outremer, king of France, visited Rouen, during the minority of Richard I. of Normandy, whom he claimed to be guardian. In a subsequent dispute he was captured and imprisoned at Rouen, A.D. 945-6. In 1066, being at war with Richard, he attacked it, but Guillaume, or William the Conqueror, died at Rouen, A.D. 1087. In the year 1204 it was seized, with the rest of the duchy, by Philippe II. Auguste, king of France. The townsmen offered an obstinate resistance to the king, but were at last obliged to open the gates; and the mission determined that of the other towns and lands of the duchy. [NORMANDIE.]

From this time till 1419 it continued subject to the king of France, under whom it was enlarged on the east and west sides. It was at Rouen that Charles le Mauvais, king of Navarre, was seized by John II, king of France, in 1355. In 1418-19 it was besieged by the English, under Henry V. [HENRY V.] The town was defended by a garrison of 4000 men, who were resolutely sustained by the townsmen, under their gallant commander Alain Blanchard. As the town militia mustered 15,000 men, the population of Rouen at the time may be estimated at not less than 50,000 or 60,000. Famine at last compelled the town to surrender, and Henry tarnished the fame of his victory by the execution of the gallant Blanchard. Two other townsmen, who had been excluded from the benefit of the capitulation, escaped punishment by payment of money.

Rouen remained for many years in the possession of the English. In 1431 Jeanne d'Arc was burned to death at Rouen. The Duke of Bedford, regent of France for the English party, died here, A.D. 1435. [FORD, JOHN, DUKE OF.] In 1449 the city was retaken by the French, under the king, Charles VII. [CHARLES VII.]; the town was taken in three days, the castle or citadel held out a fortnight longer, and then capitulated. In 1465 Rouen revolted from Louis XI, who took an oath of allegiance to his brother the Duke of Burgundy, whom the duchy of Normandy was formally ceded to that prince by the peace of Conflans; but it was recovered in 1475 by Louis, who severely punished some of his chief adherents. In 1562 the Huguenot party succeeded in seizing the town, almost without resistance, and committed great excesses. They were almost immediately expelled by the Royalists, under the Duke of Aumale, whom they had expelled; but the siege was soon renewed by the royalists, at first under Antoine de Bourbon, king of Navarre, who was mortally wounded, and then under the Duke of Guise, who took the town the same year, and gave it up to the English for eight days. [CHARLES IX.] The massacre of St. Bartholomew extended to this town, but the humanity of the governor somewhat checked the excesses. In 1592 the townsmen who had embraced the party of the League were besieged by Henri IV., but were relieved by the arrival of the Duke of Parma, with a Spanish army, from the Spanish Netherlands. They did not recognise Henri's title as king till after his conversion. Since that period it has few historical events connected with it. Famished by some troubles in 1789, and the Revolution gave rise to others in 1792, 1793, and 1795; but Rouen suffered less from the excesses of that period than many other towns.

The city stands on the right or north bank of the Seine. Its form approximates to an oval, defined by the boulevards, which form a line of street adorned with trees, and occupying the site of the ancient walls, except on the side of the river, where the city is bounded by a quay. The boulevards are far less frequented than those of Paris, and resemble in appearance, as well as effect, the public walks of Cambridge, except that the addition of females in the fanciful Norman costume, and the Seine in the fine prospect beyond, and Mount St. Catherine above, give it a new interest. (Dawson Turner's *Tour in Normandy*.) Separated from the city by the boulevards, are the faubourgs or suburbs, viz., the Faubourg Cauchoise, on the west; Epreuil, on the north-west; Beauvoisine, on the north; Hilaire, on the north-east; Martainville, on the east; and Eauplet, on the south-east. South of the city, from which it is separated by the Seine, is the Faubourg St. Sever, the most important of the suburbs. Opposite the central part of the city the channel of the river is clear; and it was from

in this part by a floating bridge, supported by nineteen large boats or barges, so as to rise and fall with the tide; but it is now taken away. Just below this may be seen, at low-water, the ruins of a stone bridge, erected in the twelfth century by the empress Matilda or Maud, daughter of Henry I. of England, and carried away by a flood, A.D. 1564. Opposite to the upper and lower parts of the city and suburbs are two long islands: the upper called 'Ile de la Croix or de la Moucque,' the lower, the 'Ile du Petit Gay.' At the western or lower end of the Ile de la Croix, a stone bridge crosses the river; it is divided into two parts by the point of the island, resembling in this respect the Pont Neuf at Paris. Each part has three arches, the centre one of more than 100 feet span, the side arches of 85 feet. On the point of the island between the two parts of the bridge is a circular area adorned with a column. This bridge was begun by Napoleon, but has been finished since his reign. Two small rivers, the Robec and the Aubette or Prefontaine, flowing from the east-north-east, traverse the eastern part of the suburbs and city by artificial channels, formed by the Cardinal Georges d'Amboise, archbishop of Rouen, and flow into the Seine, the Aubette above and the Robec just below the stone bridge. Another little stream flows from the north in a covered channel, and falls into the Seine some distance lower down. On the east side of the city, just above the bank of the Seine, between that river and the Aubette, rises the hill or mount of St. Catherine, a bold eminence 380 feet high, which presents to the city a steep side of bare chalk, except where spotted with patches of vegetation or with cottages. On the south bank of the Seine, along which it extends for about a mile eastward of the bridges, is the principal public walk, 'Le Grand Cours,' planted with four rows of fine elms.

The interior of the city is very disagreeable, more particularly in the eastern part. An English traveller thus describes it in 1818: 'The filth is extreme; villanous smells overcome you in every quarter and from every quarter. The streets are gloomy, narrow, and crooked; and the houses at once mean and lofty. Even on the quay, where all the activity of commerce is visible, and where the outward signs of opulence might be expected, there is nothing to fulfil the expectation. Here is width and space, but no trottoir; and the buildings are as incongruous as can well be imagined, whether as to height, colour, projection, or material. Most of them, and indeed most in the city, are merely of lath and plaster, the timbers uncovered and painted red or black, the plaster frequently coated with small grey slates laid one over another like the weather-tiles in Sussex. Their general form is very tall, and very narrow, which adds to the singularity of their appearance; but mixed with these are others of white brick or stone, and really handsome, or it might be said elegant. The contrast however which they form only makes their neighbours look the more shabby, while they themselves derive from their association an air of meanness.' (Dawson Turner's *Tour*.) The frequent rains, by cleansing the streets, render the town less unhealthy than it would be; and beneficial changes introduced of late years have contributed to the same result. But the lank figures and pale faces of the inhabitants of the eastern part of the city show that much remains to be done. On the western side of the city and suburbs are some handsome straight streets lined with good stone houses. The squares and other open spaces are numerous, but for the most part very irregularly laid out; the 'Champ de Mars,' adjacent to the eastern boulevards, and the 'Place du Boulingrin,' used for the cattle and horse market, adjacent to the northern boulevards, are of more regular form. The Place St. Ouen, or Place de l'Hôtel de Ville, is large, and planted with trees.

The cathedral, the most remarkable building in Rouen, is a noble and spacious edifice, superior perhaps as a whole to most or all of the French cathedrals. It is a cruciform building, with two towers at the extremities of the west front, and a lofty tower and spire from the intersection of the nave and the transepts. The dimensions are given in French feet as follows:—length of the interior, 408 feet; width of ditto, 83; length of nave, 210; width of ditto, 27; width of aisles, 15; length of choir, 110; width of ditto, 35½; length of transept, 164; width of ditto, 25½; length of Lady-chapel, 88; width of ditto, 28; height of spire, 380; ditto of western towers, 230; ditto of nave, 84; ditto of aisles and chapels, 42; ditto of interior of central tower, 152; depth of chapels, 10. (The French foot is to the English in the proportion of 65 to 61, or nearly as 16 to 15.)

The general character of the architecture is what is termed by Rickman 'Early English.' The changes which mark the different epochs in the progress of Gothic architecture were introduced into Normandie earlier than into England. The west front, which opens upon a spacious close, is about 170 feet wide; the towers by which it is flanked are of dissimilar architecture, though of nearly equal height. The spire which surmounts the central tower, and appears over the centre of the west front, is of bold and light construction. The summit of the west front is crowned by a range of open screens, with the lightest and most elegant tracery. There are three doorways 'deep in retiring mouldings:' the central one, which is by far the largest, 'projects like a porch before the others, and is surmounted by a gorgeous pyramidal canopy of open stone-work, in whose centre is a great dial, the top of which partly conceals the rose window behind. This porch is adorned with numerous statues in niches, and was begun by the archbishop Georges d'Amboise, A.D. 1509. The side doorways are obtusely pointed, and are much older. The western towers flank the church so as to leave three sides free, and thus conduce to the great extension of the west front. The northernmost of these towers, called the tower of St. Romain or Romanus, is one of the oldest portions of the church; it has circular windows looking into the cloister court (the cloisters are nearly all destroyed), which are perhaps of the eleventh century. The southernmost of the towers is of very rich pointed architecture, and was built at a much later period by archbishop Georges d'Amboise. A great bell, 33,000 lbs. weight, cast by order of the same prelate and named after him, hung in this tower; it was of very inferior tone, and, after being cracked in 1786, was melted down at the time of the Revolution, and cast into cannon. The doorway in the northern transept, called the 'Portal of St. Romain,' is adorned with an endless variety of fanciful sculptures. The end of the northern transept is flanked by towers, and in the centre is a magnificent rose window. The southern transept bears a general resemblance to the northern, but has suffered more from the violence of the Huguenots and the Revolutionists. The central tower is of the year 1200; it is low and comparatively plain; the spire, the fourth by which it has been surmounted, was erected in 1824, in place of the former one destroyed by lightning: it is described as being much more elegant than its predecessor, which, though not elegant, was remarkable for the boldness of its architecture. The first spire was of stone, the second and third, and, we believe, the present one, of wood. The Lady-chapel and the roof of the choir were finished in the sixteenth century.

The interior of the cathedral contains twenty-five chapels, and many interesting monuments, including those of Rollo and his son Guillaume or William I. (Longue Epée), dukes of Normandie; but the effigies of these princes are of later date than their time. The tombs or cenotaphs of Henry the younger, son of Henry II.; of his brother Richard Cœur de Lion (whose heart was buried here); of Charles V. of France; of John, duke of Bedford; and others of interest, have been destroyed, partly by the religious and political troubles of subsequent ages, partly to make way for repairs and alterations in the building. The library was plundered during the Revolution; the staircase of the room which contained it is remarkable for its delicacy and beauty. The extensive palace of the archbishop, adjoining the cathedral, contains some good paintings.

The abbey church of St. Ouen is the noblest edifice in the pointed Gothic style in the city, and perhaps in France. Its beauty caused it to be preserved in the general destruction of the conventual churches at the Revolution, though it did not escape being plundered and desecrated. It had suffered much from the hands of the Huguenots in 1562. The abbey to which it was attached was founded in the sixth century, if not earlier; and the first church was dedicated to the twelve apostles, but afterwards transferred to the patronage of St. Ouen. The church was rebuilt in the twelfth century, but a fire having destroyed it and the rest of the abbey, except one tower, attached still to the present church, it was again rebuilt in the fourteenth and following centuries. It is a cruciform building, with a central tower, and two western towers, which jut out diagonally from the angles of the western front, and were intended to be connected by a porch of three arches, extending along the lower story of the western front: the towers have been raised only to about fifty feet, and are imperfect. The lightness and purity of the architecture; the flying buttresses,

with crocketed pinnacles and unusually lofty shafts; the beautiful south porch; the large rose or circular windows; the balustrade of varied quatrefoils round both the body of the church and the aisles; the painted windows, the whole of which have been preserved; and the rich central tower, terminated by a smaller octagonal tower, entitle this church to the highest admiration. Its dimensions are as follows: they are little inferior to those of the cathedral itself, and in some respects surpass it:—Length of the church, 416 French feet; of the nave, 234; of the choir, 108; of the Lady-chapel, 66; of the transept, 130; width of the transept, 34; of nave without aisles, 34; of nave with aisles, 78; height of roof, 100; of tower, 240.

The church of St. Maclou is next in beauty to the cathedral and the church of St. Ouen. The churches of St. Paul and St. Gervais, insignificant in themselves, show some remains of the Norman style. Those of St. Patrice and St. Godard are in a vitiated intermediate style between Gothic and Roman. There are in all fourteen Catholic (six of them parish) churches, several of Roman architecture. There are also a Protestant consistorial church and a Jews' synagogue.

The Palais de Justice, or court-house, built in the 15th or 16th century for the parliament of Rouen, forms three sides of a quadrangle, of which the fourth side consists of an embattled wall and a gateway of elaborate architecture. It is, notwithstanding many faults, a fine specimen of Gothic architecture of a late period, in a style approximating to what in England is sometimes called the Tudor style. Several of the apartments are admirable for their noble dimensions, just proportions, or carved and ornamented walls and roofs. In the Place de la Pucelle is a house, l'Hôtel Folleville, of similar architecture to the Palais de Justice, but far richer. It is ornamented with bas-reliefs or tablets, one series representing the interview of Henry VIII. and François I. in the Field of the Cloth of Gold. There are a town-hall, formerly an abbey, a clock-tower, and several other Gothic buildings of less interest and importance: there are some remains of the antient castle, and a very few fragments of the town wall. The Caserne Martainville, or barrack of Martainville, in the square of the Champ de Mars, has an imposing front; the Hôtel Dieu, or great hospital, is spacious and airy; and the 'Halles,' or covered markets, are considered to be among the finest in France. They surround on three sides one of the public squares, and form several conveniently arranged and extensive apartments. The Mercery Hall, or Halle des Rouenneries, is 272 French or 290 English feet long by 50 French or 53 English feet wide; the corn-market is 300 French or 320 English feet long. A considerable number of fountains are distributed through the streets and squares of the city, two are Gothic, and of better architecture than the rest; the fountain of La Croix de Pierre resembles the crosses erected by our own Edward I. to the memory of his queen Eleanor; that of La Crosse is of smaller size and more recent date. The fountain of La Place de la Pucelle consists of a plain triangular pedestal, with dolphins at the base, surmounted by a statue of Jeanne d'Arc in military costume; it marks the place of her execution. There are mineral springs in two places: those of La Marquerie are resorted to by a number of people; they are chalybeate. La Bourse, or the Exchange, sometimes called La Bourse-à-couvert, from its being used only in unfavourable weather, the merchants at other times meeting in an uncovered enclosure adjacent to it, is a fine building on the quay.

The population of Rouen, in 1826, was estimated at 90,000; in 1831 it was 88,086; in 1836, 92,083. Rouen ranks next to Lyon among the manufacturing towns of France; it is the principal seat of their cotton-manufacture. Cotton-yarn is spun, but not the finest sorts. In fact, the manufactures of Rouen are chiefly designed to meet the wants of the middling and humbler classes. The spinning-machines are worked by manual labour, by horses, by water, or by steam. Weaving is actively carried on, and one class of the productions of the town is known by the name of *Rouenneries*, or Rouen goods; it comprehends chiefly checked and striped cottons for women's dresses, distinguishable usually by certain predominant colours, violet, lilac, rose, and more commonly red. Since 1810 the manufacture of nankeens has been introduced and carried to a great extent. Dupin, in 1827, estimated the quantity made yearly at 600,000 pieces, of 4½ metres, or about 5 yards each. They are carefully made up to imitate the India nankeens,

under which character they are sold. Kerseymeres are manufactured from dyed wool mingled with white cotton, so as to produce the shade of colour required. Dyeing cottons with Turkey and Indian red, dyeing woollens, calico-printing, and bleaching by chemical processes are carried on to a considerable extent. To the above manufactures may be added dimities, muslins, lace, bed-ticking, woollen hosiery, silk and cotton velvet, fabrics of mingled silk and cotton. From the increasing demand for labour, many of the Rouen manufacturers have been induced to send their raw materials into the departments of Somme, Pas de Calais, Aisne, and Nord, to be manufactured there. The products of the looms of Rouen are sent chiefly to the central parts of France. Paris, Lyon, Limoges, Bordeaux, Toulouse, and Marseille are the principal marts to which they are transmitted: from Lyon, Toulouse, and Marseille they are exported to Germany, Italy, and the Levant.

Besides the woven fabrics, confectionary of high repute, especially apple-sugar and apple-jelly, cards, pasteboard, paper-hangings, toys, hats, pottery, cards and combs, leather, glue, catgut, colours, chemical products, neat's-foot and seal oils, soap, brass wire, copper sheathing, small shot, sheet lead, and pitch are made. The western part of the city is the mercantile part; the centre is chiefly occupied by retail traders; and the eastern part is inhabited by the manufacturing population. The Faubourg St. Sever is also occupied by persons engaged in manufacture. In the northern part of the town, and in the Faubourg Cauchoise, on the western side, the gentry and persons not engaged in business chiefly reside. Ship-building is carried on along the bank of the Seine.

The river forms a commodious port, divided by the stone bridge into two parts; the upper devoted to the large boats which convey goods to Paris and other places higher up the river, the lower part to sea-borne vessels. The direct distance of Rouen from the sea is about forty-five miles, but the length of the navigation is almost twice that distance. The influence of the tide is sensibly felt at Rouen; and vessels of 250 or 300 tons can get up to the town. The ready communication of Rouen with the capital and with other towns, either by the navigation of the Seine, or by the roads, which are very good, has made it a place of considerable trade, independently of its manufacturing industry. The articles of trade are wine, brandy, cider, corn, fruits, &c. There are six fairs in the year, two of them of fifteen days each.

Rouen, besides being the capital of the department, and of an arrondissement, is the seat of an archbishopric, of a Cour Royale, of an Académie Universitaire, and of the headquarters of the fourteenth military division. The archbishopric is of great antiquity: the diocese comprehends the department of Seine Inférieure; the archbishop has for his suffragans the bishops of Bayeux, Evreux, Séez, and Coutances, whose dioceses comprehend the departments formed out of the antient province of Normandie. The Cour Royale and the Académie Universitaire have jurisdiction over the departments of Eure and Seine Inférieure, and the fourteenth military division includes the departments of Seine Inférieure, Eure, Manche, Calvados, and Orne. Government offices, administrative, fiscal, or judicial, are numerous; they include, with others, a Cour Royale, a tribunal of commerce, a subordinate justiciary court, a mint, and a custom-house. The churches and other places of worship have been enumerated. There are two seminaries for the priesthood, a faculty of theology, a school of medicine, a royal college or school, with cabinets or museums of natural history and natural philosophy, schools of drawing, painting, and navigation, and forty elementary schools. There are two public libraries, one of them, which is deposited in the town-hall, was estimated several years since to contain 70,000 vols. and 800 MSS.; a gallery of paintings, some of them very good, also established in the town-hall; an excellent botanical garden, with much admired hot-houses; a royal academy of science, literature, and art; societies of commerce, agriculture, medicine, pharmacy, a central society of agriculture, and a commission of antiquities. Among the charitable institutions are four hospitals, including one for the insane, and one for foundlings; a savings'-bank, and a Protestant Bible Society. There are, besides these institutions, a prison (the Bicêtre), comprehending three departments; three ranges of barracks, well kept public baths, and two theatres.

Rouen was the birth-place of Corneille, his brother Thomas Corneille, Fontenelle, the Jesuit Sanadon, Du-

chart, Jacques Basnage, the painter Jouvenet, and the architect Blondel.

The arrondissement of Rouen has an area of 502 square miles, and comprehends 155 communes; it is divided into fifteen cantons or districts, each under a justice of the peace. The population in 1831 was 225,996; in 1836 it was 238,805.

ROUERGUE, a province in France, forming the eastern extremity of the military government of Guienne: it was bounded on the north by Auvergne; on the north-east by Gevaudan, a portion of Languedoc; on the east by the district of the Cévennes, also in Languedoc; on the south-east, south, and south-west by other portions of Languedoc; and on the west by Quercy, which, like Rouergue, was a part of Guienne. It was of considerable size, extending about ninety miles from the Cévennes in the east, to the town of St. Antonin on the Aveyron in the west; and seventy-eight or eighty miles from north to south. Its capital was Rhodéz [RHODEZ], pop. in 1831, 8249; in 1836, 9685; and the other chief towns were Milhaud or Milhau [MILHAU], pop. in 1831, 9806; St. Affrique [AVEYRON], pop. in 1831, 6336; in 1836, 6421; and Villefranche [VILLEFRANCHE], pop. in 1831, 9540; in 1836, 8738. The population given is for the whole commune. The department of Aveyron comprehends nearly the whole of the province of Rouergue; the physical features are described in the article AVEYRON. Rouergue was subdivided into Le Comté (de Rhodéz?) in the north, chief town Rhodéz; La Haute Marche in the east and south, chief town Milhaud; and La Basse Marche in the west, chief town Villefranche.

Rouergue derives its name from the Ruteni, a Celtic people who inhabited it. A few Celtic or Roman towns are known to have been within its limits: as Segodunum, afterwards Ruteni, now Rhodéz; Carentomagus, near Villefranche; and Condatomagus, somewhere on the south-eastern border, near the Cévennes. On the downfall of the Roman empire this part of France underwent various changes, the possession of it being contested by the Visigoths, Franks, and the Ostrogoths of Italy, under their king Theodoric. It was afterwards incorporated with the duchy of Aquitaine. [GUYENNE.] From the time of Charlemagne it was governed by counts of its own, who were a branch of the same family as the counts of Toulouse; their power was very considerable. The county was afterwards united to the dominions of the counts of Toulouse. [LANGUEDOC.] The county of Rodez, which comprehended about a third part of Rouergue, was held by a line of nobles, vassals of the counts of Toulouse; it was united early in the fourteenth century to the county of Armagnac. It was seized by Louis XI., and reunited to the crown about A.D. 1470.

ROUFFACH. [RHIN, HAUT.]

ROULERS, or ROUSSELAER, is situated in the province of West Flanders, in the kingdom of Belgium, on the Mandel, a small river which falls into the Lys. The chief occupation of the inhabitants is the linen manufacture and bleaching of linen: there are some sugar-refineries, and many persons are employed in the cultivation of flax in the adjacent country. The pasture-land in the vicinity is rich, and the breed of cattle is very fine. A considerable quantity of butter is exported. The number of inhabitants is about 9000. Roulers is eighteen miles south of Bruges. (Hörschelmann; Hassel; Stein.)

ROULOUL, the name of a bird whose position in the system has occasioned some difference of opinion among ornithologists.

Gmelin placed it among the pigeons, Sparrman among the pheasants, and Latham (the female) among the *Tetraones*. The form has been elevated to the rank of a genus under the names of *Cryptonyx*, Temm., and *Liponyx*, Viell.

Cuvier arranges it between the pheasants and the great genus *Tetrao*, Linn.

Mr. Vigors observes that the groups which compose the *Tetraonidæ* are chiefly distinguished in modern systems from those of the *Phasianidæ* by their more simple appearance; by the absence, in fact, of those ornaments to the plumage, and those naked or carunculated appendages to the cheeks and head, so conspicuous in the latter family, but which are reduced in the *Tetraonidæ* to the mere space that encircles the eye. The still weaker conformation of the hind toe, he remarks, tends further to separate them. In the *Tetraonidæ* this member becomes shorter and gradually weaker, until it is completely lost in some of the groups. In this point of view he considers that the *Tetraonidæ* hold

an intermediate station between the *Phasianidæ*, where the hind toe, although articulated high on the *tarsus*, is yet comparatively strong, and the *Struthionidæ*, where it is generally if not always deficient; and he is of opinion that the groups which compose the *Tetraonidæ*, corresponding with those which form the genus *Tetrao* of Linnæus, seem to be immediately united to the preceding family (*Phasianidæ*) by means of *Cryptonyx*, which resembles them in the similar appendage to the plumage of the head. This group, he adds, leads directly to *Coturnix*, Briss., and the true *Perdix*, where it has indeed been generally arranged, and from which it has been chiefly separated by the defalcation of a nail to the hinder toe. (*On the Natural Affinities that connect the Orders and Families of Birds*, in Linn. Trans., vol. xiv.)

M. Lesson arranges the form as the first genus of the family *Tetraonidæ*, a position which it occupies in Mr. Swainson's method.

Mr. G. R. Gray (*List of the Genera of Birds*) places it in the subfamily *Perdicinæ*, between the genera *Ptilopachus*, Sw., and *Ortyx*, Stephens.

*Generic Character*.—Bill strong, stout, compressed, convex above, curved towards the point; nostrils longitudinal, placed in the middle of the bill, and covered by a naked membrane; orbits and lore naked; hind toe without any nail, not touching the ground; wings short; third, fourth, and fifth quills longest.

*Geographical Distribution of the Genus*.—India and its islands.

M. Lesson states that only one species is known; but Mr. Swainson says that three or four species have been recently described—*Cryptonyx niger*, for instance.

Example, *Cryptonyx cristatus* (*Cryptonyx coronatus*, Temm.).

This is the *Rouloul de Malacca* of Sonnerat. According to Mr. T. C. Eyton, the Malay native name is *Bestum*. (*Catalogue of a Collection of Birds from Malaya, &c.*, in *Zool. Proc.*, 1839.)

*Description*.—*Male*.—On the front a few long and floating hair-like appendages. A thick crest directed backwards covers the occiput: at its origin it is pure white, and then becomes fire-red. Forehead and upper parts of the neck blackish-blue, on which the red patch round the eye and that of the commissure of the bill are well defined. Upper part of the body emerald-green, lower part rich azure-blue; wings ruddy-brown; bill lead-colour; and feet flesh-colour. Tail short and but little visible, its feathers black. Length about ten inches.

*Female*.—No crest, but only the isolated hair-like appendages of the forehead. Head and neck deep brown: the whole body uniform grass-green. Wings ruddy-brown, waved with brown.

*Locality and Habits*.—These beautiful birds haunt the great forests of Malaya, Sumatra, and Java. Wild and shy, they avoid the face of man, and are kept in captivity with great difficulty.

*Cryptonyx cristatus*. Male in the front; female behind.

ROUND (*rotundus*, from *rota*, a wheel) is a term which is

indiscriminately applied in common language to everything which has no very sharp corners. A cylinder and a sphere, a wheel and a ball, are equally styled round. In geometry the sphere, cylinder, and cone, are sometimes denominated the three round bodies, and it would certainly add much to many persons' power of describing shapes if they would learn the meaning of the terms circular, cylindrical, conical, spherical, spheroidal, and annular, for all of which the term round is employed without any distinction.

**ROUND**, a short vocal composition in three or more parts, in the performance of which the first voice begins alone, singing to the end of the first part, then passes on to the second, and afterwards to the third, &c., the other voices following successively the same routine, till all are joined together, the round ending at the mark of a pause (  $\frown$  ) or at a signal agreed on. This is frequently, but most erroneously, called a *catch*, and sometimes, not less incorrectly, a 'Canon in the unison.'

**ROUND TOWER**. Numerous lofty towers, tapering from the base to a conical cap or roof, which crowns the summit, are found in Ireland, and are almost peculiar to that country. That they are of great antiquity appears from their having been considered antient even in the twelfth century, when the British connection with Ireland began. Had they been then in actual use, it is not probable that so accurate a writer as Giraldus Cambrensis, who had been in Ireland, and circumstantially describes them, should not also have mentioned to what purpose they were applied.

There are 107 of these towers, or of the sites where they once stood, now known, and there is reason to believe they were formerly more numerous. Some of them are still perfect, and preserve their conical roofs; but only one, the tower of Devenish, possesses the singular ornament of an obtuse crescent rising from the cone, and somewhat resembling what is called the trident of Seeva.

Ardmore tower, near Waterford, had also, within the memory of man, this finishing ornament. In the other towers, the conical caps are either more or less injured, or have altogether vanished. Some few are topped by battlements, but all these appear to be of more modern construction than the towers, except Kilree, in the county of Kilkenny, which seems to have been built originally with a battlement; but as the stone roof is completely destroyed, there can be no certainty upon this point.

The battlement on Tullsherin tower, in the same county, as well as the uppermost fifteen feet of the tower, is built in the early dove-tail style of masonry, of which the comparatively modern church in the same churchyard is built, and with precisely the same pattern of battlement, while the remainder of the tower is constructed of hammered stone, in the most perfect manner, each stone being an accurate segment of the circular courses of the building.

This low-browed church of Tullsherin was built by St. Kieran, early in the sixth century, at which time the masonic art was in a very degraded state, when compared with that which is shown in the erection of the tower. Kildare tower also terminates in a battlement, but that we know was added to it in the eighteenth century, as was the battlement on Cloyne tower in 1749.

Though most of these round towers were evidently divided into stories, yet Cashel tower is smooth, and even polished on the inside from top to bottom. That at Ardmore was plastered with a very fine white and durable cement. The divisions are usually formed by projecting ledges for the flooring joists, which however in some instances were inserted in square holes in the wall, where the ends were still visible not many years ago.

On each floor there is one very small window, and immediately below the conical cap four windows may be traced in the greater number of towers; in one there are five and in a few six windows; and so many as eight appear in one or two of the towers, but this is the largest number hitherto observed. In three or four of these buildings no windows appear in the upper story—only one small loop-hole—a convincing proof that they could not have been intended for campanili. In most of the towers the doors are at a considerable height above the ground, in one even twenty-four feet, in several fourteen, and in others only eight, seven, or six feet, but in none of them are there any traces to assist conjecture as to the mode of reaching those doors, except in those where the door is on the ground, or raised from it by a couple of steps.

The height of these towers varies greatly, one being only thirty-five feet, while the loftiest is one hundred and twenty, but the common range is between eighty and a hundred feet. Some stand on circular bases, which form one or two deep steps round the tower. Thus Donoughmore has a two-step base, each step or plinth being composed of very large blocks of stone. The basement of Kell's tower is square, and the stones are of great size. Kilree and Aghaviller, both in the county of Kilkenny, have circular plinths fourteen inches deep, projecting six inches, and resting upon a square base formed of great blocks of stone.

The tower of Clondalkin, about five miles from Dublin, stands on massive stone-work; and St. Columb's tower, at Londonderry, rises from a vaulted crypt. So also does that at Oughterard, in the county of Kilkenny.

In external character all the towers may be said to agree, since there is only one which does not taper, and in that case the tower is cylindrical throughout its entire height. It is nicely faced, inside and out, with coggle-stones, and filled up with rubble.

Though all bear to each other the strongest family likeness, there are many striking differences in the mason-work and in the minor details.

The stones in some are truly chiselled, and closely and beautifully laid in fine cement. Some are only coarsely hammered, others merely faced, and of various shapes and sizes, but still well fitted to each other. Some towers are built of round coggle-stones. In all the mortar is as hard as the imbedded stones.

The above and various other little diversities prove that these remarkable structures were erected by various workmen and at divers times, and, as Giraldus Cambrensis says, 'according to the manner of the country;' but this clearly implies that the æra of their erection must have prevailed through a very long period.

Their situation on hill or dale is equally variable, nor does any one circumstance respecting their situations seem to be common to all, except their immediate vicinity to a small and very antient church, though in some instances this antient building has been replaced by a more modern fabric.

It is a well known fact that the early missionaries usually chose the sites of Pagan places of worship for their churches, but it is not equally well known that the undoubted relics of Pagan places of worship remain in close association with these towers, and even in the same churchyard; the pillar stone of witness, the tapering sun-stone, the crombac, the fire-house, and the holy spring of sacred water necessary in the mystic rites, all these are found along with the tower, and the little antient church within the same narrow boundary.

The speculations of antiquaries as to the objects of rearing these mysterious towers have indeed been manifold—penitentiaries, the abode of anchorites, beacon-towers, alarm-posts, places of safety for goods, sepulchral steles, bell-towers, &c. All these theories have been nearly set at rest, and opinion seems now to vibrate between their being trumpet-towers, from whence, by means of the great brass trumpet, the people were invited to worship; or fire-towers, where the sacred fires of Bel or Baal, who was undoubtedly worshipped in Ireland and Scotland, were kept alive, the tower itself being an emblem of the sun-beam or ray of heavenly fire.

A third idea indeed has been lately suggested by Oriental scholars, that they are Buddhic in their origin, and sepulchral in their immediate application, and that they have been erected over the bones or relics of saints.

Before closing this article, it should be mentioned that though these towers are almost peculiar to Ireland, there are two in Scotland, but in that district which, in the very early ages, was in close and constant connection with Ireland.

In other parts of the world, as Andalusia, the Caucasus, Persia, and part of India, towers of all sizes and shapes, and in various situations, have been discovered. As in all these there are some points of resemblance, they may all perhaps prove to be successive links of that long chain of evidence by which these mysterious buildings may be traced downwards from their origin to the pagan rites of the Scots or Irish.

**ROUNDHEADS**, a name given to the republicans in England, at the end of the reign of Charles I. and during the

Commonwealth. The name seems to have been first applied to the Puritans because they wore their hair cut close, but to have been afterwards extended to the whole republican party. The Cavaliers, or royal party, wore their hair in long ringlets. [CAVALIER.]

**ROUSSEAU, JEAN BAPTISTE**, was born in Paris, April 6, 1670. His father, who was a shoemaker, furnished him with a liberal education. In 1688 he attended the French ambassador to the court of Denmark, and afterwards came to England with Marshal Tallard. On his return to Paris he devoted himself to poetry. His first productions consisted chiefly of satirical epigrams, most of which were pointed against contemporary writers. He thus created a number of enemies, and laid the foundation of that spirit of persecution which afterwards drove him from his native land. In 1694 his first comedy, 'Le Café,' was performed, with little success. This was followed, in 1696, by the opera of 'Jason, ou la Toison d'Or,' and, in 1697, by that of 'Venus and Adonis,' both of which were even more unsuccessful than his first comedy. His next dramatic effort was the comedy of 'Le Flatteur,' which was brought out at the Théâtre Français, and was received with considerable applause, but did not command more than ten representations. It was then in prose, but he afterwards put it into verse. He finished his dramatic career about four years afterwards with the comedy of 'Le Capricieux,' which met with an unequivocal condemnation, while Danchet's opera of 'Hésione,' which was brought out at the same time, was brilliantly successful. For some time previous to this, the Café Laurent, in the Rue Dauphine, had been and still continued to be frequented by La Motte, Saurin (Joseph), T. Corneille, Crebino, Boindin, Rousseau, and other literary men; and Rousseau, who seems to have thought that a cabal had been formed among them to ruin his piece and exalt the other, gave vent to his disappointed feelings in a satirical parody of some couplets of the prologue to 'Hésione.' The parody consisted of five couplets, confessedly by Rousseau, but they were followed by others still more calumnious, which were aimed at the frequenters of the Café Laurent, and these were also attributed to him by La Motte, Saurin, and others, who belonged to an opposite literary party. To this charge he made no other reply than that of stating to his friends that they were not written by him; but withdrew himself from the meetings at the Café; and there, for the present, the matter ended.

In 1703 we find Rousseau living in Paris with M. Rouillé, director of the finances, by whom he was taken to court, and introduced to the first society. About this time he began to write his 'Sacred Odes,' in accordance with the solemn piety, real or affected, which Louis XIV. had rendered fashionable at his court during the latter years of his reign. He is charged with composing licentious epigrams at the same time, to suit the taste of another class of his acquaintance. He was said to be

'Pétronie à la ville,  
David à la cour.'

In 1710 the place left vacant by T. Corneille in the Académie Française was contended for by La Motte and Rousseau, and obtained by the former. The approaching death of Boileau however was expected soon to occasion another vacancy, and also to leave at the disposal of the court the pension which he had enjoyed, and which could only be bestowed upon an academician. Rousseau expected to fill the vacancy, and also aspired to the pension; La Motte, however, prepared to contend with him for the latter. Such was the state of the two literary parties which then divided Paris, La Motte and Saurin being leaders of the one, and Rousseau of the other, when a new series of couplets made their appearance, more calumnious and indecent than the former, in which the frequenters of the Café Laurent, and especially La Motte, were attacked. These couplets were immediately attributed to Rousseau by his enemies; but he indignantly disavowed them; and having discovered the man who dropped them about the streets, and drawn from him a confession that they were given to him by Saurin, he charged that gentleman before a court of law with having written them, but failed in establishing his charge by legal proof. Finding that he was now placed in a dangerous situation, he withdrew to Switzerland; and on the 7th of April, 1712, an arrêt of parliament, given 'par contumace,' condemned him to perpetual banishment from France. Rousseau denied to the last that he had anything to do with these couplets; and Boindin, to whom they were addressed,

P. C., No. 1255.

and who was much abused in them, always refused to believe that they were Rousseau's, and left a memoir, which was published after his death (Brussels, 1752, 12mo.), in which he accuses Saurin, La Motte, and a jeweller of Paris, of being the authors of them.

From this time Rousseau's life was passed in various countries of Europe. The Comte de Luc, the French ambassador to Switzerland, received him under his protection, and admitted him to an intimacy which was only terminated by the death of that nobleman in 1740. Rousseau accompanied De Luc to Baden in 1714, where he became known to Prince Eugene, who also took him under his patronage; and in 1715, when the Comte was appointed ambassador to Vienna, Rousseau went with him to that city, where he remained three years.

Rousseau had left powerful friends in Paris, among whom the Baron de Breteuil exerted himself with so much success as to obtain for him letters of recall, which were forwarded to him in February, 1716; but Rousseau refused to avail himself of them, on the ground that they were granted to him as an act of grace, whereas he required a public acknowledgment of the injustice of his sentence. In 1720 he went to Brussels, where he became acquainted with Voltaire, and they were very friendly for some time, but afterwards became bitter enemies. In 1721 he came to England, where he published a new edition of his works (1723, 2 vols. 4to.) which produced him about 2000*l.* This sum he unfortunately invested with the Ostend Company, which failed, and he again became dependent on his friends for support. He now returned to Brussels, and was received under the protection of the Duke d'Arenberg, who, when he quitted Brussels in 1733, settled a pension upon him.

In 1738 Rousseau became desirous of returning to France, and made interest to procure the same letters of recall which, more than twenty years before, he had indignantly rejected, but he could not obtain them. He however ventured to visit Paris *incognito*; but though the authorities shut their eyes to this infraction of the law, they gave him no hope of being recalled. After remaining a few months in Paris, he returned to Brussels, where he died, March 17, 1741.

The first collected edition of his works was published by himself, after his banishment, at Soleure, in Switzerland; the next was that of London, 2 vols. 4to., 1723, which was reprinted at Paris in 1743, and was again reprinted at Paris in 1757, with a 5th volume, containing the licentious epigrams, many of which were no doubt properly ascribed to him, and also the notorious couplets, engraved in imitation of the hand in which they were written. The most complete edition of his works (not including the licentious epigrams) was published at Brussels in 1743, under the superintendance of M. Seguy, 3 vols. large 4to., with the author's last corrections. It consists of his poems, his dramatic pieces, and a collection of his letters. There is a beautiful edition of his works, 5 vols. 8vo., Paris, Lefèvre, 1820. There are several other editions.

Jean Baptiste Rousseau stands indisputably at the head of the lyric poets of France. His poems consist of—'Odes Sacrées,' 1 book; 'Odes,' 3 books; 'Cantates,' 1 book; 'Epîtres,' 2 books; 'Allégories,' 2 books; 'Epigrammes,' 3 books; and 'Poésies Diverses,' 1 book. Rousseau's dramatic pieces, as may be inferred from the manner in which they were received by the public, are of little value. His epistles, allegories, and miscellaneous poems are perhaps not much inferior to Boileau in strong sense and elegance of versification, but are inferior to him in wit. His epigrams are neat and sparkling, and the satire is directed to its mark with an aim that seldom fails. His fame however rests upon his odes and his cantatas. His sacred odes are free imitations of the Psalms of David, not so close as translation nor so wide as paraphrase. Too many of his other odes are addressed to kings, ministers, and generals, and relate to events of temporary interest. His best odes however are distinguished by boldness and justness of thought; by simplicity of expression, by fullness and distinctness of imagery, without being overloaded with it; by an earnestness and enthusiasm which seem to spring spontaneously from the feelings of the poet; and by a splendour and harmonious richness of diction in which he seems to have no rival among French poets. His cantatas are a species of ode of which part is adapted for recitation and part for singing. They are beautiful compositions. Some of them may be said to approach the sublime, if they do not reach it;

VOL. XX.—2 C

and others, which are of a lighter character, are exceedingly graceful.

(*Biographie Universelle; Dictionnaire de la Conversation; Auger, Essai Biographique et Critique.*)

ROUSSEAU, JEAN JACQUES, born at Geneva in 1712, was the son of a watchmaker. While yet a child he lost his mother, and his father having married again, young Rousseau was removed from his paternal roof, and after remaining for some time at a village school in the neighbourhood of Geneva, was apprenticed to an engraver, a coarse man, whose brutal treatment tended to sour a temper naturally irritable and morose. The boy became addicted to idle habits, and to lying and pilfering. At last, through fear of punishment for some act of misconduct, he ran away from his master, and wandered into Savoy, where, finding himself destitute, he applied to the bishop of Annecy, on the plea of wishing to become a convert to Catholicism. The bishop recommended him to Madame de Warens, a Swiss lady, who, being herself a convert to Catholicism, had settled at Annecy. Through her kind assistance he obtained the means of proceeding to Turin, where he entered the college of the Catechumeni, and after going through a preparatory course of religious instruction, he abjured the Reformed religion and became a Roman Catholic. But as he refused to take orders, he was dismissed from the establishment, and left to his own resources. Accordingly he became a domestic servant, but his want of discretion and self-control rendering him unfit for his situation, he left Turin and recrossed the Alps. He found Madame de Warens residing at a country-house near Chambéry, who received him kindly, and afforded him support and protection in her own house during the next ten years. Of his foolish, profligate, and ungrateful conduct during a great part of this period he has given an account in his 'Confessions.' After many absences and many returns, he quitted her finally in 1740, with letters of introduction for some persons at Lyon. He acted in succession as preceptor, musician, and private secretary to the French envoy to Venice, whom he followed to that city. From Venice he came to Paris, in 1745. On alighting at an inn, he became acquainted with a servant girl, Therese Levasseur, with whom he formed a connection which lasted for the rest of his life. He attempted to compose music for the stage, but he did not succeed in selling it. His next employment was as a clerk in the office of M. Dupin, fermier-général, where however he did not remain long. In 1748 he became acquainted with Madame d'Epinau, who proved one of his steadiest and truest friends. At her house he formed the acquaintance of D'Alembert, Diderot, and Condillac, and by them he was engaged to write articles for the 'Encyclopédie.'

One day he read in an advertisement that a prize was offered by the Academy of Dijon for the best essay on the question—'Whether the progress of science and of the arts has been favourable to the morals of mankind?' Rousseau determined to support the negative, and Diderot encouraged, but did not originate, his determination. He supported his position in a style of impassioned eloquence, and obtained the prize. His success confirmed him in his bias for paradox and exaggeration, and henceforth he seemed to have adopted as a general principle that the extreme opposite to wrong must of necessity be right. His opera, 'Le Devin du Village,' was played before Louis XV., at the Court Theatre of Fontainebleau. Rousseau was in one of the boxes with a gentleman of the court. The king, being pleased with the opera, expressed a desire to see the author, which being signified to Rousseau, his shyness took alarm, and he actually ran away out of the house, and did not stop till he reached Paris. He had neither easy manners nor facility of address, and his own acute feeling of these deficiencies tormented him throughout life, and tended to perpetuate and increase his natural awkwardness. In order to hide these imperfections, he affected disregard of manners, and put on the appearance of a misanthropist, which he in reality was not. He lived chiefly by copying music, and several persons who knew his straitened circumstances sent him work, for which they offered him three or four times the usual remuneration, but he never would accept anything beyond the accustomed price.

In 1753 he wrote his 'Lettre sur la Musique Française,' which sorely wounded the national vanity. His next publication, a letter to D'Alembert, 'Sur les Spectacles,' gave rise to a controversy between them. He wrote also a 'Discours sur l'Origine de l'Inégalité parmi les Hommes,' which

was admired for its eloquence; but his usual paradoxical vein runs through the whole composition. Rousseau asserts that man is not intended for a social state; that he has a bias for a solitary existence, and that the condition of the savage in his native wilds is a true state of freedom, and the natural state of man, and that every system of society is an infraction of man's rights. He also maintains that all men are born equal, in spite of the daily evidence which we have of the inequalities, physical and moral, observable even in childhood. This idea of the equal rights of men, derived not from reason or religion, but from his favourite theory of man's equality in a state of nature, Rousseau afterwards developed more fully in his 'Contrat Social,' a work which after leading astray a number of people, and causing considerable mischief, is now regarded by all sound thinkers as a superficial essay. [ROMAGNOSI.] It is a curious fact that Rousseau, after reading the works of Bernardin de St. Pierre, had observed that in all the projects of society and government of that writer there was the fundamental error of 'supposing that men in general and in all cases will conduct themselves according to the dictates of reason and justice, rather than according to the impulse of their own passions or wayward judgment.'

In 1756 Rousseau, at the invitation of Madame d'Epinau, took up his residence at her country-house called l'Hermitage, in the pretty valley of Montmorency near Paris. Here he began to write his celebrated novel, 'Julie, ou la Nouvelle Héloïse,' which he finished in 1759. It is of little value as a work of imagination or invention, but as a specimen of impassioned eloquence it will always be admired. Rousseau, while he wrote it, was under the influence of a violent attachment for Madame d'Houdetot, sister-in-law of Madame d'Epinau; and this passion, absurd and hopeless though it was, served to inspire him during the progress of his work.

'La Nouvelle Héloïse' has been censured as tending to render vice an object of interest and sympathy. The character of the hero is culpable, for he forgets the obligations of hospitality, and betrays the confidence reposed in him. But here we again perceive the influence of Rousseau's favourite paradox; for, in a state of nature, such as Rousseau fancied it, the relative position of St. Preux, his pupil, and her parents would not have been the same as in the novel, for they would have all been savages together, and the intimacy of St. Preux with Julie would have been a matter of course. Rousseau however, by the character which he has drawn of Julie after she becomes a wife, has paid a just homage to the sacredness of the marriage bond, and to the importance of conjugal duties, which constitute the foundation of all society. Rousseau admired virtue and felt its value, though he did not always follow its rules. He says of himself, that after much reflection, perceiving nothing but error among philosophers, and oppression and misery in the social state, he fancied, in the delusion of his pride, that he was born to dissipate all prejudices. But then he saw that, in order to have his advice listened to, his conduct ought to correspond to his principles. It was probably in compliance with this growing sense of moral duty that at last he married the woman whom he had so long been living with, who had then attained the age of forty-seven, and who, as he himself says, did not possess either mental or personal attractions, and had nothing to recommend her except her attention to him, especially in his fits of illness or despondency. He also repented in the latter years of his life of having sent his illegitimate children to the foundling hospital.

Rousseau's 'Emile,' which appeared in 1762, contained a new system of education. He gives many good precepts, especially in the first part of the book, which was productive of a beneficial change in the early treatment of children in France: it induced mothers of the higher orders to nurse their children themselves; it caused the discontinuance of the absurd practice of swaddling infants like mummies; it taught parents to appreciate the feelings of children, and to develop their rational faculties rather than frighten them into submission by blows or threats, or terrify them by absurd stories. In these respects Rousseau was a benefactor to children, but as he proceeded in his plan for older boys, he became involved in speculations about religion and morality, which gave offence both to Roman Catholics and Protestants. The parliament of Paris condemned the book. The archbishop issued a 'mandement' against it. The States-General of Holland

proscribed it; and the council of Geneva had it burnt by the hand of the executioner. The publication of his 'Contrat Social,' which took place soon after, added to the outcry against him, in consequence of which Rousseau left Paris and repaired first to Yverdon, but the senate of Bern ordered him to quit the territory of the republic. He then went to Neuchâtel, of which Marshal Keith was governor for the king of Prussia. Keith received him kindly, and Rousseau took up his residence at Motiers in the Val de Travers, whence he wrote a reply to the archbishop of Paris, and a letter to the magistrates of Geneva, in which he renounced his citizenship. In his retirement he wrote the 'Lettres écrites de la Montagne,' being a series of strictures on the political and ecclesiastical government of Geneva as it then was. This work increased the irritation against the author, a feeling which spread even among the villagers of Motiers, who annoyed their eccentric visitor in various ways, which however the suspicious temper of Rousseau probably exaggerated. He removed to the little island of St. Pierre in the Lake of Bienna, where he assumed, no one knows why, the Armenian costume. Being sent away from thence by an order from the senate of Bern, he accepted the kind invitation of David Hume, who offered him a quiet asylum in England. Rousseau arrived in London in January, 1766, and the following March went to Wootton in Derbyshire, where Hume had procured him a private residence in the house of Mr. Davenport. It was not long however before Rousseau quarrelled both with Hume and Davenport, and suddenly returned to France. A letter had appeared in the newspapers bearing the name of Frederic of Prussia, and reflecting severely upon Rousseau's moral infirmities. Rousseau accused Hume of being the author or planner of the pretended communication. In vain did Hume protest that he knew nothing of the matter. At last Horace Walpole acknowledged himself the author of the offensive letter. Rousseau however would not be pacified, and he continued to charge Hume with the blackest designs against him. The correspondence that passed between the parties has been published in the complete editions of Rousseau's works. Rousseau afterwards appeared to have acknowledged that during his residence in England he had been subject to fits of insanity.

After his return to France, Rousseau led an unsettled life, often changing his place of residence, till 1770. He published in the mean time a 'Dictionnaire de Musique,' which was considered to be both imperfect and obscure. He then returned to Paris, and took lodgings in the Rue Plâtrière, which has since been called Rue J. J. Rousseau. He was left undisturbed by the authorities, but he was cautioned, as there was still a prosecution pending against him on account of his 'Emile,' not to make himself conspicuous in public, an advice which seemed to produce the contrary effect upon his wayward temper. He now fell into a real or affected state of misanthropy, fancying that everybody was conspiring against him, and he complained at the same time of acute mental suffering. Byron, who in his mental bias had some points of resemblance with Rousseau, thus describes him:

His life was one long war with self-sought foes,  
Or friends by himself banished; for his mind  
Had grown suspicion's sanctuary, and chose  
For its own cruel sacrifice, the kind,  
'Gainst whom he roged with fury strange and blind.  
But he was phrenzied—wherefore, who may know?  
Since cause might be which skill could never find;  
But he was phrenzied by disease or woe,  
To that worst pitch of all, which wears a reasoning show.

For then he was inspired, and from him came,  
As from the Pythian mystic cave of yore,  
Those oracles which set the world in flame,  
Nor ceased to burn till kingdoms were no more.

(*Childe Harold*, canto iii.)

One of Rousseau's grievances was that he thought the French ministers had imposed restrictions upon his writing. One of his friends applied to the duke of Choiseul on the subject. The duke's answer, dated 1772, is as follows: 'If ever I have advised M. Rousseau not to publish anything without my previous knowledge, of which fact I have no remembrance, it could only have been with a view to save him from fresh squabbles and annoyances. As now however I have no longer the power of protecting him (the duke had just resigned his premiership), I fully acquit him of any engagement of the sort.'

As Rousseau grew old and infirm, the labour of copying music became too irksome, and all his income consisted of an

annuity of 1450 livres, not quite 60 pounds sterling. His wife was also in bad health, and provisions were very dear, and he found that he could not remain in Paris. The Marquis de Girardin, being informed of this, kindly offered Rousseau a permanent habitation at his château of Ermenonville near Chantilly. Rousseau accepted for his residence a detached cottage near the family mansion, whither he removed in May, 1778. In this new abode he appeared for once contented. He used to botanise in the neighbourhood with one of the sons of the marquis. On the first of July he went out as usual for the purpose, but returned home fatigued and ill. The next morning after breakfast he went to his room to dress, as he intended to pay a visit to Madame de Girardin, but he felt exhausted, and his wife coming in gave the alarm. Madame de Girardin came at once to see him; but Rousseau, whilst thanking her for all her kindness, begged of her to return to her house, and leave him for the present. Having requested his wife to sit by him, he begged her forgiveness for any pain that he might have caused her, and said that he died in peace with all the world, and that he trusted in the mercy of God. He asked her to open the window, that he might once more behold the lovely verdure of the fields. 'How pure and beautiful is the sky,' observed he: 'there is not a cloud on it. I hope the Almighty will receive me there.' So saying, he fell with his face to the ground, and when he was raised, life was extinct. His death was purely natural, and not in consequence of suicide, as was said by some. He was buried, according to his request, in an island shaded by poplars, in the little lake of the park of Ermenonville, and a plain marble monument was raised to his memory.

He had begun to write his autobiography when he was in England, under the title of his 'Confessions.' This work contains many exceptionable passages: it ought to be observed however that he did not intend it for publication until the year 1800, judging that the persons mentioned in it would then be dead; but through an abuse of confidence on the part of the depositaries of his MS., it was published in 1788. Rousseau cannot be called a bad man. He did not, like Voltaire, sneer at religion and morality. He was sceptical, but had no fanatical hatred of Christianity; on the contrary, he admired and praised the morality of the gospel. 'I acknowledge,' he says in the 'Emile,' 'that the majesty of the Scriptures astonishes me, that the holiness of the gospel speaks to my heart. Look at the books of the philosophers; with all their pomp, how little they appear by the side of that one book! Can a book so simple and yet so sublime be the work of men? How prejudiced, how blind that man must be, who can compare the son of Sophroniscus (Socrates) with the son of Mary!' With such sentiments Rousseau could not long agree with Diderot, Helvetius, D'Holbach, and their coterie. They ridiculed him as a bigot. Voltaire, on his part, coarsely abused him on many occasions, it is believed from literary jealousy; but Rousseau never retorted. 'I have spent my life,' says Rousseau, 'amongst infidels, without being seduced by them: I esteemed and loved several of them personally, and yet their doctrines were insufferable to me. I told them repeatedly that I could not believe them. . . . I leave to my friends the task of constructing the world by chance. I find in the very architects of this new-fangled world, in spite of themselves and their arguments, a fresh proof of a God, Creator of all.'

Through his deficient education, and his infirmities of judgment and temper, Rousseau was totally unfit to be a political writer. He set a pernicious example to many others, who were still less qualified by proper study to consider themselves as legislators and reformers. Rousseau by his eloquence misled the understanding: Voltaire by his sneers and ribaldry destroyed all moral feeling. Both writers exerted a great influence on the generation which they saw grow up, and which afterwards effected the great French revolution; and yet Rousseau might well disclaim all intention to contribute to such a catastrophe. While Helvetius maintained the principle that 'any action becomes lawful and virtuous in the furtherance of the public weal,' Rousseau says that 'the public weal is nothing unless all the individuals of society are safe and protected.' And elsewhere he says that if the attainment of liberty should cost the life of a single man, it would be too dearly bought. He also said, speaking of his 'Contrat Social,' that it was not written for men, but for angels. M. Angar one day introduced his son to Rousseau, saying that

he had been educated according to the principles of the 'Emile:' when Rousseau gruffly replied, 'So much the worse for you and for your son too!' All these circumstances serve to show the real character of Rousseau's mind.

Rousseau set to music about one hundred French 'Romances,' some of them very pretty, which he published under the title of 'Consolations des misères de ma vie.' He was passionately fond of music, though he seems not to have attained a profound knowledge of the subject.

There have been several editions of Rousseau's works: those of Lefevre, 22 vols. 8vo., 1819-20, and of Lequien, 21 vols. 8vo., 1821-2, are considered the best.

The town of Geneva has raised a bronze statue to his memory in the little island where the Rhône issues from the lake, which is a favourite promenade of the citizens.

ROUSSILLON, a province of France, coinciding with the department of Pyrénées Orientales, under which it is described. It obtained its name from the town called by the Romans Ruscino, and afterwards Roscilion, now Tour de Roussillon, near Perpignan. It was subdivided into Roussillon, properly so called, chief town Perpignan; Le Valespir, chief town Prats de Mollo; Le Conflent, chief town Villefranche; Le Capsir, chief town Puyvalador; La Cerdagne Française, chief town Mont Louis; and La Vallée de Carol, chief place Carol. [PYRENEES ORIENTALES.]

Its condition under the Romans is mentioned elsewhere. [PYRENEES ORIENTALES.] The country came afterwards into the hands of the Visigoths, the Saracens, and the Franks. In the ninth and tenth centuries it was united with the county of Ampurias in Spain; but towards the close of the tenth century they were separated. In 1173 this county was bequeathed, by its count Gérard or Guinard II., to Alphonso, king of Aragon. It was ceded by John II. of Aragon to Louis XI. of France, in pledge for the repayment of money borrowed; but restored by Charles VIII. to Ferdinand the Catholic. In the reign of Philip IV. of Spain, the inhabitants of this province joined the Catalans in their resistance to the Count-Duke Olivarez. The French, who had early fomented the rebellion, afterwards openly took part in it, and ultimately obtained possession of Roussillon, which by the treaty of the Pyrenees, A.D. 1659, was ceded to them.

ROUT. [RIOT.]

ROVERE'DO. [TYROL.]

ROVIGNO. [ILLYRIA; ISTRIA.]

ROVIGO, the Province of, in the Lombardo-Venetian kingdom, is bounded on the north by the province of Padua, from which it is divided by the Adige; east by that of Venice, west by the provinces of Verona and Mantova, and south by the papal province of Ferrara, from which it is separated by the Po. The length of the province of Rovigo is 35 miles from east to west, and its greatest breadth is about 15 miles. The surface is flat, and is crossed by various canals, which communicate with the Po and the Adige.

The principal towns of the province are:—1, Rovigo, the capital of the province, a bustling modern town, with about 7000 inhabitants, a collegiate church, the Palazzo del Podestà, or government-house, and church dedicated to the Virgin, with some good paintings. Luigi Celio Richeno, who took the surname of Rhodiginus, a learned man of the sixteenth century, and author of the 'Antiquæ Lectiones,' was a native of Rovigo. 2, ADRIA. 3, Badia, a small town, with a manufactory of fine pottery.

The province of Rovigo produces abundance of corn, hay, hemp, pulse, and fruits. Its population amounted to 135,000, by the census of 1833. (Serristori, *Statistica*.)

ROWAN-TREE, or ROAN-TREE, is a species of *Pyrus*, known also under the names of the Fowler's service-tree and mountain ash. Its Latin name, *P. aucuparia*, and its various modern designations, have been given to it on account of the general use made of its fruit for the purpose of decoying birds into traps. It is much cultivated, both on account of its valuable wood and rapid growth. It is known from the other species of *Pyrus* by its slightly glabrous serrated leaflets and its globose fruit. It is found in most parts of Europe, in the north-west of Asia, in Nova Scotia, and other regions of the northern parts of North America, and in the island of Japan. It does not however attain equal magnitude in all climates. In its most northern localities and alpine situations it is a low shrubby bush; whilst in southern districts it forms a handsome tree, growing to the height of twenty or thirty feet. The finest trees in this island are

found in the Western Highlands and on the west coast of Scotland. This tree has enjoyed from remote times a distinguished reputation. A belief in its power against witchcraft and evil spirits of all kinds seems to have been prevalent at a very early date; and, according to Lightfoot, in his 'Flora Scotica,' it was till a late period held in high reputation in Scotland as a charm against evil influence. It is through a hoop of this wood that sheep are made to pass night and morning as a preservative against evil spirits.

The rowan-tree is a graceful tree, with an erect stem and orbicular head. It grows very rapidly for the first three or four years of its existence, and, on this account, it is well adapted for planting with young oaks, which it protects till they grow above it, when it is destroyed by their shade. It also forms excellent coppice-wood, the shoots being adapted for poles and for making hoops. The bark is used by tanners. The leaves, when dried, have been sometimes used in the north of Europe as a substitute for wheat in times of scarcity. It is prized next to yew for making the bow. In Wales it is as religiously planted in churchyards as the yew is in England.

The rowan-tree will grow in almost any situation, being found on the sea-shore and the tops of mountains. Hence it is a valuable plant for growing in places exposed to the sea or in very open situations. It flourishes best in a free soil, near water, and in open airy spots, especially in a moist climate.

ROWE, NICHOLAS, an English dramatic poet, was born at Little Beckford in Bedfordshire, in 1673. His father was John Rowe, of an old Devonshire family, and a serjeant-at-law of some eminence in his day. The son was educated at Westminster under Busby, and chosen one of the king's scholars. At the age of sixteen he was removed from school by his father, and entered as a student of the Middle Temple. He studied law for about three years, when, being left his own master by his father's death, he began to turn his attention to poetry, and withdrew himself from the less attractive reading of his profession. When he was twenty-five years of age he produced a tragedy, called 'The Ambitious Step-Mother,' which was very well received; and in 1702 appeared 'Tamerlane,' in which play, according to the taste of the time, Louis XIV. and William III. are represented respectively by Bajazet and Tamerlane.

This tragedy obtained great popularity, from its connection with the politics of the day. In 1703 was published 'The Fair Penitent;' and in the interval between this date and his death he wrote 'Ulysses,' 'The Royal Convert,' a comedy called 'The Biter,' which proved a failure, 'Jane Shore,' written professedly in the style of Shakspeare, though with little of Shakspeare's manner, and lastly 'Lady Jane Grey.' In the mean time he had other avocations besides poetry: we find him in the office of under secretary for three years when the duke of Newcastle was secretary of state, and after having been made poet-laureate at the accession of George I., he was appointed one of the land-surveyors of the customs of the port of London. He was also clerk of the council to the prince of Wales, and was made secretary of the presentations by Lord Chancellor Parker, afterwards Lord Macclesfield. Rowe died December 6, 1718, aged forty-five, and was buried in Westminster Abbey. He was twice married, and had issue by both wives. Besides the plays enumerated, he wrote short poems, a translation of Lucan, and of Quillet's 'Callipædia.' He published an edition of Shakspeare, in which there are, according to Johnson (*Life of Rowe*), some happy restorations of his author's text. In the composition of his dramas, Rowe shows little depth or refined art in the portraying of character, but he writes with the easy grace of a well-educated man of fashion, undisturbed by the cares of busy authorship, or the ambition of writing himself into notice at the expense of good taste. His versification is harmonious, and the language of his characters natural in the dialogues. 'The Fair Penitent' contains several passages which are well wrought and show great power of imagination. His translation of Lucan has been much praised by Johnson for preserving the spirit of the original, though upon comparison it will often be found feebly diffuse. His other poems are not of sufficient importance to require a separate notice.

(Johnson's *Lives of the Poets*, who quotes a former Life written by Dr. Welwood, and prefixed to the early editions of his works.)

**ROWLEY, WILLIAM**, an English dramatic writer, of whose life hardly anything is known. He flourished during the reign of James I., and belonged to the royal company of players, and as an actor excelled most in comedy. The 'Maister Rowley, once a rare scholar of Pembroke Hall, in Cambridge,' mentioned by Meres (2nd part of 'Wit's Commonwealth,' 1598) is probably some earlier author. Rowley wrote many plays, of which the following are the best known: 'A new Wonder, a Woman never vext,' a comedy, 4to., 1632. A tragedy, called 'All's lost for Lust,' 4to., 1633. 'A Match at Midnight,' a comedy, 4to., 1633. 'A Shoemaker a Gentleman,' a comedy, 4to., 1638. 'The Witch of Edmonton,' a tragi-comedy (in this he was assisted by Thomas Decker, John Ford, &c.), 4to., 1658. 'The Birth of Merlin,' 4to., 1662. Shakspeare is said to have aided him in this play. The titles of others of his plays may be found in Wait's 'Bibliotheca Britannica,' and the 'Catalogue of the Library of the British Museum.' Rowley is a somewhat unpolished writer, hardly deserving a less obscure fate than he has met with. Hazlitt, 'Lectures on the Dramatic Literature of the age of Elizabeth,' says of him, 'Rowley appears to have excelled in describing a certain amiable quietness of disposition and disinterested tone of morality, carried almost to a paradoxical excess, as in the comedy of the "Woman never vexed," which is written, in many parts, with a pleasing simplicity and naiveté equal to the novelty of the conception.' (p. 78.)

Several of his plays are printed in Dodsley's collection. He is the author of a rare tract, noticed with extracts in the 'British Bibliographer,' iv., entitled, 'A search for Money; or, the lamentable complaint for the losse of the wandering knight Monsieur l'Argent; or, Come along with me, I know thou lovest money: dedicated to all those that lack money. by William Rowley,' London, 1609, 4to.; a composition full of the ribaldry and low wit of his time.

For notices of his life, see a copy of Langbaine's 'Dramatic Poets,' with MS. notes, in the British Museum, and some statements in Collier's 'Dramatic History.' Two extracts from his plays are given in Lamb's 'Specimens of English Dramatic Poets.'

**ROXANA** was the daughter of Oxyartes, a Bactrian prince, who fell into the power of Alexander (B.C. 327), on his conquest of a strong natural fortress in Sogdiana, where Oxyartes had placed his wife and daughters. Roxana was pronounced by the followers of Alexander to be the handsomest woman they had seen in Asia after the wife of Darius, and her beauty made such an impression on Alexander, that he resolved to share his throne with her. Roxana, who was with child at the death of Alexander, subsequently bore a son, to whom the name of Alexander was given, and who was acknowledged as partner of Arrhidæus Philip in the empire. Statira, the other wife of Alexander, was also supposed to be pregnant; and accordingly, Roxana fearing lest Statira's child should become a rival of her own son, invited her and her sister Drypetis to Babylon, where they were put to death with the concurrence of Perdicas. Roxana and her son subsequently fell into the hands of Cassander, who kept them in close confinement in Macedonia. In the treaty of B.C. 311, made between the principal generals of Alexander, it was agreed that Cassander should continue military governor (*σπαρτηγός*) of Europe, till the son of Roxana came of age. Cassander however, to remove this obstacle to the throne, put to death the young king and his mother in the following year.

(Diod. Sic., xxi. 105; Droysen, *Geschichte der Nachfolger Alexanders*.)

**ROXBURGH.** [ROXBURGHSHIRE.]

**ROXBURGH, WILLIAM, M.D.**, a native of Scotland, who proceeded to India in the medical service of the East India Company, and distinguished himself by his attention to the botany of that country. In the early part of his career his attention was confined to the peninsula, as he was stationed at Samulcottah from the year 1781, where he paid particular attention to the cultivation of pepper. Into the plantations established for this purpose he introduced the coffee, cinnamon, nutmeg, annatto, bread-fruit tree, sapanwood tree, and mulberry. He also endeavoured to introduce the culture of silk, as well as to improve the manufacture of sugar, and was remarkable throughout for the great attention which he always paid to the improvement of the resources of the country. He knew and corresponded with Kœnig, a pupil of Linnæus, who first gave an impulse to scientific botany in India. Dr. Roxburgh made large col-

lections of plants in the Carnatic, but he had the misfortune to lose them all, with his books and papers, in an inundation at Injeram. He however recommenced making a fresh collection, and the Court of Directors sent him out a present of botanical books.

In the autumn of 1793, from his great merits, he was removed to Calcutta, where he was appointed superintendent of the botanic garden which had been established by Colonel Kyd. During his superintendence, which extended to 1814, few men have laboured with greater zeal, assiduity, and success, though he had very indifferent health; having been obliged to make three separate voyages for its re-establishment, once to the Cape and twice to Europe, on the latter of which occasions he died, in 1815. On one of these occasions Dr. Carey, the celebrated missionary and Orientalist, took charge of the garden, and published, at Serampore, Dr. Roxburgh's catalogue of the contents of the botanic garden at Calcutta. From Dr. Carey's preface to this catalogue we learn that the number of described species then in the garden amounted to 3500, of which 1510 were named and described by Dr. Roxburgh, besides 453 which, though described, had not then been introduced. Besides describing, he had been in the habit of having splendid drawings made of the various plants that he discovered; these, to the amount of 2000, were sent to the Court of Directors. At their request, Sir Joseph Banks undertook the general superintendence of the publication of a work in which a preference was given to subjects connected with medicine, the arts, and manufactures, and which is now well known as Roxburgh's 'Coromandel Plants,' in 3 vols. fol., with 300 coloured engravings. Dr. Roxburgh's general descriptive work of the plants of India, called 'Flora Indica,' was not published for many years after his death. An edition was commenced, to be published at Serampore, by Dr. Carey, with additions by Dr. Wallich, the first volume in 1820, and the second in 1824. A complete edition, in 3 vols., was published by Dr. Roxburgh's sons, in 1832.

**ROXBURGHIA**, a genus of plants named in honour of Dr. Roxburgh. The genus was first published in his own 'Coromandel Plants,' and hence a French author has chosen to say that Roxburgh is the only botanist who has named a plant after himself, but the preface to the work would have informed him that Dr. Roxburgh's MSS. and drawings, having been sent by him from India to the Court of Directors of the East India Company, were published by them under the superintendence of Sir Joseph Banks, and by him and Mr. Dryander this genus was named Roxburghia. Being considered peculiar in many points, it was thought by Dr. Wallich to be typical of a new order, and called Roxburghiaceæ, but it is accounted allied to and a tribe of Smilacæ. The genus is characterised by having an eight-leaved corol-like perianth, of which the outer leaflets are broad and spreading, the inner ones elliptical, acuminate, and erect. Anthers four, ovary sessile, capsule one-celled, two valved, many seeded. There are only two species of the genus, *R. gloriosoides*, a native of the moist valleys of the Indian peninsula; and *R. viridiflora*, discovered in the Chittagong district by Dr. Hamilton, and said to have long trailing stems, sometimes one hundred fathoms in length. The same species seems to be found also in Siam, Cochin-China, and the Moluccas.

**ROXBURGHSHIRE**, a Scotch county situated on the south-eastern border, is bounded on the north by Berwickshire; on the east and south-east by the English county of Northumberland; on the south by the English county of Cumberland; on the south-west by Dumfriesshire; on the west by Selkirkshire; and on the north-west by Edinburghshire. Its form is very irregular: the greatest length is from north-north-east to south-south-west, from the banks of the Tweed between Kelso and Coldstream, to the banks of the Liddel Water at the junction of Dumfriesshire and Roxburghshire, 43 miles; the greatest breadth at right angles to the length is from the junction of Edinburghshire, Berwickshire, and Roxburghshire, to the Cheviot Hills on the Northumberland border, 30 miles. Its area is variously estimated; by Chalmers (*Caledonia*, vol. ii., table facing p. 26), at 696 square miles; by Playfair (*Description of Scotland*), at about 700 square miles; and by McCulloch (*Statistical Account of the British Empire*), at 715 square miles, or, including the area of its lochs, 715½ miles. Roxburghshire lies between 55° 5' and 55° 42' N. lat., and between 2° 11' and 3° 8' W. long.

The population, in 1801, was 33,682; in 1811, 37,230;

in 1821, 40,892; and in 1831, 43,663, showing an increase in the last ten years of about 7 per cent.: there were, in 1831, 61 inhabitants to a square mile. In respect of size it is the thirteenth of the Scotch counties; in respect of amount of population, the sixteenth; and in respect of density of population, the twentieth (Ross and Cromarty being taken as one county). Jedburgh, the shire town, is on the Jed Water, a small brook flowing into the Teviot, about 333 miles from the General Post-office, London, by Stamford, Doncaster, Boroughbridge, Durham, and Newcastle, and 45 miles from Edinburgh by Dalkeith and Lauder.

*Surface, Geology, Hydrography, and Communications.*—The whole surface of the county is undulating; but in the northern and central parts the hills are of less elevation than along the English and Dumfriesshire borders. A range of lofty hills extends from the eastern extremity of the shire south-west along the border of Northumberland, to which the general designation of Cheviot Hills, properly applicable only to a part of the range, is sometimes given. Arkhope Cairn, Cock Law, Windygate Hill, Blackhall Hill, Musey Law, Fairwood Fell, Carter Fell (2020 feet), and Tronting Crag form part of this range, which separates the basin of the Tweed from the basins of the Coquet and the Tyne. From the head of the Jed Water the range of hills turns westward and runs through the county into Dumfriesshire, separating the basin of the Tweed from that of the Eden. From each side of the range, hills irregularly grouped overspread a wild pastoral district drained by the upper waters of the Teviot on the one side and the Liddel on the other. In the separating range are Need's Law, Fanna Hill, Windborough or Windburgh Hill (2000 feet), the Maiden Paps, Greatmoor Hill, Caldcleugh Hill, Tudhope Hill (1830 feet), Wisp Hill (1830 feet), and Pikethaw Hill. In the hills of Lidisdale, or Liddesdale (the country drained by the Liddel), are Peel Fell, the Lauriston Hills, White Know, Tinnis Hill, Loch Know, and the Mellingwood or Mildewood Hills (about 2000 feet). In the northern part of the county, rising on the south bank of the Tweed near Melrose, are the Eildon Hills (1364 feet); and on the banks of the Teviot near the centre of the county are Ruber's Law (1419 feet) and Dunian (1120 feet) on the south side, and the Minto Crags (721 feet) and Minto Kame on the other. The altitudes are from Chalmers's *Caledonia*; Playfair's *Description of Scotland*; and the *New Statistical Account of Scotland*.

The eastern side of the county is chiefly occupied by the formations of the red-marl or new red-sandstone group; the western side by the grauwacke rocks; the Cheviot or border hills are chiefly of trap formations; and Liddesdale is occupied by the coal-measures. The red-marl formations extend westward along the valleys of the Tweed and the Teviot as far as a line drawn from the neighbourhood of Lauder in Berwickshire southward to Hobkirk on the Rule, and then east and north-east by Southdean, Old Jedburgh, Oxnam, and Yetholm to the border of the county; detached portions are found beyond this limit. The predominant if not the only rock of this formation is a sandstone, commonly red but sometimes white. It frequently occurs in strata of considerable thickness, and is employed as a good building-stone; for which purpose both the red and white varieties are quarried. It more commonly however occurs in thin horizontal beds, soft, brittle, and easily decomposing. Some of the beds have been supposed to be of the old red-sandstone formation. A small portion of the Northumberland coal-field extends into the county near the head of the Jed and the Kail waters, and overspreads the whole of Liddesdale. Scarcely any coal is dug in the county, except perhaps a little in Liddesdale. The western side of the county, from the boundary of the red-sandstone, is occupied by the grauwacke, which constitutes the mass of the hills separating Teviotdale and Liddesdale, on the southern slope of which hills the coal-measures rest. From Hobkirk the grauwacke occupies a narrow tract of country extending north-eastward, being covered by the red-sandstone on the north and west, and interrupted by the trap rocks on the south and east. The strata of the grauwacke are generally vertical, occasionally however varying from a vertical position by an angle of 30°. The whole of the district which this rock occupies is hilly; but some of the higher peaks are of trap or porphyry.

The trap and porphyritic formations of the border hills comprehend greenstone, basalt, trap tuff, amygdaloid, and

especially a felspar porphyry of reddish-brown colour. In the red-sandstone district trap rocks, in dikes or other modes of occurrence, are frequent.

Limestone is procured in some parts of the county; in Liddesdale it is abundant.

The county belongs almost entirely to the basin of the Tweed. Liddesdale alone belongs to that of the Eden. The Tweed itself first touches the border of the county at the junction of the Ettrick Water; it flows eastward, sometimes within and sometimes upon the border, passing Abbotsford, Melrose, St. Boswell's, Makerston, Kelso, and Sprouston, between which village and the town of Coldstream (Berwickshire) it quits the county; that part of its course which belongs to Roxburghshire may be estimated at 27 or 28 miles.

The principal affluent of the Tweed is the Teviot, which flows through the county in nearly its whole extent, giving to the greater portion of it the name of Teviotdale. The Teviot rises in the hills on the south-western border toward Dumfriesshire, and flows with a very direct course to the north-east, past Hawick and Denholm, to Eckford, where it turns northward and joins the Tweed at Kelso; its whole course may be estimated at from 36 to 38 miles. It drains nearly the whole county, receiving the Allan, the Slitrig, the Rule, the Jed, and the Kail from the Northumbrian border, or from the range which separates Liddesdale from the rest of the county, and the Borthwick and the Ale from the border of Selkirkshire. The Ettrick, the Gala, the Leader, the Eden, and other small affluents of the Tweed have part of their course in this county. Liddesdale is drained by the Liddel and the Hermitage, a tributary of the Liddel, with some smaller streams, all of which belong to the basin of the Cumbrian Eden. The Liddel receives all the other streams of Liddesdale, and joins the Esk, which falls into the same estuary as the Eden.

'The immediate banks of the Tweed are generally precipitous, on one side at least, sometimes on both, so that the river, flowing in a deep bed, is frequently invisible from the public roads, and many of its striking beauties are known therefore only to those who are familiar with the district. Everywhere however from the higher grounds, the views of the river, and of a richly wooded and highly cultivated country, are exceedingly fine.' (*New Statistical Account of Scotland*.) The whole course of the Teviot is beautiful; it flows in the bottom of a spacious open valley, the sides of which often rise to a considerable height; the banks are adorned with beautiful seats, and the stream is generally visible from the public roads. Above Hawick the valley is narrower, and becomes pastoral rather than agricultural.

None of the streams are navigable, except for ferry-boats or other very light boats.

The roads are generally very good. Those in the wilder districts of the country, which have been more recently made, are perhaps the best, from the greater skill and knowledge displayed in choosing their line and directing their construction. Several roads from London to Edinburgh pass through this county. One, through Newcastle, Morpeth, and Wooler, just crosses the north-eastern part through Kelso; another, branching from this at Morpeth, passes through Jedburgh and St. Boswell's; and a third, through Penrith and Carlisle, crosses the western side of the county through Dryden and Hawick to Selkirk in the adjoining county of Selkirk. A road from Hawick follows the valley of the Teviot, and then of the Tweed, through Kelso to Berwick in Berwickshire. There is coach communication along the Edinburgh roads, and also along the road from Hawick to Berwick.

*Soil and Agriculture.*—The soil in the western parts of the county, where the predominant rock is grauwacke, is generally a thin cold wet clay; capable, in some cases, where it has been intermingled with the ingredients of other rocks, and improved by underdraining, of producing good though late white crops. A poor sandy soil, intermixed in the higher grounds with peaty matter, usually characterises the districts occupied by the coal-measures. The red sandstone district, where the sandstone is finer grained, and more clayey and adhesive, is marked by a deep rich red soil producing its harvest rather early; but where the sandstone is more siliceous and loose, the surface is covered with a barren sand. The trap and porphyry district is usually covered by a loose, light, warm, and dry soil, except in the bottoms, where there is usually a deposit of rich strong clay

loam. The highest parts of the trap district afford the finest sheep pasture in the county.

About one-third of the county is under tillage; of the remainder a small part is moor-land, and another small portion wood-land; but by far the greater part is occupied as sheep walks. It is supposed that the quantity of arable land has increased one-third within the last forty years. At the commencement of the present century, the arable land, except in the immediate vicinity of the rivers, was scattered in irregular patches, and was altogether unenclosed. But the great improvements which have taken place since that period by the introduction of the drill turnip husbandry; the use of lime, bone dust, and other foreign manures; a better system of draining, and the intermixture of the feeding and grazing of live stock with tillage, have immensely increased the productiveness of the soil, as well as induced the extension of cultivation. On the larger farms, the enclosures generally contain from twenty to forty acres; the fences on the older farms are usually quick hedges with trees interspersed, but in the newer farms they are commonly dry stone dykes or walls. A very common rotation is as follows:—1st year, turnips or potatoes; 2nd, barley, oats, or wheat; 3rd, grass; 4th, oats. Sometimes this 'four-year shift' is exchanged for one of five years, by giving two successive years to grass; and at other times peas or beans, drilled, are substituted for potatoes or turnips. The number of sheep is supposed to have increased one-third since the beginning of the century; and considerable attention has been shown of late years to the breeding both of cattle and sheep. The favourite breeds of sheep are the Cheviot for the hill pastures, and the Leicester or long-woolled for the lower grounds. A cross between these two is found to answer very well. The most common sort of stock is the Teesdale or sbort-horned, but the Ayrshire and the Highland kyloë are also kept; and the small farmers and married farm-servants have sometimes a mixed breed of milch cows, produced by crossing the Teesdale with the Ayrshire, or the Galloway with the Highland.

On the tops of the border hills heath is still found, but the quantity of it has been diminished by the extension of sheep-feeding. Some parts, where the soil is wet, are covered with coarse bent grass, which is used occasionally as fodder for cattle or sheep.

During the first American war, an attempt was made to introduce the cultivation of tobacco. The first trial was made in Melrose parish, and was successful even beyond expectation. The profit was very great, and the cultivation was beginning to extend, when it was put down by Act of Parliament. The plants grew best in a dry light soil well manured. (*Beauties of Scotland.*)

Swine are reared by cottagers, farm servants, tradesmen, and others, in considerable number; but they are not kept to any extent by the farmers. The pork is cured at Berwick, and sent up to the London market. Poultry are kept by the same classes of persons as pigs. There are some very productive orchards in the neighbourhood of Jedburgh, Kelso, and Melrose.

The rents of farms have increased during the present century from 30 to 50 per cent., and in some cases even more. Tillage-farms average from 400 to 600 acres; sheep-farms from 1000 to 3000; and farms partly arable and partly pastoral, from 600 to 1400. Leases are usually for fourteen or twenty-one years. The chief landowners are the dukes of Roxburgh and Buccleugh, the marquises of Lothian and Tweeddale, the earl of Minto, and the families of Ker, Scot, Elliot, Douglas, Pringle, Rutherford, Don, &c. Many of the farmers are enterprising and intelligent; and improved methods of cultivation are extending among them, though by no means so rapidly as is desirable. Farm servants very commonly reside in little cottages grouped together so as to form a hamlet in the neighbourhood of the farm-house and offices. Of these cottages, such as have been built of late years have been made much better than similar buildings were previously made; but the older ones are wretched hovels, worse than the sheds or houses appropriated to the cattle.

*Divisions, Towns, &c.*—The county is divided into four districts, as follows:—Castletown-Melrose district, in the north-west part of the county (except Castletown parish, which is in the south), containing six parishes and part of another (Galashiels, with Lindean, chiefly in Selkirkshire); Hawick district, in the west, containing four parishes and parts of three others (Ashkirk, Robertown, and Selkirk, all

partly in Selkirkshire); Jedburgh district, central, containing eight parishes; and Kelso district, including eleven parishes and part of a twelfth (Stitchel, partly in Berwickshire), which constitute the eastern portion of the county, making in all twenty-nine parishes wholly, and five partly in Roxburghshire. Of the five parishes which are only partly in this county, Stitchel, Robertown, and Ashkirk may be considered as belonging to Roxburghshire, the greater part of their population being within it.

There are five market-towns, namely, Jedburgh (the shire town, also a royal burgh), Kelso, Hawick, Melrose, and Castletown.

Jedburgh (colloquially Jeddart or Jethart) is on the Jed Water, which flows into the Teviot. The parish consists of two detached parts, the one in which the town is situated being near the centre of the county, the other on the Northumberland border: the whole area is about 38 square miles; and the population, in 1831, was 5647, of whom 3617 were in the town. The name of the parish was antiently written Gedworde, Jedworth, Jedwood, and Jedburgh: the first syllable, Ged or Jed, the name of the stream on which the town stands, has been supposed to embody the element of the name Gadeni (Γαδηνοί in the Greek geographers), by which the nation who inhabited this part of the kingdom were distinguished. The parish was celebrated in antient times for its woodland fastnesses, its castles and fortified dwellings, and the magnificence of its ecclesiastical establishments.

At Old Jedworth, four miles from the town, are the slight ruins of a chapel, with its grave-yard; and on the south side of the present town are the more prominent remains of Jedburgh Abbey. This abbey (of canons regular, imported from Beauvais in France) appears to have been founded in the first half of the twelfth century, but the year is doubtful. Some persons suppose its foundation to have been much earlier. It suffered much during the wars with the English, was pillaged and burned by the earl of Surrey at the storming of Jedburgh in 1523, and again injured by the earl of Hertford (afterwards duke of Somerset) in A.D. 1545. The church alone remains: it is 230 feet long. The choir is much dilapidated, and the south transept has disappeared; but the nave, north transept, and central tower, 100 feet high, are in better preservation. The western part of the nave has been fitted up, and is used as the parish kirk. The western end is a lofty gable, with a beautiful Norman door; and there is another beautiful Norman door, which once was the entrance from the cloisters. The architecture appears to be Norman, intermingled with Early English. On the south side of the choir is a chapel, formerly used for the grammar-school. Foundations of the monastic buildings are found extending to a considerable distance from the church, and the burial-ground is very spacious.

The town stands in a narrow valley on the left bank of the Jed. It consists of several streets, converging in the market-place in the centre of the town. There are several houses on the right bank of the river, forming a kind of suburb. There are three bridges over the Jed; and others over one or two small burns or brooks running into it, all in or near the town. The principal streets are sufficiently spacious; and though the houses have generally an air of antiquity, many of them are very good; and in the outskirts of the town are many pleasant villas. The county hall is near the market-place; and close to the southern end of the town, on an elevated site, is the county prison (including a gaol, bridewell, and debtors' prison, with a house for the governor), on a better construction than the generality of Scotch prisons. As it occupies the site of the antient castle of Jedburgh, it has retained the name of The Castle. There are three dissenting places of worship, two of them tolerably spacious. The dissenting interest is strong in and about Jedburgh.

The principal manufactures of the town are of woollens, such as blankets, flannels, tartans, shawls, shepherds' plaidings, hosiery, lamb's-wool yarn, and carpets: these branches give employment to between three and four hundred persons. There are an iron and brass foundry, and a factory for patent printing-presses. There are quarries of red and white sandstone in the parish and several corn-mills. Bread is made for the supply of the surrounding villages, and a great quantity is sent into the north of England. There are two branch banks. The markets are on Tuesday and Saturday; the Tuesday market is a well attended corn-

market. There is a monthly cattle-market, and there are four horse and cattle fairs held in the year, besides a large sheep and wool fair at Rink, in a remote part of the parish. There is a post-office, and there is communication by coach daily with Edinburgh and Newcastle, and twice or three times a week with Hawick and Kelso.

Jedburgh is the seat of a presbytery, of the circuit court of Justiciary, and of Justice of Peace, Sheriff, and Small-Debt Courts. The corporate body of the burgh consists of a provost, four bailies, dean of guild, and eighteen councillors, four of whom are chosen from the deacons of the eight incorporated trades. The royalty or jurisdiction extends only over a part of the parish: it was somewhat enlarged for parliamentary purposes by the Reform Act. The burgh unites with Haddington, North Berwick, Dunbar, and Lauderdale to return a member. The business of the burgh courts is decreasing: the corporation have the management of part of the county prison.

There were, in 1834, fourteen day or evening schools in the parish, attended by 950 scholars, about one in six of the population; of these, 170 were attending the parochial school, with which the English school had been united. There are several excellent public libraries, one of them comprehending a valuable and extensive collection of books. There are two public reading-rooms and a reading society. There are a dispensary (for which the marquis of Lothian, in 1822, erected a commodious house, with baths and other accommodations), a savings'-bank, and some religious and charitable societies.

The neighbourhood is celebrated for the growth of apples and pears, an advantage which it owes to the excellence of the soil, and the care and intelligence of the monks of a former age. There are traces of a Roman camp, and of some other antient camps, of a Roman road, and some remains of the castles and towers of the middle ages, especially of Fernichurst or Firnihirst Castle on the Jed, about two miles above Jedburgh, the antient seat of the Kers, ancestors of the marquis of Lothian.

Kelso is 11 miles north-north-east of Jedburgh, on the north bank of the Tweed, which receives the Teviot just opposite the town: the Tweed is at their junction about 440 feet wide, the Teviot 200 feet. The parish had, in 1831, a population of 4939, about one-tenth agricultural: it comprehends what antiently constituted three parishes, or parts of three parishes, and includes a portion of the antient burgh of Roxburgh, with the ruins of Roxburgh Castle, for some time the residence of the Scottish kings, and before which James II. of Scotland was killed, A.D. 1460. Kelso was famous for its abbey of Tironensis (a class of Benedictines), founded by King David I. early in the twelfth century. The abbey was repeatedly burnt or otherwise much injured, especially in the English invasions of 1523 and 1545, led by Lord Surrey and the Earl of Hertford (afterwards duke of Somerset) respectively. The town, which was originally little more than a suburb of Roxburgh, acquired greater importance from the foundation of the abbey, and rose rapidly after the decay of Roxburgh; but it was nearly destroyed in Hertford's invasion in 1545.

The town consists of several streets converging in an open square, and extends for about half a mile along the river Tweed, to which the principal street is parallel. The old houses, with gables to the street, have very generally given way to more modern buildings of freestone, roofed with slate, giving to the town a very handsome appearance, which is improved by the picturesque scenery of the surrounding country.

The ruins of the Kelso Abbey church are of mingled architecture: the predominant character however is Norman, more or less decorated, with some portions of early English intermingled. The building was in the form of a cross 99 feet long (the nave being shorter than the choir), with a transept 71 feet long and 23 feet broad, with a central tower 91 feet high. The ruins are considerable, and have been in the course of the present century cleared from some incongruous additions made to them in order to adapt the nave to the purpose of a modern church, for which it was used until late in the last century.

There are two modern churches: the one lately erected on the north side of the town is one of the most chaste and beautiful on the border; it is in the Elizabethan style, with a tower 70 feet high. There are five places of worship for dissenters. There is a bridge over the Tweed 494 feet long, with five elliptical arches of 72 feet span; the piers

are 14 feet wide: it was designed by the late Mr. Rennie. [RENNIE.] The town-house is a neat modern building on the east side of the square.

The manufactures of Kelso are not important; leather, linens, stockings, hats, woollen cloth, and tobacco are manufactured; but all these branches give employment to no more than 150 men. There are four branch banks and numerous good shops. There are a daily market for provisions, a weekly corn-market, and a monthly cattle and sheep market, besides five yearly fairs, including that of St. James, one of the best-attended on the border. Professional men are tolerably numerous. There are races at Kelso; and rural sports of various kinds are much practised in the neighbourhood.

Kelso is a burgh of barony with a peculiar constitution, the baron bailie has jurisdiction in small matters, civil and criminal. There is a small prison or lock-up-house. The police of the town is inefficient, especially as the population has been deteriorated by an influx of gipsies from the neighbouring parish of Yetholm, and by the settlement of some Irish. There is a good deal of petty crime.

There is a post-office at Kelso; and communication is maintained by coaches with Newcastle and Edinburgh daily, and with Berwick, Jedburgh, and Hawick twice or three times a week.

There were, in 1834, ten day-schools, two of them parochial, namely, an English and a grammar school, three supported by private charity, and five private schools. The number of scholars, in 1836, was 664; it had been diminishing for the previous three or four years. There were also six Sunday-schools. There are three joint-stock libraries, of 5000, 2000, and 1500 volumes respectively; and several other libraries, a book-club, a Physical and Antiquarian Society, and two news-rooms. Two newspapers are published in the town.

There are a dispensary, with a house for receiving patients, furnished with baths, &c.; and a savings'-bank. Pauperism has much increased at Kelso.

Hawick is about 10 miles south-west of Jedburgh, on the right or south-east bank of the Teviot, at the junction of the Slitrig, Slitterick, or Slitridge, which flows through the town. The parish contains about 24 square miles, and had in 1831, a population of 4970. Hawick suffered much in the border warfare of former days; and both in the town and the rural parts of the parish are several towers or houses whose strength shows they were designed for fortifications. Among these, on the left bank of the Teviot, three miles above Hawick, is Braxholm, rebuilt by Scott of Buccleugh, its owner, after being almost entirely destroyed by the English under the earl of Sussex, A.D. 1570: the building has been so altered and repaired as to have lost much of its antient appearance, but it is of interest as occupying the site of the Braxholm, or Branksome, of Sir Walter Scott's 'Laird of the Last Minstrel.' The town consists chiefly of one long spacious street along the bank of the Teviot, which is here crossed by a stone bridge. There are two bridges over the Slitridge, one of them very antient. There are in the whole parish eight bridges. The streets are well paved, and lighted with gas. The general appearance of the town has been much altered of late years by the laying out of new streets and the substitution of better dwelling-houses and shops for those previously existing. The parish-church was built in the middle of the last century; it is destitute of architectural beauty, but in a good situation. There are four dissenting meeting-houses, a town-hall, and a suite of rooms used occasionally for public meetings.

The manufactures are chiefly of woollen yarns, flannels, and other woollen under-clothing, plaiding, shawls, tartans, druggets, woollen-cloths of various descriptions, blankets, and lamb's-wool hosiery. In these branches, in 1839, 1700 workpeople were employed in and round the town; and the annual consumption of wool was estimated at 108,000 stones. There were 11 extensive factories, 1209 stocking-frames, and 226 weaving-looms. A number of females were employed in sewing stockings. Machinery, candles, and gloves were also manufactured, and the tanning of leather and the dressing of sheep-skins were also carried on. There is a post-office. Mails to and from London and Edinburgh, by way of Carlisle, pass through the town; there are coaches to Edinburgh three times a week, and to Jedburgh and Kelso twice or three times. There is a weekly market on Thursday, and there are four yearly fairs for horses, cattle, sheep, and hiring servants, generally well attended.

There were in the parish, in 1839, a parochial school with a small additional endowment; a second parochial school at the village of Newmill; and ten private schools; besides twenty-four Sabbath-schools on the local system, connected with the establishment, and four Sabbath-schools managed by dissenters. The number of children in the day-schools was 802, viz. 427 boys and 375 girls; there is scarcely any person a native of the parish who is not able to read and write. There are a public library of 3500 volumes, a trades' library of 1200 volumes, three juvenile libraries, and a school of arts. There are a savings'-bank, and several religious and charitable institutions. The police of the town is very inefficient; petty thefts, embezzlements, and petty assaults are frequent. Pauperism has increased of late years with more than ordinary rapidity. Hawick is a burgh of barony; civil causes to any extent and criminal cases of minor description are tried before the burgh justices. There is a wretched prison of only one room.

Melrose is on the south bank of the Tweed, 11 miles north-west from Jedburgh. The parish has an area of 45 square miles, and had, in 1831, a population of 4339, rather less than one-third agricultural. This parish appears to have been the seat of a religious community in the time of the Saxon heptarchy; but the establishment was destroyed when the Scots obtained the district from the Northumbrian Saxons. Some monks afterwards made it the place of their temporary residence; and, in A.D. 1136, David I. of Scotland founded here a Cistercian abbey, the ruins of which yet remain. The original Saxon monastery was on a site nearly surrounded by the Tweed, three miles to the east of the ruins of the later abbey. These ruins are well known from the description in Sir Walter Scott's 'Lay of the Last Minstrel.' They are chiefly of the abbey church, which was in the form of a cross; the length of the nave and choir was 258 feet, the breadth 79 feet; the length of the choir alone about 50 feet; the length of the transept was 130 feet, the breadth 44 feet. The walls of the nave, choir, and transept are standing, and part of the central tower. There are traces of the cloisters and of the monastic buildings. The beauty and finish of the architectural decorations, and the majestic appearance of the ruins, altogether render Melrose an object of great attraction. There are a few other antiquities in the parish; the shaft of an antient cross in the centre of the village is surmounted by the crest of the earls of Haddington; there is a large barrow on the Eildon Hills, and a stone with an antient Latin inscription, evidently Roman, has been found.

The town of Melrose consists of a central triangular space with streets diverging from it, and contains about 700 inhabitants, chiefly retail shopkeepers, handicraftsmen, or labourers, with their families. The place has an air of antiquity; and some of the houses have in their walls stones with inscriptions derived from Catholic times. Some good modern houses have been built. The church is on an eminence a short distance west of the town; it is a plain modern building with a spire. There are two stone bridges over the Tweed in the parish, but neither of them near the town, and a suspension-bridge for foot-passengers and single horses. There are two dissenting meeting-houses, one in the town. There is a small prison or lock-up-house, consisting of a single cell, secure, dry, and tolerably well ventilated.

There is no manufacture but that of woollens. Some of the establishments connected with the manufacturing district of Galashiels extend into the western part of the parish. The linen and cotton manufactures, which flourished for awhile, have become extinct, and the fisheries have dwindled to nothing, but agriculture is conducted with spirit and skill. The farms are large, and the farm buildings commodious and substantial. There are three yearly fairs for cattle and sheep. There is a post-office, but no coaches through the town. The Edinburgh and Jedburgh road passes near it.

There are several schools in the parish; the parochial school, with 70 or 80 scholars, being in Melrose itself, the others in the surrounding villages and hamlets. Education is generally diffused, and is much valued. There is a subscription library at Melrose, and there are small religious libraries in the surrounding villages. There are a savings'-bank, three friendly societies, and two missionary societies. Melrose is a burgh of barony, but the powers conferred by the charter have never been exercised. The superior of the burgh (the duke of Buccleugh) nominates a baron bailie, whose deputy exercises a jurisdiction in trifling

P. C., No. 1256.

matters as a magistrate. Abbotsford, the residence of the late Sir Walter Scott, is in the parish of Melrose, two or three miles west of the town.

Castletown is in the southern part of the county. The parish is the most extensive in the south of Scotland, and comprehends a large part of Liddesdale. It is separated from the rest of the county by a range of hills, the ramifications of which, separated by narrow valleys, extend over the whole parish. The population in 1831 was 2227, about half agricultural. There are a number of antiquities; several circular enclosures, or antient British forts or camps, called 'Picts' works,' a druidical circle, several cairns, a stone cross, and the castle of Hermitage, with the ruins of the chapel near it. The castle is a massive border tower or fortress, nearly 100 feet square. The walls are entire, and have been lately put into complete repair. The town of Castletown consists of two long streets parallel to each other, lined with neat new houses, on the right bank of the Liddel, and contains a population of above 1000. The town was commenced in 1793, and has superseded the old village of Castletown (so called from a border fortress now demolished) higher up the vale. There are a weekly market established in the last two or three years, two yearly sheep-fairs, and three hiring-days. The parish church is at the junction of the Hermitage with the Liddel, above a mile from the town, and will contain 700 or 800 people. There is a dissenting meeting-house in the parish. There are four parochial schools, one principal and three auxiliary, besides two private schools, and a public subscription library. No public conveyance passes through any part of the parish.

The village of Yetholm, in the eastern part of the county, is remarkable as the usual abode of a gipsy colony, of which an account is given in 'Blackwood's Magazine,' vol. i., pp. 154-161. St. Boswell's, near Melrose, is celebrated for a great sheep-fair, the greatest in the county, held in July.

*Divisions for Ecclesiastical and Legal Purposes.*—Of the thirty-four parishes wholly or partly in Roxburghshire, nine in the north-east are in the presbytery of Kelso, nine along the north-western border are in the presbytery of Selkirk, one in the north (Smailholm or Smallholm) is in the presbytery of Lauder, and one on the south (Castletown) in the presbytery of Langholm. The remaining fourteen central parishes are in the presbytery of Jedburgh. The presbyteries of Kelso, Selkirk, Lauder, and Jedburgh are in the synod of Merse and Teviotdale; the presbytery of Langholm is in the synod of Dumfries.

The circuit court of justiciary and the sheriff-court are held at Jedburgh, where the county gaol is. There are six prisons in the county, viz.: the burgh and county prison at Jedburgh, and a small lock-up-house; and small prisons or lock-up-houses at Kelso, Hawick, Melrose, and New Castle-town. 'There appears to be a good deal of crime in this county in proportion to the population. The offences consist chiefly of thefts (particularly sheep-stealing and embezzlement) and assaults . . . The offenders as a class are said to be of drunken habits, and to be much below others in the same rank of life in education and intelligence. Many of the younger offenders have learned no honest means of getting a livelihood; and, as might be expected, their parents are themselves either positively bad, or at least very negligent of their children. The offences are chiefly committed by resident inhabitants; many however are by strangers. The police of Roxburghshire has been lately organised and greatly improved; but the procurator-fiscal is of opinion that about one-third part even of the offences which are of sufficient importance to be referred to the sheriff, are still committed without any clue being obtained to the parties concerned, or without sufficient evidence being obtained to warrant a prosecution.' (*Inspectors of Prisons' Third Report, 1837.*)

The county returns one member to parliament. Jedburgh is the principal place of election. The same burgh is united for the return of a member with Haddington, North Berwick, Dunbar, and Lauder. The constituency of the county amounted in 1834-5 to 1674, in 1835-6 to 1863, that of the burgh district in 1834-5 to 601.

*History and Antiquities.*—In the earliest period of authentic history the county seems to have been comprehended in the territories of two antient British nations, the Gadeni in the west, and the Otadeni in the east. Of these Celtic nations the cairns and barrows or tumuli, and other sepulchral antiquities which have been found, are supposed

to be relics. Druidical stones, some of them arranged in circles, are found; and the Eildon Hills and other eminences are crowned with forts. On the conquest of this part of the island by the Romans, the county was comprehended in the province of Valentia, and Roman roads were carried across it, and Roman stations established within it. Some of these stations were formed by occupying the antient forts or hill-camps of the natives, and strengthening and adapting them by Roman skill and labour. The camp on the Eildon Hills was thus occupied. A chain of Roman posts may be traced by their existing remains, and there are traces of Roman roads. One, which was a continuation of Watling-street, may be traced from the Northumbrian border across the county near Jedburgh and Melrose, in the direction of Lauder. Coins, vessels of copper and brass, and other Roman antiquities have been discovered. The Trimontium of Ptolemy and Richard of Cirencester is fixed by some antiquaries at the camp on the Eildons near Melrose; but Chalmers places Trimontium at Birrenswork Hill in Annandale, Dumfriesshire, and makes the Eildon camp to be the Ad Fines of Richard of Cirencester, which others fix at Chew Green. Gadanica, mentioned by Richard, is fixed by some at Hawick. (See *Map of Antient Britain*, published by the Society for the Diffusion of Useful Knowledge.)

On the departure of the Romans this county was exposed to the attacks of the Angles, who founded the Northumbrian kingdom. The natives struggled long and gallantly, and it is to this period that Chalmers ascribes the construction of the Catrail, a vast ditch at least twenty-six feet broad, with a rampart eight or ten feet high on each side of it, formed of the earth thrown out of the ditch, extending from near Galashiels in Selkirkshire to Peel Fell on the border of Northumberland, forty-five miles, of which eighteen are in Roxburghshire. But the Angles gained ground, and before the end of the sixth century occupied Teviotdale, which became part of the kingdom of Northumbria. [NORTHUMBERLAND.] In the tenth century it was relinquished by the Anglo-Saxons to the king of Scotland, together with the rest of the Scoto-Northumbrian territory comprehended under the general name of Lothian. From this time the county was gradually strengthened by castles and towers against that hostility to which its situation on the border peculiarly exposed it. Jedburgh Castle was erected in the time of David I., in the earlier part of the twelfth century, and is the earliest in the county of which any distinct account can be given. Roxburgh Castle was perhaps of as early date, and at one time of greater importance. Hermitage Castle was built during the reign of Alexander II. (A.D. 1214-49); and in following years, but especially after the aggressions of Edward I. had embittered the hostility of the two nations, rose the various castles, towers, and peels, of which many ruins exist, and some of which have been brought into notice by the 'Minstrelsy of the Scottish Border,' and the poems of Sir Walter Scott.

Of Roxburgh Castle, now in Kelso parish; of Clintwood Castle, in Castletown parish; of Gossford Castle, in Eikford parish; and of Haliedean or Holydean Castle, in Bowden parish, the remains are very scanty. Of Delphiston Tower, in Oxnam parish, and Minto Tower, in Minto parish, there are rather more remains, also of Goldielands Castle near Hawick; but none of these call for particular notice. The ecclesiastical ruins, Kelso, Jedburgh, and Melrose abbeys, have been noticed already. There are remarkable caves at Jedburgh, Roxburgh, and Ancrum, which appear to have been used as habitations, probably as temporary retreats during the border wars. There are some remarkable remains of walls in Ancrum parish, forming a quadrangle, enclosing an eminence above which they rose; they are called the Maltese wall, and are supposed to be the remains of a building belonging to the Knights of Malta. Smallholm Tower is so conspicuous as to form a landmark for seamen entering Berwick harbour.

Roxburghshire appears to have been early established as a shire. Mention of the sheriff occurs in the reigns of Alexander I. (1107-1124) and David I. (A.D. 1124-1153). The chief fortresses in the shire were ceded to the English by William the Lion, to redeem himself from captivity, A.D. 1174, but restored A.D. 1189 by Richard I. When Edward I. seized Scotland into his own hands, he placed this county under a military administration; but the successes of Robert Bruce and his supporter Douglas, the latter of whom took Roxburgh Castle, A.D. 1313, restored the for-

mer mode of administration by a sheriff. The county was still however claimed, and at times successfully, by the kings of England, who occasionally appointed the sheriff, while in the intervals of English weakness and decline the Scottish princes exercised the right of appointment. In 1342 Roxburgh Castle, then in the hands of the English, was taken by Sir Alexander Ramsay of Dalwolsy, who was appointed by the Scottish king, David II., sheriff of the county. This appointment roused the jealousy of the great Douglas family, one of whom, Sir William Douglas of Liddesdale, seized the sheriff, and carrying him off to his castle of Hermitage, there starved him to death, A.D. 1343. In the interval between A.D. 1346 and 1384, in which year the Scotch again possessed themselves of the county, except the castles of Jedburgh and Roxburgh, Roxburghshire was in the power of the English. It was chiefly by the valour of the Douglas family that it was recovered, and the sheriffs were commonly chosen from that family, who came to regard it as their right, so that the appointment of Sir David Fleming of Biggar to the office, in A.D. 1405, led to his assassination by James Douglas of Balveny. The office of sheriff then became hereditary in the Douglas family, and continued so until the final abolition of hereditary jurisdictions. Roxburgh Castle was taken from the English, A.D. 1460, by Mary of Gueldres, widow of king James II., who had fallen during the siege; Jedburgh Castle had been recovered long before.

The calamities of war led to the ruin of the town of Roxburgh, which had, in the reign of David I., been the royal residence and the county town. On its downfall Jedburgh became, and has continued to be, the county town. The sheriffs appointed by the English made Hawick their residence. Liddesdale was possessed by various branches of the Douglas family, and passed by exchange, in 1492, to the earls of Bothwell. It was held by the notorious earl of Queen Mary's time, and she visited him when he lay wounded in his castle at Hermitage, in A.D. 1566. In the commencement of this unfortunate queen's reign, A.D. 1545, an English army, which had invaded the country under Sir Ralph Evers and Sir Bryan Layton, was here defeated with considerable loss by the earls of Arran and Angus. The county suffered materially in the succeeding invasions of the Earl of Hertford, afterwards duke of Somerset, A.D. 1545-1547; of Lord Gray, A.D. 1548; and of the Earl of Sussex, A.D. 1570.

ROYAL ACADEMY OF ARTS IN LONDON. At the accession of George III., painting, sculpture, and architecture, notwithstanding there were eminent artists in all these branches, were in a lower state in Great Britain than in most parts of Europe. Foreign critics did not hesitate to assert, that the ungenial climate or the physical defects of the English presented insuperable obstacles to the attainment of excellence in the arts. Whether these opinions induced the young king to turn his attention to the subject, and endeavour to remove this national stigma, cannot now be known, but it is certain that he soon began to show a strong disposition to encourage the arts. The study of architecture under Mr. (afterwards Sir William) Chambers became his favourite recreation, and we have heard that his patriotic wish to advance the taste and refinement of the nation was strengthened by the representations and advice of Drummond, then archbishop of York. This prelate introduced to his notice Benjamin West, a young American artist just returned from his studies in Italy, to whom the king thenceforward allowed a liberal pension.

An institution which had been formed in 1754, called 'A Society for the Encouragement of Arts, Manufactures, and Commerce in Great Britain,' was the first which included among its objects the offering of rewards to the fine arts. Attempts were made about the same time by the principal artists to form a permanent academy for the cultivation of painting, sculpture, and architecture, which failed. In 1760 however, with the assistance of the above-mentioned Society, who liberally allowed the use of their great room for the purpose, the artists were enabled to open the first public exhibition, which though not entirely satisfactory to the promoters, attracted great attention, and was for several seasons successfully followed by a similar display of their talents. They were in consequence enabled to apply to the king for a charter, which the king granted, and in 1765

they were constituted a body corporate under the title of 'The Incorporated Society of Artists.' The way was thus paved for the institution of the Royal Academy; but its immediate cause was a schism which took place in the 'Society' soon after their incorporation. According to Edwards (whose 'Anecdotes of Painting' furnish the best accounts of the state of art at this period), 'Unfortunately they were scarcely collected when discussions arose which, in the course of three years, caused an irreparable breach, and in the end a total dissolution of the incorporated Society.' This event he attributes 'to the loose and unguarded manner in which the charter was composed: for it did not provide against the admission of those who were distinguished neither by their talents as artists nor their good conduct as men.' The number of members already amounted to a hundred and forty-one, of whom a large portion were artists of very inferior merits. 'It was now seen,' says another writer well acquainted with the facts, 'that no society of this kind could be lasting, unless it were more limited in its numbers and select in the choice of its members, and that it could have no national dignity without the avowed and immediate patronage of the sovereign.' Accordingly the principal artists withdrew, and endeavoured to obtain the protection and patronage of the king. W. Chambers, F. Coates, G. M. Moser, and B. West presented to him a memorial signed by twenty-two artists, the purport of which was to show the probability that with his royal sanction and encouragement, and by means of an annual exhibition of their works, they would soon be able to raise sufficient funds for the support of a gratuitous national school of art. The memorial stated, 'The two principal objects which we have in view are the establishing a well-regulated school or academy of design, and an annual exhibition open to all artists of distinguished merit; we apprehending that the profits arising from the last of these institutions will fully answer all the expenses of the first; we even flatter ourselves that they will be more than necessary for that purpose, and that we shall be enabled annually to distribute somewhat in useful charities.' The proposal was graciously received. The plan of a constitution was drawn up by Mr. Chambers, and laid before the king, which he approved, and signed on the 10th of December, 1768. Thus was founded 'The Royal Academy of Arts in London, for the purpose of cultivating and improving the arts of painting, sculpture, and architecture.'

The artists who signed this memorial were: Benjamin West, Francesco Zuccarelli, Nathaniel Dance, Richard Wilson, George Michael Moser, Samuel Wale, J. Baptist Cipriani, Jeremiah Meyer, Angelica Kauffman, Charles Cotton, Francesco Bartolozzi, Francis Cotes, Edward Penny, George Barrett, Paul Sandby, Richard Yeo, Mary Moser, Agostino Carlini, William Chambers, Joseph Wilton, Francis Milner Newton, Francis Hayman. These, with John Baker, Mason Chamberlin, John Gwynn, Thomas Gainsborough, Dominick Serres, Peter Toms, Nathaniel Hone, Joshua Reynolds, John Richards, Thomas Sandby, George Dance, Francis Hayman, William Hoare of Bath, and Johan Zoffani, composed the original thirty-six academicians. The number forty was not completed till 1780—by the addition of Edward Burch, Richard Cosway, Joseph Nollekens, and James Barry. Their first meeting was held on the 14th of December, when the following officers were elected, viz.: J. Reynolds, *President*; G. M. Moser, *Keeper*; F. M. Newton, *Secretary*; E. Penny, *Professor of Painting*; T. Sandby, *Professor of Architecture*; J. Wall, *Professor of Perspective*; Dr. William Hunter, *Professor of Anatomy*. The king appointed William Chambers *Treasurer*, and R. Wilson *Librarian*.

This list of the founders of the Royal Academy evidently includes the great mass of talent existing at that period in London.

The other academies of Europe which have been established for the advancement of the fine arts and the promotion of public taste, are supported entirely at the expense of their respective governments as *national* objects, and are usually under the control of some person of distinction. Such is the Royal Academy of Paris, founded just a century before. The Royal Academy of London is essentially different from these, inasmuch as it originated in the private munificence of the reigning king, and, since the first years of its existence, has been entirely maintained by the exertions of the artists themselves, unaided by a single national grant or public subscription.

The king's adoption of the artists was immediately followed by the most liberal and effective support. He caused apartments for the schools to be fitted up in his own palace of Somerset House, supplied the Society with rooms in Pall Mall for their exhibitions, and for several years made up every deficiency in their expenditure from his privy purse; with true and considerate benevolence he allowed them at the same time to reserve a hundred pounds a year to form a fund for necessitous members or their widows, and twice that sum to administer occasional relief to artists in distress, whether they were members of the Society or not.

George III. constituted himself the head of the Academy, and showed a personal interest in its success; he gave frequent audiences to its officers, confirmed its proceedings when his sanction was necessary, and attended to all its concerns as if it were part of his household. When Old Somerset House was purchased by the nation as a site for a number of public offices, the king took care to reserve a portion of the new building for his Academy.

In 1776 the plans of a new site were submitted to the approval of the president and council, and the apartments devoted to this purpose were fitted up with a degree of magnificence worthy of a royal palace, the talents of many of the principal members having been employed in its decoration. In July, 1780, the preparations being completed, the Royal Academy obtained possession of their new residence, by an order from the Treasury to the surveyor-general of the works, and their first exhibition in Somerset House took place in the following year. This friendly superintendence of its affairs and anxious desire to promote the welfare and utility of the Society continued till the year 1800, when the health of the king unfortunately became so much impaired as to prevent any further interviews between the Academy and its patron. But the institution had now acquired stability, and though its acts for some time remained unconfirmed, it continued to exercise its functions; and when the government was placed in the hands of the Prince Regent, he took the Academy under his protection, and approved of their proceedings. On his accession to the throne, in 1820, the position of the Academy had become somewhat changed. A gradual augmentation in the receipts of the annual exhibitions, aided by a judicious economy, had enabled the members to support the schools on an increased scale of expenditure, and to provide for the continuance of the establishment from its own resources, without the assistance of the king. On the death of George III., the Academy solicited his successor to honour them with the same patronage which they had received from his predecessor. George IV. readily consented to adopt the Royal Academy, and, in furtherance of the views of its founder, placed himself at the head of the institution, and thenceforward gave the sanction of his signature to such of their proceedings as required it.

Though the Society did not derive any pecuniary assistance from George IV., they were on many occasions indebted to his munificent patronage. He honoured the president with a distinctive badge, a gold medal and chain, to be worn on all public occasions. He presented them with a magnificent lamp for their principal room, and greatly forwarded the utility of the schools by giving them a large and highly valuable collection of casts from the finest antiques, which were procured from Rome by the intervention of Canova.

On the death of George IV., his successor, William IV., immediately extended his patronage to the Royal Academy. He entered cordially into the views of his royal father, received the officers with promptness, and attended with great kindness to their wishes on all occasions.

In 1834, a proposal having been made by Lord Grey and the existing ministry to transfer the establishment from Somerset House to Trafalgar Square, where an edifice was proposed to be raised which would be large enough for a national gallery of paintings, and at the same time offer better accommodations to the Royal Academy, the king was appealed to on the subject. At first he seemed rather adverse to the removal of the Society from apartments which he considered to be his own, where they had been planted by their founder, and where they had carried on their operations with success for above half a century, but on being informed that it would probably conduce to the advantage of the arts that the Society should have better exhibition-rooms, particularly for works of sculpture, he consented, though with some reluctance, to the exchange proposed.

Plans of the new building were accordingly laid before the president and council, and the accommodation of the Academy was consulted as far, we may suppose, as circumstances would permit, but it appears that some inconveniences of a very serious kind could not be overcome. The apartments were put into their possession in 1836, in a very unfinished state, and wholly devoid of such decoration as might have been expected in an academy of the arts. The removal has been attended with great expense to the Society, and in many respects they have been disappointed in their expectation of improved accommodation.

Upon the accession of Her present Majesty, and a representation of the position of the Academy with relation to her royal predecessors, the queen adopted the Royal Academy, consented to become its head, to grant the same privileges of a private audience to its officers, and to sign such of their proceedings as require the royal sanction.

The Royal Academy consists of forty academicians, painters, sculptors, and architects. There is a second order of members, styled associates, twenty in number, from whom alone the vacancies that occur among the academicians are supplied. The body of academicians elect, but the approbation and signature of Her Majesty are necessary to make this election valid.

There are also six associate engravers. Associates are elected by the body of academicians, from a list of exhibitors who declare themselves candidates for this honour.

There are a treasurer and a librarian. A bye-law of the Academy requires that they shall be academicians. These offices are filled by Her Majesty's nomination.

There are also a keeper and a secretary. These offices are filled by election, with the approbation of Her Majesty.

There are four professors, academicians, elected by the general assembly, and approved by the queen, who read lectures on painting, sculpture, architecture, and perspective.

There is a professor of anatomy, elected by the academicians, with the approbation of Her Majesty.

There are three schools: a school for study from casts from celebrated works of antiquity; a school for study from living models; and a painting school. The first is under the care and direction of the keeper; and the other two are under the care of visitors, annually appointed.

The council consists of nine members, including the president, and has the management of all the concerns of the Society. All bye-laws of the Academy must originate in the council, and have the approbation of the general assembly, and the sanction of Her Majesty's signature to give them effect.

The president, council, and visitors are annually elected, and confirmed by Her Majesty's signature.

There are also several honorary members of the Royal Academy, namely, a professor of antient literature, a professor of antient history, a chaplain of high rank in the church, an antiquary, and a secretary for foreign correspondence, elected by the general assembly and approved by the queen.

Among the honorary members are the names of Samuel Johnson, Goldsmith, Franklin the translator of Sophocles, Gibbon, Mitford the historian of Greece, Barretti, Bennett Langton, Dr. C. Burney, Walter Scott, and others.

All persons are admissible as students of the Academy. Nothing but indication of talent and a respectable character are required from them. Their names remain unknown till judgment is passed on the specimens which they send in, and when admitted they receive a gratuitous education from the best masters.

All painters, sculptors, or architects, whose works show sufficient merit, are allowed to exhibit with the Academy, and, being admitted exhibitors, they are immediately eligible as associates. Many young artists whose great abilities have promised to contribute to the credit and support of the institution, have been chosen associates, and soon afterwards academicians, though they had scarcely left the schools.

The executive government of the Academy passes in rotation to all the academicians, and half the council retires, and is renewed annually.

The operations of the Academy are continued in regular succession throughout the year, excepting vacations of a month in September and a fortnight at Christmas. Unfortunately the necessity of giving up the only room fit for an antique academy to the annual exhibition of sculpture, renders the cessation of that school during the exhibition still unavoidable.

The schools of drawing, painting, and modelling are open daily from ten to three and from six to eight, under the direction of the keeper and visitors. A practical course of lectures on perspective is given during the spring. The lectures on anatomy are delivered before the Christmas recess; those on painting, sculpture, and architecture, are given twice a week, from January to the end of March. The library is open three times a week.

Prizes are annually given to encourage meritorious students, and those who have gained the biennial gold medal have from time to time an opportunity of being sent abroad to study for three years at the expense of the Academy.

Among the chief improvements in the practical working of the Academy, besides the professorship of sculpture, may be reckoned the institution of a school of painting, which is under the superintendence of a special officer. It is attended twice a week by visitors, who are appointed from among the academicians for that purpose, and premiums are annually awarded to the successful students. This school is from time to time favoured with the loan of some of the finest pictures from the royal collections, from the Dulwich Gallery, and from all the principal collections of the metropolis, which are during the greater part of the year placed before the students. For the furtherance of this object the Academy have purchased the finest copy extant of Leonardo da Vinci's celebrated Last Supper.

The library of the Academy is continually improving, and it now contains all the best works on art, besides a considerable number of modern prints and a valuable collection of engravings of the Italian school from the earliest period, formed by George Cumberland, for which they paid 600*l*. On the death of Sir Thomas Lawrence the Academy purchased his collection of architectural casts for 250*l*. (although their apartments could not accommodate them), and presented them to the British Museum, where they are well arranged for the benefit of students.

The question has often been raised, whether academies are calculated to advance the arts; but these institutions vary so much in their plan and character, that any answer to this question must depend on the precise meaning attached to the word. Academic education will probably be less effective than the education obtained under a master of eminence who is daily teaching his pupil by precept and example in his own studio; but an academy, considered as a school of art, is just as likely to stimulate genius as a private school, if it is well conducted. The great men who have been brought up in private schools would not have been less eminent if they had been reared in an academy, which term properly means a place of instruction, a school which offers every opportunity of study. If such schools cannot create genius, they have no tendency to stifle it. Sir J. Reynolds always regretted that he had not had a more academic education. The school of the Caracci sent out a number of well-trained and excellent artists, though they had not the good fortune to produce a Raffaello. The fact is, that the true school of any country is in the mass of talent existing in it, and not in the studio of any particular artist.

It is only the elementary education that can be acquired in a school of any kind, but this is precisely the kind of education which a well-constituted academy can give better than any private master. The utility of such an establishment as the Royal Academy cannot therefore be doubted; and it must be from want of diligence or capacity, or both, if, with such numerous aids and advantages, the students do not acquire sufficient preparatory knowledge to enable them fairly to commence their profession.

If we look back to the general condition of painting, sculpture, and architecture when the Royal Academy of Arts was established in 1768, they will be found to have made at least as great a progress here as they have made in any other country in an equal period. In many respects the English may vie with any modern school of painting; in colour and effect it confessedly stands alone, and has become a model to the rest of Europe. It is characterised by originality and a great variety of styles, and it has produced many works of first-rate excellence. In portraiture, familiar subjects, animals, and landscape it is unrivalled. In historical painting alone, from the want of national encouragement, it has not been so successful. This branch of art can only be kept alive by public encouragement, and by the decoration of churches, palaces, and other public buildings, a subject to which the government of this country have hitherto paid

little or no attention. About two thousand students have been reared under the tuition and auspices of the Royal Academy. Among these the well-known names of Bankes, Flaxman, Nollekens, Deare, Bacon, Rossi, in sculpture; Soane, J. Wyatt, Wyattville, in architecture; Northcote, Opie, Hoppner, Lawrence, Westall, Stothard, and Hilton, in painting, are conspicuous. Some of these artists are entitled to be ranked with the best of any period of art, and others gave proof of powers which, if they had been employed in national works, might have raised English art to a still higher elevation. This list might be much enlarged if we could with propriety include in the enumeration the names of living artists. The creation of so large a number of well-trained students has tended to diffuse a love for the arts throughout the country, and given rise to institutions for their cultivation in many parts of the empire. Thus the public taste has been improved, and those branches of our manufacturing industry which require the aid of the art of design, have been indirectly encouraged by the establishment of the Royal Academy.

Among the benefits derived from the institution of the Royal Academy may be mentioned the various lectures and discourses which have been delivered there. The discourses of Reynolds are highly appreciated both at home and abroad; and the lectures of Fuseli, Flaxman, and other professors have established the theories of their respective arts on a sure basis.

The attention which the Royal Academy has uniformly shown to unfortunate artists in general, and the liberal assistance they have bestowed to such out of their funds, should not be omitted. It appeared in evidence before a committee of the House of Commons, in 1836, that the gross sum that they have expended in pensions to distressed members amounted to 11,106*l.*, and the donations to artists, not members, and their families, to 19,249*l.* With this generosity the Academy has combined a prudent degree of economy in the management of their funds, both for the purpose of providing against casualties and for the gradual improvement of the establishment. This is shown by the fact that they have already expended 240,000*l.* in carrying out the objects for which they were associated, and have still reserved for exigencies a sum of 47,000*l.* stock.

It will appear from what has been stated, that the Royal Academy owes its corporate existence entirely to the crown, and is neither supported nor aided by any public funds. It has also been shown in what manner it has become entitled to accommodation in the National Gallery. Though the exertions of the Academy have been directed to a public object—the improvement of the arts—it differs in no respect from any other body incorporated for literary or scientific purposes, such as the Astronomical Society for instance, and others, which support themselves by their own funds. Accordingly it is not easy to see on what grounds the House of Commons claim the right of inquiring into the receipts, expenditure, and general management of the Academy. The committee of the House of Commons on Arts and Manufactures, in 1836, did however inquire into the affairs of the Academy, and the printed evidence reported by the committee shows that every information was readily given to them. The result of the inquiry was in every way creditable to the institution, and the administration was proved to be strictly conformable to the purposes for which the Academy was instituted.

In the year 1834 the House of Commons had addressed the king, requesting him to direct the Royal Academy to furnish them with certain returns explanatory of the constitution of the body and its proceedings.

This was the first attempt to withdraw the Royal Academy from its immediate connection with the crown and to bring it under the control of the House of Commons. On this occasion the Academy, having first asked the permission of the king, William IV., gave the House all the information that was desired. But in 1839 an order was made to furnish the House with similar returns in continuation, as well as with the particulars of their domestic expenditure. These returns were not made, and a petition was presented to the House, in which the position and claims of the Royal Academy were fully and clearly explained. The petition produced its effect, and the order was rescinded.

We have purposely abstained from any notice of the various attacks made on the Royal Academy. Its constitution and administration are now so well known, that it is

not very difficult to form a right judgment of what is said either for or against it. Those who find fault with its constitution, should show how it can be improved, and those who would deny that it has done service to the arts, must be prepared to dispute the truth of a large part of the petition just referred to. The administration of the finances of this body deserves unqualified praise. It has itself produced all the funds necessary for its support, and by a rare combination of liberality and economy it has expended large sums on proper objects, and yet is far from being poor. There are few public bodies of which the same can be said.

**ROYAL EXCHANGE.** Although there is no such building actually existing at present, we insert here some account of the one destroyed by fire in 1838, which was the second structure—the original one having met with a similar fate in the Great Fire of London in 1666. The first edifice, which was a brick building, was erected by Sir Thomas Gresham, for the accommodation of the merchants, entirely at his own expense. [GRESHAM.] Notwithstanding the general confusion and trouble occasioned by the calamitous conflagration, the new Exchange was commenced at the end of the following year, and was so far advanced in 1669, as to be publicly opened for business, on September 28: a rather curious circumstance, when it is considered that more than the same time has elapsed since the last fire, and the future Exchange can hardly be said as yet (March, 1841) to be actually begun.

The design of the late Royal Exchange had always been attributed to Wren, until Mr. Brayley claimed it for Mr. Edward Jerman, who was one of the city surveyors at that time, and who, it appears, was employed by the committee to conduct the works, which, however, is no proof whatever that he was the author of the design. On the contrary, as that point is left doubtful, the more plausible conjecture is that he was not; because, had he been so, his name would in all likelihood have been less obscure, if only on account of that single production, for it was certainly looked upon at one time as a splendid structure. It is for such reason alone that we call in question Jerman's title to be considered the real architect, since we are not at all solicitous to claim that honour for Wren, being of opinion that it was in many respects not a little barbarous in taste, and that Ponz [PONZ], certainly not the most fastidious of critics, did not do it any very great injustice when he spoke of it, in his account of his tour in England, as being totally devoid of elegance in its decorations. The large order of four Corinthian columns, in the centre of the Cornhill front, was so managed as to disturb the whole design, for instead of its architrave being upon the same level as that of the smaller order on each side over the arcades, it was lower down; consequently, besides the disagreeable irregularity so occasioned, that portion appeared depressed, although made actually loftier than the rest by the attic and tower. Another very singular solecism was, that over the intercolumn on each side of the large central archway there was a segmental pediment most unmeaning in purpose and insignificant in effect, or rather, the only effect was to make us sensible of the omission of a central pediment in the design. Over the archway or middle compartment the clock-tower was carried up in three receding and diminishing stories or stages, in each of which was an arched window, and at the angles a Corinthian half-column grouped with a semi-pilaster on each side, similar to the small order over the arcades in the lateral divisions of the front; and so far there was some uniformity kept up between those portions of the design and the tower. There were also at one time two ugly octagonal lanterns with ogee domes, not at the extremities of the front, but over the extreme compartments where the arcades projected beyond the general plan. When those turrets were removed we have not been able to ascertain; but the larger tower was taken down, and a new one erected, about 1821, by Mr. George Smith, architect to the Mercers' Company, at which time other alterations were made in the upper part of the central compartment, and among them was that of substituting balustrades, with statues on their pedestals, for the two small pediments above mentioned. Immediately behind these balustrades rose an attic, containing a large pannel with bas-relief, flanking the loftier stylobate or lower story of the tower, to which succeeded a low octagonal base, with clock dials on its faces, supporting a circular Corinthian peristyle of eight columns, crowned by a dome. This arrangement seems to us much better than that of the first tower, with its three square

chest-like stories dwindling upwards into insignificance. Still there were two circumstances which detracted considerably from the merit of the second or circular story of the last tower: one, the absurdity of introducing balustrades between the shafts of the columns when there was no passage behind them; the other, the introducing stumpy arched windows squeezed into all the intercolumns.

The chief merit of the inner quadrangle was, that it afforded a spacious sheltered ambulatory (28 feet wide) round the open area: in point of architecture it was poor, and in some of its features very offensive. The lower and much better half consisted of seven arches on each of the longer sides, and five on each of the shorter sides of the open area, springing immediately from the capitals of the Doric columns; those at the angles of the plan had clustered shafts. But the beauty of such a combined ordinance was materially injured by the great span of the arches in comparison with the height of the columns. This scantiness of the columniation, and consequent apparent fragility of the lower part, was rendered more offensive by the heavy superstructure over it. This last was of barbarous design, in proof of which it is sufficient to observe that the architrave was cut through by ugly little oval windows, just at the vertex of each arched compartment, where, if anything, there ought to have been some kind of keystone.\*

These remarks have been more minute than may seem consistent with an article of this kind; yet the subject derives from circumstances far more interest just now than it would else possess. We shall not say anything with respect to the competitions for the new Exchange, except that the last, to which only six architects had been invited, was confined to Mr. Cockerell and Mr. Tite, and that the design by the latter was selected for execution. It would be altogether premature however to attempt any description of what will probably undergo considerable modifications in many parts, for it is said that the western portico (a Corinthian octastyle) is now to be extended so as to be *diprostyle*, instead of *monoprostyle*. [PORTICO.] It is singular that the opportunity should not now be taken of covering in the area where the merchants assemble, instead of forming, as before, a mere court with colonnades around it, where the open area at least must be exposed to the weather. Every edifice of the kind erected within the last century is covered in: the Royal Exchange, Dublin, the Bourse at Paris, the Exchange at Hamburg, that at New York (since destroyed by fire), and the Birzha or Exchange at St. Petersburg. Though small, the first of these is singularly elegant in its plan, the interior forming a rotunda within a square, having a circular peristyle of twelve Corinthian columns supporting a dome over the central part of the area below. For some account of the Bourse in that capital we refer to PARIS. The Birzha at St. Petersburg, on the contrary, calls for some little notice here: it is an insulated edifice surrounded by a Doric peristyle, forming nine intercolumns at each end and thirteen on each of the longer sides. As the *cella*, or body of the edifice enclosed by the colonnades, is carried up rather higher than these last, there are no pediments over the ends or fronts, though the ends of the *cella* terminate in a pediment outline, and have a large semicircular arch serving to light the interior or *salle*, which has also a lantern in the centre of its semicylindrical roof.

We here subjoin the dimensions of the late Royal Exchange, with those of the intended structure, &c.

*Old Royal Exchange.* Extreme external dimensions 210 by 175 feet. Interior quadrangle 155 by 118 feet, or 18,290 square feet. Open area of quadrangle 99 by 75 feet, or 7425 square feet.

*Plan of New Exchange.* (By Mr. Tite.) Extreme length from east to west, including portico, 293 feet; breadth at east end 175 feet; interior quadrangle 170 by 113 feet, or 19,210 square feet; open area of quadrangle 114 by 57 feet, or 6398 square feet.

*Exchange, St. Petersburg.* Built 1804-10. Exterior 330 by 246 feet. *Salle* 190 by 90 feet, or 17,100 square feet.

*Bourse, Paris.* Exterior 234 by 164 feet. *Salle* or interior covered area 108 by 59 feet, exclusive of galleries, or 6372 square feet.

\* That we do not borrow our opinion from Ralph, who is generally quoted as an oracle on the buildings of London, is evident, for he says that the quadrangle is 'laid out in a very good style, and finished with great propriety of direction.' Another writer assures us 'there are many beauties in the architecture, and but few defects. The four orders (?) of the quadrangle are magnificent, and richly decorated with the bas-reliefs (?), arches of the walks, the ornaments over them, niches, statues, pillars, circular windows, entablature, pediments, and balustrades, all in correct proportion and arrangement.'

ROYAL SOCIETY (of London), consists of a number of persons associated together for the purpose of promoting mathematical and physical science. At its formation the more particular object of the members was to assist each other in extending their knowledge of natural and experimental philosophy.

Philosophical societies for the cultivation or advancement of particular branches of human knowledge existed, both on the Continent and in this country, before the end of the sixteenth century. In Italy, the Florentine Academy and the Academia della Crusca had been founded with the view of improving the language and literature of that country. France had its Academy of Painting and Sculpture, and its Royal Academy of Inscriptions; and the Antiquarian Society in England was founded in 1572. With the exception of the persons connected with these institutions, who were engaged in the pursuit of letters, the fine arts, and antiquities, the learned world was in that and the preceding ages chiefly occupied with scholastic philosophy. But the discoveries of Galileo in astronomy and mechanics having opened a field for research in those sciences, men of learning began to turn to pursuits which, while they seemed to constitute a worthy exercise of human intellect, promised to lead to results of great practical utility.

England appears to have led the way to the formation of a body of men who sought by mutual co-operation to advance the *new philosophy*, as it was called; for Dr. Wallis, in an account of his own life, relates that in 1645, which must therefore have been while the civil war was raging in the country, several persons who then resided in London, at the suggestion of a Mr. Haak, a native of Germany, joined themselves into a club, in which, purposely excluding politics and theology, they agreed to communicate to each other the results of their researches in chemistry, medicine, geometry, astronomy, mechanics, magnetism, navigation, and experimental philosophy in general. Among those who first met for this worthy purpose, were Drs. Wilkins, Wallis, Goddard, Ent, and Glisson, and Messrs. Haak and Forster (the professor of astronomy at Gresham College); and the place of their meeting was generally at Dr. Goddard's lodgings, but they occasionally assembled in Gresham College or in its neighbourhood. This is supposed to be the club which Mr. Boyle, in a letter (1646), designates the invisible or philosophical society.

Before the year 1651, Drs. Wilkins, Wallis, and Goddard, having obtained appointments at Oxford, went to reside in that city, where, being joined by Drs. Seth Ward, Bathurst, Petty, and Willis (the last an eminent physician), and Mr. Rooke, they constituted themselves a society similar to that which they had left in London. They met at first at Dr. Petty's lodgings, which were in the house of an apothecary, where they had access to such drugs as they wished to examine; and as often as any of the members had occasion to visit the metropolis, they did not fail to attend the meetings of their former associates. When Dr. Petty went to Ireland in 1652, the meetings at Oxford appear to have been for a time suspended; for that gentleman, writing from Dublin to Mr. Boyle, in the beginning of 1653, expresses his gratification that the club was revived; and in the same year the members met either at the apartments of Dr. Wilkins in Wadham College, or at the lodgings of Mr. Boyle. It appears however that, in the beginning of 1659, all of them except the latter gentleman, who continued to reside at Oxford till 1668, came to London, where they rejoined the friends who had remained there, and where the united clubs were almost immediately strengthened by the accession of several new members. At that time the lectures on astronomy and geometry in Gresham College were delivered, the former by Mr. Christopher Wren, on every Wednesday, and the latter by Mr. Rooke (who had been appointed in 1652), on every Thursday; and these gentlemen, together with Lord Viscount Brouncker, Mr. Brereton (afterwards Lord Brereton), Sir Paul Neile, Mr. John Evelyn, Mr. Balle, Dr. Croone, and others, besides the Oxford members, used after the lectures to assemble for philosophical conversation in an adjoining room. This state of things did not however continue long, for during the same year, in consequence of the troubles which ensued on the resignation of the Protectorship by Richard Cromwell, the apartments which had been occupied for scientific purposes were converted into quarters for soldiers, and the members of the society were obliged to dis-

We learn also from Dr.

in the restoration

in 1660, the meetings were revived; and on the 28th of November in that year, the members came to a resolution that they would assemble during term-time in Mr. Rooke's chambers at Gresham College, and during the vacation at Mr. Balle's chambers in the Temple. It was further resolved that the members should constitute themselves a society for promoting physico-mathematical learning, similar to the voluntary associations of men for other branches of knowledge in foreign countries. At this time also a series of resolutions relating to the objects proposed by the society were drawn up, and of these the following is a brief outline:—It was agreed that records should be made of all the works of nature and art of which any account could be obtained; so that the present age and posterity might be able to mark the errors which have been strengthened by long prescription, to restore truths which have long been neglected, and to extend the uses of those already known; thus making the way easier to those which are yet unknown. It was also resolved to admit men of different religions, professions, and nations, in order that the knowledge of nature might be freed from the prejudices of sects, and from a bias in favour of any particular branch of learning, and that all mankind might as much as possible be engaged in the pursuit of philosophy, which it was proposed to reform, not by laws and ceremonies, but by practice and example. It was further resolved that the Society should not be a school where some might teach and others be taught, but rather a sort of laboratory where all persons might operate independently of one another. Lastly, it was resolved that each member should subscribe his name to an agreement that he would constantly attend the Society's meetings, if not prevented by illness or some indispensable business; that he should pay ten shillings on his admission, and that he should subscribe one shilling weekly while he continued to belong to the Society; but from this obligation he was to be freed if he chose to withdraw. At the same time Dr. Wilkins was chosen chairman, Mr. Balle, treasurer, and Dr. Croone, registrar. It was agreed to meet every Wednesday, from 3 to 6 o'clock in the afternoon.

The revenue thus raised from the members was intended to enable the Society to accomplish the various objects for which it was instituted, and particularly to defray the expenses of the philosophical experiments which it was proposed to make. The intention was, that persons should be sent to travel abroad, for the purpose of collecting information, while others should remain in London, and present the results of their researches at the weekly meetings. It was determined that the members should be formed into committees for the consideration of the subjects which were to be illustrated by experiments, and that the performance of the latter should be assigned to persons who, by their particular talents, were best qualified for the duty. Some of the members also were to be appointed to examine all works on the natural history of foreign countries, that out of them they might prepare directions as a guide in making inquiries concerning the phenomena of the atmosphere and the currents of the sea, and in performing experiments on light, magnetism, &c. It was proposed to bring the results of the researches into one common stock, and to consign them in public registers for the benefit of future generations, without regard to any order in the arrangement; it being considered, that if subjects of a like nature were brought together, persons might be tempted too early to form general systems, which might be detrimental to the progress of philosophy. (Dr. Sprat, *History of the Royal Society*.)

Such were the plan and constitution of the infant Society, which was destined, in its maturity, to hold so distinguished a place in the annals of science. Its first recorded steps, which took place Dec. 5, 1660, consisted in appointing Mr. Wren, at the next weekly meeting, to perform an experiment on the vibrations of pendulums, and Lord Brouncker to bring in a series of instructions for conducting some experiments (relating to the temperature, moisture, &c. of the air), the performance of which on the Peak of Teneriffe it was intended to procure.

A week afterwards it was resolved that persons desiring to be admitted should be recommended by some member, and that the election should take place by ballot. No one below the rank of a baron was to be admitted without a scrutiny; and the number of members was to be limited to fifty-five, of whom twenty-one were to be a quorum for elections and nine for other matters. It was agreed also that the fellows of the Royal College of Physicians and the pro-

fessors of mathematics and natural philosophy in both universities should, if they desired, be admitted as supernumeraries on paying the fees and lending their assistance when convenient. The restriction respecting the number of members was however soon afterwards taken off; and, at this time, candidates who were proposed on one evening were often admitted at the next, or at the second following meeting, though the practice respecting the interval between the application and the admission seems to have been very variable. The president or chairman held his post sometimes during the evening only, sometimes he was appointed for a month, and he was occasionally re-elected. Two persons were appointed to superintend the arrangements for performing the proposed experiments, and one of the members acted as a reporter at the meetings. An amanuensis for copying minutes, and an operator under the superintendents, were engaged as servants, and received salaries.

In that age, the constitution and qualities of material bodies being very imperfectly known, suggestions founded on ill-observed phenomena, and the marvellous relations of credulous travellers, were often thought deserving of consideration from the bare possibility that they might lead to the discovery of useful truths; and this circumstance may serve to account for the apparently absurd inquiries and experiments which appear in the notices of the Society's first labours. Thus, in 1661, Mr. Boyle was requested to ascertain the name of the place in Brazil where there was said to have been a kind of wood which attracts fishes; he was also desired to inquire into the truth of the circumstance mentioned by Schottier—that a fish suspended by a thread would turn towards the wind. And in the same year, the opinion that a spider could not get out of a space enclosed within a circle formed of powdered unicorn's horn was actually made the subject of an experiment. The philosopher will however forget these early occupations of the Society when he meditates on the works of a Newton and a Davy, which are also recorded in the pages of its history.

The Society having presented an address to the king (Charles II.) on his restoration, his majesty expressed much satisfaction that the institution had originated in his reign, and promised to support it with his influence. And, in 1662, by the concurrence, it is said, of Lord Clarendon, the chancellor, Sir Geoffry Palmer, the attorney-general, and Sir Heneage Finch, the solicitor-general, he granted a charter, by which the members were incorporated into a Society consisting of a president, council, and fellows, under the name of the Royal Society. In this they were declared capable of holding lands, tenements, &c. in perpetuity or otherwise, and of suing or defending in any court of law; a coat of arms was given them, and they were allowed to have a common seal for their use. William Viscount Brouncker was appointed president, and twenty-one persons were appointed by name to form a council. It was further regulated that the president should be elected annually on St. Andrew's day, and that ten of the council should, at the same time, be replaced by ten other persons chosen from among the fellows. (Birch, *History of the Royal Society*, vol. i.) This charter being found not sufficiently explicit, in the following year another was obtained, in which the president and fellows are designated the President of the Council and the Fellows of the Royal Society of London for promoting natural knowledge; and in which, after declaring that the Society might hold lands, &c., there is added '*Statuto de alienatione in manum mortuam non obstante*.' (Birch, *ut sup.*) Between 1661 and 1664, the king made several visits to the Society, and on those occasions experiments were exhibited, for the preparation of which committees of the members were appointed. In 1663 his majesty bestowed a mace on the Society, and in 1664 he signed himself, in the Charter-book, its founder; at the same time the duke of York (afterwards James II.) signed himself a fellow.

The Royal Society of London may now be said to have been completely formed, and it must be considered as the oldest of its kind in Europe, if we except the Academy of the Lyncei at Rome. The Académie Française, which, in 1635, had been established by Richelieu, had for its object only the improvement of the French language; and though, in 1657, a number of learned men, among whom were Descartes, Gassendi, and Roberval, were accustomed to assemble at the apartments of Père Mersenne in Paris, for the purpose of making philosophical experiments, and of reading the solutions of such mathematical problems as, according to the general practice of that age, had been proposed

to them, yet it was not till 1666 that Louis XIV., at the suggestion of M. Colbert, founded what was then called the Royal Academy of Sciences for purposes similar to those which engaged the attention of the Royal Society. To the latter therefore belongs the honour of having preceded the former in time, and probably that of having in some measure led to its formation. It must also be considered as having been the parent of the numerous scientific institutions which have since been formed in the British Isles as well as on the Continent.

It is observed by Hume, that its patent was all that the Society obtained from the king, who, though a lover of the sciences, animated them by his example alone, not by his bounty; and the historian contrasts the conduct of the English king with that of his contemporary Louis XIV., who fell short of Charles in genius and knowledge, while he exceeded him in liberality. There may be truth in this, but it ought to be remembered that, in 1667, the Society received from the crown a free gift of what was then called Chelsea College, which it afterwards sold for its benefit.

From the time of the charter being granted, the business of the Society assumed more importance, and in 1664 Mr. Hooke was appointed curator, with a salary of 80*l.* per annum. The west gallery of Gresham College was appointed as a repository for the instruments which were under his charge, and for a museum of natural curiosities which had been given by Mr. Colwal, one of the members. Sir John Cutler also settled on Mr. Hooke 50*l.* per annum, in consideration of his delivering a course of lectures on the History of Nature and Art, under the regulation of the Society; and the latter, in the same year, formed itself into seven committees for the purpose of considering the different subjects of which it was cognizant. These were mechanics, astronomy and optics, anatomy, chemistry, agriculture, the history of trade, natural phenomena; and there was, besides, a committee to manage the correspondence. The Royal Society early received many tokens of approbation from foreign nations, as well as from the nobility and the learned in this country. It corresponded frequently with the scientific men in France, and it was invited by Prince Leopold, the brother of the grand-duke of Tuscany, to keep up a mutual communication with the philosophers of Florence. The Germans published in their books favourable testimonials of its labours, and foreigners of distinction often attended its weekly meetings.

The first portion, or number, of the 'Philosophical Transactions,' as the work which the Society published was designated, appeared on Monday, March 6, 1665. It contained sixteen quarto pages, with an introduction by the secretary of the Society, Mr. Oldenburg, who was considered as the editor; and it was intended that one such number should be published on the first Monday of every month. After the fifth number came out (June, 1665), the public meetings of the members were discontinued on account of the plague which then raged; but it appears from a letter written by Mr. Boyle, at Oxford, to Oldenburg, who remained in London, that several of the members were then in the former city, and that they met and made experiments at his lodgings. From these experiments and the communications made by some of the members, there were formed three more numbers of the 'Transactions;' these were published at Oxford; but the ninth and all the succeeding numbers came out in London. The title of the work was changed in 1679 to that of 'Philosophical Collections,' when Dr. Hooke became the editor; but the former title was restored in January, 1683, with No. 143, which was published by Dr. Plot, who was then the secretary.

The council met again in Gresham College, in February, 1666, but the public meetings of the Society did not take place till June in that year. In the same year the great fire, which laid nearly all London in ashes, having compelled the authorities of the city to take possession of the rooms hitherto occupied by the Society, the latter gratefully accepted the offer of apartments in Arundel House, and it met there for the first time in January, 1667. The munificent owner of the mansion, Mr. Henry Howard of Norfolk (afterwards earl marshal of England), at the same time presented the Society with the library which had been purchased by his grandfather, Thomas, earl of Arundel, and which had formerly belonged to Matthew Corvinus, king of Hungary. This valuable library, consisting of several thousand printed volumes and numerous manuscripts, thus became the property of the Society, which immediately took measures to

put it under the care of its own officers, and it has been subsequently greatly increased by donations and purchases. Being probably anxious to trespass as little as possible on the hospitality of the noble family to whom the mansion belonged, the Society proposed (November, 1667) to raise, by subscription among its members, money to build a college for itself; and by May in the following year 1000*l.* were subscribed. Mr. Howard at the same time generously promised to give the ground for the purpose. The same gentleman also offered a design for the building, and both Dr. Christopher Wren and Mr. Hooke gave plans; but it does not appear that the project was carried any further. In October, 1674, at the invitation of the Gresham professors, the Society returned to its former apartments in that college, which had now the name of the Royal Exchange. The west gallery was cleared out for the Society as a repository, and the long gallery as a library for the reception of the books, which had till then remained at Arundel House.

Soon after this time the prosperity of the Society seems to have suffered some diminution. In 1667, when Dr. Sprat's 'History' was published, there were nearly 200 members; in 1673, it appears that the number was only 146, and of these, 79 were persons who had long neglected to pay their subscriptions. This great number of defaulters gave much uneasiness to those who wished well to the Society; and the latter, besides making pressing applications for the arrears, seriously contemplated an attempt to enforce payment by legal processes. It does not appear that this last measure was ever put in practice, and the council adopted a more effectual means of promoting the welfare of the Society in charging themselves with the duty of delivering lectures on philosophical subjects, and in providing a number of good experiments. The first lecture, in pursuance of this plan, appears to have been delivered in 1674, by Sir William Petty, and it was ordered to be printed. The president (Lord Brouncker) also proposed, in 1668, that a silver medal, worth about twenty shillings, should be given to any fellow, not a curator, who should make before the Society any particularly meritorious experiment.

Dame Lady Sadleir, the relict of Dr. Croone, one of the earliest members, left by her will, in 1706, a sum of money for the purpose of founding a lecture for the advancement of natural knowledge, to be read before the Royal Society; this did not however come into operation till 1738, when the first was delivered by Dr. Stuart. The Bakerian lecture on electro-chemistry was founded in 1774, and the first was delivered in 1775, by Mr. Peter Woulfe.

In the infancy of the Society a due attention to the characters of the persons admitted as fellows does not appear to have been always given; and, in consequence, many joined who neither paid the fees nor contributed any information at the meetings, and, at the same time, the number of those who were excused the payments was found to bear too great a proportion to the whole. In order to remedy these evils, in 1682, the president, Sir Christopher Wren, brought in the draught of a statute in which it was provided that any person proposing a candidate for admission should give his name to some member of the council; at the next or at some following meeting of the council, it was to be considered whether the proposed candidate was likely to be useful to the Society or not; if the members were satisfied on this head, the candidate was to be formally proposed at the next meeting, and afterwards balloted for as usual. On his election he was to sign the statute book, and on or before being admitted, he was to pay the prescribed fees. In the same year it was agreed that none except foreigners should be exempted from the payments. It is to be presumed that the persons who were excused the payment of the admission-fees or the weekly subscriptions were such as, from the pressure of their circumstances, were unable to incur the expense, or such as, from the services which they rendered to the Society, might justly claim the exemption; but it must be regretted that, among those who petitioned to be excused on the former ground, is to be found the name of Newton. This great man, who was elected in January, 1672, though he was not admitted till February 1676 (probably on account of his residence being at Cambridge), cannot certainly be considered as one whose income did not enable him to make an annual payment of fifty-two shillings.

It was proposed, in October, 1674, to refuse to strangers the permission, which had been granted, to be pre-

sent at the meetings of the Society, from an opinion that members might be unwilling to bring forward their communications in the presence of such persons. And at the same time it was proposed that the members should bind themselves not to divulge what passed in their meetings, it being thought prejudicial to the interests of the Society that the particulars of the experiments and communications should be made known before they appeared in the printed 'Transactions.' We read that, on one occasion only, a lady was permitted to be present at the meetings of the Society; this was in 1667, when the duchess of Newcastle, having expressed a wish to that effect, it was agreed to invite her grace, and some experiments, which had been prepared for the purpose, were repeated in her presence.

In 1667 Dr. Sprat (afterwards bishop of Rochester) published the first edition of his 'History of the Royal Society;' and in that work, while the object of the Society is distinctly declared to be the promotion of philosophy by experiment and by the observation of natural phenomena, an effort is made to remove the misapprehensions respecting the tendency of its proceedings, which appear to have been generally entertained. It was objected that the members of the Society neglected the wiser and more discerning ancients, and sought the guidance of their own unassisted judgments; and that, by admitting among them men of all countries and all religions, they endangered the stability of the established church. It was urged moreover that a philosophy founded on experiment was likely to lead to an overthrow of the Christian religion, and even to a denial of the existence of a Deity. Among these bigots were Henry Stubbe, a physician, at Warwick, and the Rev. Robert Crosse, of Somersetshire; both these persons wrote pamphlets, in which they attacked the Society with great virulence and scurrility of language, charging the members with bringing contempt on ancient and solid learning, with undermining the universities, destroying Protestantism, and introducing popery in its stead. In his apology for the Society, Dr. Sprat asserts that it in reality reverences the footsteps of the ancients, and that it willingly subscribes to their opinion in matters purely probable; but he claims for it the privilege of judging from facts, and he justifies this liberty by the practice of the Greeks, who, he observes, readily received the learning of the Egyptians, while they entirely rejected their superstitions. He further adds that the conversation of the learned men who first met at Oxford served to form a race of young students whose minds became imbued with a taste for natural knowledge; and that, by their influence, the discipline of the university was preserved from the spiritual frenzy which then prevailed in the kingdom. The Society also found an able apologist in Mr. Glanville, who, in 1668, published a pamphlet, entitled 'Plus Ultra, or the Progress of Knowledge since the days of Aristotle.'

By the death of Dr. Wilkins (then bishop of Chester), one of the earliest members, the Society obtained a legacy of 400*l.*, which, in January, 1675, was laid out in the purchase of an annual income of 24*l.*, from certain fee farm rents at Lewes in Sussex; and in January, 1682, the college and lands in Chelsea, which had been granted to the Society, were sold to the king for 1300*l.*; this sum was soon afterwards vested in African and East Indian stock; and from that time the Society began to possess a permanent revenue. Till the year 1668 no fixed salary was allowed to the secretary, but Mr. Oldenburg, who had long held that post, received 50*l.* occasionally; and in that year it was agreed to allow him 40*l.* per annum. After his death (1677) two secretaries were appointed, with salaries; but in 1685, Mr. Aston and Mr. Robinson declining on a sudden to serve the Society, the council resolved, in order to avoid the inconvenience of being so deserted in future, to have two honorary secretaries; it was agreed also to have a secretary with a fixed salary to transact the business, and the qualifications required in the person who should fill the latter post are stated at length in Birch's 'History,' vol. iv. Of the former, Sir John Hoskyns and Dr. Gale were the two first; and in January, 1686, Mr. Edmund Halley was appointed the paid secretary, at 50*l.* per annum.

In 1701 the Society, which till this time had continued to hold its meetings in Gresham College, removed to a spacious house which it purchased in Crane Court, Fleet Street. It had long been felt that the college was too remote from the dwellings of many of the members; and, as early as 1666, it had been proposed to obtain a house in Westminster.

P. C., No. 1257.

The house in Crane Court afforded room for the meetings, for the library, and for the museum of curiosities; and here the reading of papers and the exhibition of experiments took place, as before, till the year 1782, when the government assigned to the Society the apartments which it now occupies in Somerset House. On removing to the latter place, it became necessary to dispose of the museum for want of room; but this inconvenience has since been obviated, as in 1826 the rooms formerly used by the commissioners of the lottery were given up to the Society. The library is now very extensive, and a catalogue of the scientific books, lately made at a great expense, forms a thick octavo volume.

In 1703 Sir Isaac Newton was appointed president of the Society, and this honourable post was held by the greatest of philosophers till his death, which happened in 1727. The experiments of Newton on telescopes and on light and colours were amongst the first subjects which gave a value to the 'Transactions' of the Society; and the latter showed its sense of the honour which it derived from being able to number him among its fellows, by publishing, at its own expense, in 1686, the first edition of the 'Principia;' though its pecuniary circumstances could not then have been flourishing, since at the end of the following year it had incurred debts, for the payment of which it was obliged to sell part of its East India stock.

The service rendered to the cause of science from the beginning of the eighteenth century has earned for the Society the respect and gratitude of every man to whom the advancement of the human intellect is an object of high consideration. The Society numbers among those who are and who have been its members, some of the brightest ornaments of philosophy and human nature; and it may be said that most of the discoveries by which the face of science has been changed have been made known to the world through the papers published in the volumes of its 'Transactions.' In proof of this we may refer to Dr. Thomson's 'History of the Royal Society,' in which the subjects of the papers are reduced under the heads of natural history, mathematics, mechanical philosophy, and chemistry, besides some miscellaneous matters; also to the volumes of the 'Transactions' which have been published since 1800, when the above-mentioned 'History' terminates, and which contain, among others of great value, the papers of Sir Humphry Davy, with those of Faraday, Young, Kater, and Wollaston.

It has been said above that the 'Philosophical Transactions' were at first published in monthly numbers: these were afterwards collected into volumes, and, from the commencement in 1665 to the year 1800, the work consisted of 90 volumes. From that time a volume has come out annually, and, up to the present year (1841), 131 volumes have been published. It appears that, till the 47th volume was published, the printing of the Transactions was entirely the act of the several secretaries, the Society never interesting itself further in that matter than by occasionally recommending the revival of the publication, when from any circumstance it appeared to be suspended. But in 1752 a committee was appointed to consider the papers which were read before the Society, and to select such as should be judged most proper to appear in the future Transactions; and this practice has ever since been followed. The Society however constantly declares that it never, as a body, gives its opinion on any subject, whether of nature or art, which comes before it; the facts and reasonings stated in their papers resting entirely on the credit and judgment of their respective authors.

Honorary recompenses have been liberally bestowed by the Society on persons distinguished by their discoveries in pure science or in philosophy. The first occasion on which the Society became possessed of the means of so rewarding merit arose from a bequest of Sir Godfrey Copley, one of its members; this gentleman, at his death in 1709, left 100*l.*, the interest of which, or five pounds, was to be given annually to the person who, in the course of the preceding year, had written the best paper on any subject relating to experimental philosophy. The donation has since been put in the more liberal form of a gold medal, and it is awarded indifferently either to foreigners or Englishmen, for the sake of encouraging an honourable competition among the philosophers of all countries.

In 1796 Sir Benjamin Thomson (Count Rumford) presented to the Society 1000*l.* in the 3 per cent. stock, for the purpose of forming, with the interest for two years (60*l.*), a

biennial prize to be given for the most important discovery or the most useful improvement made during the two preceding years on heat or on light. The prize is given in the form of a gold and a silver medal, both of which are struck in the same die. During several of the biennial periods no opportunity occurred of awarding the prize, and at these times the interest was added to the principal sum. The interest of this additional sum is always given with the two medals; and the first who received the prize was Count Rumford himself, in 1800; and the second was Professor Leslie (1804). In 1825 his majesty George IV., for the purpose of further promoting the objects and progress of science, made to the Society an annual grant of 100 guineas in order to establish two prize medals, which are to be presented to the persons who during the year shall make the most important discovery in science or art; and in 1826 the medals were awarded to Mr. John Dalton and Mr. James Ivory.

On delivering to a gentleman the medal which had been awarded to him for his discoveries in science, Sir John Pringle, who held the office of president from 1772 to 1778, made it a rule to deliver a speech, in which, after touching on the history of that branch of philosophy to which the discovery or communication referred, he stated the particular points in which the individual had distinguished himself. The first of these speeches was made on presenting to Dr. Priestley the gold medal for his paper entitled 'Observations on the different kinds of Air,' which had been read before the Society, in March, 1772. Five other speeches were delivered by the same president on similar occasions; and all the six are considered elegant compositions, as well as learned and critical dissertations. This liberal practice, by which the value of the testimonial to the receiver is so much enhanced, is still continued; and it is also become customary, at every anniversary meeting, to notice, in an appropriate speech, the principal circumstances in the life of any distinguished member who may have died during the year. When the council, in 1826, had awarded the royal medals to Mr. Dalton of Manchester and to Mr. Ivory, the President, Sir Humphry Davy, took occasion to state that the first was for the development of the chemical theory of definite proportions, commonly called the *atomic theory*, and for various other labours in chemical and physical science. He further observed that Dalton's discovery had laid the foundation for future researches respecting the sublime and transcendental part of corpuscular action; and he compared the merits of the discoverer, in this respect, to those of Kepler in astronomy. The president also stated that the second medal was awarded to Mr. Ivory for his papers on the laws regulating the forms of planets, on astronomical refractions, and for other mathematical illustrations of important points in astronomy; and he paid at the same time some high compliments to Mr. Ivory for his disinterested pursuit of objects of science which have no immediate popularity. One of the Copley medals had been on the preceding year awarded to M. Arago and another to Mr. Barlow, for their discoveries in magnetism. On the same occasion the president mentioned with particular notice, among the foreign members deceased, Scarpa, the celebrated anatomist of Pavia, and Piazzi, the astronomer, who discovered the planet Ceres; and, among the home members, Mr. Taylor Combe and Sir Stamford Raffles.

The nobleman who now occupies the chair of the Royal Society, following the example of his illustrious predecessors, delivered at the last anniversary meeting (November 30, 1840) an eloquent address which has been printed at the request of the Fellows. On this occasion the royal medals were presented to Sir John F. W. Herschel for his discoveries in optics and chemistry, and to Professor Wheatstone for his solution of the phenomena of double vision. One of the Copley medals was presented to Professor Liebig for his researches in chemistry, and another to M. Sturm for his mathematical labours; and lastly the Rumford medal was presented to M. Biot for his researches on light.

It is perhaps impossible that, in a large body of men engaged in similar pursuits, differences should not arise; and the Royal Society has not been entirely free from the evils attending disagreements among its members. In 1778 a dispute about the comparative advantages of blunt and pointed conductors for protecting buildings from the effects of lightning arose to such a height that the president, Sir John Pringle, felt himself compelled to resign. [PRINGLE, JOHN.] At a later period Sir Joseph Banks was accused of par-

tiality in the disposal of the medals and even in the election of members; and, under the impression that his government was arbitrary, scientific men were deterred from making communications to the Society. Even the awards of the medals to Dalton and Ivory by Sir Humphry Davy were made subjects of animadversion, on the ground that the discoveries of the former had been indicated by another person, and that the researches of the latter were not immediately useful to man. In the first instance mentioned above, the president may have erred in putting himself at the head of a party in the Society; but it is probable that most of the grievances subsequently complained of originated only in the disappointed expectations of ambitious individuals. If at any time however the complaints have not been without foundation, the elevated character of the papers which within the last twenty years have been published in the 'Transactions,' shows that the interests of science have been generously placed above every private consideration.

According to the present statutes of the Society, every candidate for admission must be recommended by a certificate in writing signed by six or more Fellows, of whom three at least must certify that the recommendation is from personal knowledge; and the name, qualifications, &c. of the candidate must remain in the meeting-room of the Society during five ordinary meetings before he can be put to the vote. The votes are taken by ballot, and the person cannot be elected unless two-thirds of the number present vote in his favour. The person elected must appear for admission on or before the fourth ordinary meeting of the Society after his election; and previously to such appearance he must pay the sum of 10*l.* for admission money; he must also pay 4*l.* per annum as long as he continues a fellow of the Society; but the annual payments may be compounded for by paying at once the sum of 60*l.* Fellows are entitled gratis to a copy of the 'Philosophical Transactions,' commencing with that volume which is published next after their admission. Any Fellow disobeying the statutes or orders of the Society or council, or defaming the Society by speaking, writing, or printing, or doing anything detrimental or dishonourable to the Society, will be ejected from it.

A prince of the blood, a peer of the United Kingdom, a member of the Privy Council, any foreign sovereign prince, or the son of such prince, may be proposed at one of the ordinary meetings of the Society, and voted for on the same day; notice having been given of such proposal at the preceding meeting of the Society. Foreign members are exempted from the obligations which ordinary fellows are enjoined to perform; but their number is not to exceed fifty.

The council and officers for the ensuing year are elected on the 30th November; the latter consist of the president, treasurer, principal secretaries, and foreign secretary. The new council consists of eleven members of the existing council and of ten fellows who are not so. These are nominated previously to the anniversary meeting.

The president presides at the meetings, and regulates the debates of the Society, the council, and the committees; he states questions, calls for reports and accounts, checks irregularities, and observes that the statutes of the Society are executed. The treasurer receives all money due to the Society and disburses all sums payable by it; he also keeps accounts of the receipts and payments. He has charge of the title-deeds of the Society's estates, the policies of insurance, &c. The secretaries attend all meetings of the Society, the council, and the committees of papers; on such occasions, when the president has taken the chair, the senior secretary reads the minutes of the preceding meeting, and afterwards takes minutes of the business and orders of the present meeting; these are to be entered by the assistant-secretary in the books to which they relate. They have also charge (under the directions of the committee of papers) of printing the 'Philosophical Transactions.' The assistant-secretary is not a fellow of the Society, and is paid for his services. He enters all minutes in the journal-books, and makes an index to each; he has the custody of the charter-book, statute-book, &c., and of all papers and writings belonging to the Society. The librarian attends at the library every Monday and Thursday, from 11 A.M. to 4 P.M., for the accommodation of such fellows as come to read the books and MSS.

The ordinary meetings of the Society are held once a week, from November till the end of Trinity term, at half-past 8 P.M., in the apartments at <sup>London.</sup>

In the introduction to Dr. Thomson's 'History of the Royal Society,' there is given a list of all the presidents, from Lord Brouncker, who was appointed in 1663, to Sir Joseph Banks, who was elected in 1778, and who held the chair till his death (1820). The succeeding presidents were:—

Sir Humphry Davy,	elected in	1820,
Mr. Davies Gilbert,	"	1827,
H. R. H. the Duke of Sussex,	"	1830,
The Marquis of Northampton (who continues)		1838.

The offices of principal Secretaries have been successively filled, since 1807, by Sir H. Davy, Dr. Wollaston, Mr. Combe, Mr. Brande, Sir John Herschel, Mr. Children, Major Sabine, Dr. Roget, and Mr. Christie: the two last named of whom are the present Secretaries. Mr. Daniell is the present Foreign Secretary.

During many years the Royal Society may be said to have been the depository of nearly all the science of the country; but that science became at length too extensive to be adequately cultivated by one body of men, and then separate and independent societies formed themselves, each having in view the promotion of one particular branch of the philosophy of nature or one branch of the arts. The labours already accomplished by these associations are such, that the Royal Society may be justly proud of them as the works of her children; and the high place which she continues to hold, in the promotion of the sciences generally, cannot fail to inspire the societies themselves with reverence for the body from whence they diverged.

The important part which the Royal Society has performed in advancing the objects of the British Association in the present expedition to the antarctic regions of the earth for scientific objects, deserves to be particularly mentioned in this place. The lords commissioners of the Admiralty having requested the president and council of the Society to communicate for their information any suggestions concerning the subjects to which they might wish the attention of Captain James Ross to be directed, the council formed itself into five distinct committees, consisting of members particularly conversant with the several branches of science comprehended in the observations and experiments proposed to be made during the voyage. The result of their labours is a series of reports on the several objects of scientific inquiry in physics, meteorology, geology and mineralogy, botany and zoology: and the report on physics and meteorology, which has been printed, contains a course of instruction relating to the use of the instruments to be employed, and to the manner of making the necessary observations for terrestrial magnetism, the figure of the earth, the tides, meteorology, the distribution of temperature in the sea and on land, currents, the depth of the sea, variable stars, refraction, and eclipses. It may be objected that the details of all the subjects of inquiry are too numerous to be accomplished in the time allowed for the voyage, but it ought to be observed that the instructions profess to have been drawn up not only as a guide for the persons employed on the present expedition, but also to enable scientific persons in general to co-operate in promoting the same objects.

The Royal Society of Göttingen was established by George I. in 1751, and it has published several volumes of Transactions.

The Royal Society of Edinburgh was incorporated by a charter in 1783; though, under the name of the Philosophical Society of Edinburgh, the association had existed since 1739, in which year it was formed by the influence of Mr. Maclaurin and other learned men in the metropolis of Scotland. In 1811 the Society obtained a new charter, by which it was empowered to form a library and a museum. A volume of its 'Transactions' comes out as often as the number of papers which are thought worthy of being printed are sufficient to make one; and up to the present year (1841) fourteen volumes have been published. A medal of the value of 60*l.*, arising from a part of the interest on 1000*l.* which had been left by Mr. Alexander Keith, in 1819, for advancing the sciences and arts of Scotland, is awarded as a biennial prize for the most important scientific discoveries which may be communicated to the Society and published in its 'Transactions.' This Keith medal was adjudged, for the first time, to Dr. (Sir David) Brewster in 1828.

**ROYALTY.** The French words *roi* and *royal* correspond to the Latin words *rex* and *regalis*; and from *royal* has been formed *royauté* (now *royauté*); whence has been bor-

rowed the English word *royalty*. The corresponding Latin word is *regalitas*, which occurs in the Latin of the middle ages. (Ducange, *in v.*)

*Royalty* properly denotes the condition or *status* of a person of royal rank, such as a king or queen, or reigning prince or duke, or any of their kindred. [KING.] The possession of the royal *status* or condition does not indicate that the possessor of it is invested with any determinate political powers; and therefore *royalty* is not equivalent to *monarchy* or *sovereignty*. A royal person is not necessarily a monarch; or, in other words, does not necessarily possess the entire sovereign power. The powers possessed by persons of royal dignity have been very different in different times and places; and have varied from the performance of some merely honorary functions to the exercise of the entire sovereignty. The *kings* (*ἀνακτες*, *βασιλῆες*) of the Homeric age were properly a governing class of nobles. (See Müller, *Hist. of Liter. of Greece*, ch. 4, § 1.) Thus Telemachus says that there are many kings in Ithaca, both old and young, besides himself (*Od.*, i. 394); and Alcinous says that he rules over the Phæacians, with twelve other kings (*Od.*, viii. 390). As popular institutions were developed in Greece, the office of king became, in several states, merely honorary, and was particularly connected with the performance of certain antient religious rites. Thus, at Athens, the king-archon (*ἀρχων βασιλεύς*) was an annual officer, who had the superintendence of religious affairs; his wife was called, during the year of office, *βασιλισσα*, or *queen*. (Compare Hermann, *Gr. Ant.*, § 56.) Rome likewise retained, after the expulsion of its kings, a high sacerdotal officer, named the *king of the sacrifices* (*rex sacrificulus*), who performed the sacred rites which had formerly been performed by the kings. In like manner the Teutonic kings were only the chiefs of the military and sacerdotal aristocracy of the tribe, and did not possess the entire sovereign power ('*nec regibus infinita ac libera potestas*,' says Tacitus, *Germ.*, 7. See Grimm, *Deutsche Rechtsalterthümer*, p. 229-65). In more modern times, the kings of England, France (since 1815), Holland, Belgium, Bavaria, Saxony, Wirtemberg, Spain, and Portugal (since the late revolutions) have possessed only a share of the sovereign power.

On the other hand many kings have possessed the entire sovereign power, and have therefore been monarchs properly so called. Such were the kings of antient Persia, and the kings of France and Spain in the seventeenth and eighteenth centuries, and such are the kings of Prussia.

From the preceding observations it results that the name of king or the possession of the royal *status* does not determine the political powers of the person indicated (as would be the case if he were called monarch or sovereign); but that *king* is a title of honour which may be borne by persons having very different amounts and sorts of political power. 'Titles of office,' says Mr. Bentham, 'are aggregates of dissimilar parts, which cannot be compared until we know the nature of their constituent elements. If these elements were determined, they would form the basis of a universal political language. But as it is, how can the powers of the officers of a government be described except with reference to the actual institutions of some given state? What relation is there between the First Consul of France and the consuls of Rome, or the consuls of trade? between the king of England, the king of Sweden, and the king of Prussia? between the emperor of Germany and the emperor of Russia? between the antient *duc et pair* of France, the English duke, the grand-duke of Russia, the grand-duke of Tuscany? between the mayor of Bordeaux and the mayor of London? A volume would not suffice to state all these discrepancies.' (*Traité de Législation*, tom. i., p. 309.)

In popular discourse *royalty* is made equivalent to *monarchy* or *sovereignty*; and a king is called monarch or sovereign without any reference to the fact whether he possesses the entire sovereign power or only a portion of it. The principal causes of this confusion are stated in **MONARCHY**. The confusion is attended with important consequences both in speculative and practical politics.

It may be added, that the attribute of royalty is sometimes transferred metaphorically to certain animals or species of animals, in order to denote pre-eminence. Thus the principal bee in the hive is called the *queen-bee* [BEE, vol. iv., p. 151] (called the *king-bee* by the Romans: Virg., *Georg.*, iv., 68, 75, 95, 106, 212); the lion is known (particularly in fables) as the king of animals; and a species of tiger is styled the *royal tiger*. [TIGER.] Compare **SOVEREIGNTY**.

**ROYDSIA**, an Indian genus of plants allied to the natural family of Capparidæ, named by Dr. Roxburgh in compliment to Sir J. Roys, one of the judges of the supreme court of Bengal, whom he describes as an eminent benefactor to the science of botany. The genus consists of a single species indigenous in the forests of Silhet, where, with a stout stem and numerous branches, it climbs over the trees to a great extent, and flowers in the month of March, diffusing a strong but pleasant odour from its numerous blossoms, arranged in axillary racemes or terminal panicles. The leaves are alternate, oblong, coriaceous, smooth on both sides, and without stipules. The calyx is six-partite and of a pale yellow colour. Corol none. Stamens numerous, with the filaments inserted on the apex of a short column. Ovary pedicelled, three-celled, with two rows of ovules in each, attached to the axis. Drupe berried, of the size of a large olive, orange-coloured. Pulp abundant and yellow. Nut oblong, single-celled and three-valved. Seed solitary, conformable to the nut. The plant is figured in Roxburgh's 'Coromandel Plants,' p. 289, and is well suited to the hothouses of this country.

**ROYE.** [SOMME.]

**ROYLEA**, a Himalayan genus of plants, of the natural family of Labiatae and tribe Balloteæ, named by Dr. Wallich in compliment to Dr. Royle, author of the 'Illustrations of the Botany of the Himalayan Mountains and of Cashmere,' who first found it on the Sirmore Mountains. The plant forms a handsome shrub, with many branches and an abundance of pale-green glaucous leaves. It is characterised by having the calyx ovate, tubular, 10-nerved, and semi-quinquefid; corol shorter than the calyx, two-lipped, lips unequal; stamens 4, didynamous, ascending under the upper lip; anthers bilocular; style bifid.

*R. elegans*, the only species known, is called *putkuroo* by the natives of the mountains, where it is indigenous, and is employed by them as a febrifuge. It is suited to the shrubberies of this country.

**ROYSTON.** [HERTFORDSHIRE.]

**ROYSTON CROW**, the common English name for the *Hooded Crow*, *Corvus Cornix*, Linn.

*Description.*—*Male.*—Head and the whole body fine grey-ash colour; throat, wings, and rounded tail black with browned reflections; bill and feet black; iris brown. Length about 22 inches.

*Female.*—Less than the male; the black on the throat not so extensive in front as it is in him; reflections of the wings and tail less vivid; and the grey of the body more clouded with rusty hue.

The *young* assume the colour of their parents at an early period.

This is the *Mulacchia*, *Munacchia*, *Cornacchia*, and *Corvus palumbino* of the Italians; *Corneille sauvage* and *Corneille mantelée* of the French; *Kraka* of the Swedes; *Grau-krähe* and *Nebel-krähe* of the Germans; and *Brunyr Jwerddon* of the antient British.

*Habits, Food, &c.*—The sea-shore and the banks of tidal rivers are the favourite haunts of this species, though they are frequently found far inland, and animal substances are preferred by them as food. Sand-worms, shell-fish, crustaceans, and other animal matters left by the retiring tide seem to be most welcome to them. They appear to be both knowing and affectionate. Mr. Selby repeatedly observed one of these birds to soar up to a considerable height in the air with a cockle or muscle in its bill, and then drop it upon the rock in order to obtain the included fish. Pennant tells a painful story of its affection. 'One,' says he, 'which had been shot and hung by its legs on a tree adjacent to the nest, was discovered by its companion on returning from forage. It perched over the dead body and surveyed it attentively, as if in expectation of its revival; at length, on a windy day, the corpse being put in motion, the survivor deceived by it, descended, fluttering round for a considerable time, endeavouring to release its mate and uttering a melancholy scream; at last, finding its efforts to be in vain, it retired without ever returning to its usual haunts.' The same author however gives the species a very bad character for mischief, worse even than that of the *Carrion Crow*, and says that they pick out the eyes of lambs, and even of horses when bogged; whence they are proscribed in many places and a price set upon their heads. He adds that for want of other food they will eat cranberries and other mountain-berries.

The nest is generally built in trees; but in their absence,

among rocks and deep chasms in hill sides. Mr. Salmon, who found it in the last-mentioned localities in Orkney, describes the outside of the nest as composed of withered heather and large roots or stalks, and the lining as being of wool and hair: the three young in one nest which he looked into, were of the same colours as the parents. The eggs, four or five in number, are greenish mottled with dark brown.

The Hooded Crow is said to be more docile in learning to speak than the Carrion Crow. In the *Portraits d'Oyseaux* the following quatrain appears under a very fair cut of this species:—

' Ceste Corneille est dite emmantelée,  
Qui seulement en hiver se peut voir.  
Sa couleur est cendrée avec le noir,  
Comme un manteau; dout elle est appellée.

*Geographical Distribution.*—Extensive. In Europe it is widely spread. Denmark, Sweden, Norway, Germany, Holland, our own islands, Italy (where it is permanent according to the Prince of Canino), and France possess it. It is found at Iceland, in Russia, and Siberia, but not beyond the Lena. It is common in Smyrna, according to Mr. Strickland. The Grecian Archipelago generally possesses it, and it

Hooded Crow returned with a new mate of the same sable hue as the former one to her old nest. The Carrion and young Crows were again all the old female by her vigilance escaped all the efforts to destroy her

and a third time returned with a fresh mate; she was not however again successful, but was shot, and is now preserved in the Scarborough Museum. The young birds varied, some resembling the Hooded and others the Carrion Crow in their plumage.' (*Zool. Proc.*, 1836.) Mr. Selby has noticed such a union at Fowberry. (*Address to the Berwickshire Naturalists' Club*, 1834.) The same ornithologist mentions that Sir W. Jardine observed a similar pairing in Dumfriesshire. Temminck also observes that a mixed breed between the Hooded Crow and Carrion Crow sometimes occurs in the northern countries, where the latter is scarce.

'For four successive years,' says a correspondent in the *Field Naturalist*, 'I had opportunities of witnessing the pairing of the Carrion Crow and the Hooded Crow in some large beech-trees which surround my house in Forfarshire. They never occupied the old nest, nor did they always build their nest on the same tree; nor was I positively certain that it was the same individuals who returned every year to these trees, though it is probable they were, for they were never molested. Knowing the predatory propensities of the Carrion Crow on hen's eggs, young ducks, and even Turkey poults, I would have shot them had they been a pair of Carrion Crows; but I was anxious to mark the result of what appeared to me at the time to be a remarkable union. Judging from the manners of the two birds, the almost constant incubation, and carefulness exhibited, I should say that the Hooded Crow was the female, though the Carrion Crow did frequently sit upon the eggs. After the young of the first year took wing, I perceived that the one was a Carrion and the other a Hooded Crow; and this distinctive character was maintained in the young which were hatched every year as long as I remained in the country. I shot the first young pair, and ascertained that the Hooded one was the female, and the Carrion was the male, which confirmed me in my conjectures of the sexes of the parents. Ever after young and old were unmolested by me; but notwithstanding the increase of number every year after the first one, only one pair came annually to build on these beech-trees. In Atkinson's *Compendium of the Ornithology of Great Britain*, the pairing of a male Hooded Crow with a female Carrion Crow at Aroquhar on Loch Long is recorded. Their nest, which was like that of a Carrion Crow, was built in the fork of a tall pine, and the union lasted for three or four years.

**RUBEFACIENTS** are external agents which cause redness of the part to which they are applied. If long continued, they may, according to their nature, produce inflammation and some of its consequences. In such circumstances they are termed **BLISTERS**, or **ESCHAROTICS**. It is however a degree of action short of what entitles them to these appellations which is now contemplated. Thus friction with the hand or warm cloths often relieves spasmodic or neuralgic pains; and a hot poultice or warm fomentations lessen inflammation of superficial or even deep-seated parts. Embrocations, when of a stimulating kind, act as rubefacients; and blisters kept in contact with the surface for a short time only, cause redness of the part, and some remote secondary effects of a very beneficial kind. Many cases of fever in the sinking stage may be recovered by a succession of flying blisters, as these temporary applications are termed, placed on different parts of the body, particularly over parts where the skin is thin. Their action may be expedited by previously rubbing the part with proof spirit or oil of turpentine, or by using a portion of linen steeped in the acetum cantharidis instead of the common blister. By diligent employment of such means many valuable lives may be saved. (See Dr. Graves, in Johnson's *Medico-Chirurg. Review*, for Oct. 1835, p. 529.) Rubefacients are also very usefully applied to the spine in many nervous diseases.

#### RUBELLITE. [TOURMALINE.]

**RUBENS, PETER PAUL**, the most celebrated painter of the Flemish school, was born at Cologne, on the 29th of June, 1577. His father, John Rubens, who was one of the believers of Antwerp, had taken refuge at Cologne with his family, in consequence of the disturbances prevailing in the Netherlands. In that city he died, in the year 1587. His widow shortly afterwards took advantage of the restoration of Flanders to the Roman Catholic faith by the victories of the Duke of Parma, and returned to Antwerp. In his 16th year Peter Paul Rubens was placed as a page in the household of the Countess of Lalain, but the life did not suit

him, and he soon returned home. At his own desire he became the pupil, first of Tobias Verhaegt, a landscape painter, and then of Adrian van Oort, who was celebrated as a colourist. His next master was Otho van Veen, or, as he is commonly called, Otho Venius, court painter to the Infanta Isabella and the Archduke Albert. In the year 1600, when Rubens was 23 years old, he was advised by his master to visit Italy. He was already thoroughly conversant with all the technical and general knowledge which would enable him to reap the full benefit from such a journey, and he had executed some considerable pictures. He proceeded first to Venice, and thence to Mantua, where his letters of recommendation from the Archduke Albert secured him the favour of the Duke Vincenzo Gonzaga. At his court Rubens accepted the place of gentleman of the chamber, and availed himself of the opportunity thus afforded him of studying the frescoes of Giulio Romano and the other works of art then belonging to the family of Gonzaga. In 1601 he went to Rome for a short time, and after returning to Mantua, visited Venice, and devoted himself to the study of the pictures of Titian and Paul Veronese. The works of these two masters probably exercised the strongest influence in the full development of his natural genius for colour. The Archduke Albert commissioned Rubens to paint three pictures for the church of Santa Croce in Gerusalemme, at Rome, and he returned thither for that purpose, and with the object of copying some celebrated pictures for the Duke of Mantua, and he probably visited Florence in his way back. In 1605 the Duke Vincenzo Gonzaga sent him on a special mission to Spain with a present for Philip III. That king received him most graciously, and after painting a large number of portraits of persons connected with the court of Madrid, he returned to Mantua. He paid a third visit to Rome, where he was joined by his elder brother Philip, and in 1607 went through Milan to Genoa. In the latter city he executed many works, and a great number of his pictures still remain there. In 1608 he received news of his mother's illness, and returned immediately to Antwerp, where however he arrived too late to find her alive.

The wishes of Albert and Isabella induced Rubens to abandon his project of returning to Italy; and in 1609 he married his first wife, Elizabeth Brant, and settled at Antwerp. The beautiful picture in the Munich gallery, representing himself and his wife seated in a garden, was probably painted shortly after his marriage. The outline is more precise and the style more true and homely than in most of his works. The best account of its characteristic merits is to be found in a note of Mrs. Jameson's to Dr. Waagen's *'Life of Rubens'* (Translation, p. 21). In the year 1620 Rubens was commissioned to paint the series of pictures now in the Louvre which represent the principal events in the life of Maria de' Medici. He went to Paris, and received his instructions for these works, but the pictures themselves were executed at Antwerp, for the most part by the hands of his numerous pupils. In fact, as they were placed in the Luxembourg in 1625, it was physically impossible that he should have painted them himself. The original sketches, now in the Munich gallery, are very far superior to the finished pictures. During his last residence at Paris, Rubens became acquainted with the Duke of Buckingham, who purchased his collection of statues and other works of art for 60,000 florins, or according to De Piles, for 100,000. In 1626 Rubens lost his wife, and he shortly afterwards made a journey, in which he visited the principal Dutch painters of that time.

Rubens had been highly esteemed by the Archduke Albert, and after the death of that prince he continued in the favour of his widow the Infanta. On her return from the siege of Breda, in company with Spinola, in 1625, she visited Rubens's house; and in 1627, when Charles I. declared war against France, Rubens was entrusted with some negotiations with Gerbier, Charles's agent at the Hague. In the autumn of the same year he was dispatched to Madrid. During his stay in Spain he executed several very fine pictures, and gained the favour of Philip IV. and the Count-Duke of Olivarez. In 1629 Rubens was sent by the Infanta as ambassador to England. The painter succeeded as a diplomatist, and his merits in procuring Charles's acquiescence in the peace were recognised by the court of Spain. Whilst in England, he stood high in the favour of Charles I., whose feeling for the fine arts seems to have been of the strongest kind. The allegory of War and Peace,

now in the National Gallery, was painted as a suitable present to the king, on the occasion of these negotiations. After the breaking up of Charles's matchless collection, this picture was transferred to Genoa, but was purchased during the French revolution from the Doria family, and thus restored to this country. The ceiling of Whitehall was sketched during Rubens's stay in England, but painted at Antwerp at a later period. For the latter work he is said to have received 3000*l*. In 1631 Rubens married his second wife, Helena Forman, a beautiful girl of sixteen. Her portrait often recurs in his pictures. He was again employed on a mission to Holland in 1633; and in December of that year, his patroness, the Infanta Isabella, died.

Rubens's fame now stood very high, and the commissions he received could only be executed by the aid of his numerous and able pupils. In 1635 he became subject to gout in the hands, which disabled him from painting with ease on a large scale. At the request of the authorities of Antwerp, he executed sketches for the decoration of the arches to be erected on the entry of the Cardinal Infant, Don Ferdinand, the new regent of the Low Countries. In 1640 the disease under which he had suffered caused his death. He expired in the 63rd year of his age, and was buried in the church of St. James at Antwerp.

Rubens's personal appearance was prepossessing, and his manner and conduct such as to make him generally beloved. Towards other artists he acted with the greatest generosity, and he is said to have relieved the poverty of Vandyck by purchasing all the pictures which that artist had in his studio.

His own character and merits as a painter have been the subject of much controversy, and will probably always furnish matter for discussion.

In all questions of literature and art, we are never satisfied without constantly comparing things which are in themselves utterly dissimilar. The source of pleasure from works of art is obscure, and the nature of the pleasure itself is little capable of definition, but men think to obtain greater precision, and to arrive at the reason why they are pleased, by this process of comparison. To a certain extent perhaps we may succeed, but in general such comparisons have a tendency to narrow our field of enjoyment, and to lead us to dogmatise on what cannot be reduced to fixed rules. A man may derive greater satisfaction from the works of Perugino or Fraucesco Francia than from those of Rubens or Teniers; he may feel the beauty of the Parthenon more than that of Strasburg cathedral; but he is not therefore justified in saying that Rubens was a bad painter, or that Erwin of Steinbach was an indifferent architect.

The principal sources of pleasure in painting appear to be form, composition, colour, and, the highest of all, the expression of human character and action. The subdivisions of this last branch are of course infinite, and comprise the higher and holier feelings, as well as those which are more properly a portion of our animal nature. In those parts of his art which act immediately on the senses, Rubens was without doubt a great master. He understood the perfect management of light and shade, of composition, and of colour. If his merits are disputed, it is with reference to the subjects which he painted and to his mode of treating them, not to his technical skill. Before his visit to Italy he had acquired an individual character as an artist. The fruit of his labours there was not a crude mass of detached imitations, but, whilst he carefully studied the great masters at Venice and elsewhere, his vigorous genius assimilated and appropriated to itself all that it took up or borrowed. The excess of individual peculiarity in Rubens certainly amounts to *manner* in the narrower sense of the word. That peculiarity of feeling too did not dwell on the forms which are best fitted for expressing the tranquil and devotional sentiments which prevail in early Christian art, but still, such as it was, it was eminently characteristic of a *great painter*. Sculpture exceeds painting in its power of expressing form, and equals it in that of portraying fixed character; but painting only can express the tumult and energy of human action in full power and motion. In this Rubens excelled, and it is surely no mean excellence. We are ready to grant that his Madonnas are, for the most part, clumsy and undignified; that their forms are unfitted for the being whom they represent; and that exaggeration sometimes disfigures scenes where quiet and holy feelings would be more in place. Notwithstanding all this, the stronger human passions and

actions have an intense interest for mankind. The animal energy and the sensual characteristics of man are a part of that complex whole which we call human nature, although they are not the most elevated part. If art is to represent man as he is, these elements cannot be wholly overlooked. The Greek drama displayed them too glaringly in the olden comedy, and Greek sculpture embodied them in its fawns and satyrs. An acute sense of beauty indeed generally softened the more disgusting features, and we might wish that Rubens had been oftener touched with similar scruples. We must take him however as he is; with all his technical excellence, and with all the incomparable energy and heartiness which animates his best works. In them there is none of that idle filling up of vacant corners, or that insertion of cold academic figures wholly unconcerned with the scenes portrayed, which we find in works of the same kind by other masters. If we look at Rubens's Village Fête, in the Louvre, the ring of peasants wheel round in the dance with a drunken merriment which seems in actual motion before us. The smaller picture of the Last Judgment, at Munich, is just as wonderful for this quality of movement, as for its glorious colour and execution. His Battle of the Amazons, in the same collection, conveys, in a most wonderful degree, the struggle and energy of a combat. Action and life he never failed to represent as no other painter has done before or since, and this alone, in our opinion, entitles him to a place in the very foremost rank of artists.

In landscape, Rubens's facility of execution and gorgeous colour produce a marvellous effect. His hunting-pieces and portraits are equally celebrated. The picture commonly referred to as the *chef-d'œuvre* of Rubens is the Descent from the Cross, at Antwerp. The best of his works are in the Munich gallery (principally derived from the Düsseldorf collection) and at Blenheim and Vienna. Many fine pictures by him remain in Spain, and many of course at Antwerp.

His principal pupils were Vandyck, Jordaens, Van Thulden, Kraye, Diepenbeck, and Quellin, but most of them imitated the outward characteristics of their master without catching his fire and energy. The engravers of his school, such as Pontius and Bolswert, succeeded admirably in conveying the general character of those pictures which it would seem most difficult to translate into mere black and white.

We may conclude by saying that Rubens did that for his country which has rarely if ever been accomplished for any other land. At the time of John and Hubert van Eyck, the school of Flanders had obtained the highest pitch of excellence. Those artists united a diligent and minute observation of nature to the finest technical skill and the most successful delineation of character and feeling. At a later period this excellence had vanished, and given way to the crude and affected imitation of the Italian masters which we find in Mabuse and Van Orlay. Rubens however a second time placed the Low Countries in the first rank, and by his own genius restored to them a reputation different indeed in kind, but perhaps equal in degree to that which they had formerly enjoyed.

(*Peter Paul Rubens, his Life and Genius*, translated from the German of Dr. Waagen, by Robert R. Noel, edited by Mrs. Jameson, London, 1840, whence the greater part of the information contained in this article is taken; *Edinburgh Review*, No. 146.)

RU'BIA, a genus containing about forty species, found both in Europe and Asia. It belongs to the very large natural family of Rubiaceæ, to which it gives the name which it itself derives from *ruber* (red), in allusion to the red colour yielded by many of the species. This genus is characterised by flowers monopetalous, superior; tube of the calyx ovate globose, limb scarcely any; corol sub-campanulate, rotate, 5-partite; stamens 4-5, short; styles two, short; berries two, one-seeded. Amongst the numerous species several are employed in medicine and in the arts; in the latter for the sake of the colouring matter, which is contained in the roots. *R. tinctorum*, madder, has been long known, and was employed in medicine even in the time of Hippocrates, but is valued chiefly as a dye. It is a native of Europe and Asia Minor, but is now extensively cultivated in Holland and France; the culture has likewise been attempted, and successfully, in this country, but the English madder could not be sold so cheap as the foreign; it is therefore still largely imported, chiefly from Holland, France, Italy, Turkey, though since cochineal has become

cheaper, it is much used for the same purposes. It is employed by dyers and calico-printers as a red and scarlet dye. It has also the singular property of turning red the bones and secretions of fowls and other animals fed on it.

*R. cordifolia* (*Munjista*), the *Munjeet* of India, a native of Nepaul, &c., possesses very similar properties, and is imported into England from Calcutta. The root is used as a substitute for that of *R. tinctorum*; it is known in commerce under the name of East Indian madder, and is also employed in medicine. Like madder, munjeet was probably known from very early times, as *rodeen* is given as the Greek name in Persian works on *Materia Medica*. *R. chilensis* and *R. Relbun*, both natives of South America, are also esteemed there as dyes.

RUBICON. [CÆSAR, C. J.]

RUBLE. [MONEY.]

RUBRIC (from the Latin *ruber*, red), a name given to the titles of chapters in certain ancient law-books; and more especially to the rules and directions laid down in our Liturgy for regulating the order of the service. These, in both instances, were formerly written or printed, as the case might be, for distinction's sake in red characters, and have retained the name though now printed in black.

RUBUS (the Latin *rubus*, a bramble), a genus of plants belonging to the natural order, Rosaceæ, and to the section Potentillæ of the suborder Rosaceæ proper. This genus, like that of *Rosa*, has proved a source of difficulty and difference amongst botanists. Some writers on the British Flora have described upwards of twenty-five species, whilst others have reduced them to four or five, or even two.

The following excellent description of this genus from Hooker's 'British Flora' has been drawn up by Mr. Borrer, who has investigated the British species with more success than any other botanist:—

'Shrub-like plants or herbs, with perennial roots. The latter offer nothing very peculiar. In some species of the former the stem is upright, or merely curved at the top; but in the greater number it is either prostrate, or, as is more generally the case, assurgent, arched, and decurved; and the ends of the shoot and of the side branches, if it produce any, unless prevented by circumstances from reaching the ground, take root in the latter part of the year. In the winter the shoot is partially destroyed, the part next to the original root surviving to produce flowering branches during the ensuing summer, and usually dying after the fruit has been perfected; young shoots meanwhile springing up by its side. The rooted ends also become distinct plants at various distances from the parent root, often many yards. This mode of growth adds much to the difficulties in the discrimination of the species; since an acquaintance with both the leafy shoot and the floriferous stem, formed in the second year from its remains, is necessary. The best characters are found in the figure, the arms, and the leaves of the former. The leaves in all the British species of this division are, occasionally at least, quinate, and, with one exception, digitate, or somewhat pedate from a partial junction of the stalks of the two lateral pairs of leaflets; the margins serrated, for the most part unequally and irregularly; the prickles on the leaf-stalks more curved than those of the stem. In some species the inflorescence is remarkable, but in general the panicle varies so much as to afford no good distinction, nor can the arms of the calyx or the form of its segment be depended on. The petals are all delicate and crumpled, and in several species very considerable in size and width. There are some differences in the fruit, but they are rarely discriminative. In examining the figure of the leaves, the central leaflet is to be regarded; the lateral ones are always smaller and of a narrower proportion. In several species the leaves occasionally survive a mild winter, and are found the next season subtending flowering branches. The leaves of these branches are of less determinate figure; the number of their leaflets reduced as they approach the inflorescence, and their place is supplied in the upper part of the panicle by first bifid and then simple bracteas, formed by the coalescence of the stipules. These last are usually long and narrow, entire, or sometimes toothed or jagged, and issue from the etiole, for the most part, a little above its base. They afford no distinguishing characters.' This description applies equally to the foreign species as to those of Britain. The essential characters of the genus are:—calyx 5-cleft; petals 5. Fruit superior, of several single-seeded juicy carpels, placed upon a protuberant spongy receptacle. The

species are universally diffused over the mountainous and temperate regions of the Old and New World.

As a group of plants this genus is more interesting to the botanist than the horticulturist, but at the same time several species are cultivated both as ornaments and on account of their agreeable, acid, and astringent fruit.

One hundred and forty-seven species of this genus are enumerated by Don, in Miller's 'Dictionary,' which are divided according to the character of their leaves. The first division is known by the plants having pinnate leaves and from three to seven leaflets. The most remarkable of these is the *Rubus Idæus*, Common Raspberry, or Mount Ida bramble, well known for its crimson edible fruit. [RASPBERRY.] The whole plant is villose, stem round, with slender recurved prickles; leaves pinnate, with 5 or 3 ovate serrated leaflets, tomentose beneath; flowers drooping; petals obovate, wedge-shaped, entire, conniving shorter than the calyx; carpels numerous, tomentose. It is a native of woods in Europe, from Norway and Sweden to Spain and Greece. It is found also in Asia on the Himalaya, in the North of Africa, and in America from Canada to Pennsylvania. It is found abundantly in almost every part of Great Britain and Ireland. The fruits are called raspberries, and are very generally eaten. They enter into the composition of different syrups, jams, jellies, ratafias, and ices, and are preserved either alone or with currants. Raspberry-wine is much used in Poland. Raspberries are sometimes dried in ovens for winter use. Raspberry-vinegar is not only an agreeable beverage, but is said to act as a febrifuge. They are amongst the most agreeable of garden fruits when properly cultivated, and when ripe may be eaten in almost any quantity with impunity.

*Rubus suberectus*, Upright Bramble, is known by its nearly upright, not rooting, obsoletely angular stem, uniform few and small prickles, lower pair of leaflets sessile or nearly so, and panicle nearly simple. The stems are between three and four feet high. The fruit consists of a number of small dark-red aggregated carpels, which have something the flavour of the raspberry, and hence recommended for cultivation. It is a British species, and grows on boggy heaths, by the sides of streams, &c., chiefly in mountainous districts of the North.

*Rubus micranthus*, Small-flowered Bramble, has an upright, round, branched stem, pinnate leaves, with 5-7 oblong, ovate, doubly serrate, tomentose beneath, and green above leaflets, with small reddish-purple flowers arranged in corymbs, and black fruit. It is a native of Nepaul, and one of the most gigantic of the genus, attaining a height of eight or nine feet. It is easily distinguished by its nearly erect, strong, smooth, dark mahogany-coloured shoots, and very long pinnate leaves. The shoots sometimes attain a length of 20 feet. There are two other species, *R. distans* and *R. asper*, found with this in Nepal, which have been grown in this country.

*R. occidentalis*, the Western Bramble, is a native of Canada and the West Indies, and was introduced into this country in 1696. It has umbellate flowers, and fruit like the raspberry, but black, and grows to the height of 4 or 6 feet.

The second division is known by the plants having digitate leaves, with from three to five leaflets.

The Grey Bramble, or Dewberry (*Rubus cæsius*), is known by the following characters:—Stem trailing, round or nearly so, glaucous; prickles straight, unequal, passing insensibly into setæ, the length of the largest rarely equalling the diameter of the stem; leaves digitate, of 3 or more rarely 5 ovate leaflets, the outermost sessile; calyx embracing the fruit. It is a native of Europe and the North-East of Asia, in woods and hedges. Many of the species described by botanists may be referred to this; the most important of these are *R. Sprengelii*, *R. dumetorum*, *R. foliolosus*, *R. flagellaris*, *R. coryliflorus*. The last, the Hazel-leaved Bramble, is admitted as a species by most British botanists. It is known by its stem being decurved and roundish, prickles straight, passing into setæ; leaves digitate, with 5 ovate leaflets; fruit spreading or reflexed. It is generally a much larger and stronger plant than *R. cæsius*. Dr Lindley refers several of the species of the German botanists Weihe and Nees, to the *R. coryliflorus*, which he admits as a genuine species.

*Rubus spectabilis*, Showy Bramble, is one of the handsomest of the genus. It has a glabrous stem, not bearing prickles; leaf of three ovate, acute, doubly and unequally

serrated leaflets, downy beneath; flowers of an agreeable purplish colour, on terminal peduncles. It is an elegant shrub, growing to the height of four or five feet. It flowers in April and May, and has a large dark-yellow fruit, of an acid and astringent taste. It was brought from the banks of the Columbia river, in North America, by Mr. Douglas, in 1827, and is very deserving of cultivation.

*Rubus fruticosus*, Shrubby Bramble, or Common Blackberry, is one of the most common species of the genus. It has a 5-angled erect stem, rather tomentose, bearing recurved prickles, 3-5 leaflets, each on a secondary petiole; rose-coloured or white flowers arranged on a panicle; reflexed sepals, almost without prickles; purplish black fruit. It is a native of almost all Europe, in hedges, thickets, and woods. There are not less than ten generally admitted varieties of this species, and some botanists make many more. The fruit of this species and its varieties are well known as blackberries, or bumblekites, and also scald-berries, from their supposed power of giving scald-head to children. Wherever they grow, they are picked by the children of the district on account of their agreeable acid flavour. Sometimes they are employed in making an inferior wine, and also for the distillation of a spirit. They are frequently used by the inhabitants of rural districts for making tarts. The red muscat of Toulon is coloured by their juice. Medical properties have been attributed to them, but they are not now used. Both the fruit and leaves are employed in the arts, for colouring and dyeing. The *R. fruticosus* is a good plant for growing on loose dry ground for the purpose of fixing it previous to planting forest-trees. The shoots are used by thatchers for binding their straw, and also for making beehives. It is sometimes cultivated in order to produce a picturesque effect in gardening.

One of the most diminutive plants of the genus is the *R. arcticus*, the Arctic Bramble. It has three glabrous obtusely-serrated leaflets, no runners, stem bearing only one flower, and without prickles, the petals notched. It is a native of the mountainous and colder regions of Europe. Its stem never attains a greater height than six inches, and is furnished with from three to four leaves, with a single large deep rose-coloured flower, which is succeeded by a purplish red fruit highly prized for its flavour among the Swedes.

A third division of the brambles have their leaves singly lobed, not digitate or pinnate. A well known species of this division is *R. odoratus*, the Sweet-scented Bramble. It has an upright stem, with large showy red flowers, numerous ovate velvety carpels, and red fruit. It is a native of North America, in the woods of Canada, and the Alleghenies. It grows to the height of four or five feet, and is called *odoratus* on account of the fragrance of its foliage. Another American species, resembling the last, is the *R. nutkanus*, the Nootka-Sound Bramble. It flowers from May to October. Its flowers are white, succeeded by large red berries.

*Rubus chamaemorus*, the Cloud-berry, is known by its dioecious flowers, simple-lobed leaves, and herbaceous single-flowered stem without prickles. It grows in great abundance on the Scotch Highlands, and, under the name of roebuck-berries and knot-berries, the fruit is gathered in great quantities by the inhabitants of those districts. They have an agreeable flavour, and form a useful article of diet where they grow in sufficient number to be worth gathering. This plant is one of the smallest of the genus, never growing more than eight or ten inches high. It is the badge of the clan of M'Parlane.

Further information on the genus *Rubus* is contained in Hooker's 'British Flora;' Lindley's 'Synopsis of the British Flora;' Don's 'Miller's Dictionary;' Weihe and Nees' 'Rubi Germanici;' and Loudon's 'Arboretum.'

RUBY. [CORUNDUM]

RUD or RED EYE. [LEUCISCUS.]

RUDBE'CKIA, a genus of plants dedicated by Linnaeus to the memory of his predecessors the Rudbecks, father and son, in the botanical chair at Upsal. It belongs to the natural order Compositæ, and possesses many species. Some of these are well known in gardens. They are herbaceous, biennial, and perennial. All the sorts may be raised from seeds, which should be sown in April, and when the plants are two or three inches high they may be pricked out into nursery-rows till autumn, when they should be planted out where they are to remain. They may also be increased by offsets.

RUDDER. [SHIP.]

RUDDIMAN, THOMAS, was born in October, 1674, at Raggel, in the parish of Boyndie and county of Banff, Scotland. He was instructed in Latin in the parish school of Boyndie, where he made a rapid progress. At the age of sixteen he obtained, at King's College, Aberdeen, the first exhibition or bursary of the year, on account of his superior knowledge of Latin. Here he studied four years, and then took his degree of master of arts, at which time he was well read in the Roman classics. Soon after this he engaged himself as tutor in a private family, and in the course of another year he became schoolmaster of the parish of Lawrence Kirk. He remained here three years and a half, and then, through the interest of Dr. Pitcairne, he was appointed assistant-keeper of the advocates' library at Edinburgh. In this office, though he had good opportunities of becoming known, and of reading and teaching for his further improvement, yet his pecuniary advantages were so small that he was obliged, in 1707, to commence auctioneer. In the same year he published an edition of Volusenus's 'Dialogue on Tranquillity of Mind,' with a Life of Volusenus, o. Wilson, prefixed. In 1709 he published Johnston's Latin 'Poetical Paraphrase of Solomon's Song' and Johnston's 'Cantica.' He was next invited by the magistrates of Dundee to be rector of the grammar-school there, but he declined the offer. In 1713 his friend Dr. Pitcairne died, and Ruddiman, being still an auctioneer, managed the sale of his library, which was purchased by Peter the Great, emperor of Russia. In 1714 he published his 'Rudiments of the Latin Tongue,' a book which is well known, and is still used in most of the schools in Scotland. In 1715 he published an edition of Buchanan's works, in two volumes, folio, and in the same year he commenced printer, in partnership with a brother who had been brought up to the business; and some years afterwards he was appointed printer to the University of Edinburgh. He published, in 1725, the first part of his 'Grammaticæ Latinæ Institutiones,' which treats of etymology; and in 1732, the second part, which treats of syntax. He also wrote a copious treatise on prosody, but published only an abridgement of it. After this time he was made principal keeper of the advocates' library. In 1739 he published Anderson's 'Diplomata et Numismata Scotiæ.' During the latter part of his life he was engaged very much in controversy with different persons. However in 1751 he found time to put forth an edition of Livy, in four vols. 12mo, which Dr. Harwood pronounces one of the most accurate editions ever published. About this time he resigned his post of keeper of the advocates' library, and was succeeded by David Hume.

Ruddiman died at Edinburgh, January 19, 1757, in the eighty-third year of his age. He was author or editor of some other publications, besides those above mentioned, and among them 'The Caledonian Mercury,' from which he is said to have derived more profit than reputation. A Life of Ruddiman was published by Mr. George Chalmers, 1794, 8vo.

(Chalmers's *Biographical Dictionary; Biographie Universelle*.)

RUDGELEY. [STAFFORDSHIRE.]

RUDING, ROGERS, was born at Leicester, August 9, 1751. He was the second son of Rogers Ruding, Esq., of Westcotes, a member of a highly respectable family, of which notices may be found in Nichols's 'Leicestershire.' This gentleman was receiver-general for the county, and as such came to London to pay the identical money that he received into the Treasury. A friend, to whom Ruding mentioned this circumstance, suggests the possibility that this primitive mode of transacting business may have contributed in some degree to direct the mind of his son to the subject of money transactions. The subject of this article was educated at Merton College, Oxford, of which he was some time Fellow, and by which he was presented, in 1793, to the vicarage of Maldon and Chessington, two small adjoining parishes in Surrey, which are always held together, if not legally united. He took the degrees of B.A., 1771; M.A., 1775; and B.D., 1782. Mr. Ruding married a cousin of the same name, and by her had three sons, none of whom survived him, and two daughters.

Ruding's attention appears to have been early directed to the defects of our monetary system, and in 1798 he published a pamphlet, entitled 'A Proposal for restoring the ancient Constitution of the Mint, so far as related to the expense of Coinage: together with a plan for

the improvement of Money, and for increasing the difficulty of Counterfeiting.' In 1812 he issued proposals for his great work, which was published in 1817, in four quarto volumes, under the name of 'Annals of the Coinage of Britain and its dependencies, from the earliest period of authentic history to the end of the fiftieth year of his present majesty King George III.' The whole of the first edition being sold within six months, it was shortly followed by another, in octavo, which brought down the history to the middle of the year 1818; the additional matter being also printed in the form of a supplement to the first edition. This important work, on the compilation of which Mr. Ruding bestowed no ordinary amount of laborious research, contains a chronological history of the monetary affairs of this country, the constitution of the Mint, the process of coinage, and the numerous and often ineffectual measures adopted to prevent the deterioration and counterfeiting of the money. It also embraces an account, geographically arranged, of all the Mints and Exchanges formerly existing in various parts of the kingdom; and a description of the coins, illustrated by a series of more than a hundred plates, including those previously published as tables of English gold and silver coins, by Martin Folkes, Esq., which were lent by the Society of Antiquaries for the purpose.

Viewed simply as an historical work, Ruding's 'Annals of the Coinage' is a book of great value and interest, embracing as it does the result of the author's diligent investigation of a subject to which very few could devote sufficient attention; but the work had another object, which may be explained by an extract from the author's preface. He observes, 'Had these materials been collected for no other purpose than the amusement of antiquarian curiosity, I should have held myself blameable for the misapplication of much precious time. But this work is given to the world with a higher and more important view. Its object is to show, from the experience of ages, the inadequacy of punishment, however severe, to prevent the commission of the crime of counterfeiting the money, whilst the temptation to it remains so powerful, and the execution of it so easy. The long succession of penal statutes, and the innumerable lives which have been forfeited to them, seem to prove that the system is radically defective, and that the crime can be prevented only by counteracting and weakening the force of the temptation.' Ruding considered his theory to be supported by the great re-coinage of 1816 and 1817, at which time the weight of the coins was so far diminished as to remove the temptation to melting them down, while the coarseness of the workmanship afforded such facility to imitation, that the real coins and the counterfeits were ready for delivery almost at the same instant. A new edition of this important work, extended to the commencement of the reign of Victoria, has lately been published by Mr. Hearn, in three volumes, quarto. It is edited by J. Y. Akerman, Esq., aided by other numismatists; and, while the text of Ruding is preserved unaltered, it is enriched with many additional notes and tables, and upwards of forty new plates of coins.

Mr. Ruding communicated many papers on coins, &c. to the 'Gentleman's Magazine,' and memoirs on the trial of the pix and the office of cuneator (which were, in fact, little more than chapters of his larger work, perhaps put forth in that form to excite interest on the subject) to the 17th and 18th volumes of the 'Archæologia' of the Society of Antiquaries, of which he was a fellow. He was also an honorary member of the Antiquarian Society of Newcastle-upon-Tyne. He died at Maldon, on the 16th of February, 1820, in his sixty-ninth year.

RUDOLPHINE TABLES. [KEPLER.]

RUDOLPHUS, Schumacher's name for the *Monoceros* of authors. [ENTOMOSTOMATA, vol. ix., p. 458.]

RUDOLSTADT. [SCHWARZBURG.]

RUE'LLIA, a genus of plants of the natural family of Acanthaceæ, which was so named by Linnæus in compliment to J. Ruelle, physician of Francis I., who wrote commentaries on Dioscorides, as well as some other botanical works. The genus, as formerly constituted, embraced a great many Indian species, which are now distributed among some other genera, as *Adenosma*, *Hygrophila*, *Dyschoriste*, *Clustacanthus*, *Petalidium*, *Calophanes*, *Buteræa*, *Strobilanthes*, *Æchmanthera*, *Goldfussia*, *Asystasia*, *Leptocanthus*, *Alibetema*. The genus is distributed through the tropical parts of Asia, including the tropical and subtropical parts of

P. C., No. 1258.

New Holland. It includes many highly ornamental plants, as are also those which have now been excluded from it; all are easily cultivated, and often to be seen in our hot-houses. Some of the species which have now been removed to other genera are found at considerable elevations on the sides of the Himalayan Mountains; of these the most remarkable is *Æchmanthera*, formerly *Ruellia gossypina*, which has its stems covered with a thick coating of white tomentum, which probably enables it to withstand a greater degree of cold than most others of the family.

RUFINUS, also called TORANUS, a priest of Aquileia, and, according to some writers, a native of that place, was born about the middle of the fourth century. He embraced a monastic life, and lived at first in a monastery at Aquileia, where he devoted himself to the study of the Scriptures and of the Greek and Latin fathers. During this time he became acquainted with St. Jerome, who was for a long time most sincerely attached to him. Rufinus subsequently visited Egypt, where he formed the friendship of St. Melania, who was celebrated in the church for her works of charity and love. He afterwards went to Palestine, where he encountered the opposition of the Arians, who banished him to the most desolate part of the country. He was ransomed however by Melania, and returned with her to Jerusalem, where he built a monastery on Mount Olivet, and lived for many years. During his stay at Jerusalem he translated some of Origen's works, by which he offended his former friend Jerome, who attacked him in his 'Apology.' To this work Rufinus replied, in which he maintained his own orthodoxy and defended himself by appealing to the example of Jerome, who had formerly praised and also translated some of Origen's works. This controversy excited a great stir at the time, as both writers were of high reputation and had many partisans. The Western church however was generally opposed to Rufinus, and on his return to Aquileia he was cited by Anastasius, the bishop of Rome, to appear before him; and on his not doing so, his writings were condemned, and he was deprived of his rank as presbyter at Aquileia. He subsequently retired to Sicily, where he died about the year 410.

Rufinus translated into Latin the works of Josephus; the 'Ecclesiastical History' of Eusebius, to which he added two books continuing the history to the death of Theodosius; the books of Recognitions attributed to Clement, several of Origen's works, with the first book of Pamphilus's 'Apology' for Origen, the 'Orations' of St. Gregory Nazianzen, the ascetical rules of St. Basil, and a few other smaller treatises of the Greek fathers. The translations of Rufinus are rather paraphrases than strict and literal versions. Besides these translations, Rufinus wrote two books in reply to St. Jerome, which have been already mentioned; an 'Apology' to Anastasius, bishop of Rome; an 'Explanation of Jacob's Blessing,' a 'Commentary upon Hosea, Joel, and Amos;' and an 'Explanation of the Apostle's Creed,' a work which is considered by modern theologians of considerable importance, as it contains a complete catalogue of the books of the Old and New Testament.

The opinion of Du Pin upon the literary and theological merits of Rufinus is just and impartial: 'It must be acknowledged that Rufinus, though very ill used by St. Jerome, was one of the ablest men of his time. Perhaps he had not so much learning as St. Jerome, but his temper was better and less violent. He doth not write such good Latin, but his style is more even. It cannot be denied that the Latin church is indebted to him for the knowledge of the most considerable among the Greek authors, and particularly of church history. Though he was accused of divers errors, yet he was convicted of none, and he justified himself sufficiently from the reproachful objections made against him.'

The works of Rufinus were published by Sonnius, in one volume folio, Paris, 1580.

(Du Pin, *A New History of Ecclesiastical Writers*, vol. iii., pp. 107-111, transl.; Lardner, *Credibility of the Gospel History*, vol. iv., p. 482, Lond., 1831, and the references there given.)

RUFUS, or RUPHUS (Ρούφος), commonly called Rufus Ephesius, from the place of his birth, is said by Abulfaraj (*Hist. Dynast.*, p. 59) to have lived in the time of Plato, about four hundred years before Christ; John Tzetzes calls him the physician to Cleopatra, who died B.C. 30 (*Chil.*, vi.; *Hist.*, 44, v. 300, p. 104); but Sprengel (*Hist. de la Méd.* and most modern authors follow Suidas in placing him in

VOL. XX.—2 F

the reign of Trajan, about the beginning of the second century after Christ. He is sometimes confounded with Menius Rufus, the inventor of several compound medicines, who however must have lived long before the reign of Trajan, as he is quoted by Andromachus (Galen, *De Compos. Medicam. sec. Loca*, lib. vii., tom. xiii., cap. v., p. 92), who was archiater to the emperor Nero. Nothing is known of the events of his life, except that he wrote several works, of which the titles are preserved by Galen and Suidas, and three are still extant.

The first consists of three or four books,\* entitled *περι ὀνομασίας τῶν τοῦ ἀνθρώπου μορίων*, 'De Appellationibus Partium Corporis Humani,' which are chiefly valuable for the information they impart concerning the state of anatomical science before the time of Galen. His principal object in this work was to give a general idea of anatomy, and particularly to prevent the medical students of his time from making mistakes in reading the antient authors, who do not always call the same parts of the body by the same name. From what Rufus says in this book (p. 33), we find that all the anatomical demonstrations were made upon beasts. (Compare Theophilus, 'De Corp. Hum. Fabr.,' lib. v., cap. ii., who says, 'choose an ape for dissection, if you have one; if not, take a bear; and if you have not a bear, take any animal you can get.') He considered the spleen to be absolutely useless. (p. 59.) We find also in the same book, that the nerves now called *recurrent* were then quite recently discovered. 'The antients,' said Rufus (p. 42), called the arteries of the neck *καρωτιδες*, or *καρωτικοί*, because they believed that when they were pressed hard, the animal became sleepy and lost its voice; but in our age it has been discovered that this accident does not proceed from pressing upon these arteries, but upon the nerves contiguous to them.' He shows that the nerves proceed from the brain, and he divides them into two classes, those of sensibility and those of motion (p. 36), though, like Celsus (*De Medic.*, lib. vii., cap. 18, p. 413, ed. Argent.), he reckons (p. 41; compare p. 43) among them the cremaster muscle. (Julius Pollux, himself a contemporary of Galen, gives also the name of *νεῦρα* to the ligaments which unite the bones: *Onomast.*, lib. ii., cap. 5, segm. 234, p. 265.) According to Sprengel (*Hist. de lu Méd.*), he was the first to describe, though very imperfectly, the commissure of the optic nerves at the height of the infundibulum, and the fibres which they receive from that part of the brain. (p. 54.) He clearly describes the capsule of the crystalline lens by the term *ὕμην φακοειδής*, *lenticular membrane*. (p. 37.) He considered the heart to be the seat of life, and noticed that the left ventricle is smaller and thicker than the right. (p. 37.) This work was first published in a Latin translation, by J. P. Crassus, with Aretæus, Venet., 1552, 4to.

The next work of his that remains is a valuable little treatise, *περι τῶν ἐν νεφροῖς καὶ κύστει παθῶν*, 'De Renum Vesicaque Morbis,' in which however there is nothing that requires particular notice here. The third is a fragment, *περι τῶν φαρμάκων καθαρτικῶν*, 'De Medicamentis Purgantibus.'

These three works were first published in Greek, by J. Goupyl, Paris, 8vo., 1554. There is an edition by Clinch, Greek and Latin, Lond., 1726, 4to., which is not of much value. The most complete is that by Matthæi, Mosq., 1806, 8vo., Græce, in which he has supplied, from a manuscript at Moscow, several fragments that had never before been published. A Latin translation of Rufus is inserted in the 'Medicæ Artis Principes,' by H. Stephens, Paris, 1567, fol. Some Greek fragments are to be found in the fourth volume (pp. 198-200) of the collection of 'Classici Auctores à Vaticanis Codicibus editi,' published by Angelo Mai, Romæ, 8vo., 1831. C. G. Kühn published, Lips., 1831, 'Rufi Ephesii de Medicam. Purgant. Fragm. à Cod. Paris. descript. ;' and F. Osann wrote a dissertation, 'De Loco Rufi Ephes. Med. ap. Oribasium servato, sive de Peste Lib.,' Giss., 1833. There are also several fragments preserved by Oribasius and Aëtius and among the rest the formula for the composition of a celebrated medicine called *Hiera* (Oribas., *Synops.*, lib. iii., pp. 121, 122), which appears to have been a common name among the antients, for what may be called patent medicines, as Aëtius has inserted in his compilation (Tetrab. i., serm. 3, cap. 114) the formula of one called, after the celebrated Archigenes, 'Hiera Archigenia.'

Haller is inclined to attribute to Rufus (*Biblioth. Botan.*,

\* There are in fact only three books, as the second is a sort of *alter primus*, or later edition of the first.

tom. i., p. 108) an anonymous fragment of one hundred and ninety Greek hexameter verses, *περι βοτανῶν*, 'De Viribus Herbarum,' which was first published in the Aldine edition of Dioscorides, Venet., 1518, 4to., p. 231, &c., and which is inserted by Fabricius, with Greek scholia and a Latin translation and notes, by J. Rentorf, in his 'Bibliotheca Græca' tom. ii., pp. 629-661 (old edit.). Fabricius and others have also been of the same opinion. Hermann, on metrical grounds (*Orphica*, Lips., 1805, 8vo., pp. 717, 750, 761, &c.), determines the writer to have lived some time between Manetho, the author of the *ἀπορρηματικά*, and Nonnus, the author of the 'Dionysiaca;' but this date is sufficiently vague. Rufus certainly composed a poem in Greek hexameters, *περι βοτανῶν*, in four books, which are mentioned by Galen (*De Facult. Simplic. Medic.*, lib. vi., Præfat., tom. xi., p. 796, ed. Kühn), and of which he quotes a few lines (*De Compos. Medic. sec. Loca*, lib. i., cap. 1, tom. xii., p. 425); but this is supposed by Choulant (*Handbuch der Bücherkunde für die Aelttere Medicin*, 8vo., Leipzig, 1828) to have been quite a different work from the fragment now spoken of, chiefly on the ground that so scientific and sensible a physician as Rufus would not have written anything so full in popular superstitions and absurdities. The fragment treats of thirteen different plants in as many chapters, in which, says Haller, 'Medicarum virium adest sarrago verarum et falsarum.'

#### RUGBY. [WARWICKSHIRE.]

RÜGEN is the largest of all the islands belonging to Germany, and, together with several small adjacent islands, forms the circle of Bergen in the government of Stralsund, of the province of Pomerania. This island has an area of 340 square miles and was formerly much larger: a part of it, probably above one half, was swallowed up in the middle ages by the sea. It is separated from the continent, with which it is supposed to have been formerly joined, by an arm of the sea at least a mile broad. Its shape is very irregular, being deeply indented by the sea in various directions, so as to look like a number of peninsulas united by a comparatively small nucleus in the centre. On the east side the peninsula of Jasmund is connected with the mainland by the steep ridge called Prora, and by a long, narrow, and high wall of flint, granite, and porphyry boulders. In this peninsula is the Stubbenitz, a considerable beech-forest, containing the Berg or Black Lake, an oval spot surrounded with a high wall, which is believed to be the place where the goddess Hertha was worshipped. (Tacitus, *Germ.*, c. 40.) The whole island abounds in grotesque and romantic scenery. On the west it is level, but rises in the interior, and the northern coasts consist in general of rugged steep chalk cliffs. One of the most considerable eminences in the island is Mount Rugard, on which the residence of the princes formerly stood. On the north point of Jasmund is the Stubbenkammer, a lofty chalk cliff, which rises perpendicularly from the sea in the most irregular form. The highest point, 565 feet (some say 543 feet) above the sea, is called the Königstuhl (the king's chair, or King Frederic William's chair), from which a flight of 600 steps cut in the rock leads down to the strand. Jasmund is connected by a narrow strip of alluvial soil with the peninsula of Wittow, a level tract with a rich soil, terminating in the promontory of Arkona, the most northern point of Germany. Arkona contained a very strong fortress, which was taken in 1168 by Waldemar I., king of Denmark, who destroyed the chief temple of the god Swantewic, who was highly revered by the heathens of the north. Large tumuli (called Hünengräber), are seen in several parts. The whole island, especially the peninsulas of Wittow and Jasmund, is much more fertile than the continental part of the government of Stralsund, and produces much corn. The number of cattle is considerable, and the fisheries productive. The inhabitants amount to 29,000; they are very industrious, expert sailors and fishermen, and very hospitable. The nobility are very numerous. Bergen, the capital of the island, has 2600 inhabitants. Rügen is much frequented by travellers on account of its beautiful scenery, and for the benefit of the sea-bathing. This island was ceded to Prussia in 1815, as a part of Swedish Pomerania.

(Hassel's *Geography*, vol. iii.; *Conversations Lexicon*; Stein; Cannabich, &c.)

RU'HNKEN, DAVID, was born in 1723, at Stolpe in Pomerania. His parents, who were in good circumstances, soon discovered the promising talents of the boy, and, after a course of elementary instruction, they sent him to the

gymnasium of Königsberg (Collegium Fridericianum, or Friedrichs-Collegium). Here he commenced his acquaintance with the classical writers of antiquity, and conceived that love for them which distinguished his whole life. He also made great progress in the fine arts, particularly in music and drawing. After finishing his studies at the gymnasium, it was the wish of his parents that he should become a student of theology; but this was contrary to his own inclination, and he obtained permission to go to Göttingen, where he anticipated great benefit from the instruction of J. M. Gesner. On his journey thither he passed through Wittenberg, and the kindness and hospitable reception which he experienced in the houses of two distinguished professors of that university, Berger and Ritter, induced him to stay at Wittenberg, where he remained for two years, and applied most indefatigably to the study of ancient literature, history, and jurisprudence. On the occasion of taking his degree, he published his inaugural dissertation, 'De Galla Placidia Augusta' (Wittenb., 1743), a work which raised the greatest expectations of the young scholar. Ernesti, who happened to be at Wittenberg at the time, advised Ruhnken to go to Leyden, and finish his studies under the auspices of the great Hemsterhuis. This advice coincided with Ruhnken's own wishes; and having provided himself with letters of introduction, he went to Leyden. To Hemsterhuis he had no introduction, but he nevertheless, immediately after his arrival, paid a visit to this renowned scholar, who received him with the utmost kindness. Ruhnken now began his studies afresh, following the suggestions and advice of his great master, and continued his studies under him for six years, during which he read almost all the Greek writers with the greatest care and attention. But notwithstanding his severe application, he was fond of amusements: musical entertainments, the conversation of ladies, and hunting, were now, and remained during his whole life, his favourite recreations; and often, after returning from hunting, he would sit down all night at his writing-table, and make up for the time spent on his amusements. Hemsterhuis had from his first acquaintance with him discovered the great abilities of his pupil, and was anxious to keep him at Leyden; but as there was at the time no prospect of a professorship becoming vacant in the university, he advised him to resume his former study of the Roman law. Ruhnken, who was accustomed to follow the advice of Hemsterhuis like that of a father, complied with his request, and soon made such progress as to gain a considerable reputation as a jurist. But he did not neglect his favourite pursuits, and made preparations for a new edition of Plato. With this view he collected the scholia on Plato, and published a very valuable edition of Timaeus, 'Lexicon Vocum Platoniarum,' with a commentary, Leyden, 1754. (A new and much improved edition appeared in 1789.) But as he had no appointment in Holland, his friends in Germany urged him to return and apply for a professorship in some university in his own country. His attachment however to his friend and master, and his love of the mode of life at Leyden, induced him to wait there until a vacancy should occur. In 1755 he went to Paris, where he spent a whole year in examining the MSS. of the Royal Library and those of the library at St. Germain. About the time when he was preparing to set out for Spain, he received the intelligence that Hemsterhuis had succeeded in gaining for him the appointment of lector (reader) in the university of Leyden. In this capacity he was the assistant and colleague of his former master. Ruhnken returned to Holland, and, in October, 1757, he opened his course of lectures by a discourse, 'De Graecia Artium et Doctrinarum Inventrice' (printed at Leyden in 1757, 4to.). Ruhnken filled this place for four years, and his zeal, his success, and his erudition soon gained him the reputation of being one of the most eminent scholars of Holland.

In 1761 Oudendorp died, and Ruhnken was appointed his successor as professor of eloquence and history. In the same year J. M. Gesner of Göttingen died, and Ruhnken was invited to take his chair; but he refused this honourable offer, and recommended Heyne in his stead. This proof of his attachment to the university of Leyden was rewarded by a considerable increase of his salary. At the age of forty Ruhnken married a beautiful and accomplished young lady, with whom he lived very happily; but in the year 1769 his wife began to suffer from apoplexy, which first deprived her of speech, and afterwards also of sight, and in this deplorable state she survived her hus-

band. In 1767, two years before this calamity, Hemsterhuis had died, and Ruhnken, then rector of the university, delivered a noble eulogium on his late friend and patron. This eulogy is known under the name of 'Elogium Tiberii Hemsterhusii,' printed at Leyden in 1768, in 8vo.; a second edition, accompanied by two letters of R. Bentley to Hemsterhuis, appeared in 1789. About this time Ruhnken conceived the plan of making a new and complete edition of the great works of Fabricius, the Bibliotheca Graeca and Latina, but this plan has never been realized, and other works, of which we subjoin a list, occupied almost all his attention. In 1774 Ruhnken succeeded Gronovius in the office of librarian to the university, in which capacity he enriched the library with a great many valuable books and MSS.

The life of Ruhnken henceforward presents scarcely any incidents: his time was divided between the discharge of his official duties and his literary occupations, by which he acquired a reputation equal to that of his master Hemsterhuis. To his suffering wife he always showed the greatest affection, and all the leisure hours which he could spare he devoted to her. The only thing which in some degree interrupted his quiet pursuits were the disturbances which broke out in Holland in the year 1787. He died on the 14th of May, 1798, leaving two daughters, the younger of whom had from her childhood always been in bad health. The city of Leyden purchased his valuable library, and granted to his widow an annual pension of 500 florins.

Ruhnken was one of the most eminent scholars and critics of the 18th century. With a refined taste and great acuteness, he combined an extraordinary memory and immenso erudition. His critical sagacity and his grammatical knowledge were not inferior to those of any modern philologist; and his works are still an inexhaustible source of information, though it has, perhaps not unjustly, been observed, that Ruhnken, as a critic, is more refined and elegant than profound. As a Latin writer Ruhnken has scarcely been excelled by any modern author. In teaching he was very successful; the most distinguished among his pupils was Daniel Wyttenbach, to whom we are indebted for an eloquent Life of his master (Leyden, 1799, 8vo.). This Life was reprinted at Leipzig in 1822, and edited by Lindemann, together with the Elogium Hemsterhusii, under the title 'Vitae duum Virorum Tib. Hemsterhusii et D. Ruhnkenii.'

Besides his edition of the Lexicon of Timaeus, Ruhnken wrote, in 1754, a commentary on the title in the Digest and Code, 'De Postulando, sive de Advocatis et Procuratoribus.' He also edited the second volume of Alberti's Hesychius, with notes and emendations, Leyden, 1766, fol.; Rutilius Lupus, 'De Figuris Sententiarum et Elocutionis,' Leyden, 1768 (a new edition of this work was published at Leipzig in 1831 by Frotscher); Velleius Paterculus, 2 vols., Leyden, 1779 (a separate edition of Ruhnken's commentary was published at Hanover, in 1815, by Cludius); 'Homeri Hymnus in Cererem,' with a Latin translation and commentary, 1780 (a second edition appeared in 1782, in which a fragment until then unknown, was added); 'Mureti Opera,' 4 vols. 8vo., Leyden, 1789. Besides these editions of ancient authors by Ruhnken himself, he communicated to Ernesti his remarks on Callimachus (Leipzig, 1761), and on Xenophon's 'Memorabilia' (Leipzig, 1773), and to Schweighäuser those on Polybius and Appian. Besides his three original compositions already mentioned (viz. on 'Galla Placidia Augusta,' 'De Graecia Art. et Doctr. Inventr.,' and the 'Elogium Hemsterhusii'), Ruhnken wrote 'Epistolae Criticae: prima in Homeridarum Hymnos et Hesiodum' (Leyden, 1749); 'secunda in Callimachum et Apollonium Rhodium' (Leyden, 1751); 'Oratio de Doctore Umbratico,' 1753, 4to.; 'Dissertatio de Vita et Scriptis Longini,' 1766, 4to. (reprinted in Toup's edition of Longinus). These discourses and essays were collected and published by Ruhnken himself in 1797, in 2 vols., under the title 'Ruhnkenii Opuscula Oratoria, Philologica, Critica, nunc primum conjunctim edita.' A new edition, with some additional dissertations, was edited by Bergmann, in 2 vols., Leyden, 1823. Some parts of the correspondence of Ruhnken with his learned friends have likewise been published. J. A. H. Tittmann has edited 'Ruhnkenii, Valckenarii, et aliorum ad J. A. Ernesti Epistolae; accedunt Ruhnkenii Observationes in Callimachum,' &c., Leipzig, 1812. Mahne has edited 'Ruhnkenii et Valckenarii Epistolae mutuae,' Vliessingen, 1832, and 'Ruhnkenii Epistolae ad Diversos,' Vliessingen, 1834.

**RULE, RULER.** In a mechanical sense these words are both used for a straight piece of wood, brass, or ivory, from which a straight line is drawn on paper by guiding a pen or pencil along the edge. These rules or rulers are convenient for the laying down of scales, on which point see **SCALE**; **SECTOR**; **SLIDING-RULE**.

The word rule, in its more common sense, means a set of directions for the attainment of any required object, and various rules will be found in this work, scattered under many heads. The word rule is generally dropped; thus we do not speak of the rule of addition, or the rule of subtraction, but simply of addition or subtraction. In some isolated cases the word rule is most usually retained, as in the rule of three [**THREE, RULE OF**] and the rule of false. [**FALSE POSITION.**]

A rule differs from an algebraical formula only in the language employed; both the former and the latter indicate processes to the mind. The rule describes its data at length, and requires many more signs than the formula, which however is much more intelligible than the rule, as soon as its symbols are well understood. For example, when it is known that  $a, b, c$  are the units in the sides of a right-angled triangle, the formula for determining  $c$  is—

$$c = \sqrt{a^2 + b^2}:$$

the rule is—To find the hypotenuse of a right-angled triangle, multiply the number of units in each side by itself, add the products, and extract the square root of the sum: this square root is the number of units in the hypotenuse required. It might perhaps be thought that the preceding rule might have been expressed more briefly, but the practice of abbreviating the language of rules is almost sure to destroy the sort of advantage which, in one point of view, they possess over a formula. A rule should embody a description of the object to be gained, and the process by which it is to be gained; it should also point out the step at which it is gained, and everything necessary to describe the result. It should even specify the case in which the rule is to be used, or that in which it becomes necessary rather than any other; and should be so complete in itself, that any reader of that class to whom the book is addressed might learn all it teaches (that is, everything but the demonstration) by reading only what comes between the word **RULE** and the full stop at the end of it. Thus, though we have described the preceding rule in words which some persons may think too many, we should say that they are not too many for the student who is somewhat of a mathematician, and too few for the beginner. For the latter we should state as follows:—To find the hypotenuse of a right-angled triangle of which the two sides are given, reduce the two sides to the same denomination if necessary (feet and decimals of a foot, inches and decimals of an inch, &c., as most convenient), multiply the units in each side by itself, add the results, and extract the square root of the sum: this square root is the number of such units in the hypotenuse as were used in the expression of the sides.

If however many rules are to be learned, it would in all probability be found more easy to learn the symbols of algebra, that is, to learn to read an algebraic expression, and to use formulæ, than to recur frequently to rules.

**RULE OF THREE.** [**THREE, RULE OF.**]

**RULE** (in Law) is an order of one of the three superior courts of Common Law. Rules are either general or particular.

General rules are such orders relating to matters of practice as are laid down and promulgated by the court for the general guidance of the suitors. They are a declaration of what the court will do, or require to be done, in all matters falling within the terms of the rule, and they resemble in some respects the Roman edict. The power of issuing rules for regulating the practice of each court is considered to be incident to the jurisdiction of the court. By a recent and very important act of parliament (3 & 4 Will. IV., c. 42), the judges were authorised within five years from the date of it (1833) to make rules of a more comprehensive nature, relating especially to pleading in civil actions. These rules, after being laid before both houses of parliament within certain times mentioned in the act, were to have 'the like force and effect as if the provisions contained therein had been expressly enacted by parliament.' In exercise of this authority, a number of rules, generally called 'The New Rules,' have been promulgated, which have introduced very material changes in the mode of pleading. [**PLEADING.**] (Stephens on Pleading; Chitty on Pleading; Jervis on the New Rules.)

Formerly each court of common law issued its own general rules, without much consideration as to what was the practice in other courts. Of late the object has been to assimilate the practice in all the courts of common law.

Rules not general are such as are confined to the particular case in reference to which they have been granted. Of these, some, which are said to be 'of course,' are drawn up by the proper officers on the authority of the mere signature of counsel, without any formal application to the court; or in some instances, as upon a judge's fiat or allowance by the master, &c., without any signature by counsel; others require to be handed in as well as signed by counsel. Rules which are not of course, are grantable on the application, or, as it is technically termed, 'the motion,' either of the party actually interested or of his counsel. Where the grounds of the motion are required to be particularised, the facts necessary to support it must be stated in an affidavit by competent witnesses. After the motion is heard, the court either grants or refuses the rule. A rule, when granted, may, according to the circumstances, be either 'to show cause,' or it may be 'absolute in the first instance.' The term 'rule to show cause,' also called a 'rule nisi,' means that unless the party against whom it has been obtained shows sufficient cause to the contrary, the rule, which is yet conditional, will become absolute. After a rule nisi has been obtained, it is drawn up in form by the proper officer, and served by the party obtaining it upon the party against whom it has been obtained, and notice is given him to appear in court on a certain day and show cause against it. He may do this either by showing that the facts already disclosed do not justify the granting of the application, or he may contradict those facts by further affidavits. The counsel who obtained the rule is then heard in reply. If the court think proper to grant the application, or if no one appears to oppose it, the rule is said to be made 'absolute.' If they refuse the application, the rule is said to be 'discharged.'

Rules may be moved for either in reference to any matter already pending before the court, as for a change of venue in an action already commenced, or for a new trial, &c.; or in respect of matters not pending before the court, as for a criminal information, a mandamus, &c.

A copy of a rule obtained from the proper officer is legal proof of the existence of such a rule. (Tidd's Practice; Archbold's Practice.)

**RULE** in **SHELLEY'S CASE.** [**REMAINDER.**]

**RUM**, a spirit distilled from the sugar-cane, that is, 'from cane-juice, or the scummings of the juice from the boiling-house, or from the treacle, or molasses, or from 'dunder,' the lees of former distillations.' (Edwards's *West Indies*, vol. ii., p. 279.) As the entire juice of the cane is not necessary for making rum, the distillation is carried on in conjunction with the manufacture of sugar. The best rum is made from the uncrystallized syrup called molasses [**MOLASSES.**] The proportion of molasses made in crystallizing a cwt. of sugar varies from 50 to 90 gallons, and depends both upon the climate and the season, being lowest in the Leeward Islands, which have a dry climate, and highest in Demerara and Trinidad, and it is in the latter that in fine seasons the proportion reaches 90 gallons per cwt. Nearly one gallon of proof rum may be made from one gallon of molasses. The value of the raw material for a gallon of rum has recently been as high as 1s. 10d. in the West Indies; the cost of distillation averages about 8½d. per gallon; and for an additional 8½d. for freight and other charge the spirit may be brought into the English market, where, since June, 1830, it has been subject to a duty of 9s. per gallon. This is 1s. 6d. higher than the duty on English spirits, the distillers of the latter claiming to be protected on account of the corn-laws raising the raw material above its natural price. On the other hand rum is protected by heavy duties on foreign spirits; and rum the produce of the West Indies has hitherto been protected against East India rum by a different rate, the duty on the latter being 15s. per gallon.

The rum consumed in the United Kingdom is entirely the produce of the West Indies, and to a great extent of the island of Jamaica, which is of a superior quality. For many years the home demand has not taken off the whole supply, and the surplus, which consists chiefly of the Leeward Islands rum, and other kinds of inferior quality, is exported. The consumption of rum in this country has been long declining, and the imports and exports have both fallen off. In 1839 the number of gallons which duty

was paid in England was 2,739,363; Scotland, 75,337; Ireland, 15,663: total, 2,830,363 gallons. In 1840 the quantity consumed was 2,510,668 gallons. In 1826 there were 5,051,966 gallons of rum in bond; 3,585,386 gallons in 1836; 2,573,627 gallons in 1838; and 3,007,563 in 1839, of which rather more than one-half was bonded in London, and the remainder at the outports. The proportion of rum consumed is now less than one-tenth of the total consumption of spirits in the United Kingdom, but in 1820 the proportion was about one-fifth. British spirits are said to be extensively sold for rum, the flavour being imitated by the rectifier.

At the present time (April, 1841) a Bill, introduced by the Government, has passed through the Commons, the object of which is to equalize the duty on East and West India rum by reducing the former. Rum made from the date or palm-tree, as well as from the sugar-cane, will be included in this measure, but not if made from any other material. The equalization of the duties on East and West India sugar, by 6 Wm. IV. c. 26, rendered it expedient to give a practical equality to all the products of the sugar-cane, without which the cultivation of sugar-plantations in India could not have been so profitably extended, as the molasses would have been comparatively wasted. The Government measure equalizes the import duty on rum in the colonies as well as in the United Kingdom. Great improvement in East India rum is anticipated from its admission to the English market. In December, 1836, the Lords of the Admiralty rescinded an order which confined the navy contracts to West India rum. The imports of East India rum in 1837 amounted to 67,761 gallons; in 1838, to 45,212 gallons; in 1839, to 170,380 gallons; but none of it was entered for home consumption, in consequence of the high duty.

1. Average quantities of rum annually imported from the West Indies, and Demerara and Berbice, from 1821 to 1838 inclusive, for periods of six years each:—

	1821-1826. Galls.	1827-1832. Galls.	1833-1838. Galls.
Jamaica	2,876,468	3,154,866	2,510,728
Demerara	996,500	1,616,944	1,500,808
Berbice	44,904	173,000	92,968
Trinidad	14,688	21,415	4,875
Tobago	355,188	393,070	297,045
Grenada	264,136	300,247	216,717
St. Vincent's	91,734	163,224	144,254
Barbadoes	862	5,853	1,128
St. Lucia	3,544	17,985	4,659
Dominica	15,160	31,129	18,014
Antigua	42,233	90,773	35,909
St. Kitt's	61,409	158,023	51,387
Nevis	16,229	47,213	15,020
Montserrat	24,327	33,113	14,707
Tortola	3,113	96	3,716
<b>Total</b>	<b>4,147,659</b>	<b>6,351,957</b>	<b>4,933,164</b>

2. Average quantities of rum annually imported into the United Kingdom, re-exported, consumed, and used as ships' stores and in the navy, in two periods, from 1827 to 1839 inclusive:—

Annual Average.	Imported. Galls.	Re-exported. Galls.	Consumed. Galls.	Ships' Stores. Galls.	Navy. Galls.
1827-33	7,182,188	1,756,478	3,591,257	377,654	320,691
1834-39	5,065,800	1,448,024	3,316,498	366,594	308,993

3. Quantities of rum imported into the United Kingdom, distinguishing the imports from the British West Indies, also the quantities consumed and re-exported, in each year from 1833 to 1839:—

Years.	Imported.		Paid Duty for Consumption. Galls.	Re-exported. Galls.
	Total (from all places). Galls.	From the Brit. W. Ind. Galls.		
1833	5,146,877	5,109,975	3,492,133	1,834,206
1834	5,158,489	5,112,399	3,345,177	1,642,282
1835	5,540,170	5,453,317	3,416,966	1,678,374
1836	4,993,942	4,868,168	3,324,749	1,279,845
1837	4,613,095	4,418,350	3,184,255	1,174,273
1838	4,912,227	4,641,212	3,135,651	1,134,436
1839	5,477,669	4,021,821	2,830,263	1,155,753

In addition to the above, the quantity of rum delivered for the use of the navy and for ship's stores averaged 743,305

gallons annually, all of which (with the exception of 3978 gallons in 1838, and 87,998 gallons in 1839, from the East Indies, admitted into the navy contracts) was the produce of the West Indies.

The duty on rum averaged 1,593,685*l.* for the years 1831-2-3; for the years 1834-5-6 it amounted to 1,399,912*l.*; and for 1837-8-9 it was 1,372,540*l.* In 1840 the gross receipt was 1,154,544*l.*

The exports of rum are chiefly to Germany, Prussia, Holland, Italy, and the Australian colonies.

RUM, Island. [ARGYLESHIRE.]

RUMEX, the name of a genus of plants, from *rumex*, a sort of spike, spear, or halberd, which the shape of its leaves resembles. It belongs to the natural order Polygonaceæ. Most of the species of this genus are well known as troublesome weeds to the agriculturist, under the name of docks and sorrels. Some of them have been used in medicine, but their incomplete flowers and inelegant appearance have caused their almost entire neglect in the garden. The essential characters of the genus are: Calyx with six sepals, the outer three slightly coherent, the inner ones enlarged after flowering; stamens six; styles three, reflexed; stigmata three and cleft; fruit a three-cornered nut, with a lateral embryo and superior radicle. In the descriptions of this genus by botanists, the three inner sepals are often designated as corolla, but it is more consistent with what we know of the general structure of the order Polygonaceæ to refer it to the apetalous or incomplete subclass of Exogens, and thus to consider the flower of Rumex as destitute of corolla. Rumex is nearly allied to Rheum, but may be distinguished from that genus by its three-cornered carpels not having wings, and by the embryo of the seed being lateral, not central as in Rheum. The wings that are observed upon the fruit of some species of Rumex are produced by the calyx.

The species of Rumex that have been chiefly used in medicine are the *R. acetosa* and *hydrolapathum*. *R. acetosa*, common Sorrel, is known by its granular valves, dioecious flowers, oblong awl-shaped leaves, with converging (often notched) lobes. It is indigenous in this country, and it is also common in meadows and grassy pastures throughout Europe, from Lapland to Greece. It flowers early in June. *R. hydrolapathum*, Great Water-Dock, is distinguished from other species, and the foregoing, by the following characters: Sepals petaloid, nearly entire, unequally tuberculated; lanceolate leaves acute at each end; almost leafless whorls. It is found growing in marsh-land ditches, stagnant waters, and the margins of great rivers throughout Europe, as well as in North America from Pennsylvania to Virginia. It is by far the largest and most conspicuous of our indigenous docks; flowering from July to August. This seems to have been the plant known under the name of *Herba Britannica* to Pliny (xxv., c. 3. 8), Galen, and others, and which was employed, on account of its astringent properties, in various diseases in which those remedies are indicated. (Martinius, *De vera Antiquorum Herba Britannica*, Amst., 1681.)

RUMFORD, BENJAMIN, COUNT, was born at Woburn, New England, in 1752. His family name was Thompson. By his marriage he was raised above the necessity of acting as a teacher, in which capacity he had employed himself, and when the Revolution commenced he was a major of militia, and for his services to the king's cause obtained an appointment in the Foreign Office. During the contest he returned to New York, and raised a regiment of dragoons, of which he was appointed colonel. In 1784 he returned to England, was knighted, and is said for some time to have acted as one of the under-secretaries of state. It was subsequently, while in the service of the king of Bavaria, that he prosecuted his most useful labours; amongst which were plans for the suppression of mendicity and for relieving poverty and elevating the poor, besides various civil and military reforms, for which several orders of knighthood were conferred upon him, and he was made a lieutenant-general and created a count. Towards the close of the century he once more came to England, and devoted his time to experiments on the nature and economical application of heat, and assisted in founding the Royal Institution. In 1802 he went to reside at Paris, and married the widow of Lavoisier, the chemist, but soon afterwards separated from her. He then retired to Auteuil, a village near Paris, and having a handsome pension from the king of Bavaria, devoted his time to rural pursuits and to chemistry and natural philosophy. He died in August, 1814.

The plans of Count Rumford for improving the arts and conveniences of domestic life have rendered his name well known in England. An account of these will be found in his 'Essays, Political, Economical, and Philosophical.' Several of these essays were published separately, and effected much good at a time when the amelioration of the condition of the poor was attracting great attention. His views are enlightened as well as benevolent, and on the whole he appears to have been in advance of his time. Two volumes of the 'Essays' were collected and published in 1798, and a third in 1802. In the latter year also was published a volume of 'Papers on Natural Philosophy and Mechanics.' Some of these had been read before the Royal Society, in whose 'Transactions' they are also printed.

**RUM-ILI'**, a large division of European Turkey, which comprehends the central part of it, namely, the countries of Albania, Macedonia, Thessaly, and part of Mæsia. It is bounded on the north by the eyalets of Silistria and of Bosnia; on the east partly by the province of Gallipoli, which belongs to the eyalet of Jezayr, and partly by the *Ægæan* Sea; on the south by the kingdom of Greece, and on the west by the Adriatic. Rum-ill is an eyalet, or general government under a beglerbeg, who ranks above all other pashas of Europe, and who has under him the following livas or pashaliks:—1, Monastir, which is in general the residence of the beglerbeg himself; this province includes the western and southern parts of Macedonia. The capital, Monastir, called also Bitolia, near the site of the antient Heraclea, not far from the banks of the river Erigonus, an affluent of the Axios, and on the borders of Albania, is a considerable town, with about 15,000 inhabitants; 2, Salonichi, which occupies the eastern pass of Macedonia [THESSALONICA]; 3, Ghiustendil, which embraces the northern part of Macedonia, as far as the sources of the Strymon. It has some rich copper-mines and some copper-works. 4, Uskub, which corresponds to the antient Pæonia. The head town, called Uskub, or Scopia, on the Axios, is the seat of a Greek archbishop; it has some leather manufactories, and about 10,000 inhabitants. 5, Prisrend, or Perzerin, north of Mount Scardus. 6, Krukovatz, or Aladjia Hissar, north of Prisrend, as far as the borders of Servia, embracing a part of the former Roman province of Mæsia Superior. 7, Scutari, or Eskanderié, in North Albania. 8, Ochrida, south-east of Scutari. 9, Avlona, in Central Albania. 10, Yanina, or JOANNINA. 11, Delviné, along the southern coast of Albania, opposite Corfu. 12, Trikhala, which embraces the whole of antient Thessaly.

A general description of the whole region is given under **TURKEY**. For particular accounts of its great divisions, see **ALBANIA**, **MACEDONIA**, and **THESSALY**.

**RUMINANTS**, *Ruminantia*, Cuvier's name for his eighth order of *Mammifères*, the **PECORA** of Linnæus.

Cuvier remarks that this is perhaps the most natural and the best defined of the class; for these animals have the air of being nearly all constructed on the same model; and the camels alone present some small exceptions to the common characters. [CAMEL; LLAMA.]

The first of these characters, observes the great French zoologist, is the possession of inci-or teeth in the lower jaw only, and these are nearly always eight in number. They are replaced above by a callous rim (bourrelet). Between the incisors and the molars is a wide space, where are found, in one or two genera only, one or two canines. The molars, nearly always six in number on each side of the upper and lower jaws, have their crown marked with two double crescents, the convexity of which is turned inwards in the upper and outwards in the lower teeth.

The four feet are terminated by two toes and two hoofs, which oppose to each other a flattened surface, so that they have the appearance of a single hoof which has been split; whence these quadrupeds have obtained the name of animals with divided or bifurcate hoofs, &c.

Behind the hoof there are sometimes two small processes or spurs, the vestiges of the lateral fingers. The two bones of the metacarpus and the metatarsus are united into a single one, the cannon bone, but in some species there are also vestiges of the lateral metatarsians and metacarpians.

The name *Ruminants* indicates the singular faculty possessed by these animals of masticating a second time their food, which they return into the mouth after a previous deglutition, a power which is the result of the structure of their stomachs, four of which they always have. Of these

stomachs the three first are so disposed that the aliment can enter at the will of the animal into any one of the three, because the œsophagus terminates at the point of communication.

The first stomach or paunch (*rumen, penula, magnum venter, ingluvies—la panse* of the French) is much the largest in the adult animal; but not so in the recently born calf or lamb. It is divided outwardly into two bag-like appendages at its extremity, and it is slightly separated into four parts on the inside. The internal coat of this stomach is beset with innumerable flattened papillæ. Here are received the masses of herbage rudely broken up by the first mastication, and here it is (though they sometimes, but seldom, occur in the second) that the morbid concretions of a globular or elongated, but rounded, figure are generally found. These concretions are composed of three sorts of substances—of hairs, of the fibrous parts of plants, or of stony matter. The first of these are formed, particularly in the cow, by the animal's own hair, or that of another cow or ox licked off and gradually accumulated in the stomach. Sometimes these are hairy externally, but generally they are covered with a dark polished coat. The *Ægagropile* found in the Chamois consist of vegetable macerated fibres. The stony concretions have received the name of *Bezoar stones*. [BEZOARS.]

The herbage in the state above noticed is transmitted into the second stomach, honey-comb bag, bonnet, or king's-hood (*reticulum, ollula—bonnet* of the French), the walls of which are furnished with laminae somewhat resembling the cells of bees: this, which is small and globular, may be considered as an appendage of the first stomach or paunch, but is distinguished from that by the elegantly arranged polygonal and acute-angled cells, forming superficial cavities on its internal coat. Here the herbage is arrested, imbibed, and compressed into small masses or balls, which are thence returned successively into the mouth for remastication. During this operation, the animals remain in a state of repose,

'Some ruminating lie.'

until all the herbage swallowed has undergone the action of the molar teeth a second time. The aliment thus remasticated is transmitted into the third or smallest stomach, the *manipulus* (manyplices)—(*echinus, conclave, centipellis, omasus, psalterium—feuillet* of the French). This stomach is distinguished from the two former, both by its form, which has been fancied to resemble a hedgehog rolled up (whence the name *echinus*), and its internal structure, the longitudinal laminae of its walls resembling in some degree the leaves of a book (whence the name *feuillet*). These numerous and broad duplicatures of its internal coat be lengthwise and vary in breadth in regular alternate order, amounting to some forty in the sheep, and about a hundred in the cow.

From the third stomach the food is transmitted into the fourth, the *red* (*abomasus, faliscus, ventriculus intestinalis—caillette* of the French), which is next in size to the first stomach or paunch, of an elongated pyriform shape, and with an internal villous coat similar to that of the human stomach, with large longitudinal wrinkles. This last is, so to speak, the true organ of digestion, analogous to the simple stomach of ordinary animals.

We will now proceed to inquire how this complicated machine is connected together, and how it acts.

Blumenbach observes that the three first stomachs are connected with each other, and with a groove-like continuation of the œsophagus, in a very remarkable way. The latter tube enters just where the paunch and the second and third stomachs approach each other; it is then continued with the groove, which ends in the third stomach. This groove is therefore open to the first stomachs, which lie to its right and left. But the thick prominent lips which form the margin of the groove admit of being drawn together so as to form a complete canal which then constitutes a direct continuation of the œsophagus into the third stomach. The functions of this very singular part will vary according as we consider it in the state of a groove or of a closed canal. In the first case, the grass, &c. is passed, after a very slight degree of mastication, into the paunch as into a reservoir. Thence it goes in small portions into the second stomach, from which, after a further maceration, it is propelled, by a kind of antiperistaltic motion, into the œsophagus, and thence returns into the mouth. It is here ruminated, and again

swallowed, when the groove is shut, and the morsel of food, after this second mastication, is thereby conducted directly into the third stomach. During the short time which it probably stays in this situation between the folds of the internal coat, it is still further prepared for digestion, which process is completed in the fourth or true digestive stomach. (Lawrence's Blumenbach.) In notes to the same work it is stated that the shutting of the groove when the food is again swallowed after rumination supposes a power of voluntary motion in this part, and indeed, it is added, the influence of the will in the whole affair of rumination is incontestable. It is not confined to any particular time, since the animal can delay it according to circumstances when the paunch is quite full. It has been expressly stated of some men, who have had the power of ruminating (instances of which are not very rare), that it was quite voluntary with them. 'I have known,' continues Blumenbach, 'two men who ruminated their vegetable food: both assured me that they had a real enjoyment in doing this, which has also been observed of others; and one of them had the power of doing it or leaving it alone according to circumstances.'

Whilst the Ruminants remain at the teat and live upon nothing but milk, the fourth stomach is the largest of all. The first stomach or paunch only develops itself into its enormous volume in proportion as it receives supplies of herbage.

The intestinal canal of these animals is very long, but little enlarged or sacculated in the great intestines. The cæcum is moderately long and smooth.

In the museum of the Royal College of Surgeons the following preparations in the physiological series will be found highly illustrative of the function of the machinery above noticed:—No. 555 consists of the stomach and small intestines of a foetal calf (*Bos Taurus*, Linn.); and No. 556, of portions of the four cavities of the stomach of a calf. The description of these two preparations will be found in the article *Ox* [vol. xvii., p. 75]. No. 557 is the stomach of a goat (*Capra Hircus*, Linn.). The greater portions of the *rumen*, *reticulum*, and *abomasus* have been removed; but the *psalterium* left entire, showing the different characters of their inner surfaces, and their several communications with each other and with the œsophagus. The inner surface of the *rumen* is beset with elongated villi, spatulate at the extremity; these become shorter as they approach the *reticulum*, and gradually blend with the alveoli of that cavity. The communication of these two cavities is so free as to lead to the belief that food, when first swallowed, passes into both cavities. The muscular sphincter bounding the canal which conducts the re-masticated food from the œsophagus to the *psalterium* is also clearly shown in this preparation, and the necessary result of its contraction in shutting out the *rumen* and *reticulum* from the œsophagus may be as readily understood. A bristle is placed across the commencement of the *abomasus*, showing the width of the orifice leading from the *psalterium*. No. 558 is a portion of the *rumen* of a sheep (*Ovis Aries*, Linn.). The villi are flattened and dilated towards the extremity. No. 559 and 560 are noticed in the article *Ox* (*loc. cit.*). No. 561 is a small portion of the *rumen* of a reindeer (*Cervus Tarandus*, Linn.), showing the form of the villi, which are longitudinally plicated. No. 562 is a small portion of the *rumen* of a sheep. A part of the cuticle with which this cavity is lined is turned down; and the stomach has been injected, to show the vascularity of the subjacent mucous membrane. No. 563 shows a portion of the *rumen* and *reticulum*, uninjected, of a sheep, with part of the cuticular lining reflected. No. 563 A is a portion of the *reticulum* of a reindeer, with the cuticular lining partially removed. The cells remarkably shallow. No. 564 is a portion of the *reticulum* of a goat, with the cuticular lining partially reflected. The cells partially divided into smaller cells. The descriptions of Nos. 564 A and 564 B will be found in the article *Ox* (*loc. cit.*). No. 565 is a portion of the *reticulum* and *psalterium*, injected, of a lamb. The latter cavity has been divided transversely, showing the longitudinal disposition of the laminae, and how nearly they occupy the whole cavity. Their different sizes and relative proportions are also well shown by this section. Bristles are inserted in the interspaces of the different laminae. No. 566 is the remainder of the *psalterium* and the *abomasus* of the same stomach. The chief characteristic of the fourth cavity, viz. its vascular villous lining membrane, is well shown in this preparation. This tonic is thrown into large oblique rugæ, at what may be

termed the cardiac end. The pylorus is protected by a valvular protuberance. In its shape and function this cavity resembles the stomach of carnivorous quadrupeds. No. 566 A is the stomach of a wapiti fawn (*Cervus Canadensis*, Briss.) six days old. At this period the food, consisting of milk only, is conveyed directly to the fourth stomach to be digested: as it requires no preparation in the preceding cavities, they are accordingly collapsed, and of comparatively very small size. The descriptions of Nos. 566 B, 566 C, 566 D, and 566 E, will be found in the article *LLAMA* [vol. xiv., pp. 69, 70]; and those of Nos. 567, 568, and 569, in the article *CAMEL* [vol. vi., p. 189]. No. 569 A is a portion of the *psalterium* and *abomasus* of a llama, showing the same structure as exists in the camel, but on a somewhat smaller scale. A comparison of this preparation with No. 566 B shows that the laminae characterising the *psalterium* are not developed in the foetal stomach of the llama. In the ox, the laminae of the *psalterium* preserve the same proportions in the foetal as in the adult state (No. 555). No. 569 B exhibits the pyloric end of the *abomasus* and the commencement of the *duodenum* of a llama. This preparation was made for the purpose of showing the form, position, and structure of the valvular protuberance at the pylorus. It has been divided by a longitudinal incision, and seems principally composed of an accumulation of the sub-mucous cellular texture, the cells of which are large, and, being filled with fluid, must render the part elastic. No glandular follicles are perceptible, nor any conspicuous orifices in the mucous membrane covering the protuberance; yet it has been called glandular. (Home's *Comparative Anatomy*, i., p. 173.) Daubenton however terms it simply 'boursuffure,' without hinting at its use. Its office seems to be merely mechanical: if pressed on by any mass of undigested matter, it would shut up the pylorus, and prevent the passage of such matter into the duodenum; while substances sufficiently comminuted and digested would pass beneath the protuberance, through the semilunar pylorus, into the duodenum. This gut forms at its commencement a capacious reservoir, a small part of which only is preserved in this preparation. No. 723 B is part of the small intestines of a wapiti fawn injected, dried, and put into oil of turpentine. It shows the limited extent of the convolutions of the intestines arising from the shortness of the mesentery, and the mesenteric artery forming in consequence only a single series of arches. No. 735 is a portion of the intestinal canal of a small deer (*Moschus*), showing similar concentric folds of the colon. This disposition occurs in all the Ruminants. (*Cat.*, vol. i.)

Pallas describes and figures, in his 'Spicilegia Zoologica,' the third stomach, with its manyplies, of *Moschus moschiferus*.

The fat of the Ruminants, when cold, after death, becomes harder than that of other animals, and even brittle: it is called tallow and suet (*suyf* of the French). The mammae of this order are situated between the thighs. The general osseous structure may be seen in the articles *BISON*, *DEER*, *MOSCHIDÆ*, and *Ox*. There is a fine series of skeletons of Ruminants in the museum of the College of Surgeons; and among the skulls of oxen, a remarkable pug-nosed variety which is now wild on the pampas of Buenos Ayres.

The foetus of the Ruminants is developed by the aid of a placenta, divided into numerous detached lobes or cotyledons, the various forms of which are shown in the preparations, numbered from 3481 to 3528 inclusive, in the physiological series of the Hunterian Collection. The camel tribe however here again deviate from the true Ruminants, having no cotyledons, but only a general villous condition of the chorion, as in the mare.

The genera placed by Linnæus under his order *PERCORA* will be found under that head.

Cuvier makes the Ruminants consist of two divisions:—1st, those without horns; 2nd, those with horns.

The 1st division embraces the camels (*Camelus*, Linn.), or the *Camels* properly so called, and the *Llamas*; and the *Chevroitains* (*Moschus*, Linn.). 2nd. All the rest of the Ruminants, of the male sex at least, have two horns or prominences, more or less long, projecting from the frontal bones, which is not found in any other family of mammals.

In some these prominences are covered with a case of elastic substance, composed, as it were, of agglutinated hairs, which grows in layers, and during the whole life of the animal. The name *horn* (*corne*) is particularly applied to the substance of this case, which is termed a *hollow horn*.

The bony prominence or core which this case envelops, grows, like it, during the whole life of the animal, and is never shed. Such are the horns of oxen, sheep, goats, and antelopes. (See the several articles.)

In others the prominences are invested only with a hairy skin, which is continued from that of the head, and is never destroyed during life. These prominences are never shed. Such is the modification of horn possessed by the GIRAFFE, the sole genus of this subdivision.

Finally, in the great genus *Cervus*, Linn. [DEER], the prominences covered during a certain period with a hairy or velvety skin resembling that of the rest of the head, have at their base a ring of bony tubercles, which, as it increases, compresses and obliterates the nutrient vessels of that skin, which, when the horn is complete, dries and is removed. The naked bony prominence separates in due time from the skull, to which it grew, falls, and the animal becomes defenceless. But new horns soon begin to bud, ordinarily, and while the animal is in the vigour of life, larger than the preceding ones, and destined to fall in their turn. These horns, purely osseous and subjected to periodical changes, are termed by the French *bois*, and are known in England by the name of antlers.

Mr. G. R. Gray makes his fifth order consist of the *Ungulata* of Ray (*Bruta, Pecora, and Belluæ*, Linn.). Of this order, his first family, *Bovidæ*, comprises the whole of the ruminating animals. [Ox, vol. xvii., p. 89.]

Col. Hamilton Smith, whose researches and method form the groundwork of most of the treatises on ruminating animals since the appearance of his work,\* which should be carefully perused by every zoologist, is followed so closely by Mr. Swainson, that the arrangement of the latter is in fact, with slight change of position, the arrangement of the former. Mr. Swainson indeed places the Camels as the ruminating form among the *Solipedes*; but still they stand between the Camelopards and the Horse. He makes the *Bovidæ*, or Oxen, the typical family; but adopts the names given by the Colonel to that and the other families, with the exception of the *Antelopidæ*, which are equal to the *Capridæ* of Smith; Mr. Swainson making the Antelopes the typical form.

Mr. Swainson's fourth order, *Ungulata*, is divided into the following five tribes: *Pachydermes, Anoplotheres, Edentates, and Solipedes*.

The Ruminantes are thus arranged:—

- 1. *Sub-typical group*.—Horns sheathing; form gracile, slender.

Fam. Antilopidæ. (Sw.—*Capridæ*, Smith.)

Genera.—*Dicranocerus*, Sm.; *Aigocerus*, Sm.; *Oryx*, Sm.; *Gazella*, Sm.; *Antilope*, Sm.; *Redunca*, Sm.; *Tragulus*, Sm.; *Raphicerus*, Sm.; *Tetracerus*, Leach; *Cephalophus*, Sm.; *Neotragus*, Sm.; *Tragelaphus*, Sm.; *Nemorhædus*, Sm.; *Rupicapra*, Ant., Sm.; *Aplocerus*, Sm.; *Capra*, Auct.; *Ovis*, Auct.; *Damalis*, Sm.; *Acromotus*, Sm.; *Buselaphus*, Sm.; *Strepsicerus*, Sm.; *Portax*, Sm.

- 2. *Typical*.—Horns sheathing; form heavy, robust.

Fam. Bovidæ, Sm.

[Ox, vol. xvii., p. 89.]

Genera and Subgenera.

- 1. *Alce*, Sm. (Subgenera, *Rangifer*, Sm.; *Dama*, Sm.)
- 2. *Cervus*, Linn., Sw. (Subgenera, *Rusa*, Sm.; *Axis*, Sm.)
- 3. *Capreolus*, Sm. (Subgenus, *Mazama*, Sm.)
- 4. *Subulo*, Sm.
- 5. *Stylocerus*, Sm.

3 Aberrant . . .  
Horns solid, deciduous.  
*Cervidæ*, Sm.,  
*Cervus*, Linn.

Horns wanting; forelegs shorter than the hinder. *Moschidæ*, Sw.

- 1. *Moschus*, Linn.

Horns very short, covered with a skin. *Camelopardæ*, Sw.

- 1. *Camelopardalis*, Antiq.

The tribe *Solipedes*, which immediately follows the Ca-

\* See Griffith's 'Cuvier.'

melopards, consists of the genera *Camelus, Auachenia, and Equus*. Thus the Camels and Llamas, with which Colocel Smith, following Cuvier, commences the Ruminants, are placed by Mr. Swainson at the conclusion. With the exception of this and a few other modifications, the two arrangements are similar.

Mr. Ogilby, in his interesting paper, written with a view of pointing out the characters to which the most importance should be attached in establishing generic distinctions among the *Ruminantia*, read before the Zoological Society, in December, 1836, commenced by observing that it has been justly remarked by Professor Pallas, that if the generic characters of the *Ruminantia* were to be founded upon the modifications of dentition, in accordance with the rule so generally applicable to other groups of Mammals, the greater part of the order would necessarily be comprised in a single genus; since the number, form, and arrangement of the teeth being the same in all, except the Camels and Llamas, these organs consequently afford no grounds of definite or general distinctions. Hence, Mr. Ogilby observes, naturalists have resorted to other principles for regulating the distribution of ruminating animals, and the form, curvature, and the direction of the horns, selected for this purpose at a period when an extremely limited knowledge of species permitted the practical application of such arbitrary and artificial characters without any very glaring violation of natural affinities, still continue to be the rule adopted by zoologists in this department of mammalogy. But Illiger, he remarked, forms a solitary but honourable exception; for he first introduced the consideration of the muzzle and lachrymal sinus into the definitions of the genera *Antilope, Capra, and Bos*: his labours however were disregarded by subsequent writers, or his principles only applied to the genus *Antilope*. 'It is obvious,' continued Mr. Ogilby, 'that as the knowledge of new forms and species became more and more extensive, the prevailing gratuitous rule above mentioned, founded as it is upon purely arbitrary characters which have no necessary relation to the habits and economy, or even to the general external form of the animals themselves, would eventually involve in confusion and inconsistency the different groups which were founded upon its application; and such has long been its acknowledged effect. The genus *Antilope* in particular has become a kind of zoological refuge for the destitute, and forms an incongruous assemblage of all the hollow-horned *Ruminants*, without distinction of form or character, which the mere shape of the horns excluded from the genera *Bos, Ovis, and Capra*; it has thus come to contain nearly four times as many species as all the rest of the hollow-horned *Ruminants* together; so diversified are its forms, and so incongruous its materials, that it presents not a single character which will either apply to all its species or suffice to differentiate it from conterminous genera.

To meet this obvious evil, MM. Lichtenstein, De Blacville, Desmarest, and Hamilton Smith have applied Illiger's principles to subdivide the artificial genus *Antilope* into something more nearly approaching to natural groups: the reform thus effected however was but partial in its operation; the root of the evil still remained untouched, for none of these eminent zoologists appear to have been sufficiently aware of the extremely arbitrary and artificial character of the principal group itself, which they contented themselves with breaking up into subgenera, nor of the actual importance and extensive application of the characters which they employed for that purpose. By mixing up those characters moreover with others of a secondary and less important nature, the benefit which might have been expected from their labours has been in a great measure neutralized; and even the subdivisions which they have introduced into the so-called genus *Antilope* are less definite and comprehensive than they might otherwise have been made.

The truth is however that the presence or absence of horns in one or both sexes; the substance and nature of these organs, whether solid or concave, permanent or deciduary; the form of the upper lip, whether thin and attenuated, as in the Goat, or terminating in a broad, heavy, naked muzzle, as in the Ox; and the existence of lachrymal sinuses, and interdigital pores, are the characters which really influence the habits and economy of ruminating animals, and upon which, consequently, their generic distinctions mainly depend. These, with the assistance, in a very few instances, of such necessary characters as the ar-

periorbital and maxillary glands, the number of teats, and the existence of inguinal pores, are sufficient in all cases to define and characterise the genera with the strictest reference to logical precision and zoological simplicity.'

Waiving the discussion of the value of these characters, or a statement of the reasons which induced him to adopt them in preference to those more generally employed in this department of mammalogy, Mr. Ogilby contents himself with observing, 'that the presence or absence of horns in the females regulates, in a great measure, the social intercourse of the sexes; that upon the form of the lips and muzzle, the only organs of touch and prehension among the *Ruminantia*, depend the nature of the food and habitat, making the animal a grazer or a browser, as the case may be; and that the existence or non-existence of interdental glands, the use of which appears to be to lubricate the hoofs, has a very extensive influence upon the geographical distribution of the species, confining them to the rich savannah and the moist forest, or enabling them to roam over the arid mountain, the parched karoo, and the burning desert.'

Mr. Ogilby then arranges the *Ruminants* under the following families: 1, *Camelidæ* (observing that they form what Mr. MacLeay would call an aberrant group). 2, *Cervidæ* (comprising the genera *Camelopardalis*, *Tarandus*, *Alces*, *Cervus*, *Caprea* (type, Roebuck), and *Prox* (type, Muntjak). 3, *Moschidæ* [*MOSCHIDÆ*, vol. xv., p. 430]. 4, *Capridæ* [*GOAT*, vol. xi., pp. 285, 286]. 5, *Bovidæ* [*Ox*, vol. xvii., p. 89].

There is no order of animals that ministers so freely to the wants and comforts of man as the *Ruminants*. They form the great staple of the food and clothing of civilised and generally of savage life. Their milk, their flesh, their wool, their leather, their tallow, their horns, in short almost every portion of these quadrupeds is made available; and many of them are of high utility as beasts of burthen.

#### FOSSIL RUMINANTS.

*Ruminants*, Oxen and Deer especially, occur in a fossil state in the tertiary series of strata, and most abundantly in the third and fourth divisions of the fresh-water deposits (Pliocene period of Lyell). Bones of the Ox have indeed been found in the second or Miocene system of deposits, as at Georgensgünd in Bavaria; but in the Pliocene period the *Ruminant* remains are to be numerous traced, with extinct species of existing genera of *Pachydermata*, viz. Elephant, Rhinoceros, Hippopotamus, and Horse, together with the extinct genus *Mastodon*. The bone-caverns and the osseous breccia in the limestone fissures contain them plentifully; and they are widely spread over the face of the globe. A more detailed account will be found under the different articles which treat of the several families and genera of this order.

Dr. Lund, in his *View of the Fauna of Brazil, &c.*, remarks, that of *Ruminants* there is only one genus in Brazil, that of *Cervus*, which contains five species, whereof one, of the size of the musk, is undescribed. This animal, he observes, does not penetrate into the limestone caverns; but when their entrances form a spacious chamber, its slot may be frequently seen there. Only in Lappa Nova de Maquiné did Dr. Lund discover the remains of a single individual of that genus (*Cervus rufus*). He had since observed, in many caves that lay near to the habitations of men, the uninjured skeletons of several domestic animals, especially oxen and goats, the examination of which clearly explained to him the cause of their introduction; namely, that those creatures, whose footsteps he had often traced in the mouth of caverns, had undoubtedly visited them for the purpose of hoking the saltpetre, crystals of which cover the surface of the floor; and that they had lost themselves in the labyrinthine passages.

The poverty of genera in the family of *Ruminants* did not characterise the antient fauna of Brazil; for besides the genus *Cervus*, Dr. Lund had discovered two others belonging to that period. He refers them to two species, of which one is about the size of *Cervus simplicicornis*, Ill., the other nearer to *Cervus campestris*. The genus *Antilope* had left remains of one species, *Ant. Maquinensis*, as large as a buck, with short bow-shaped horns curved backwards. It was gregarious, like its congener, which is now confined to the Old World.

Of the genus *Camelus* Dr. Lund possesses the remains of two species; one exceeding a horse in size [*MACRAUCHENIA*?], the other a little less. To which of the two subgroups of this genus the fossils belong, that is, whether to the modern

inhabitant of the warm regions of the Old World, *Camelus* Ill., or to that now found in the chain of the Andes, *Auchenia*, Ill., Dr. Lund's insufficient means of comparison would not allow him to decide.

Dr. Lund concludes his account of the *Ruminants* with a small group that does not exactly coincide with any of its existing genera. This genus, he tells us, which in the lightness of its form rivals the most agile of the Antelope tribe, departs far from that group in the details of its structure, as also from the goat, sheep, ox, and camel. In some isolated points it approaches the genus *Cervus*, while in others it differs from it more than do any ruminants from each other. He proposes the name of *Leptotherium* for this extinct genus, of which he possesses the remains of two species, one less than the roe, the other bigger than the stag.

'If now,' continues Dr. Lund, 'we take a comparative view of the genera and species of this family, in the former and present periods, we must remark, in the first place, the much greater abundance of generic forms that distinguished the ancient creation, inasmuch as their numbers are in the proportion of four to one: of these four, *Leptotherium* is entirely extinct; with regard to the genus *Camelus*, I have already observed that the insufficiency of my means of comparison prevents me from deciding whether the fossil species belong to those of the Old World, or to the sub-group of this continent; but if I might be allowed to venture a speculation on this subject, I should declare for the latter opinion, on the strength of a rule which we shall, in the sequel, see confirmed by many examples, namely, that the animal species of the antient world exceeded in size the corresponding species of the existing races; and we have seen that the fossil species of *Camelus* are considerably inferior to those of the old continent, while they somewhat surpass those of the New World.

'In regard to the genus *Antilope*, it is well known that, in our times, the warmer portions of Africa and Asia constitute its dwelling-place. At the same time I must observe, that one of the latest travellers in Chili, M. Gay, believes that he has recognised a species of Antelope in the descriptions given to him of an animal that inhabits the inaccessible regions of the Andes. Should this supposition prove correct (at which we should not be surprised, when we remember that other animals, more likely to attract man's attention, such as the tapir and the bear, had escaped the observation of naturalists in those very same mountains, until a very recent period), we are then brought back to this remarkable result, that two genera, which are at present restricted to the highest chain of the South American coast, were in the age of our fossil remains extended over its plains.

'The discovery of an animal form, now usually considered as peculiar to the Old World, among the purely American forms, such as the extinct fauna of this quarter has hitherto produced, being a fact of great importance, I thought it right to allude to this novel information, while I reserve myself from giving any positive judgment until further inquiries shall have enabled M. Gay to verify or disprove this report.

'But not only the number of genera, but also the total amount of species was greater in those days than now. There are now five species (all, as before mentioned, belonging to the genus *Cervus*) that inhabit this district, while I already reckon seven species of the four fossil genera. The great number of species which the genus *Cervus* now contains within this region inclines us to suspect that our knowledge of the fossil species is very far from being complete. The circumstance of these animals living solitary, or at most in small herds, together with their rapidity of flight, secures them from the attacks of predatory beasts, much more than animals that either live in large societies, like the cloven-footed generally, or which are bad runners, as the *Tardigrada*, and this accounts for our finding their remains so seldom in the caves of wild beasts, in comparison with those of the other classes. Therefore, as the main result of our inquiry respecting this family, we see that of the four genera of which it was composed in that former period, only one still continues to exist in this same district, two must be sought for in the higher chain of the Andes (or perhaps only in the warmer zones of the Old World), and finally, one has entirely disappeared from the surface of the earth.' (*Transatl. Magazine of Nat. Hist.*, New Series, 1840.)

RUMINATION. [RUMINANTS; STOMACH.]

VOL. XX.—2 G

**RU'MPHIA**, a genus named by Linnæus in honour of George Eberhard Rumph, who was born at Hanau, and went as physician to Amboyna, where he subsequently became chief magistrate and president of the mercantile association, and died there in 1706. He paid great attention to the natural products, especially the plants, of the Spice Islands. Many of these are figured in his 'Herbarium Amboinense,' in 696 plates, each with often two plants, published by Burmann, in six volumes, from 1741 to 1751, with a supplemental one in 1757. The genus which has been named after him is only known from a figure of Rheeda, published in his 'Hortus Malabaricus, vol. iv., t. 11, who describes it as being found in Parabaroo and other provinces of Malabar. It has not been seen by any modern botanist. It is usually referred to the natural family of Terebinthaceæ and to the suborder Bursereæ. It has a tubular trisid calyx, three oblong petals of the corol; stamens three, equal to the petals, and exserted. The ovary is single, three-cornered. Style one. Drupe coriaceous, turbinate, three-furrowed, with the nut three-celled, three-seeded. But Messrs. Wight and Arnott remark, that as each apparent stamen may be composed of several filaments, this doubtful genus would be brought near Byttneriaceæ.

**RU'MPHIUS.** [RUMPHIA.]

**RUNCORN.** [CHESHIRE.]

**RUNIC LETTERS** is the name given to an ancient alphabet peculiar to the Teutonic nations, especially the Scandinavians and Germans. The time when this alphabet began to be used, is only matter of conjecture, and while some, notwithstanding the statement of Tacitus (*Germ.*, c. 19: 'literarum secreta viri pariter ac fœminæ ignorant'), have advanced the opinion that the Runic characters were used by the Germanic nations long before the commencement of the Christian æra, others suppose that they were an invention of a much later age. The alphabet consisted only of sixteen letters, most of which bear a great similarity to the Greek and Roman characters. This similarity seems to support the opinion of Fr. Schlegel (*Lectures on Ancient and Modern Literature*) and others, that the alphabet was originally introduced among the inhabitants of the coasts of the Baltic by Phœnician merchants, and that, with some modifications, it was kept a secret by their priests, and applied to various magic purposes, so that Tacitus would have been perfectly justified in saying that writing was unknown to the Germans.

The earliest Runic characters are found cut on stones, which were either sepulchral monuments or land marks. Such stones are found in Norway, Sweden, Denmark, Northern Germany, and in some parts of France and Spain, in short in almost all countries where nations of the Teutonic race took up their abodes during the fourth and fifth centuries of our æra.

All Runic letters have been divided into three great classes: 1, the Northern or Scandinavian; 2, the German (in the limited sense of the word); and 3, the Anglo-Saxon Runes. Grimm is of opinion that the German Runic characters are only a late modification of the Scandinavian Runes, as the Anglo-Saxon are of the German. In Scandinavia however the Runes seem to have been in use longer than in any other country, and we find that they were written there down to the middle of the fifteenth century, although the common alphabet was known there long before that time. Several Scandinavian MSS. are written in Runic letters, but none of them appear to be older than the thirteenth century, and the most recent were written before the year 1450. The number of stones covered with Runic inscriptions which have been discovered in Sweden and Denmark, is very great. The characters consist almost invariably of straight lines, in the shape of little sticks either singly or put together. Such sticks were in early times used by the Germans for the purpose of ascertaining future events. The sticks were shaken up, and from the figures that they formed a kind of divination was derived. Hence the mysterious character of the Runes (*Rûna* itself signified secret or mystery), and hence also the word *buchstabe*, the German name for letter, which signifies a stick of a beech-tree. In their zeal for discovering stones with Runic characters, antiquarians have frequently been deceived, and led to consider figures on stones as Runes which were never made by human hands, but were produced by natural circumstances. (Klemm, *Germanische Alterthumskunde*, p. 194, &c.) The word Runes is derived by some from the verb *runen*, to slit or scratch; by others from *raunen*, to whisper.

(For further information the reader may consult Adelung, *Altteste Geschichte der Deutschen*, p. 373, &c.; Brynjulf, *Periculum Runologicum*, Copenhagen, 1823; Lega, *Fundgruben des alten Nordens*, Leipzig, 1829; Liljegren, *Run-Lära*, Stockholm, 1838, with plates; Schmittbener, *Kurzes Deutsches Wörterbuch*, under 'Rune;' and more especially W. C. Grimm's work, *Ueber Deutsche Runen*, Göttingen, 1821, 8vo.)

**RUNNER.** [STEM.]

**RUNNYMEAD.** [JOHN.]

**RUPELLA'RIA.** [LITHOPHAGIDÆ, vol. xiv., pp. 47, 48.]

**RUPERT, PRINCE ROBERT**, of Bavaria, better known by the title of Prince Rupert, was born in 1619. His mother, Elizabeth, the eldest daughter of James I. of England, married Frederic V., elector palatine, who was banished and deprived of his estates in consequence of his unsuccessful attempt to seat himself upon the throne of Bohemia. Rupert, an exile from his youth, received little education; his disposition was active; he had a taste for military pursuits, and as the civil wars in England presented an opportunity for employment, he offered his services to Charles I., who put him in command of a regiment of cavalry. He took Cirencester, Hereford, and Lichfield, and was engaged in the battles of Worcester, Edgehill, and Chalgrove Field; but he was remarkable rather for his rash courage and impetuosity than for prudence or military knowledge. He gave strength however to the king's cause: his resolute vigour compensated in part for his want of judgment as a leader, and the king continued to employ him, endeavouring to ensure a continuance of his services by creating him a Knight of the Garter and Duke of Cumberland. He took Bristol, dispersed the parliamentary army at Newark, and was afterwards successful in the north; but at Marston Moor his indiscretion ruined the king's hopes: his want of concert with the marquis of Newcastle and the hasty withdrawal of his troops from the field of battle are gravely censured by Lord Clarendon. Had Prince Rupert 'stayed with the army he marched away with, at any reasonable distance, it would have been long before the jealousies and breaches which were between the English and Scotch armies, would have been enough composed to have agreed upon the renewing the siege.' As it was, in two days after the battle they returned to the posts they had occupied before it took place. (*Hist. Rebel.*, vol. iv., §12.) The king's confidence in him however did not diminish: on the contrary. Rupert, who had been commander only of the horse, was soon after appointed general of all the king's forces, with which he forced Sir Robert Pye to surrender Leicester, after a gallant defence. He gave the first charge in the battle of Naseby, and repulsed the troops with which he was engaged. After the day was lost, he accompanied the king and some remnants of their forces to Hereford, the king hoping to join Gerrard, who had a body of royalist troops in South Wales, and thus to muster a new army. At Hereford, before it was agreed what should be done next, Rupert left the king, and went hastily to Bristol that he might put that city in condition to resist an attack, which there was reason to expect would soon be made upon it. The reverses that the king had lately sustained rendered his continuing in possession of Bristol a point of the most vital consequence. Rupert wrote so confidently of his operations, that the king marched to Chepstow with the intention of joining him. He was dissuaded however; fortunately, as it proved, for after a short defence, Rupert surrendered the city to the parliamentary army. This pusillanimity justly disappointed and irritated the king, who signified his pleasure to the lords of the council that they should require Prince Rupert to deliver his commission into their hands. He likewise wrote the following letter to him, depriving him of his command:—

'Nephew,—Though the loss of Bristol be a great blow to me, yet your surrendering it as you did is of so much affliction to me, that it makes me not only forget the consideration of that place, but is likewise the greatest trial of my constancy that hath yet befallen me; for what is to be done, after one that is so near me as you are, both in blood and friendship, submits himself to so mean an action? (I give it the easiest term) such—— I have so much to say, that I will say no more of it: only, lest rashness of judgment be laid to my charge, I must remember; on of your letter of the 12th of August, whereby you assured me that, if no mischief happened, you would keep Bristol for four months. Did you keep it four days? Was there anything like a meeting?

More questions might be asked; but now, I confess, to little purpose: my conclusion is to desire you to seek your subsistence, until it shall please God to determine of my condition, somewhere beyond the seas; to which end I send you herewith a pass; and I pray God to make you sensible of your present condition, and give you means to redeem what you have lost; for I shall have no greater joy in a victory than a just occasion, without blushing, to assure you of my being your loving uncle and most faithful friend, G. R.'

'Hereford, September, 1646.'

(Clarendon, *State Papers*; and Oxford edit. of Clarendon's *Hist. Rebell.*)

Rupert rendered an account of his conduct before the king at Belvoir Castle, and removed the imputation of disloyalty and treason; but not that of indiscretion. He was unpopular throughout the country, and had the misfortune, says Lord Clarendon, 'to be no better beloved by the king's party than he was by the parliament.' He did not resume his military command; nevertheless the king could not long do without him. He sought the appointment of commander of that portion of the fleet which still adhered to the king, and as there was no other person to whom the king could readily confide the charge, Rupert obtained the post (1648). His services were immediately required on the Irish coast. Lord Ormond and the Royalist party in Ireland needed assistance, and Rupert, in order to give them aid, anchored in the harbour of Kinsale. Here Blake, with the Parliamentary squadron, blockaded him; until (October, 1649) he resolved to force his way out, which he did, with the loss of two or three ships, and steered for Lisbon. He was pursued by Blake, who demanded the surrender of his fleet in the name of the Commonwealth, but the king of Portugal, who was in alliance with Charles I., not only protected the king's fleet, but fitted out a squadron to assist Prince Rupert, and so induced Blake to withdraw his fleet.

Rupert now sailed to Carthage, and again Blake pursued him, and requested that the prince's ships might be given up to him, but the king of Spain, being in amity with England, a refusal was given on similar grounds to those alleged by the king of Portugal. From Carthage he sailed to Malaga, where he was so ill-advised as to sink and capture some English merchantmen. Informed of this transaction, Blake immediately followed him, and in January, 1651, attacked Rupert's squadron, without reference to the Spanish authorities, burnt and destroyed all but four or five ships, with which the prince escaped to the West Indies, where he supported himself by capturing English and Spanish merchantmen. Prince Maurice, who accompanied his brother, was cast away, and Rupert contrived, with two or three ships, to return to France, where he sold them, on behalf of Charles II., to the French government.

On the restoration of Charles II., Rupert left France and returned to England, where he was made a privy counsellor, and received other honours. By this time the impetuosity of his youth had diminished, and he judged with more consideration and calmness. When therefore there was a commencement of hostilities with the Dutch, the appointment of Rupert to serve under the Duke of York was looked on without dissatisfaction. During the expedition he acquitted himself with credit, which was in no way diminished when, in the following year, he commanded the British fleet in conjunction with Lord Albemarle. In 1673 he was again charged with the command of the fleet, which was actively engaged with the Dutch; but he found this squadron so ill-equipped, and, what was worse, so weakly manned, that he returned home. The king expressed some coolness at the manner in which he conducted some of his latter engagements. He had now finished the active part of his life; he was governor of Windsor Castle, and there spent a great portion of his time, occupied for the most part with mechanical and chemical experiments, with painting and engraving; in the latter art he was an adept, though not the inventor of mezzotint, as has often been erroneously stated. [MEZZOTINTO.] He died at his house in Spring Gardens, on the 29th of November, 1682. His collection of pictures was sold after his death, and his jewels, which were of considerable value. He had illegitimate children, but was never married.

Rupert was endowed with good natural abilities, had a quick perception, was vigorous, active, and energetic; he could readily change employments and pursuits, acquiring quickly such a knowledge of that which he undertook as

to prevent miscarriage. He was impetuous, rash, impatient of control and advice, and wanting in most qualities which constitute a great man. His conduct with the king's troops in Yorkshire, at Marston Moor, and at Bristol, and his piracies in the West Indies, have been very justly censured.

(Clarendon, *Hist. Rebell.*; Ludlow's *Memoirs*; White-lock's *Mem.*; *Mémoires de Grammont*; Campbell's *Lives of the Admirals*; *Biog. Univer.*, &c.)

RU'PICOLA. RUPICOLINÆ. *Rupicola* is also used by M. Fl. de Bellevue to designate a bivalve shell. M. de Blainville divides the *Anatina* [PYLORIDIANS, vol. xix., p. 142, 143] into three sections:--

A. Inequivalve species.

Example, *Anatina myalis*.

B. Equivalve, regular species.

Example, *Anatina subrostrata*. [PYLORIDIANS, vol. xix., p. 143.]

C. Equivalve, terebrating species.

Example, *Anatina Rupicola*, Lam. (genus *Rupicola*, Fl. de Belv.).

RUPICOLINÆ, a subfamily of Insectorial Birds allied to the *Manakins* and generally arranged under the family *Tyrpidae*. Mr. Swainson places both *Calyptomena* and *Rupicola* in the subfamily *Ampelinae*, or *Typical Chatterers*; and *Rupicola*, in his arrangement, immediately precedes the subfamily *Piprinae*, *Manakins*, which he considers as subtypical. Mr. G. R. Gray (*Genera of Birds*) places *Rupicola* and *Calyptomena* at the head of the *Ampelinae*, the fourth subfamily of the *Ampelidae* in his method.

*Rupicola*, Briss. (Cock of the Rock.)

*Generic Character*.—Bill moderate, robust, rather vaulted and curved at the point, upper mandible as wide as it is high, compressed at the base and notched at the point, lower mandible shorter, straight, and sharp; nostrils oval, lateral and hidden by the feathers of the elevated crest which covers the head. Feet large, strong, tarsi partially clothed with feathers, feet syndactyle, outer toe connected with the middle toe beyond the first joint, hallux very strong and armed with a crooked nail. Wings short, rounded; fourth and fifth quills longest.

*Geographical Distribution*.—Central and South America.

Examples, *Rupicola aurantia*, Vieill., and *Rupicola Peruviana*, Dumont.

*Rupicola aurantia*.

*Rupicola aurantia*.

*Description*.—*Male*.—Size about that of a Ring Pigeon (*Columba Palumbus*), very bright orange-yellow; a crest, which is compressed and elevated, rises from the head with a helmet-like air, and is varied at the summit with brown and bright yellow; there is some white at the bend and on the middle of the wing, which is filiform at the first quill; the tail-feathers are short, reddish-black bordered with yellow; bill and feet rosy-white.

*Female* rather smaller, and with a less elevated crest; colour entirely dirty bistre-brown.

This is the *Pipra Rupicola* of Linnæus, *Rupicola Cuyana* of Swainson, *Rupicola elegans* of Stephens, and *Rock Manakin* and *Cock of the Rock* of English ornithologists.

*Locality*.—This beautiful bird inhabits Guiana, especially about the rocks which border the small river Oyapock, and is becoming daily more rare.
